Summary

- What is Alkali-Silica Reaction (ASR or AAR)?
- What can be done to mitigate the phenomenon
- What to do with an damaged structure
- Monitoring the structure
- Laboratory testings
- Work on a damaged structure: Chambon Dam
- Conclusion

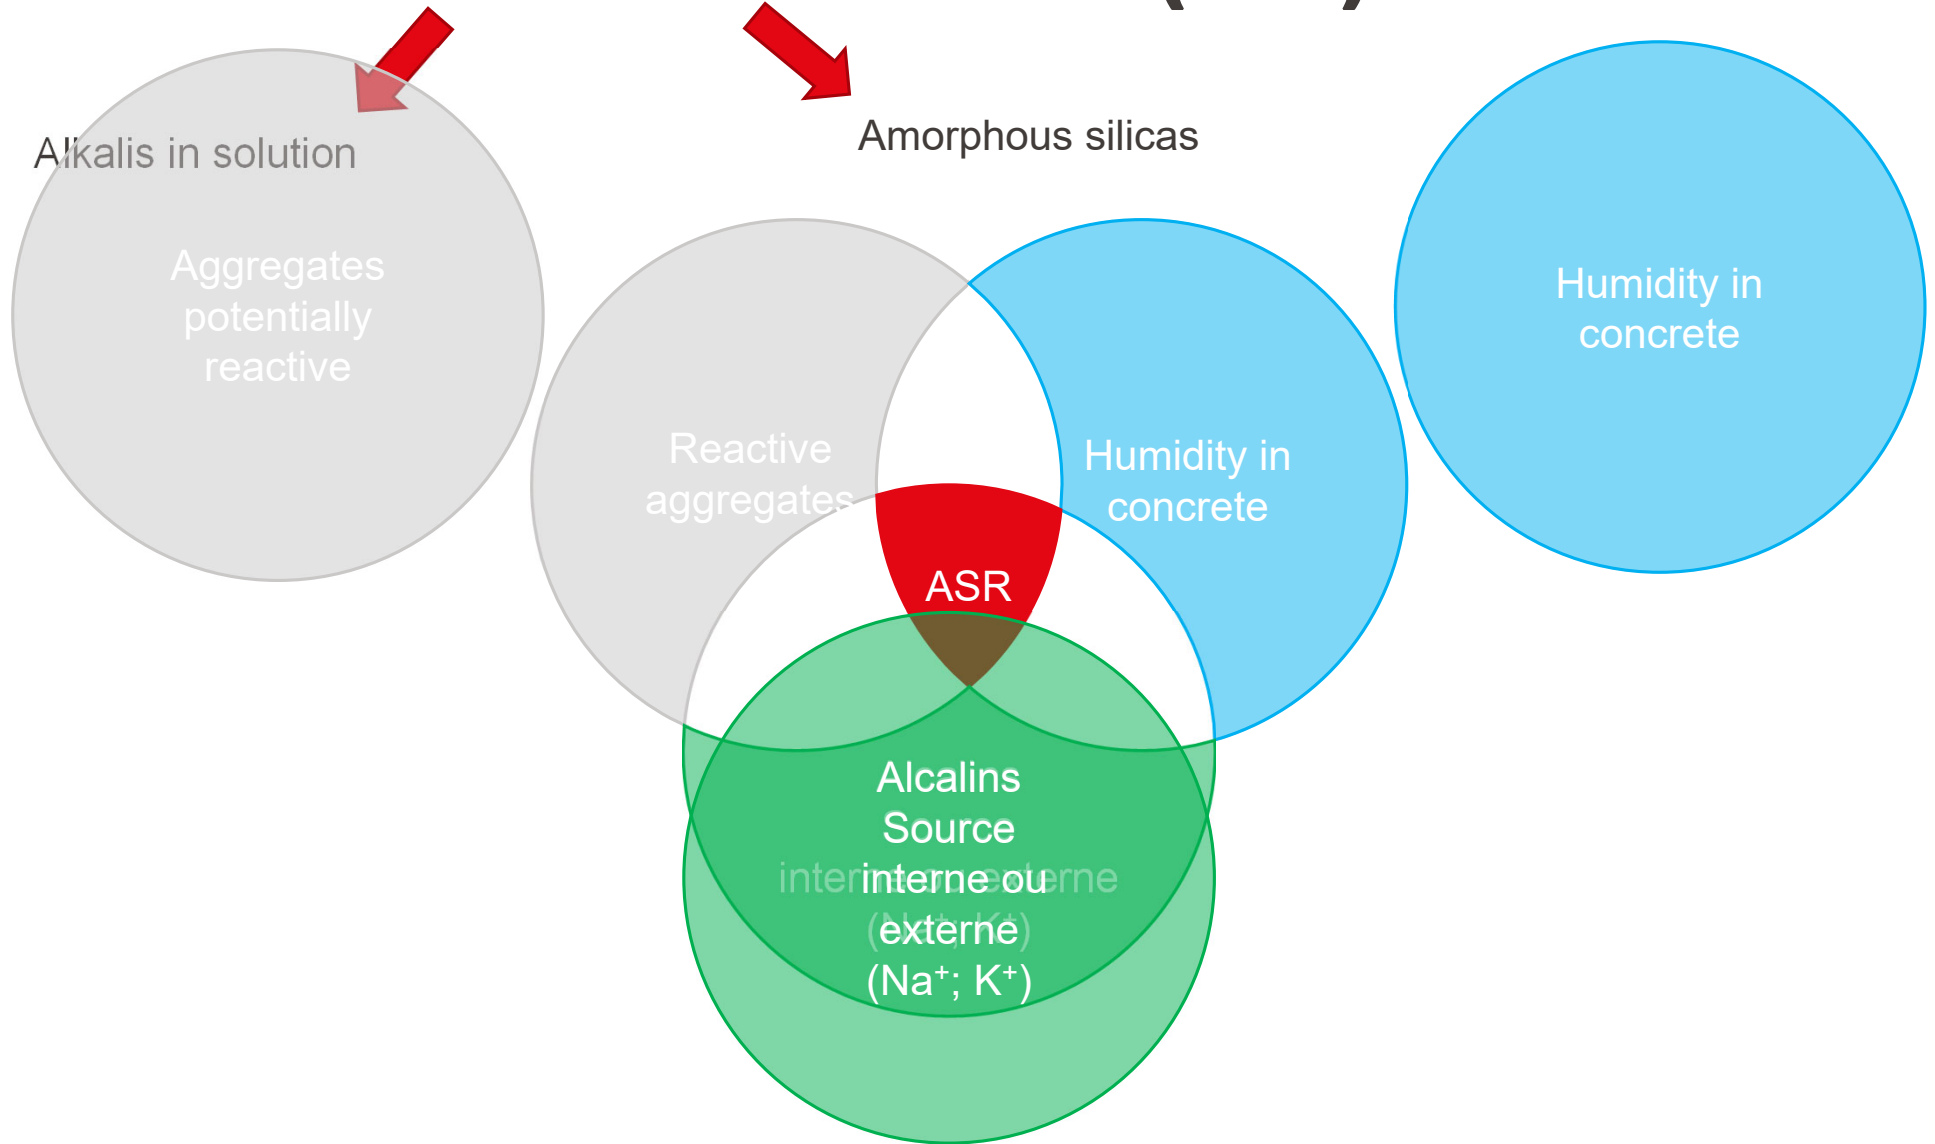

AAR?

- **Alkali–Aggregate Reaction**
 - ASR (Alkali – Silica Reaction)
 - ACR (Alkali - Carbonate Reaction)
 - Stone composed with Dolomite & Calcite & Clay
 - Dolomitic limestones with clay matrix
 - Microcrystalline clayey dolomitic limestones

Alkaline attack Dolomite → Formation of Calcite + Brucite → Swelling of the Clay matrix → Cracks.

Map cracking similar to ASR but different origin

Alkali-Silica Reaction (ASR)?

Alkali-Silica Reaction (ASR)?

Chemical reactions :

■ Petrography

https://austone.au/wp-content/uploads/2023/07/Petrographic_Report_July-2023.pdf

Plate 6: Microphotograph of the sample, showing abundant variably sized grains of quartz, zircon, chert and goethite. Image shown in plane polarised light. Scale = 500µm x 40 magnification. F.O.V. 3.7mm.

Aggregates analysis

- Petrography
- Microbar test according SIA MB 2042

| Mélange | 1 | 2 | 3 |
|---------------|---------------|---------------|---------------|
| Rapport C/G | 2 | 5 | 10 |
| Ciment | (80 ± 0,1) g | (80 ± 0,1) g | (100 ± 0,1) g |
| Solution NaOH | (24 ± 0,05) g | (24 ± 0,05) g | (30 ± 0,05) g |
| Granulat | (40 ± 0,05) g | (16 ± 0,05) g | (10 ± 0,05) g |

- Casting, unmolde after 24 h and measurement of length
- Steam curing 240 min
- Keep the sample at 20 °C until its temperature reaches 20 °C (approximately 4 to 24 hours)
- Store in a 10% KOH solution in a stainless steel container for 360 minutes at 150°C.
- Store the samples for 1 hour before measuring their length.

3 criteria are used to classify the reactivity :

- "NR" (Non-Reactive) when the average of the swelling of 3 samples is below 0.11%,
- "PR" (Potentially Peactive) when at least one average value (usually that corresponding to the C/G ratio = 2) is higher than 0.11%.
- "PRP" (Potentially Reactive with Pessim effect) when the average value corresponding to the C/G ratio = 5 is more than 10% > the C/G ratio = 2.

■

Aggregates analysis

- Petrography
- Microbar test according SIA MB 2042

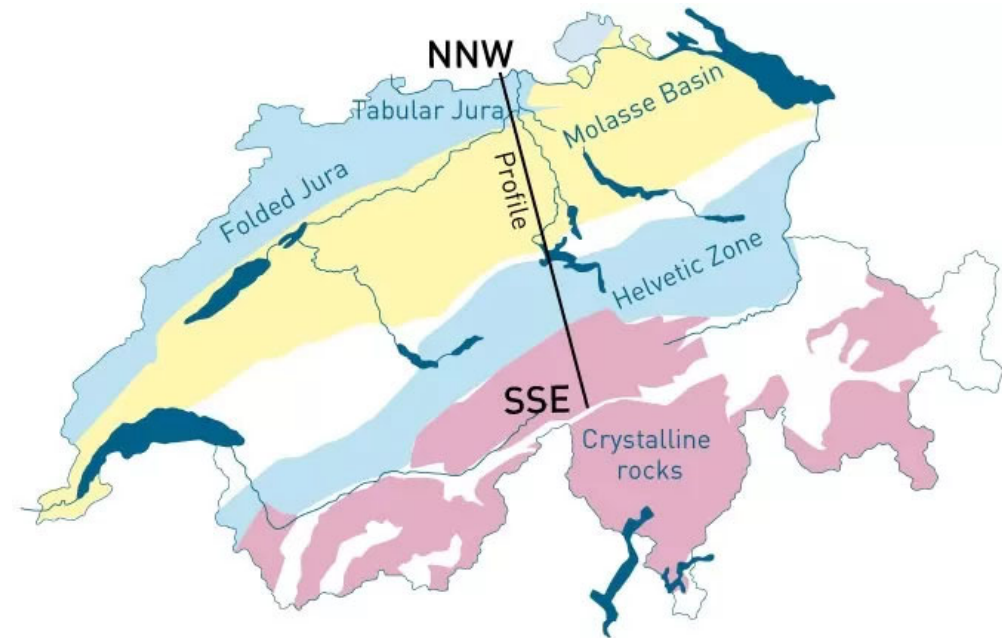

The majority, i.e. $\approx 90\%$ of Swiss aggregates, exhibit reactivity to ASR!

- **Apline geology** mainly stressed rocks rich in reactive forms of silica
- **Glacial depositis** responsible of the heterogeneity of the aggregates
- **Metamorphic rocks** dominance, gneiss, schist containing quartz under deformation
- **Siliceous impurities in limestones** present chert or siliceous layers making them reactive

■

Aggregates analysis

- More than 400 structures are affected (Merz et al. 2006).
- 20-30% of Swiss dams are affected.
- 90% of the aggregates were classified as potentially reactive to ASR (Merz & Leemann, 2012).

How to mitigate this phenomenon?

SOLUTIONS:

- Resin injection
- Paint and waterproof coating
- Pre-stressing addition
- Installation of tie rod
- Stress relief by sawing

What can be done to prevent this from happening?

Overview of the interchange Robert Bourassa - Charest

*Outils d'investigation de la réactivité alcalis-granulats
dans les infrastructures en béton*

B. Fournier, L. Sanchez, S. Beauchemin: 08.2015

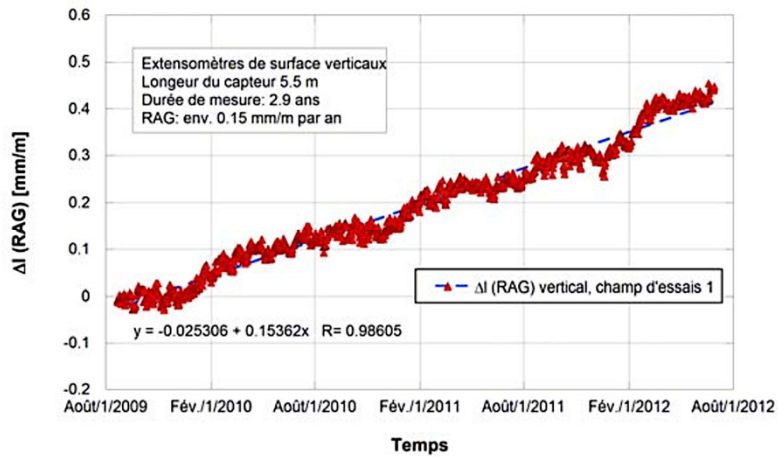

Monitoring of existing structures

- Structure monitoring
- Observation of the evolution of the reaction
- Sample collection
 - Microscopic analysis
 - SDT testing
 - Residual expansion measurements

■

Structure monitoring

- Concrete expansion
- Temperature
- Moisture

Observation on field and sampling

Must be performed by a properly trained person:

- Establish a diagnosis for any suspected ASR or swelling phenomenon.
- Establish a crack index on site
- In order to collect samples representative of the pathology

■

Observation on field and sampling

■ In-situ measurements of expansion and deformation in ASR-affected concrete elements. A-E.

What do Swiss standards offer?

- Technical specifications **SIA 2042**
- SIA 262-1: 2019 : Annexe G

Performance test

■

SIA 262-1 – Performance test?

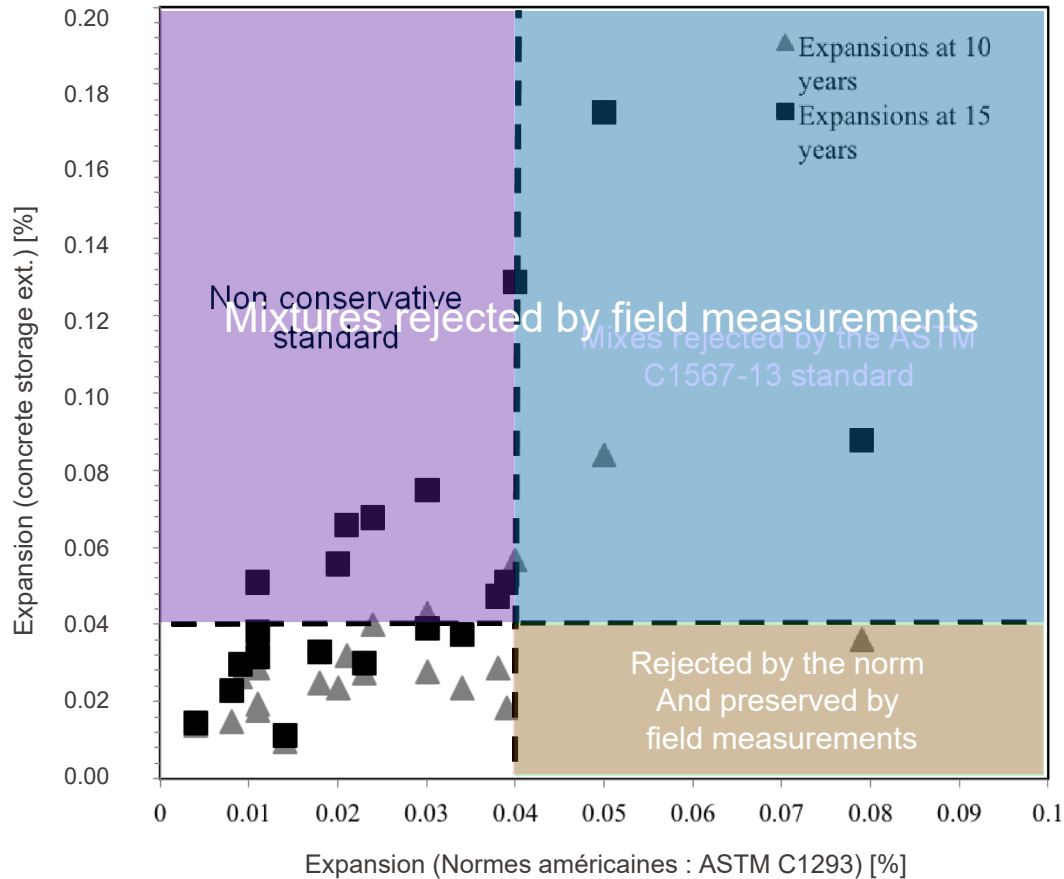

Concrete (0/20): 0.8 % $\text{Na}_2\text{O}_{\text{eq}}$

SIA 262-1 – Performance test?

Limitations of standards

Exposure blocks conditions:

Storage on field

0.95% $\text{Na}_2\text{O}_{\text{equ}}$

ASTM tests conditions:

100% relative humidity at

38°C

1.25% $\text{Na}_2\text{O}_{\text{equ}}$ (0.45 mol/l)

Current standard are not always able to predict ASR reactivity of concrete

Ref: The University of Texas at Austin Exposure Site

Limitations of standards

Typical plateau with the
M 2042 protocol

1 year → 0.3 ‰

5 month → 0.2 ‰

3 options:

- **No water**
- **No alkali**
- **No amorphous silica**

■ *Typical results of swelling-time curve according the M 2042³*

Limitations of standards

Standard (MB2042)

1 or 28 days
(9000-8000)

Alkaline solution

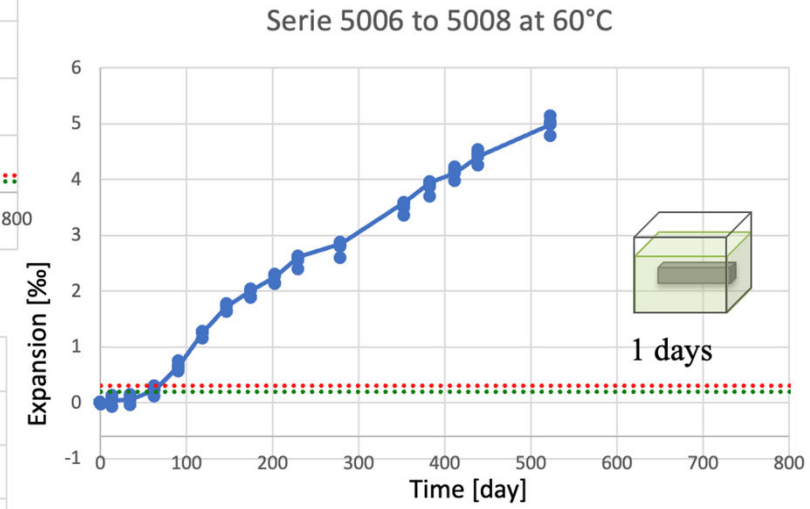

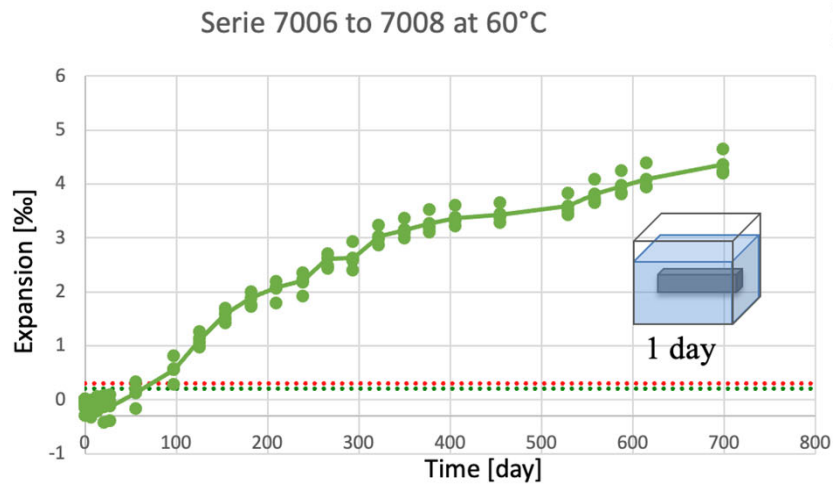

1 or 28 days
(7000-6000)

Pore solution

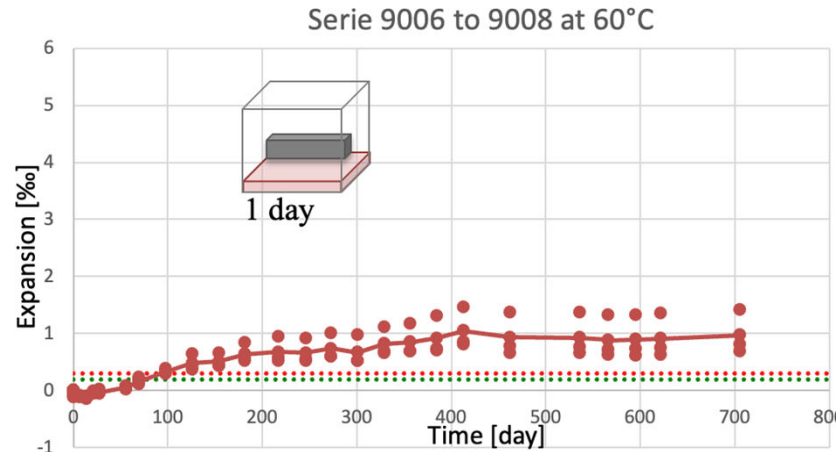

1 or 28 days
(5000-4000)

Limitations of standards

Limitations of standards

Limitations of standards

Final test in progress

- Design based on tri-axial cells used for rock mechanics
- Independent axial/lateral load
 - Axial load applied via a hydraulic jack
 - Radial load applied via a pressurised alkali solution
- Alkali solution
 - Promote the reaction
 - Avoid leaching
- Constant temperature (38°C)

What to do with a construction affected by ASR

Figure 2: The 1992-1993 campaign of reinforcement works at Chambon dam (Source: Fry)

What to do with a construction affected by ASR

Chambon - Gravity dam

- 88 m height above natural ground
- 137 m above the
- Crest length of 294 m
- built between 1929 and 1935.
- cement dosage varies from 150 to 250 kg/m³

First ASR damage observed around 1958

Figure 1 : Travaux réalisés dans les années 1990 en lien avec l'alcali-réaction

What to do with a construction affected by ASR

Chambon - Gravity dam

1. Crack injection
2. Sealing of the old spillway passages
3. Upstream protection: a waterproofing membrane was installed on the upper 40 metres of the upstream facing between 1991 and 1995.
4. Sawing: Between 1995 and 1997, eight vertical saw cuts were made using an 11 mm diamond wire in the upper part of the dam.

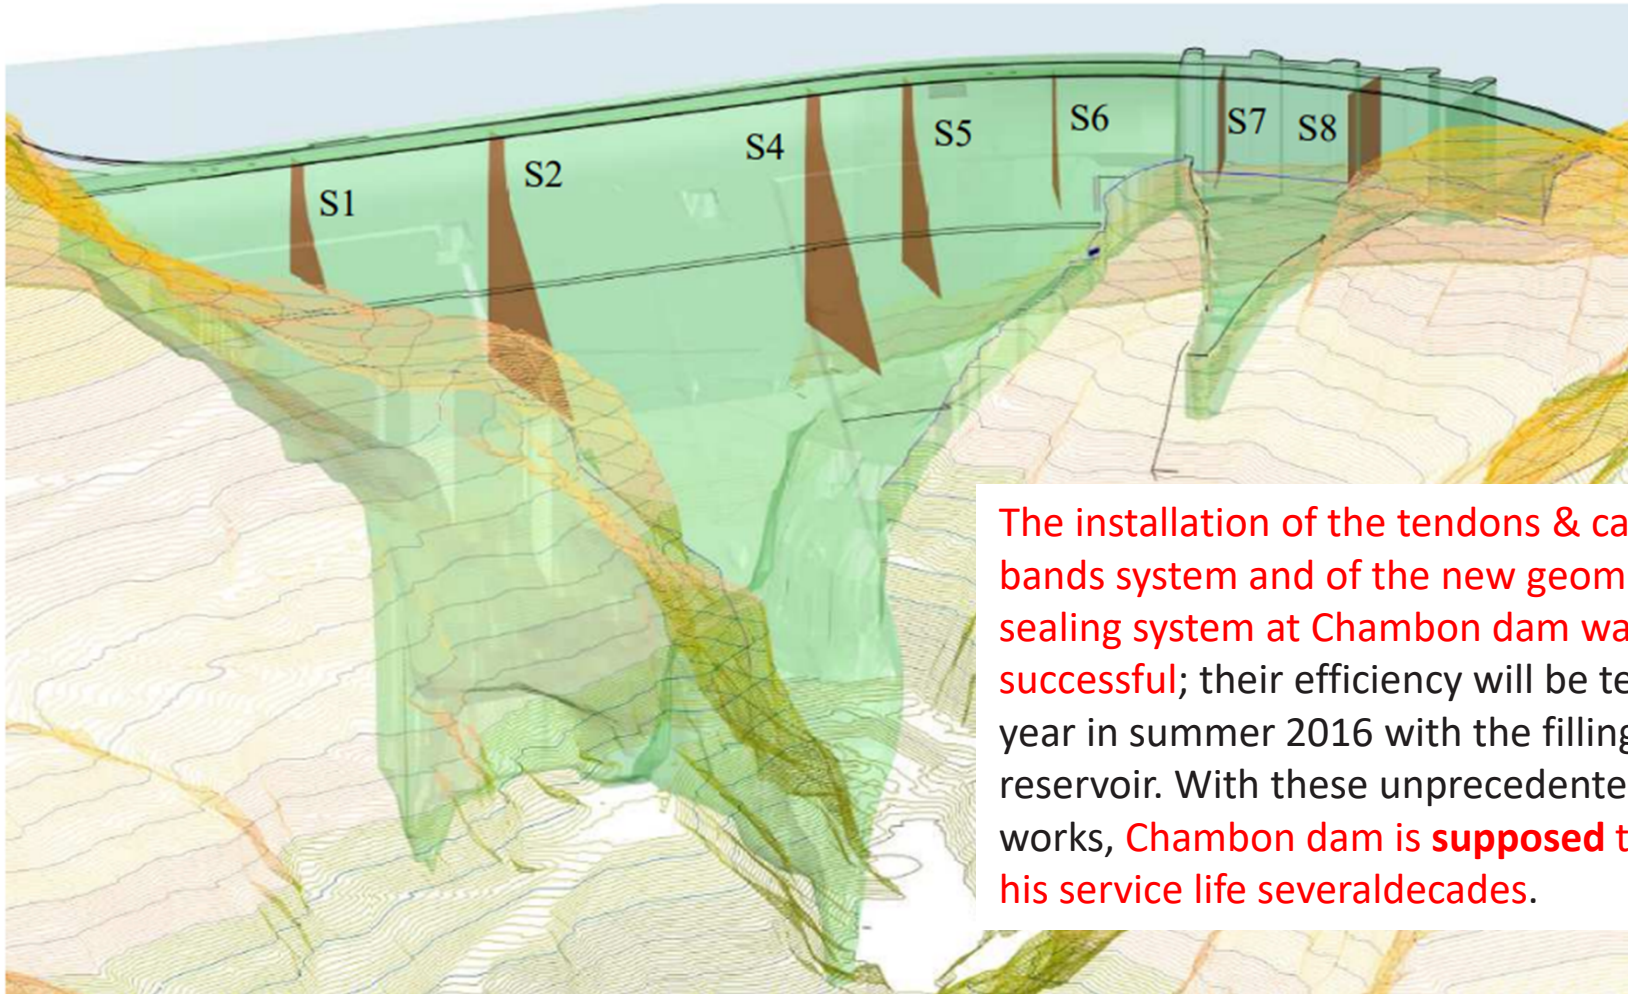

Figure 1 : Travaux réalisés dans les années 1990 en lien avec l'alcali-réaction

What to do with a construction affected by ASR

From Janvier 2013 to December 2014

What to do with a construction affected by ASR

The installation of the tendons & carbon bands system and of the new geomembrane sealing system at Chambon dam was **successful**; their efficiency will be tested this year in summer 2016 with the filling of the reservoir. With these unprecedented repair works, **Chambon dam is supposed to extend his service life severaldecades.**

■ Sources : https://www.barrages-cfbr.eu/IMG/pdf/4.01.confortement_barrage_chambon.pdf

Conclusion

Alkali Granulate reaction is a very slow chemical reaction.

- A complex reaction that requires in-depth knowledge in order to warn of or identify potential defects related to ASR.
- Prevention through concrete formulation is not sufficient, but necessary to eradicate the problem.
- Need to regularly inspect old and new structures.
- Catalyst for other pathologies and effects may accumulate (freezing/thawing, sulphate attack, chloride penetration, etc...)

Improvement?

- Establishment of a long-term exposure site to validate performance tests on standard Swiss concrete.
- Continue research to minimise the gap between laboratory measurements and field measurements..

Thank you for your attention!
