

## Lecture II

### PROBLEM 1: PREPARATION OF A BUFFER SOLUTION AND TEST

#### 1) Prepare a Buffer Solution

Calculate the pH of a buffer solution prepared by dissolving 0.1 mole of cyanic acid, HCNO, and 0.5 mole of sodium cyanate, NaCNO, in enough water to make 0.5 L of solution. For HCNO,  $K_a = 2.0 \times 10^{-4}$

#### Solution:

$n_{\text{HCNO}} = 0.1 \text{ mol}$  (cyanic acid)

$n_{\text{NaCNO}} = 0.5 \text{ mol}$  (sodium cyanate)

$V_f = 0.5 \text{ L}$

$K_a = 2 \times 10^{-4}$

pH = ?

#### First approach

We first write the equation for the equilibrium reaction and the expression for the  $K_a$ :

$$\begin{aligned} HA &\leftrightarrow A^- + H^+ \\ K_a &= \frac{[A^-][H^+]}{[AH]} = 2 \times 10^{-4} \end{aligned}$$

Let's convert now the moles in molarity amounts:

$$\text{Molarity} = \frac{\text{nr. mole}}{\text{Volume}}$$

$$[\text{HCNO}] = [AH] = \frac{0.1}{0.5} = 0.2 \text{ M}$$

$$[\text{NaCNO}] = [A^-] = \frac{0.5}{0.5} = 1 \text{ M}$$

NaCNO dissolves completely in the buffer solution:  $\text{NaCNO} \rightarrow \text{CNO}^- + \text{Na}^+$

$$[H^+] = \frac{[AH] K_a}{[A^-]} = \frac{0.2 \times 2 \times 10^{-4}}{1} = 4 \times 10^{-5}$$

$$\text{pH} = -\log_{10}([H^+]) = 4.39$$

#### Second approach

We convert mole to molarity quantities as the previous approach;

$$[\text{HCNO}] = [AH] = \frac{0.1}{0.5} = 0.2 \text{ M}$$

$$[\text{NaCNO}] = [A^-] = \frac{0.5}{0.5} = 1 \text{ M}$$

In the buffer solution, NaCNO completely dissolves:  $\text{NaCNO} \rightarrow \text{CNO}^- + \text{Na}^+$

We can summarize the information in a table based on the chemical equation:

|                             | $\text{HCNO}$ | $\leftrightarrow$ | $\text{CNO}^-$ | $+$ | $\text{H}^+$ |
|-----------------------------|---------------|-------------------|----------------|-----|--------------|
| Initial Concentration (M)   | 0.2           |                   | 1              |     | -            |
| Concentration change        | -x            |                   | +x             |     | +x           |
| Concentration @ equilibrium | 0.2-x         |                   | 1+x            |     | x            |

$$K_a = \frac{[\text{CNO}^-][\text{H}^+]}{[\text{HCNO}]} = \frac{(1+x)x}{0.2-x} = 2 \times 10^{-4}$$

Since  $x \ll 0.2 \text{ M}$ , we can approximate like:

$$K_a = \frac{[CNO^-][H^+]}{[HCNO]} = \frac{x}{0.2} = 2 \times 10^{-4}$$

Then:

$$x = [H^+] = 0.2 \times 2 \times 10^{-4} = 4 \times 10^{-5}$$

$$pH = -\log_{10}([H^+]) = 4.39$$

## 2) Add a strong base to a Buffer Solution. Will the pH change?

Calculate the pH of the buffer solution after 0.02 mole of NaOH (sodium hydroxide) has been added to it.

$n_{NaOH} = 0.02$  mol (sodium hydroxide)

$$[NaOH] = \frac{0.02}{0.5} = 0.04 \text{ M}$$

it completely dissociates in buffer solution:  $NaOH \rightarrow OH^- + Na^+$

the product reacts with cyanic acid:  $OH^- + HCNO \rightarrow CNO^- + H_2O$

So 0.04 M of  $OH^-$  consumes 0.04 M of HCNO.

Therefore the table changes as follow:

|                             | $HCNO$ | $\leftrightarrow$ | $CNO^-$ | + | $H^+$ |
|-----------------------------|--------|-------------------|---------|---|-------|
| Initial Concentration (M)   | 0.2    |                   | 1       |   | -     |
| Buffer action               | -0.04  |                   | +0.04   |   | -     |
| Concentration change        | -x     |                   | +x      |   | +x    |
| Concentration @ equilibrium | 0.16-x |                   | 1.04+x  |   | x     |

By substituting it in the  $K_a$  formula:

$$K_a = \frac{[CNO^-][H^+]}{[HCNO]} = \frac{(1.04 + x)x}{0.16 - x} = 2 \times 10^{-4}$$

we can approximate the equation, since  $x \ll 0.16$  M:

$$K_a = \frac{[CNO^-][H^+]}{[HCNO]} = \frac{x \times 1.04}{0.16} = 2 \times 10^{-4}$$

Then:

$$x = [H^+] = \frac{0.16 \times 2 \times 10^{-4}}{1.04} = 3.1 \times 10^{-5}$$

$$pH = -\log_{10}([H^+]) = 4.51$$

We can also arrive to the same conclusion by considering only the  $K_a$  equation and the changes on these quantities. Indeed, while  $[CNO^-]$  increases with the addition of NaOH,  $[HCNO]$  decreases of the same quantity since it is reacting with the NaOH. Since we have added 0.04 M of NaOH, we can modify the equation as follow:

$$K_a = \frac{([A^-] + 0.04)[H^+]}{[AH] - 0.04} = \frac{([CNO^-] + 0.04)[H^+]}{[HCNO] - 0.04} = 2 \times 10^{-4}$$

Then:

$$[H^+] = \frac{([HCNO] - 0.04) K_a}{[CNO^-] + 0.04} = \frac{0.16 \times 2 \times 10^{-4}}{1.04} = 3.1 \times 10^{-5} \text{ which means again } pH = 4.51$$

**PROBLEM 2 (BUFFER SOLUTION FOR DNA/RNA)**

How much Tris-Acetate-EDTA (TE buffer) stock buffer (3.25 M) is required to make 400 ml of solution that has a concentration of 250 mM? How much water?

**Solution:**

We need to use the formula for dilutions:

$$V_i C_i = V_f C_f$$

Where  $V_i C_i$  are Volume and Concentration of the stock solution and  $V_f C_f$  are Volume and Concentration of the final solution we want to obtain.

Therefore:

$$C_i = 3.25 \text{ M TE buffer}$$

$$V_f = 400 \text{ mL}$$

$$C_f = 250 \text{ mM}$$

$$V_i = ? ; V_{H_2O} = ?$$

$$V_i = \frac{V_f C_f}{C_i} = \frac{400 \text{ mL} \times 250 \text{ mM}}{3250 \text{ mM}} = 30.7 \text{ mL}$$

$$V_{H_2O} = V_f - V_i = 400 \text{ mL} - 30.7 \text{ mL} = 369.3 \text{ mL}$$

**PROBLEM 3 (BUFFER SOLUTION FOR PROTEINS)**

You wish to make 3 reactions with the specified amounts of protein. The remainder of each reaction consists entirely of buffer. The source of your protein is a stock solution that has a concentration of 0.5 mg/ml. What is the volume of stock solution required for each reaction (column 3). What is the volume of buffer required (column 4)?

| Reaction number | Amount of protein (μg) | Volume of protein solution (μl) | Required Volume of buffer solution (μl) | Required Final Volume (ml) |
|-----------------|------------------------|---------------------------------|-----------------------------------------|----------------------------|
| 1               | 2                      |                                 |                                         | 1                          |
| 2               | 25                     |                                 |                                         | 2.5                        |
| 3               | 100                    |                                 |                                         | 4                          |
| <b>Column 1</b> | <b>Column 2</b>        | <b>Column 3</b>                 | <b>Column 4</b>                         | <b>Column 5</b>            |

**Solution:**

We need to use the formula for dilutions:  $V_i C_i = V_f C_f$

Where:

Stock Solution:  $C_i = 0.5 \text{ mg/ml}$   $V_i$  is Column 3

Final Solution:  $V_f$  is Column 5  $C_f = \text{Column 2/Column 5}$

$$V_i = \text{Column 3} = \frac{V_f C_f}{C_i} = \frac{\text{Column 5} \times (\text{Column 2/Column 5})}{0.5 \text{ mg/ml}}$$

$$\text{Column 4} = V_f - V_i = \text{Column 5} - \text{Column 3}$$

| Reaction number | Amount of protein (μg) | Volume of protein solution (μl) | Required Volume of buffer solution (μl) | Required Final Volume (ml) |
|-----------------|------------------------|---------------------------------|-----------------------------------------|----------------------------|
| 1               | 2                      | 4                               | 996                                     | 1                          |
| 2               | 25                     | 50                              | 2450                                    | 2.5                        |
| 3               | 100                    | 200                             | 3800                                    | 4                          |
| <b>Column 1</b> | <b>Column 2</b>        | <b>Column 3</b>                 | <b>Column 4</b>                         | <b>Column 5</b>            |
