Lost time we saw how to associate a Sirichlet
series (s) to an arithmetic function f. Now
we'll see (s(s) has nice product representantion
when f is multiplicative.

Recall: Let 2n a sequence of complex numbers with tn + -1, for n & N. Then the product

The sequence $R:=\frac{N}{17(1+2n)}$ converges (=) the sequence $R:=\frac{N}{n-1}$ converges.

Them: The 11+2m) converges = 2 log (1+2m)
new converges.

The state of the s

Theorem (Fully product)

Let SER multiplicative. If Ly converges absolutely at SEC, then Lf(s) = TT (1 + 5 f(p)),

rep (1 + 5 f(p)), where the product on the right converges absolutely. Moreover, if f completely multiplicative, then $L_{\xi}(s) = \prod_{p \in P} \left(1 - \frac{5(p)}{p^s}\right)^{\frac{1}{2}}.$ Note 1+ 5 f(p) = 5/f(p) = 1 IEN ps = 1-f(p) = 1-f(p) = 1-f(p) ps = 1 f(p) ps Proof: Note that for each prime p, 5 fip!)
converges absolutely as so does (sis). == pts let R:= TT (1+ \(\frac{5}{2}\) \(\frac{5(p^2)}{\tau^2}\). Note that if $n = p_2 ... p_k$, then $f(n) = f(p_2) \cdot f(p_k)$ since f multiplicative. $n^s \cdot p_2^{e_2s} \cdot p_k^{e_2s} \cdot p_k^{e_2s}$

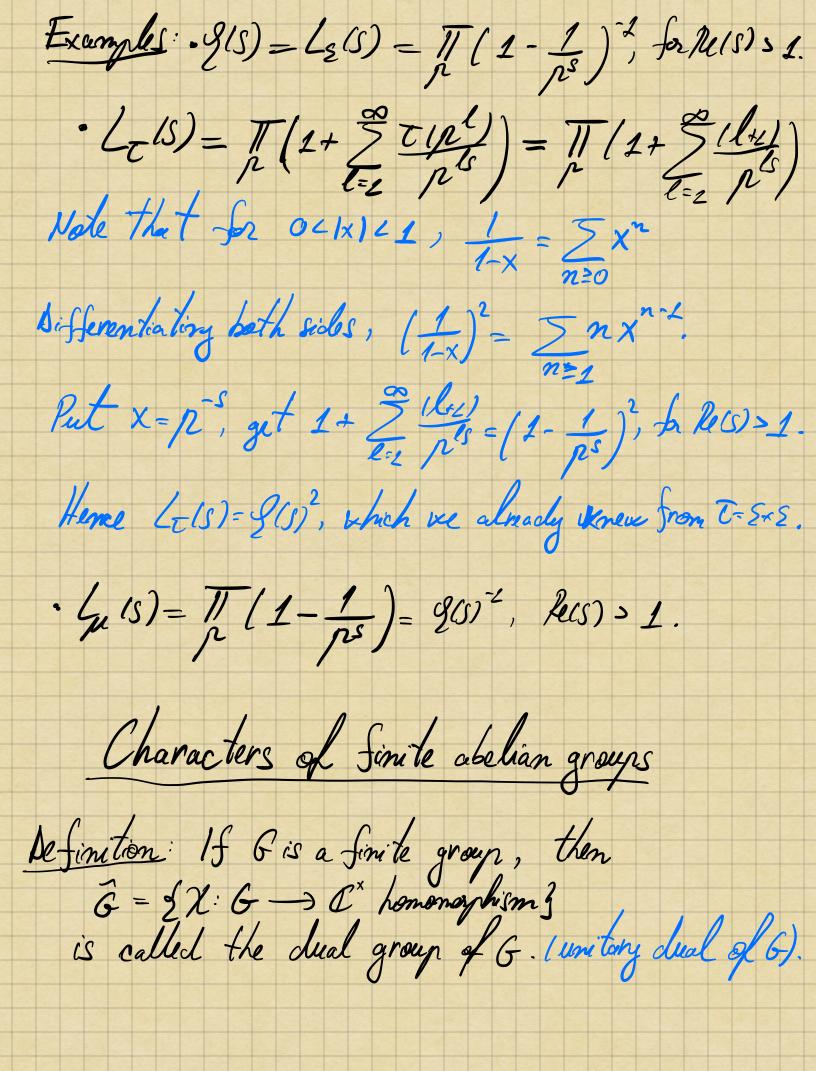

Denote B(N) = {n+N: pin => p & N }

1 set of natural members where all prime factors one less than N)

Let &p & N } = & P2,..., Pr3. Then $P_N = \frac{\infty}{5} f(p_2^{l_2}) - f(p_r^{l_r}) = \frac{5}{negar} f(n)$ (we have used unique prine forbrishion and that

5 f(p; i) is absolutely convengent)

6-0 p; is Therefore 1 PN - Lg (s) | = | = \frac{\frac}{\frac{\frac{\frac{\frac{\frac{\frac{\frac{\frac{\frac{\frac{\fi $\leq \frac{\left|f(n)\right|}{n^{s}} \leq \frac{\left|f(n)\right|}{n^{s}} = \frac{\left|f(n)\right|}{n^{s}} = 0.$ We have used that Ly1s) absolutely convergent at s and that \$1,2,..., N-13 C B(N). The product is absolutely covergent since similarly $TT(1+|\sum_{j=1}^{n}f(j)|) = TT(1+\sum_{j=1}^{n}|f(j)|) = \sum_{j=1}^{n}|f(n)| = \sum_{j=1}^{n}|$

Lemma: De fine : $\hat{G} \times \hat{G} \longrightarrow \hat{G}$ by $(\chi \cdot \psi)(g) := \chi(g)\psi(g)$, for $g \in G$. Then (\hat{G}, \cdot) abelian group with neutral element $\chi_{\circ}: g \longmapsto 1$. For any X+&, the character X(g):=X(g) (g&6)
is its multiplicative inverse. Prof: exercise. Proposition: Let G simile abelian group. Then $G \cong G$. Proof: By structure theorem of finite abelian groups, we know $G \cong \prod(Z/n; Z)$, for some n_1 , $n_k \in \mathbb{N}$.

Therefore theme exist g_1 , $g_k \in G$ with ord $(g_i) = \mathcal{X}_i$ $s \neq cong$ $g \in G$ has unique writing $g = g_1^{r_2} \cdot g_k^{r_k}, \quad 1 \leq r_i \leq n_i$. Let X66. Then X(g): X(g₂)... X(g_x)... X(g_x)... (enough to determine values of X on g_x, g_x).

Since gi his order ni, then X(gi)"= X(gi") = X(e) = 1 =>] 1 & a; & n; S.t. \(\chi(gi) = e^{2\overline{n}i}. (X(gi) is Mi-th root of unity) Note that each choice of 1 ta; in, for 1 tick
uniquely determines a character,
hence 16/=16/= Tini. It remains to show 6 and 6 isomorphic. For 14ick, define the character Xi & & s.t.

Xi (gi) = e 2ni. $\chi_{i}(g_{i}) = \ell^{-n_{i}}$ $\chi_{i}(g_{j}) = 1$, for $i \neq j$. We see that χ_{1} , χ_{k} generate \hat{G} and each $\chi_{i} \in \hat{G}$ can be written uniquely as $\chi_{i} = \chi_{i}^{r_{2}} \cdot \chi_{k}^{r_{k}}$, $1 \leq r_{i} \leq n_{i}$. Heree the map $f: G \to \hat{G}$ is an isomorphism $f_{i} + \chi_{i}$ of groups. E_{j} Remork: The isomorphism is not conomical, it depends on choice of generators generators. gr. gk.

Corollary (& separates paints)

Let & Simile abelian. If $g \in G \setminus Sl_3$, there exists $\chi \in \hat{G}$ such that $\chi(g) \neq 1$. Proof: let ge6\ses and H=2g>, so 1411>1.

Suppose for controdiction H & Ker X, & X & G.

Hence we con construct injective map

Q: G -> 6/H given by Q(X)(gH):=X(g), for $g \in G$. (well defined since $\chi(h)=1$, $\forall h \in H$, $\forall \chi \in G$). Thus 16/=16/=16/H1=10/H1=16/2161, contraction Penorx: By above $\hat{G} \cong \hat{G} \cong G$. Here isomorphism $\Xi: G \longrightarrow \hat{G}$ is cononical, given by $\Xi: (g)(x):=\chi(g)$ ($\chi \in \hat{G}, g \in G$). Indeed, Ξ is a homomorphism and injective since \widehat{G} separates points in G.

($\Xi'(g)(x)=1$, $\forall x \in G \subset \mathcal{X}(g)=1$, $\forall x \in \widehat{G} \subset \mathcal{Y}(g)=0$). Notation: We denote $\chi_0 \in G$ to be the identity character $\chi_0(g) = 1$, $\chi_0(g) = 0$.

Theorem 1 Orthogonality relations)

Let 6-be a finite abelian group.

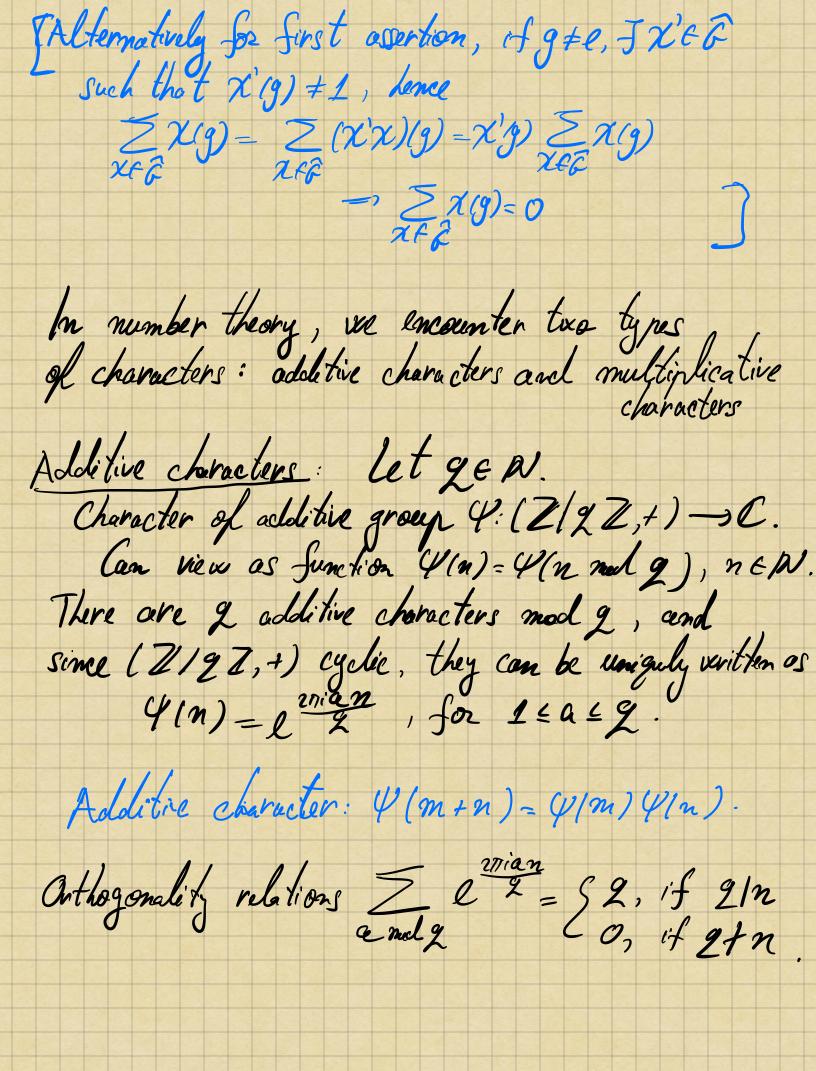

For all $g \in G$, $\sum \chi(g) = \int |G|$, if g = e, $\chi \in \hat{g}$ and for $\chi \in \hat{G}$, $\chi \in \chi_{(g)} = \int_{-\infty}^{\infty} |G|$, if $\chi = \chi_0$. Proof: We stort with second assertion.

Clear when $X = X_0$.

Suppose $X \neq X_0$. Hence $3h \in 6s.4$. $X(h) \neq 1$. Then $Z(g) = Z(gh) = \chi(h) Z(g)$ $g \in G$ $g \in G$ $g \in G$ $g \in G$ Since $\chi(h) \neq 1 = 0$ Z(g) = 0. For the first assertion, note that ZX(g) = Z E(g)(x)

X6 & X6 &

and thus it fellows from case already proven D

Multiplicative characters: A multiplicative character module 2 is a character of the multiplicative group ([Z/2Z)*, -). Since |(Z/2Z)'| - f(g), there are f(g) mult characters modulo g. Contrary to additive case, in general they consist be written in explicit form. XE (2/22) => X(mn) = X(m) X(n), Um, n with (m, 2)=(n,2)=1. Note that X = 12/22) con be viewed as a function on classes (n mol 2), where (n, g) = 1. Con extend this to all W as follows: Definition: (Sinichlet characters).

A map XEA is a Sirichlet character (mod 2)

if there exists a character (also) X on (Z/2Z) $\chi(n) = \begin{cases} \chi(n \mod 2), & f(n,2) = 1, \\ 0, & else. \end{cases}$

Note: exe utilise same symbol for both functions, usually it's clear from context which one is meant.

- Dirichlet characters are completely multiplicative! De Sintion (Principal Sirichlet character)

The Dirichlet character corresponding to trivial character Xo mod 2 is called the principal character mod 2. It is given explicitly by $\chi_{o(n)} := \{1, (n, g) = 1, (n, g) = 1,$ We can write orthogonality relations as $\sum \chi(n) = \int f(2), if n = 1 \pmod{2}$ $\chi \mod 2$ 0, otherwise and \(\sum_{\text{mod}} \gmax(n) = \left\{ \begin{aligned}
\sqrt{g}, & \text{if } \chi = \chi_0 \\
& n \text{mod} & \chi & \chi, & \text{if } \chi \chi \chi. \end{aligned} We can use sirichlet characters to look at arithmetic progressions:

Covallary 12/se Sulves of Birichlet chracters)

Let fest an arithmetic function and a e Z

with (a, 2) = 2 Then $\sum_{\substack{n \leq x \\ n \equiv a(q)}} f(n) = f(q) \sum_{\substack{n \leq x \\ x \neq a(q)}} \frac{1}{x} f(n) \frac{1}{x} f(n) \frac{1}{x} f(n)$ Proof: $\sum_{n \leq x} f(n) = \sum_{n \leq x} f(n)$ $n \leq x$ n = a(q) a = a(q) a = a = a(q) a = a = a(q) $= \frac{\sum_{n \leq x} \left(\frac{f(n)}{f(q)} \frac{\sum_{n \in x} \chi(an)}{\chi(an)} \right)}{\chi(an)}$ = L ZX(a) Z f(n) X(n)

Nedy next Dirichlet L-functions Def: Let X mod 2 a Sirichlet character. We define the Sirichlet series associated to X $L(S,\chi):=L_{\chi}(S)=\sum_{n=1}^{\infty}\frac{\chi(n)}{n}$

This is absolutely convergent for Pecs) > 1 (and hence defines holomorphic function in this region). X completely multiplicative => for Re(s) > 1, xe have

Euler product L(S,X) = TT (1-X(p))-1.

In particular for X = Xo, $L(s, \chi_s) = \pi \left(1 - \frac{\chi_{o(p)}}{p^s}\right)^{-1} = \pi \left(1 - \frac{1}{p^s}\right)^{-2}$ $=2(s)/(2(1-\frac{1}{r^s}).$
