

Cancer Biology I

Part-II

Week 12

# AGENDA

Nov 3<sup>rd</sup>: Cancer genomics- mutations

Nov 10<sup>th</sup>: Cancer genomics-copy number alterations, heterogeneity, tumor evolution

Nov 17<sup>th</sup>: Cancer Epigenetics- chromatin 3D structure, cell plasticity

Nov 24<sup>th</sup>: – Major signaling pathways leading to cancer

Dec 1<sup>st</sup>: Cancer Therapies – chemo and targeted therapies

**Dec 8<sup>th</sup>: Introduction to immunotherapies**

Dec 15<sup>th</sup>: discussion of unclear points and career development discussion towards a PhD

Dec 17<sup>th</sup>: Exam 2-4 PM – **GC A3 30**

# CANCER IMMUNOTHERAPIES

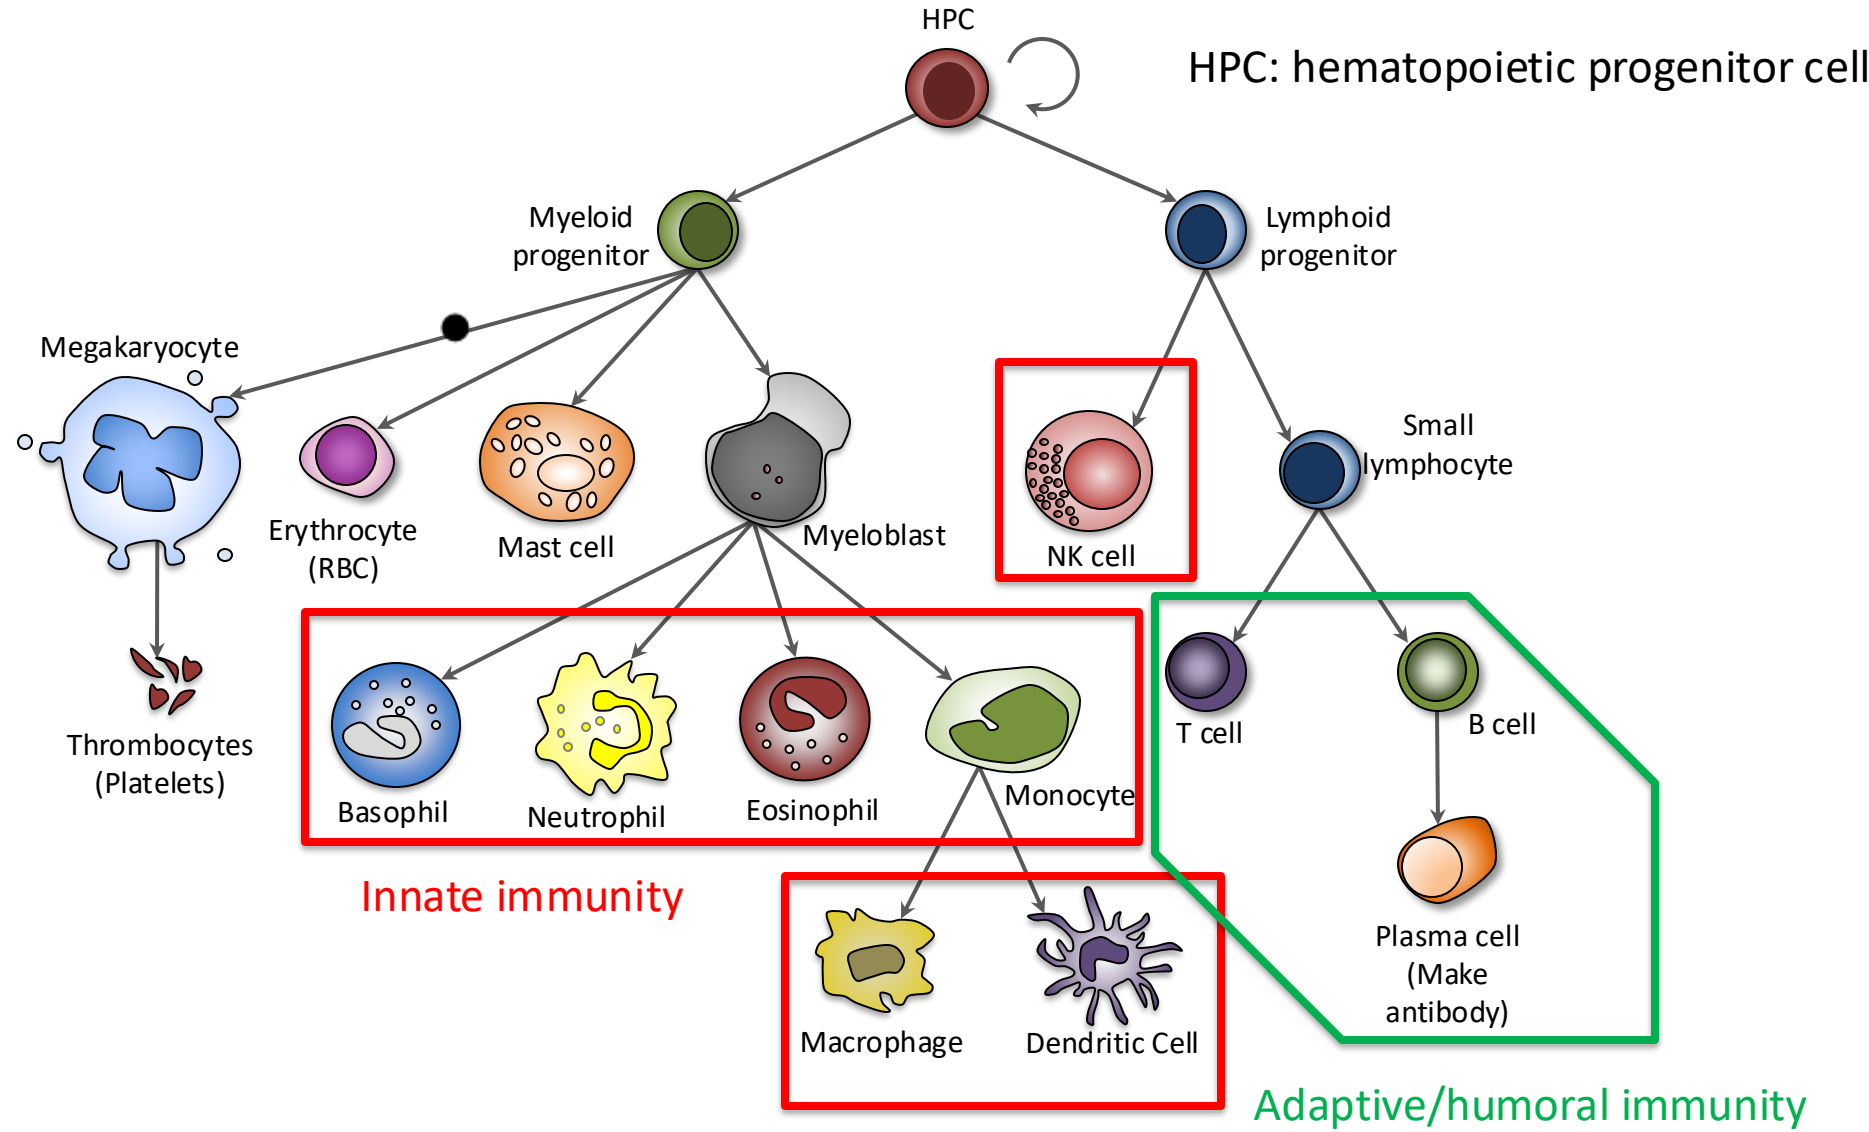

What is the GOAL/ or the principle for the design of cancer immunotherapies?

**Activate the immune-system to  
recognize and kill the tumor**

# CANCER IMMUNOTHERAPIES: VARIOUS POSSIBILITIES

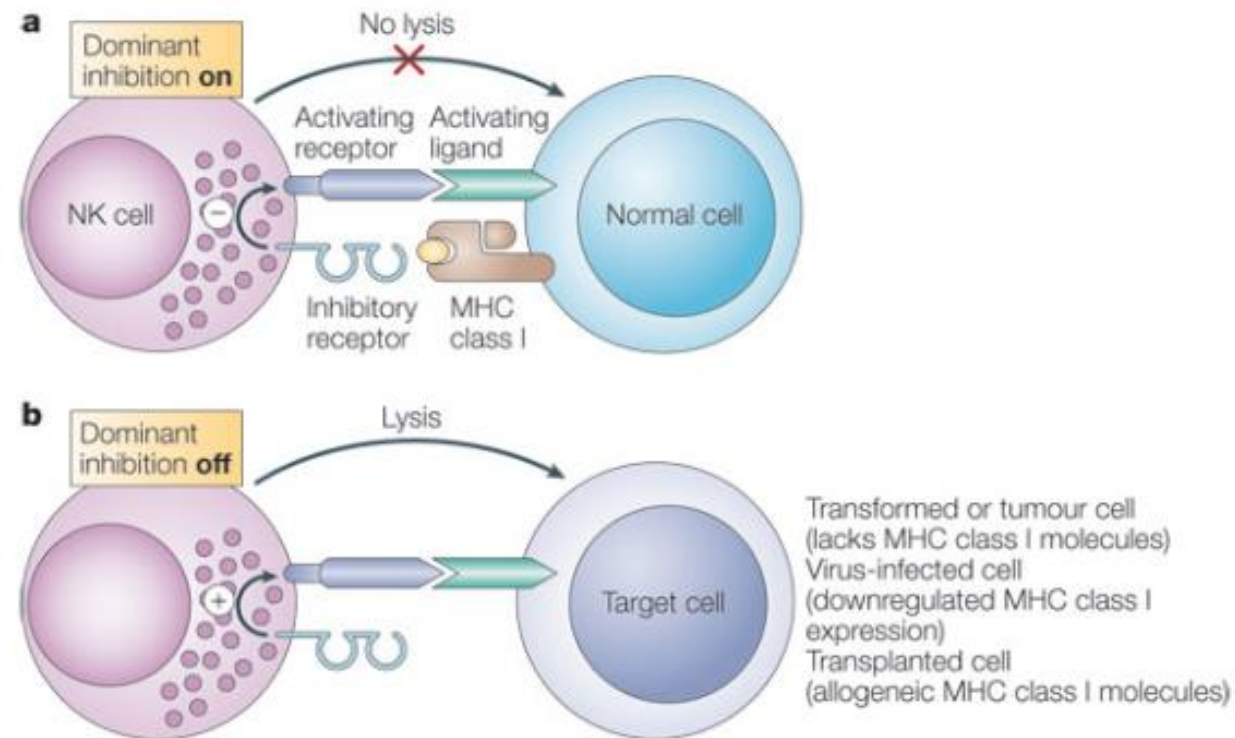

# IMMUNE SYSTEM

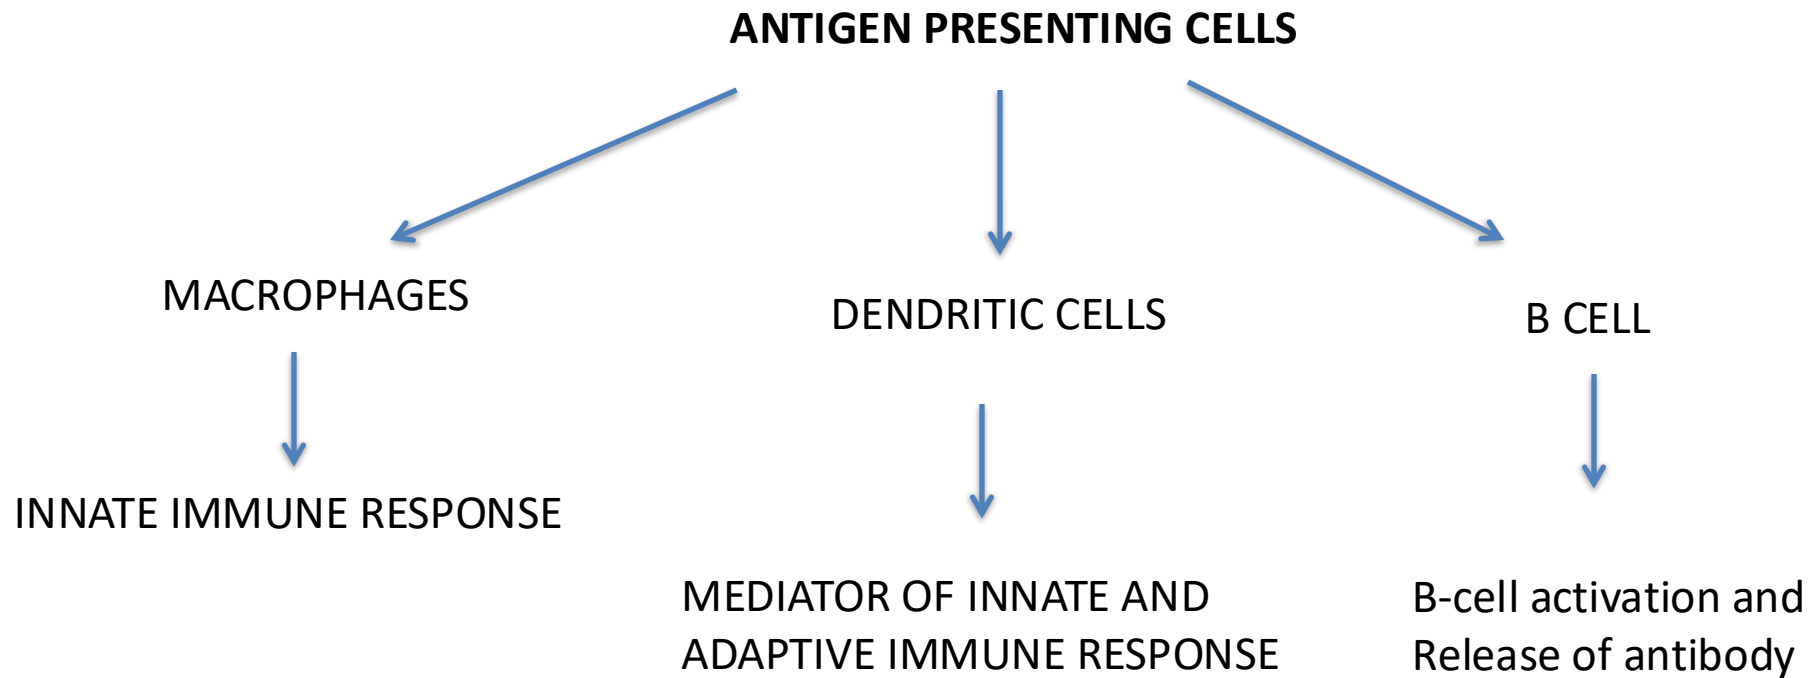

# NK cells (Natural Killer cells): Cytotoxic lymphocytes

Innate Immune response (rapid response to viral infection)

# IMMUNE SYSTEM: ANTIGEN Presenting cells

**WHAT DOES IT MEAN ANTIGEN PRESENTING CELLS?**

# ANTIGEN PRESENTATION: MHC

# ANTIGEN PRESENTATION: MHC I

ALL CELLS IN OUR BODY

# ANTIGEN PRESENTATION: MHC II

MACROPHAGES, B-CELLS , T CELLS

# IMMUNE SYSTEM: PLAYERS

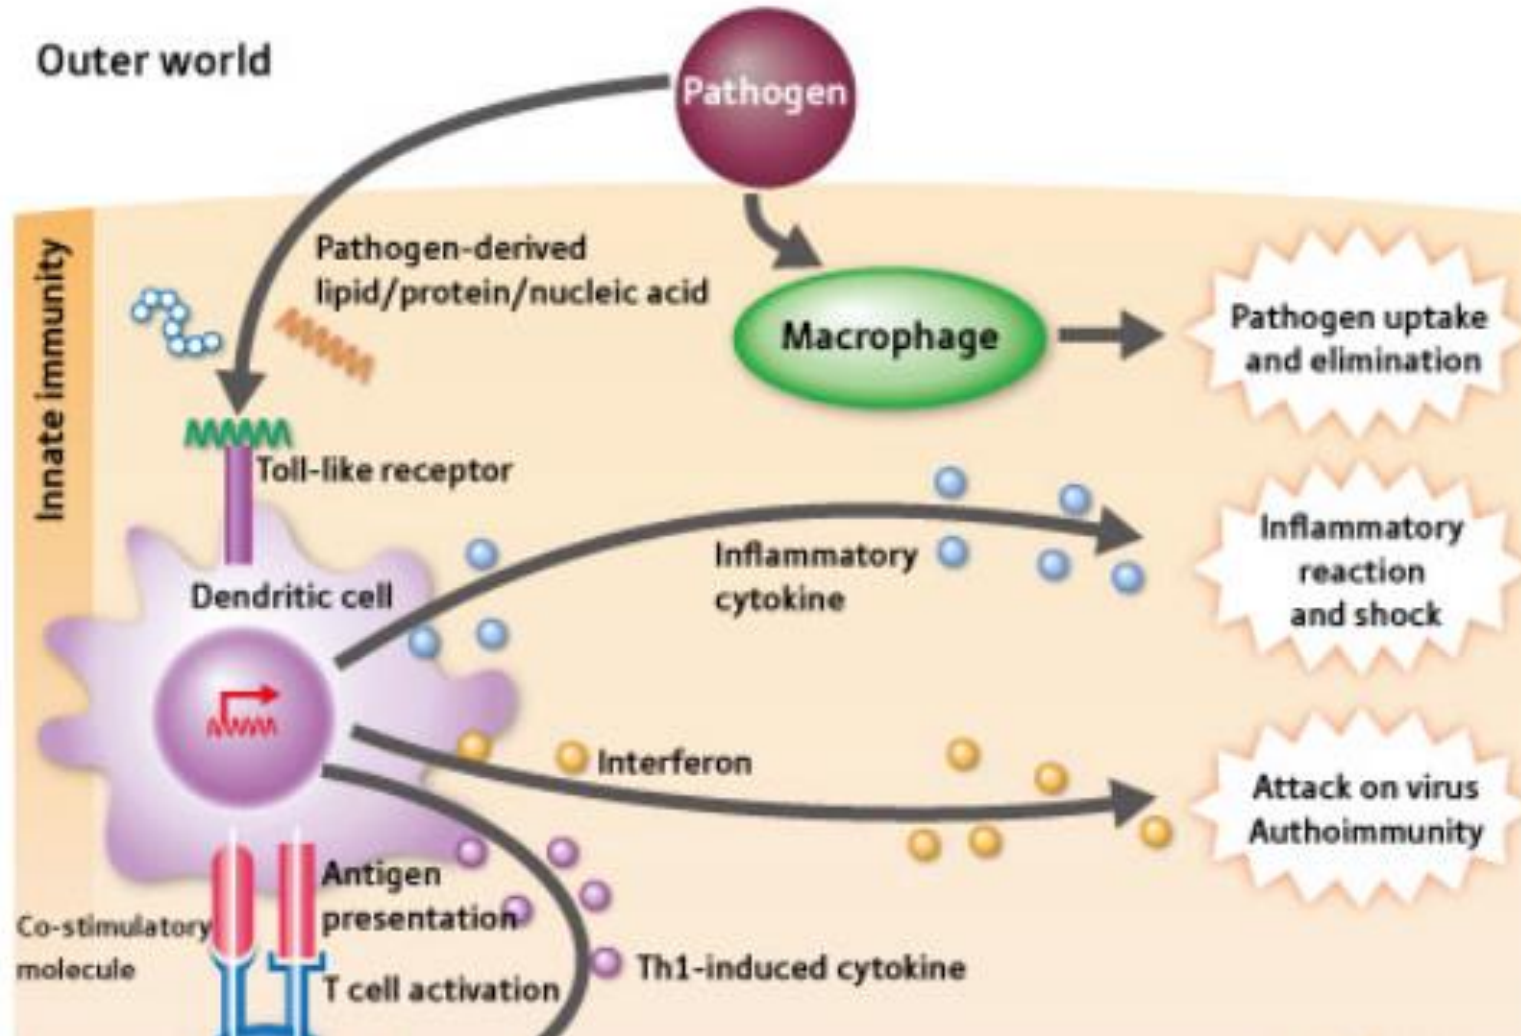

# IMMUNE SYSTEM: PLAYERS

Dendritic cells= APC (Antigen Presenting cells)  
mediator of innate and adaptive immune response

# INNATE IMMUNE RESPONSE

# IMMUNE RESPONSE

**INNATE IMMUNE RESPONSE= Fast**

**ADAPTIVE IMMUNE RESPONSE= Slow but long term memory**

# T-cells

CD4<sup>+</sup> T cell

CD4 cells/T-helper  
Activation of B and T cells

CD8<sup>+</sup> T cell

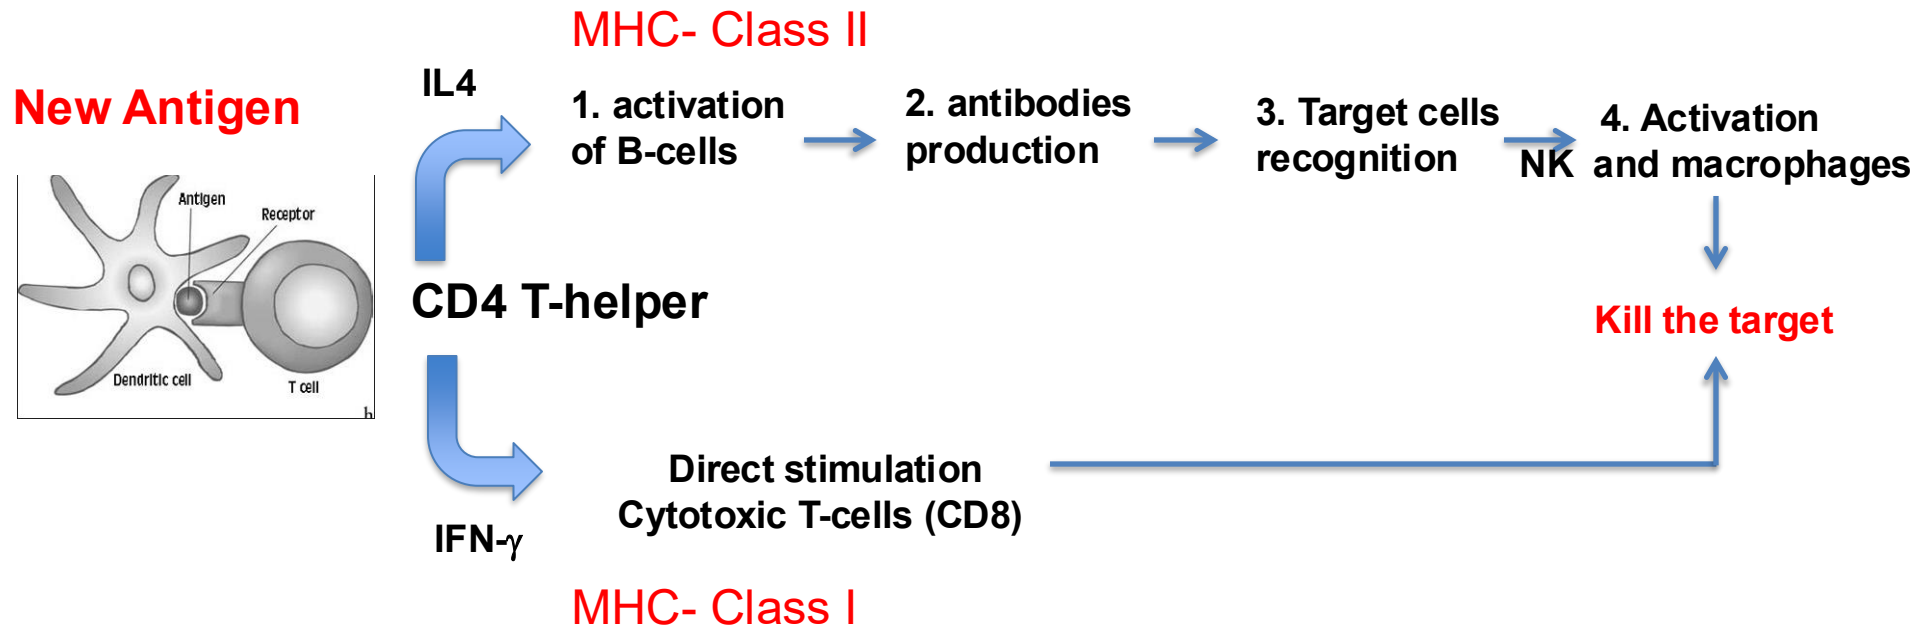

CD8  
Cytotoxic  
Adaptive immune system

T<sub>Reg</sub> cell

Regulator T cells (Treg)  
CD4/FoxP3  
Immunosuppressive

# ADAPTIVE IMMUNE RESPONSE

# B-cells

# STEP 4-5: Activation of **NK cells and macrophages** and kill the target

Antibody-mediated cellular cytotoxicity = NK  
(ADCC)

Antibody-mediated cellular phagocytosis=macrophages  
(ADCP)

# ANTIBODY BASED IMMUNOTHERAPIES to ACTIVATE IMMUNO RESPONSES

Lymphoma therapy: R-CHOP

**R= Rituximab**

CHOP= Chemotherapies MIX

1997

## Rituximab Anti-CD20 Monoclonal Antibody

### ■ Chimeric murine/human monoclonal antibody

- Variable light and heavy chain regions from murine model
- Human IgG1, kappa constant region

### ■ Long serum half-life

- RA (1000 mg)
  - ❖ After second infusion  $t_{1/2} = 19-22$  days

Berinstein NL et al. *Ann Oncol.* 1998;9:995-1001. Maloney DG et al. *J Clin Oncol.* 1997;15:3266-3274. Maloney DG et al. *Blood.* 1997;90:2183-2195. Davies B et al. *Ann Rheum Dis.* 2004;63:FR10128.

# Antibodies for cancer treatment

# Antibody-based therapies in cancer

**Rituximab**  
anti-CD20

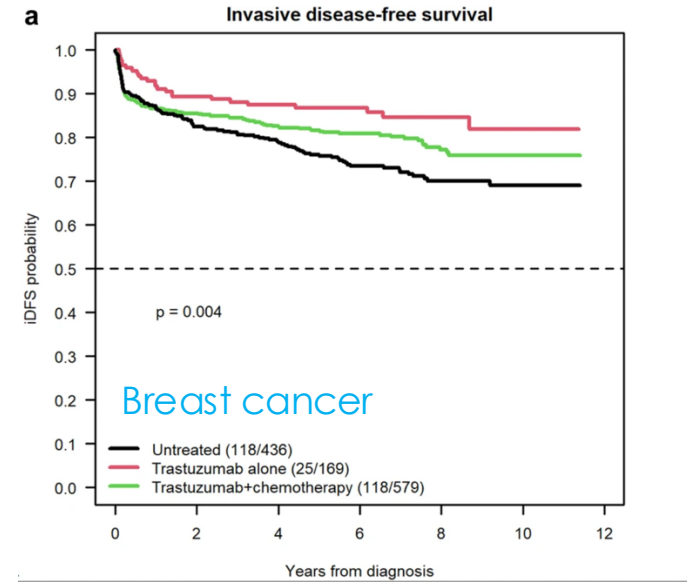

**Trastuzumab**  
anti-HER2

## Rituximab+ chemotherapies

## Trastuzumab+ chemotherapies

It improves but do not eliminate the tumor

# Antibodies for cancer treatment

**Which immune cells are missing to kill the cancer cells?**

# Bi-specific antibody

# ADAPTIVE IMMUNE RESPONSE: Cytotoxic cells

Figure 15.11 *The Biology of Cancer* (© Garland Science 2007)

# INNATE VS ADAPTIVE IMMUNE RESPONSE

	Innate Immunity	Adaptive Immunity
Speed of Onset	Immediate (within minutes)	~ 3 day lag
Specificity to Antigen	Lower	Higher
Diversity of Response	Lower	Higher
Potency	Lower	Higher
Memory (Reacts quicker to subsequent exposures)	No	Yes

**WHY DOES the IMMUNE SYSTEM NOT KILL CANCER CELLS?**

# IMMUNE TOLERANCE

**T-Regulatory cells  
(Treg)**  
(CD4, CD25 and FoxP3)

**Protect the body from  
auto-immune disease**

**Release  
IL10/TGF- $\beta$**

**Inhibit T-cells  
activation**

# IMMUNE TOLERANCE: mediated by Treg cells

# GRAFT REJECTION

Transplanted cells from donor are recognized and eliminated by the immune system

# SYNGENEIC and ALLOGENEIC TRANSPLANT

Figure 15.15 *The Biology of Cancer* (© Garland Science 2007)

# XENOGRAFT TRANSPLANT

# SUMMARY TRANSPLANT

# TUMOR MICROENVIRONMENT

# THE CANCER IMMUNITY CYCLE

# THE CANCER IMMUNITY CYCLE

**IMMUNE DESERT TUMORS**

**IMMUNE EXCLUDED TUMORS**

**INFLAMED TUMORS  
good for immunotherapies**

# IMMUNE DESERT TUMORS ARE TUMORS THAT DON'T PRESENT ANTIGENS

What is different between an immune desert tumor and an inflamed tumor?

An inflame tumor is:

characterized by high mutation rates

Mutate proteins can be recognized as non-self antigen and activate the immune response

# TUMOR WITH HIGH LEVELS OF MUTATIONS CAN BE ATTACKED BY THE IMMUNE SYSTEM

WT

MUT

Potential attack from the immune system if the mutations change the tridimensional structure of the peptide

# COPY NUMBER ALTERATIONS DON'T CHANGE PROTEIN SEQUENCE

Tumors driven by high copy number changes are less immunogenic

Antigen peptides are identical  
in tumor and non-tumor cells

# HOW THE TUMOR ESCAPE WITH HIGH MUTATION RATE ESCAPE THE IMMUNE RESPONSE

*HIDE THE ANTIGEN PRESENTATION:* REPRESS/MUTATE MHC class I

RELEASE INHIBITORY CYTOKINES (IL10 and TGF  $\beta$ )

**Mimic the function of Treg cells**

# HIDE THE ANTIGEN PRESENTATION: REPRESS/MUTATE MHC class

## MUTATE $\beta_2M$ or other component of antigen presentation

**HIDE THE ANTIGEN PRESENTATION: REPRESS/MUTATE MHC class**

**Repress the expression of MHC-I**

# RELEASE INHIBITORY CYTOKINES

Tumor blocks the immune-response

lymphocyte without TGF- $\beta$  receptor

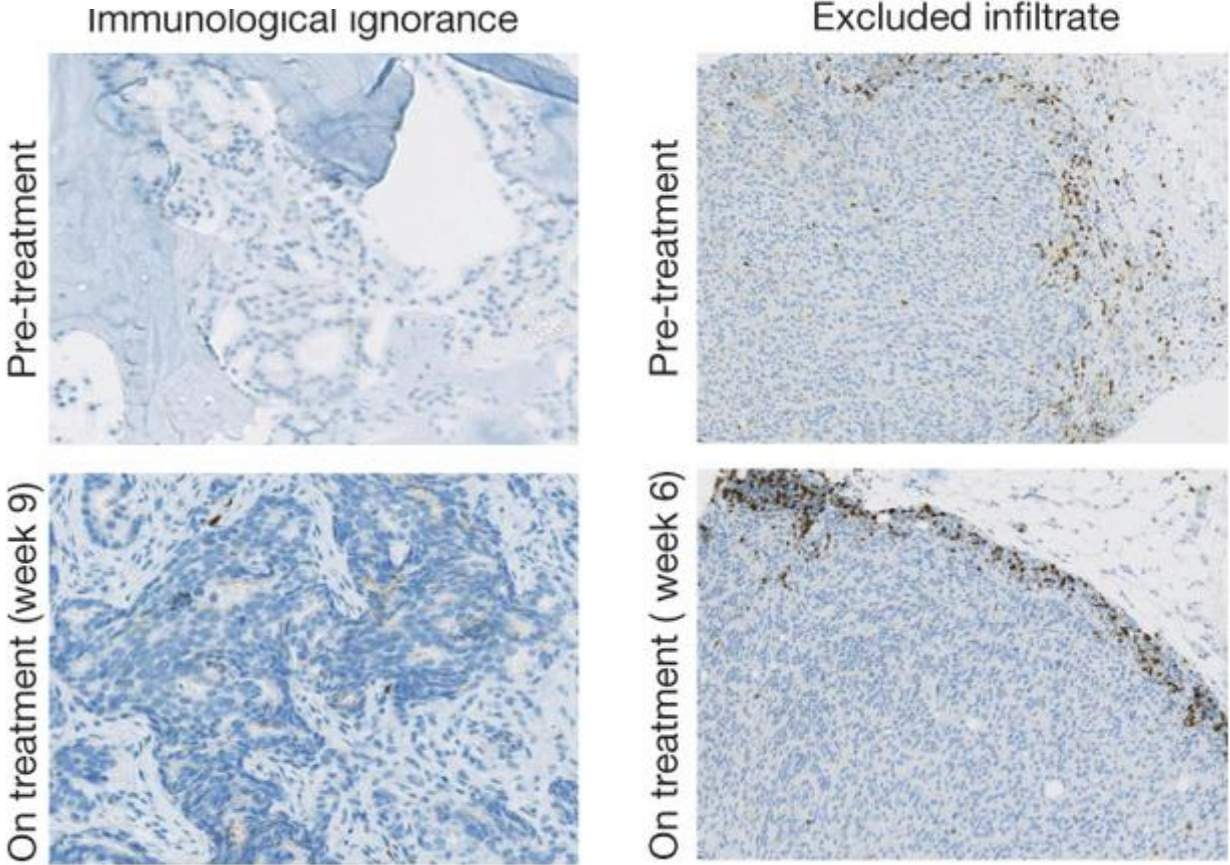

Figure 15.32a *The Biology of Cancer* (© Garland Science 2007)

# 2. IMMUNE EXCLUDED TUMORS

Cancer cells release factors that maintain immune cell to the periphery

### 3. INFLAMED TUMORS: TUMOR INFILTRATING LYMPHOCYTES

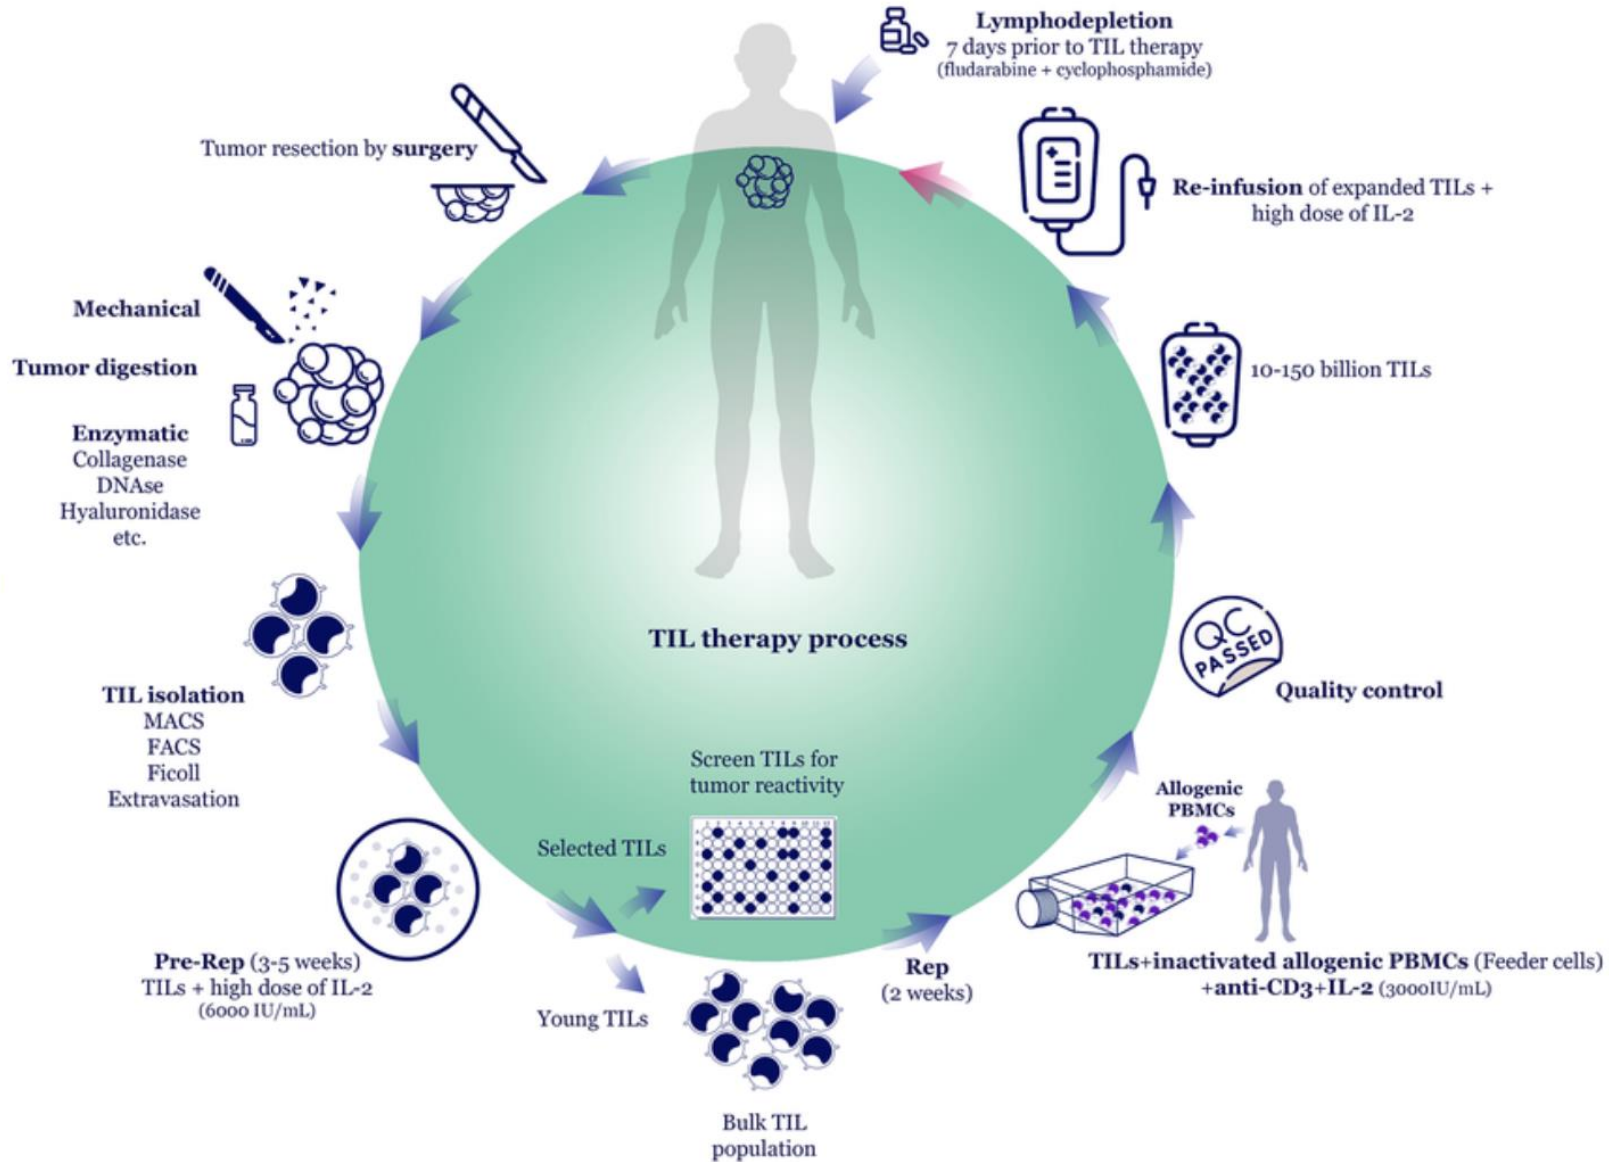

Figure 15.21c *The Biology of Cancer* (© Garland Science 2007)

# IMMUNE THERAPIES BASED ON TIL

# **MOBILIZE THE IMMUNE SYSTEM**

**Immune checkpoint inhibitors**

**Immune cell engineering:** mainly T cells, but NK and Dendritic cells are also largely studied

**Activate the immune system to attack the tumors**

# ACTIVATE T CELLS: CHECKPOINT INHIBITORS

ANTIBODIES THAT INHIBIT THE IMMUNE SUPPRESSIVE ACTIVITIES AND  
INDUCE ACTIVATION OF T-CELLS

**anti-CTLA4 (Ipilimumab) = Cytotoxic T-lymphocyte-associated antigen 4**

**anti-PD1 = Programmed cell death protein 1**

or

**anti-PDL1 = Programmed cell death protein 1 Ligand**

<http://www.nature.com/nrc/journal/v12/n4/pdf/nrc3239.pdf>

(a review if you want to read more details)

# CTLA4 BLOCKS T CELLS ACTIVATION

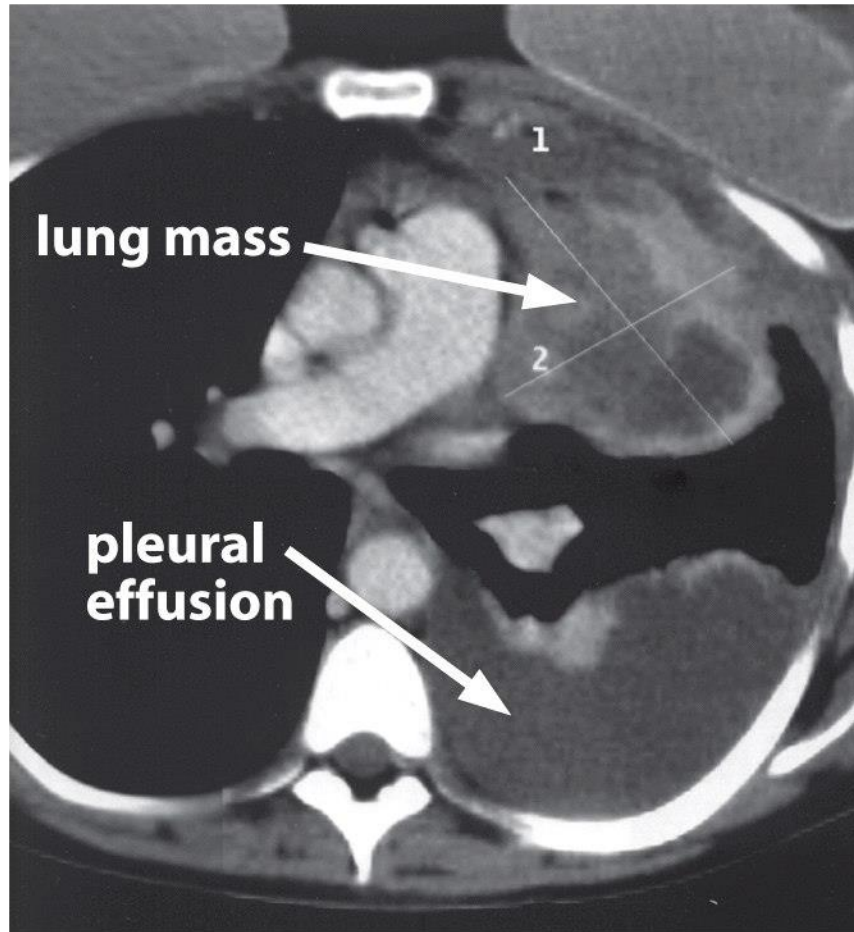

# ANTI-CTLA4 INDUCES T-CELLS ACTIVATION

Adapted from Lebbé et al. ESMO 2008

APC, antigen-presenting cell; CTLA-4, cytotoxic T-lymphocyte antigen-4; MHC, major histocompatibility complex; TCR, T-cell receptor.

# ANTI-CTLA4 TUMOR RESPONSE

**pre-treatment**

**5 months post-treatment**

# PD1/PDL1 signal

# anti PD1 and anti-PDL1

**anti-PD1 = binds receptor on T-cells**

**anti-PDL1 = binds the ligand on tumor cells**

# anti-PD1/PDL1 and anti-CTLA4

**Cover of the year, 2013**

**Nobel Prize, 2018**

# GENETICALLY ENGINEERED T-CELLS

***Express an exogenous stimulatory receptor in T-cells,  
that it will recognize the antigen on tumor cells and activates T-cells***

# Synthetic receptor is called-CAR

# CAR-T cells Therapy

# CD19 CAR-T cells therapy for B-cell malignancies

## Cytotoxicity of CD19-specific CAR-expressing T Lymphocytes against B Cell Lymphoma

# CD19 CAR-T cells Therapy

# The first patient treated with CAR-T cells
