

# Exercise 1

Three sword fighters are comparing their swords. Obi Wan Kenobi claims that light sabers are the best, Beatrix Kiddo swears by Hattori Hanzo katanas and Frodo Baggins prefers Elvish daggers.

# Exercise 1

- Five different people are randomly assigned to each weapon (15 people all together) and sent out to battle.
- The number of kills they achieve are listed in the table to the right.
- State the null and alternative hypotheses and perform an ANOVA on the data.
- What are your conclusions?
- If you reject the null hypothesis, then conduct post-hoc tests (Scheffé) to determine the best sword.

Light Saber	Katana	Dagger
6	6	0
8	5	4
5	9	0
4	4	1
2	6	0
T = 25	T = 30	T = 5

# ANOVA

**Step 1: State the hypothesis & specify the alpha level**

**Step 2: Locate the critical region**

**Step 3: Perform the analysis**

1. SS (sum of square)
2. MS (mean of square)
3. F-ratio

# Step 1: State the hypotheses, and specify the alpha level

- The null hypothesis states that there is no difference among the swords in terms of number of dismemberments/kills committed:
  - $H_0: \mu_{\text{Light Saber}} = \mu_{\text{Katana}} = \mu_{\text{Dagger}}$  (the type of sword used has no effect).
- There are a number of possible statements for the alternative hypothesis. The general alternative hypothesis is:
  - $H_1$ : At least one of the mean numbers of dismemberments/kills is different.  
That is, the type of sword has an effect on the number of dismemberments/kills.
- For this test, we'll use  $\alpha = 0.05$ .

# Step 2: Locate the critical region

- $df_{between} = k - 1 = 3 - 1 = 2$
- $df_{within} = N - k = 15 - 3 = 12$
- $F(2,12) = 3.8853$
- The obtained F ratio must exceed this value to reject H0.

F - Distribution ( $\alpha = 0.05$  in the Right Tail)

df <sub>2</sub> \ df <sub>1</sub>	Numerator Degrees of Freedom								
	1	2	3	4	5	6	7	8	9

# Step 3: Perform analysis

## 0. Mean and SS (sum of squares)

- Total number of observations:  $N = N_1 + N_2 + N_3 = 5 + 5 + 5 = 15$
- Grand total:  $T = T_1 + T_2 + T_3 = 25 + 30 + 5 = 60$
- Number of groups:  $k = 3$
- $df_{between} = k - 1 = 3 - 1 = 2$
- $df_{within} = N - k = 15 - 3 = 12$

Light Saber	Katana	Dagger
6	6	0
8	5	4
5	9	0
4	4	1
2	6	0
T = 25	T = 30	T = 5

	Light Saber	Katana	Dagger
Mean	$\frac{6 + 8 + 5 + 4 + 2}{5} = 5$	$\frac{6 + 5 + 9 + 4 + 6}{5} = 6$	$\frac{0 + 4 + 0 + 1 + 0}{5} = 1$
SS	$(6 - 5)^2 + (8 - 5)^2 + (5 - 5)^2 + (4 - 5)^2 + (2 - 5)^2 = 20$	$(6 - 6)^2 + (5 - 6)^2 + (9 - 6)^2 + (4 - 6)^2 + (6 - 6)^2 = 14$	$(0 - 1)^2 + (4 - 1)^2 + (0 - 1)^2 + (1 - 1)^2 + (0 - 1)^2 = 12$

## Step 3.1: Mean Squares between swords

$$SS_{between} = \sum_{group} \frac{T_{group}^2}{N_{group}} - \frac{T^2}{N}$$

(or)

$$= \sum_{group} N_{group} * (\bar{x}_{group} - \bar{x})^2$$

- $SS_{between} = \frac{25^2}{5} + \frac{30^2}{5} + \frac{5^2}{5} - \frac{60^2}{15} = 125 + 180 + 5 - 240 = 70$

- $MS_{between} = \frac{SS_{between}}{df_{between}} = \frac{70}{2} = 35$

## Step 3.2: Mean Squares within swords

$$SS_{within} = \sum_{group} SS_{group}$$

$$(or) = \sum_{group (g)} \sum_{observation (o)} (x_{g,o} - \bar{x}_g)^2$$

- $SS_{within} = SS_{Light\ Saber} + SS_{Katana} + SS_{Dagger} = 20 + 14 + 12 = 46$

- $MS_{within} = \frac{SS_{within}}{df_{within}} = \frac{46}{12} = 3.8\bar{3}$

Step 4: compute F

$$F = \frac{MS_{between}}{MS_{within}} = \frac{35}{3.8\bar{3}} = 9.1304$$

## Step 4: Make a decision about $H_0$ , and state a conclusion

The obtained F of 9.1304 exceeds the critical value of 3.8853. Therefore, we can **reject the null hypothesis  $H_0$** .

The following table summarizes the results of the analysis:

Source	SS	df	MS	F
Between	70	2	35	9.13
Within	46	12	3.8333	
Total	116	14		

# Post-hoc tests (Scheffé)

**Just need to compute between treatment Mean Square (MS)**

- 1.  $SS_{\text{between}}$**
- 2.  $MS_{\text{between}}$**
- 3. F - ratio**

# Step 5.1: post-hoc tests (Scheffé)

- Light Saber VS Katana (1 VS 2)
- $T_{1+2} = T_1 + T_2 = 25 + 30 = 55$
- $N_{1+2} = N_1 + N_2 = 5 + 5 = 10$
- $SS_{between1+2} = \frac{25^2}{5} + \frac{30^2}{5} - \frac{55^2}{10} = 2.5$
- $MS_{between1+2} = \frac{2.5}{2} = 1.25$
- $F_{1+2} = \frac{1.25}{3.8\bar{3}} = 0.33$
- No difference between Light Saber and Katana

## Step 5.2: post-hoc tests (Scheffé)

- Light Saber VS Dagger (1 VS 3)
- $T_{1+3} = T_1 + T_3 = 25 + 5 = 30$
- $N_{1+3} = N_1 + N_3 = 5 + 5 = 10$
- $SS_{between1+3} = \frac{25^2}{5} + \frac{5^2}{5} - \frac{30^2}{10} = 40$
- $MS_{between1+3} = \frac{40}{2} = 20$
- $F_{1+3} = \frac{20}{3.8\bar{3}} = 5.22$
- Significant difference between Light Saber and Dagger!

## Step 5.3: post-hoc tests (Scheffé)

- Katana VS Dagger (2 VS 3)
- $T_{2+3} = T_2 + T_3 = 30 + 5 = 35$
- $N_{2+3} = N_2 + N_3 = 5 + 5 = 10$
- $SS_{between2+3} = \frac{30^2}{5} + \frac{5^2}{5} - \frac{35^2}{10} = 62.5$
- $MS_{between2+3} = \frac{62.5}{2} = 31.25$
- $F_{2+3} = \frac{31.25}{3.8\bar{3}} = 8.15$
- Significant difference between Katana and Dagger!

# Exercise 2

- The heights of Oaks, Elms and Pines are given in the table.
- Plot histograms of each groups' heights.
- If we wanted to compare these groups what assumption(s) of the ANOVA does/do these data violate?

Oaks	Elms	Pines
178	165	164
177	179	164
180	178	163
178	166	165
180	178	164
178	162	162
177	178	165
178	163	164
176	177	163
176	176	163
177	164	164
177	163	164
179	180	166
179	164	165
179	164	162
178	179	165
178	177	166
179	165	163

# Assumptions of ANOVA

1. Independent samples  
(samples to be obtained independently from all other samples)
2. Homogeneity of variance
3. Normally distributed populations

Excel ribbon showing the **DATA** tab. The **Data Analysis** icon in the **Analysis** group is circled in red.

16	2	8
17	2	8
18	2	9
19	2	11
20	2	7

The screenshot shows the JASP software interface for performing an Independent Samples T-Test. The interface is divided into several sections:

- File Common**: Contains navigation icons for Descriptives, T-Tests, ANOVA, Regression, Frequencies, and Factor.
- Dependent Variables**: A list box containing 'Data'.
- Grouping Variable**: A list box containing 'Group'.
- Tests**:
  - Student
  - Welch
  - Mann-Whitney
- Hypothesis**:
  - Group 1 ≠ Group 2
  - Group 1 > Group 2
  - Group 1 < Group 2
- Assumption Checks**:
  - Normality
  - Equality of variances
- Additional Statistics**:
  - Location parameter
  - Confidence interval 95 %
  - Effect size
  - Confidence interval 95 %
  - Descriptives
  - Descriptives plots
  - Confidence interval 95 %
  - Vovk-Sellke maximum p-ratio
- Missing Values**:
  - Exclude cases analysis by analysis
  - Exclude cases listwise

**Results**

### Independent Samples T-Test

Independent Samples T-Test

	t	df	p	Cohen's d	95% CI for Cohen's d	
					Lower	Upper
