

HW10

Yukawa theory at one loop

In this homework you are asked to find one-loop beta-function in Yukawa theory (in 4 dimensions):

$$\mathcal{L} = \frac{1}{2}(\partial\phi)^2 + i\bar{\psi}\not{\partial}\psi - m_\psi\bar{\psi}\psi - g\phi\bar{\psi}\psi - \frac{m_\phi^2}{2}\phi^2 - \frac{\lambda}{4!}\phi^4. \quad (1)$$

Note, that the Lagrangian is given in Minkowski space. Even though Feynman rules haven't been discussed it is straightforward to derive those. For instance, the fermion propagator is given by

$$\text{-----} = \frac{i(\not{p} + m_\psi)}{p^2 - m_\psi^2 + i\varepsilon}. \quad (2)$$

For boson we use

$$\text{-----} = \frac{i}{p^2 - m_\phi^2 + i\varepsilon}. \quad (3)$$

We will be working in the regime $m_\phi = m_\psi = 0$

- Diagrams contributing to bosonic 2-pt function:

$$\text{---} \bigcirc \text{---} + \text{---} \otimes \text{---} \quad (4)$$

- Diagrams contributing to fermionic 2-pt function:

$$\text{---} \frown \text{---} + \text{---} \otimes \text{---} \quad (5)$$

- 3-pt function $\phi\bar{\psi}\psi$:

$$\text{---} \triangle \text{---} + \text{---} \otimes \text{---} \quad (6)$$

- 4-pt function $\phi\phi\phi\phi$ (do not forget other channels):

$$+ \quad + \quad + \quad (7)$$

- Compute beta-functions
