

Today  $X$  stands for an integral (separated, irreducible) noetherian scheme.

Def: - The group of Weil divisors is the additive free abelian subgroup spanned by the irreducible closed subsets of codim 1. It's denoted  $WDiv(X)$ .

• A member of the group of Weil divisors is called a Weil divisor. So a Weil divisor is a formal sum  $\sum_{i=1}^t n_i Z_i$ , where  $Z_i$  irr and  $\text{codim}_X(Z_i) = 1$ ,  $n_i \in \mathbb{Z}$

$$\sum_{i=1}^t n_i Z_i + \sum_{i=1}^t n'_i Z_i = \sum_{i=1}^t (n_i + n'_i) Z_i$$

Eg: In  $\mathbb{P}^1_{\mathbb{C}}$ , codim 1 pts are closed pts so a Weil divisor looks like  $\sum n_i ([x_i: y_i])$ , such as  $[1:0] - [0:1]$ .

Eg: In  $A^2_{\mathbb{C}} = \text{Spec}(k[x,y])$ ,  $V(x) - 2V(y)$  is a Weil div.

Eg: Take the rational function  $X/Y \in k(X,Y)$  on  $A^2_{\mathbb{C}}$ .  $V(x) - 2V(y)$  reads the zeros and poles of this rational function with order.

For today unless otherwise mentioned we shall assume  $X$  is regular in codimension 1. This means for every  $\xi \in X$  such that  $\dim \mathcal{O}_{X,\xi} = 1$ ,  $\mathcal{O}_{X,\xi}$  is a regular ring.

If  $Z$  is irr of codim 1 and  $\eta_Z$  be the generic point of  $Z$  (i.e.  $\overline{\{\eta_Z\}} = Z$ ),  $\dim \mathcal{O}_{Z,\eta_Z} = 1$ .

Indeed, recall for  $x \in X$ ,  $\text{codim}_X(\overline{\{x\}}) = \dim \mathcal{O}_{X,x}$ .

The codim of a point  $x \in X$  is by definition  $\dim \mathcal{O}_{X,x} = \text{codim}_X(\overline{\{x\}})$ .

§: Divisor of a rational function.

Recall:  $k(X) =$  Field of rational function of  $X$   
 $= \mathcal{O}_{X,\eta}$  where  $\eta$  is the generic pt of  $X$ .  
 $= \left\{ \frac{f}{g} \in \mathcal{O}_X(U) \mid U \subseteq X \right\} / \sim$   
 iff  $\exists v \subseteq U$  s.t.  $\frac{f}{g} = \frac{f_1}{g_1}$  on  $v$

Let  $X$  be regular in codim 1. Given an irr closed  $Z \subseteq X$  of codim 1, we want to define  $\text{ord}_Z: k(X) \rightarrow \mathbb{Z}$ . Let  $\eta_Z$  be the generic pt of  $Z$ . The local ring  $\mathcal{O}_{X,\eta_Z}$  is reg of dim 1.

For  $0 \neq f \in \mathcal{O}_{X,\eta_Z}$ , define  $\text{ord}_Z(f) = \max \{n \mid f \in m_{\eta_Z}^n \mathcal{O}_{X,\eta_Z}\} < \infty$ .

Since  $\mathcal{O}_{X,\eta_Z}$  is reg of dim 1,  $m_{\eta_Z} = (\mathfrak{p})$ . So  $\text{ord}_Z(f)$  is the unique non-negative integer  $n_0$  s.t.  $f = u \cdot \mathfrak{p}^{n_0}$  for some unit  $u$  in  $\mathcal{O}_{X,\eta_Z}$ . Note  $\text{ord}_Z(fg) = \text{ord}_Z f + \text{ord}_Z g$ .

Now extend  $\text{ord}_Z: \mathcal{O}_{X,\eta_Z} \setminus \{0\} \rightarrow \mathbb{Z}$  to  $k(X) = \text{frac}(\mathcal{O}_{X,\eta_Z})$  by  $\dots, -\infty$ .

Now extend  $\text{ord}_Z : \mathcal{O}_{X, \eta_Z} \setminus \{0\} \rightarrow \mathbb{Z}$  to  $K(X) = \text{trac}(\mathbb{C} \cup X, \eta_Z)$

setting: ①  $\text{ord}_Z(0) = \infty$ .

② For  $0 \neq h \in K(X)$ , write  $h = f/g$ .  
Define  $\text{ord}_Z(f/g) = \text{ord}_Z(f) - \text{ord}_Z(g)$ .

Remk: For  $f \in K(X)$ ,  $\text{ord}_Z(f)$  measures the order of zeroes (or poles) of  $f$  at the generic point of  $Z$  or along  $Z$ .

eg:  $X = \mathbb{A}_{\mathbb{C}}^2$ ,  $f = x^2/y$ ,  $Z_1 = V(x)$ ,  $Z_2 = V(y)$   
 $\text{ord}_{Z_1} f = 2$ ,  $\text{ord}_{Z_2} f = -1$ , for any other codim 1 subset  $Z \in \mathbb{A}_{\mathbb{C}}^2$ ,  $\text{ord}_Z(f) = 0$

Prop / Def. For  $f \in K(X)^*$ ,

$\sum_{Z \text{ irr of codim 1}} \text{ord}_Z(f) \cdot Z$  is an Weil divisor.

This is called the divisor of  $f$  and denoted  $\text{div}(f)$ .

Pf. Since  $X$  is smooth, choose a finite affine open cover  $X = \bigcup_{i=1}^n U_i$ .

For each  $i$ , write  $f = f_i/g_i$ . For an irr closed subset  $Z$  of codim 1 such that  $Z \cap U_i \neq \emptyset$  or equivalently s.t. the gen pt of  $Z$ ,  $\eta_Z \in U_i$ ,  $\text{ord}_Z(f) \neq 0 \Rightarrow$  either  $\text{ord}_Z(f_i) \neq 0$  or  $\text{ord}_Z(g_i) \neq 0$ .

Now for  $h \in \mathcal{O}_X(U_i)$ , and a codim 1 pt  $p \in \text{Spec}(\mathcal{O}_X(U_i)) = U_i$ ,  $\text{ord}_p(h) \neq 0$   
 $\Leftrightarrow h$  is not a unit in  $\mathcal{O}_X(U_i)_p$   
 $\Leftrightarrow h \notin \mathfrak{p} \in \mathcal{O}_X(U_i)_p$   
 $\Leftrightarrow h \notin \mathfrak{p}$  in  $\mathcal{O}_X(U_i)$

Now by Krull's Thm the set

$\{ \mathfrak{q} \in \text{Spec}(\mathcal{O}_X(U_i)) \mid h \in \mathfrak{q} \}$  is finite since each such prime is a min prime of  $\mathcal{O}_X(U_i)/h$ .

So # of codim 1 pts in  $\mathcal{O}_X(U_i)$  s.t.  $\text{ord}_{\overline{\mathfrak{q}}}(f) \neq 0$  or  $\text{ord}_{\overline{\mathfrak{q}}}(g) \neq 0$  is finite.

For an irr closed  $Z \subseteq X$ ,  $\text{ord}_Z(f) \neq 0$   
 $\Rightarrow \exists i$   $\text{ord}_{Z \cap U_i}(f_i/g_i) \neq 0$  for some  $i$   
 $\Rightarrow \sum \text{ord}_Z(f) \cdot Z$  is a finite sum

Prop: For any irr closed  $Z$  of codim 1,  
 $\dots - 1 - (f) + \text{ord}_Z(g)$

Prop: For any irr closed  $Z$  of codim 1,

$$\text{ord}_Z(fg) = \text{ord}_Z(f) + \text{ord}_Z(g).$$

• Thus  $\text{div}(fg) = \text{div}(f) + \text{div}(g).$

•  $\text{div}(1) = 0$  •  $\text{div}(\frac{1}{f}) = -\text{div}(f)$

• Thus  $\{ \text{div}(f) \mid f \in K(X)^* \} \subseteq \text{Weil}(X)$   
is a subgroup.

Def: ① The quotient gr  $\frac{\text{Weil}(X)}{\{ \text{div}(f) \mid f \in K(X)^* \}}$  is called the Weil divisor class gr or simply the divisor class gr and denoted  $\text{Cl}(X).$

②  $D_1, D_2 \in \text{Weil}(X)$  are called linearly equivalent if  $\exists f \in K(X),$   
s.t.  $D_1 - D_2 = \text{div}(f).$   
 $D_1 \sim D_2$  means  $D_1$  and  $D_2$  are linearly equivalent.

Ex-1)  $\text{Cl}(A_k^n) = \{0\}$  where  $k$  is a field.

$A_k^n = \text{Spec}(k[x_1, \dots, x_n]).$   $Z$  irr closed of codim 1  $\Rightarrow \exists$  an irr pol  $f$  s.t.

$Z = V(f).$  Note  $\text{div}(f) = Z.$

So  $K(A_k^n) \xrightarrow{\text{div}} \text{Weil}(A_k^n)$  is sur.

Ex 2:  $\text{Cl}(\mathbb{P}_k^n) \cong \mathbb{Z}.$  Given a codim 1 irr closed  $Z,$   $\exists$  a homo irr pol  $f,$  such that  $Z = V(f),$  define  $\text{deg } Z = \text{deg } f.$

Have a map.  $\text{deg}: \text{Weil}(\mathbb{P}_k^n) \rightarrow \mathbb{Z}.$  ( $\text{deg}(V(x_0)) = 1$ )

Given  $D \in \text{Weil}(\mathbb{P}_k^n),$  write

$$D = \sum_{i=1}^r n_i V(f_i) - \sum_{j=1}^m m_j V(g_j) \text{ where}$$

$n_i, m_j > 0.$

$$\text{deg } D = \sum_{i=1}^r n_i \text{deg}(f_i) - \sum_{j=1}^m m_j \text{deg}(g_j) = 0$$

$$\Leftrightarrow \text{deg} \left( \prod_{i=1}^r f_i^{n_i} \right) = \text{deg} \left( \prod_{j=1}^m g_j^{m_j} \right)$$

$$\Leftrightarrow R = \frac{\prod_{i=1}^r f_i^{n_i}}{\prod_{j=1}^m g_j^{m_j}} \in K(\mathbb{P}_k^n) \text{ and}$$

$$D = \text{div}(R).$$

So  $\text{deg}$  induces an isom  $\text{Cl}(\mathbb{P}_k^n) \cong \mathbb{Z}.$

$[V(x_0)]$  being a gen.

Def.  $Y$  integral scheme.  $K(Y)$  is the constant sheaf  $K(Y)(U) = K(Y).$

End of 19.11.25 lecture

Sheaves associated to Weil divisors

For  $D' = \sum n_i Z_i \in \text{Div}(X),$

•  $D'_U = \sum n_i (Z_i \cap U) \in \text{Div}(U);$  •  $D' \geq 0 \Leftrightarrow n_i \geq 0 \forall i.$

•  $\mathcal{O}_X(D)$ . define the sheaf  $\mathcal{O}_X(D) \subseteq K(X)$

•  $D|_U = \sum_i n_i (z_i \cap U) \in \text{Div}(U)$ ; •  $D \geq 0 \Leftrightarrow n_i \geq 0$

Def. Given  $D \in \text{WDiv}(X)$ , define the sheaf  $\mathcal{O}_X(D) \subseteq \underline{K}(X)$   
 by  $\mathcal{O}_X(D)(U) = \{f \in K(X) \mid (\text{div}(f) + D)|_U \geq 0\} \subseteq K(X)(U) = k(X)$

Proof.  $\mathcal{O}_X(D) \subseteq \underline{K}(X)$  is an additive subgp sheaf

pf. It is straight forward to check  $\mathcal{O}_X(D)$  is a sheaf.

We verify  $\mathcal{O}_X(D)(U) \subseteq K(X)$  is a subgp.  
 Let  $f_1, f_2 \in \mathcal{O}_X(D)(U)$  and  $Z \subseteq \text{codim} \geq 1$  such that  $Z \cap U \neq \emptyset$ . Choose a generator of the maximal ideal  $\mathcal{O}_{X, \eta_Z}$ , denoted  $t$ .

$t^{\text{ord}_Z(f_1)} \mid f_1, t^{\text{ord}_Z(f_2)} \mid f_2$  in  $\mathcal{O}_{X, \eta_Z}$ .  
 Thus  $t^{\min\{\text{ord}_Z(f_1), \text{ord}_Z(f_2)\}} \mid f_1 + f_2$   
 $\Rightarrow \text{ord}_Z(f_1 + f_2) \geq \min\{\text{ord}_Z(f_1), \text{ord}_Z(f_2)\}$ .  
 $\Rightarrow$  If  $(D + \text{div}(f_1))|_U \geq 0, (D + \text{div}(f_2))|_U \geq 0$ , then  
 $(D + \text{div}(f_1 + f_2))|_U \geq 0 \Rightarrow f_1 + f_2 \in \mathcal{O}_X(D)(U)$

Since  $\text{ord}_Z(-f_1) = \text{ord}_Z(f_1), -f_1 \in \mathcal{O}_X(D)(U)$ .

Thus  $(\mathcal{O}_X(D)(U), +)$  is a group.

Rmk. Say  $D = \sum_{i=1}^r n_i z_i, \text{div } f = \sum_{i=1}^r m_i z_i, m_i = \text{ord}_{z_i}(f)$ .

$f \in \mathcal{O}_X(D)(U) \Leftrightarrow$  for each  $i$  s.t.  $z_i \cap U \neq \emptyset$   
 $n_i + \text{ord}_{z_i}(f) \geq 0$

$\Rightarrow$  if  $n_i \geq 0, f$  can have a pole of order at most  $n_i$  along  $z_i$ , if  $n_i \leq 0, \text{ord}_{z_i}(f) \geq -n_i$  i.e.  $f$  must have a zero of ord at least  $n_i$  along  $z_i$

Proof.  $\mathcal{O}_X(D) \in \mathcal{O}(X)$

pf. We prove that for any affine open  $U \subseteq X, f \in \mathcal{O}_X(D)(U)$   
 The inclusion  $\mathcal{O}_X(D)(U) \cap \mathcal{O}_X(D)(U_f) \rightarrow \mathcal{O}_X(D)(U_f)$  where  $U_f = \mathcal{O}_X(D)(U) \cap \mathcal{O}_X(D)(U_f) \subseteq U$   
 is an isom of  $\mathcal{O}_X(D)$ -mods

To prove surjectivity, take  $g \in \mathcal{O}_X(D)(U_f)$ .  
 Write  $(\text{div } g + D)|_U = a_1 z_1 + \dots + a_r z_r$   
 where  $z_j \subseteq U$  are prime divisors. Assume  $z_1, \dots, z_r \subseteq U \setminus U_f = V(f)$ .

and  $z_j \cap U_f \neq \emptyset$  for  $j \geq r+1$ .  
 This means  $\text{ord}_{z_i}(g) > 0$  for  $1 \leq i \leq r$ . As  $(\text{div } g + D)|_{U_f} \geq 0$   
 $a_j \geq 0$  for  $j \geq r+1$

Choose  $n \in \mathbb{N}$  s.t.  $\text{ord}_{z_i}(f^n) > -a_i$  for  $1 \leq i \leq r$ .  
 then  $(\text{div}(g f^n) + D)|_U = (\text{div } g|_U + \text{div}(f^n)|_U + D)|_U \geq 0$

Choose  $n \in \mathbb{N}$  s.t  $\text{ord}_Z(f^n) > -a_i$  for  $\forall 1 \leq i \leq r$ .  
 note  $(\text{div}(\varphi f^n) + D)|_U = (\text{div} f^n|_U + \text{div}(\varphi + D)|_U) \geq 0$ .  
 Thus  $\varphi f^n \in \mathcal{O}_X(D)(U)$ . So  $\varphi$  is in the image of  $\mathcal{O}_X(D)(U)[1/f] \rightarrow \mathcal{O}_X(D)(U)$ .

- Prop.
- Let  $\eta$  be the generic pt of  $X$ .  $\mathcal{O}_X(D)_\eta \xrightarrow{\sim} k(X)$ .
  - The multiplication map on  $k(X)$  induces an  $\mathcal{O}_X$ -linear map  $\mathcal{O}_X(D_1) \otimes_{\mathcal{O}_X} \mathcal{O}_X(D_2) \rightarrow \mathcal{O}_X(D_1 + D_2)$
  - $\mathcal{O}_X(D_1) \cong \mathcal{O}_X(D_2)$  as  $\mathcal{O}_X$ -mods  $\Leftrightarrow D_1 \sim D_2$

Pf.

- Suppose  $D = a_1 Z_1 + a_2 Z_2 + \dots + a_r Z_r$ ,  $Z_i$  prime divisors,  $a_i \in \mathbb{Z}$ .  
 Choose an affine open subset  $V$  of  $X - \bigcup_{i=1}^r Z_i$

$\mathcal{O}_X(D)(V) \cong \mathcal{O}_X(V)$  as  $\text{Div} = 0$ .

Thus  $k(X) \cong \mathcal{O}_X(D)_\eta \cong k(X) \Rightarrow \mathcal{O}_X(D)_\eta = k(X)$

- clear
- $\Leftarrow$  Take  $f \in k(X)$  s.t  $D_1 - D_2 = \text{div}(f)$
- The multiplication by  $f$  map defined  $\lambda_f : k(X) \rightarrow k(X)$  takes  $\mathcal{O}_X(D_2) \rightarrow \mathcal{O}_X(D_1)$ . The inverse is given by  $\lambda_{1/f}$ .

$\Rightarrow$  Any isom  $\mathcal{O}_X(D_1) \xrightarrow{\sim} \mathcal{O}_X(D_2)$  induces an isom  $k(X) = \mathcal{O}_X(D_1)_\eta \rightarrow \mathcal{O}_X(D_2)_\eta = k(X)$  of  $k(X)$ -mods  
 Any  $k(X)$ -linear isom  $k(X) \rightarrow k(X)$  is given by  $\lambda_f$  for some  $f \in k(X) \setminus \{0\}$

So  $\lambda_f(\mathcal{O}_X(D_1)) \subseteq \mathcal{O}_X(D_2)$  and  $\lambda_{1/f}(\mathcal{O}_X(D_2)) \subseteq \mathcal{O}_X(D_1)$ .

We claim  $\text{div} f = D_1 - D_2$ . Indeed for a prime divisor  $Z$ , suppose  $Z$  appears with multiplicity  $a_1, a_2$  in  $D_1$  and  $D_2$  respectively. Suppose  $m_{\eta, Z} = (t)$ . We can choose an affine nbhd  $\text{Spec}(A)$  of  $\eta_Z$  s.t ①  $t \in A$  ②  $f$  is the  $R$  t prime ideal corresponding to  $\eta_Z$ ,  $q = (t)$

Thus  $1/t a_i \in \mathcal{O}_X(D_1)(\text{Spec}(A))$ . So  $f/ta_i \in \mathcal{O}_X(D_2)(\text{Spec}(A))$

$\Rightarrow \text{ord}_Z f - a_1 \geq -a_2 \Rightarrow \text{ord}_Z(f) \geq a_1 - a_2$

A similar argument with  $1/f$  shows  $\text{ord}_Z(1/f) - a_2 \geq +a_1 \Rightarrow \text{ord}_Z(f) \leq a_1 - a_2$

Thus  $\text{ord}_Z(f) = a_1 - a_2$   $\forall Z$  and we are done.

Example. Recall that  $\text{deg}: \mathcal{d}(\mathbb{P}_k^n) \rightarrow \mathbb{Z}$  is an isom;  $\mathbb{P}^n = \text{Proj}(k[x_0, \dots, x_n])$

Take a degree  $d$  divisor  $D$  on  $\mathbb{P}_k^n$ . We claim  $\mathcal{O}_{\mathbb{P}^n}(D) \cong \mathcal{O}_{\mathbb{P}^n}(d)$ . Since  $D \sim dV(x_0)$ , w.l.o.g we take

$D = dV(x_0)$ . Note  $\mathcal{O}_{\mathbb{P}^n}(D)(D+(x_i)) \xrightarrow{\sim} \mathcal{O}_{\mathbb{P}^n}(D+(x_i)) \xrightarrow{\sim} \frac{x_i^d}{x_0^d}$   
 $\mathcal{O}_{\mathbb{P}^n}(d)(D+(x_i)) \xrightarrow{\sim} \mathcal{O}_{\mathbb{P}^n}(D+(x_i))$

(The same description works even when  $d < 0$ ).

Define  $\mathcal{O}_{\mathbb{P}^n}(d)(D+(x_i)) \rightarrow \mathcal{O}_{\mathbb{P}^n}(D)(D+(x_i))$  by sending  $x_i^d \mapsto x_i^d/x_0^d$

These glue (check) to give an isom  $\mathcal{O}_{\mathbb{P}^n}(d) \cong \mathcal{O}_{\mathbb{P}^n}(dV(x_0))$ .

so  $\dots$  divisor  $V$  is an  $m$ -eq so

These glue (check) is given ...

Cartier divisors:  $Y$  be an  $m$ -reg so

Def.  $Y$  integral  $\underline{K(Y)^*}$  is the constant sheaf of abelian grp  $\underline{K(Y)^*}(U) = K(Y)^*$ , under ppt.

- $\mathcal{O}_Y^*$  is the sub sheaf of abelian grp given by  $\mathcal{O}_Y^*(U) = \text{units of the ring } \mathcal{O}_Y(U)$ .

Def. The group (abelian) of Cartier divisors is

The group  $\Gamma(Y, \underline{K(Y)^*} / \mathcal{O}_Y^*) = \text{Cart}(Y)$

- An elt of  $\Gamma(Y, \underline{K(Y)^*} / \mathcal{O}_Y^*)$  is called a Cartier divisor.

- There is a natural ~~map~~ grp homo.

$$K(Y)^* \longrightarrow \text{Cart}(Y)$$

The quotient grp, denoted  $\text{CaCl}(Y)$ , is called the Cartier divisor class group

Prop. Given  $\mathcal{D} \in \text{Cart}(Y)$ ,  $\exists$  an open covering  $Y = \cup_{i \in I} U_i$  and  $f_i \in K(Y)^*$  s.t.  $\mathcal{D}|_U$  is represented by  $f_i$ . On  $U_i \cap U_j$ ,  $f_i = u_{ij} f_j$  for some  $u_{ij} \in \mathcal{O}_Y(U_i \cap U_j)^*$

$\bullet X$  noeth, integral, reg in codim 1.

Def/Prop: Given  $Z$  irr local of codim 1,  $(\underline{K(X)^*} / \mathcal{O}_X^*)_{\eta_Z} \cong \frac{K(X)^*_{\eta_Z}}{(\mathcal{O}_X^*)_{\eta_Z}} = \frac{K(X)^*}{\mathcal{O}_{X, \eta_Z}^*}$

For  $f \in \mathcal{O}_{X, \eta_Z}^*$ ,  $\text{ord}_Z(f) = 0$ .

Thus  $\text{ord}_Z: K(X)^* \rightarrow \mathbb{Z}$  factors through

$$K(X)^* / \mathcal{O}_{X, \eta_Z}^*$$

- Given  $\mathcal{D} \in \text{Cart}(X)$ , define  $\text{ord}_Z(\mathcal{D}) = \text{ord}_Z(f_{\eta_Z})$  where  $f_{\eta_Z} \in \frac{K(X)^*}{\mathcal{O}_{X, \eta_Z}^*}$

- Given  $\mathcal{D} \in \text{Cart}(X)$ , define

$$\text{div}(\mathcal{D}) = \sum \text{ord}_Z(\mathcal{D}) \cdot Z \in \text{Weil}(X).$$

- The following claim gives a way to 'think about'  $\text{div}(\mathcal{D})$  for  $\mathcal{D} \in \text{Cart}(X)$  and justifies why the sum on the right hand is finite.

Claim: Given  $\mathcal{D} \in \text{Cart}(X)$ , choose a finite open covering  $X = \bigcup_{i=1}^r U_i$  such that for each  $i$ ,  $\exists f_i \in K(X)^*$  satisfying  $\mathcal{D}|_{U_i} = f_i$  in  $\underline{K(X)^*} / \mathcal{O}_{X, \eta_{U_i}}^*$

Def. • A Weil divisor  $D$  is called locally principal if  $\exists$  a (finite) open covering  $X = \cup U_i$  and  $f_i \in K(X)^*$  such that  $D|_{U_i} = \text{div } f_i|_{U_i}$  for each  $i$ .

• A Weil divisor  $D$  is called effective if  $D = \sum_{i=1}^n n_i Z_i$  where  $n_i \geq 0$

Prop. Assume  $X$  is reg in codim 1. So we have  $\text{div} : \text{Cart}(X) \rightarrow \text{Weil}(X)$

1)  $\text{div}(\text{Cart}(X)) \subseteq$  locally principal Weil divisors.

2) When  $X$  is normal, the above containment is an equality.

Pf. 1) follows from claim \*.

2) Given a locally principal Weil divisor  $D$ , choose a finite open covering  $X = \cup_{i=1}^n U_i$  and  $f_i \in K(X)^*$  such that  $D|_{U_i} = \text{div } f_i|_{U_i}$ . Since  $\text{div } f_i|_{U_i \cap U_j} = \text{div } f_j|_{U_i \cap U_j}$

$\text{div } (f_i/f_j)|_{U_i \cap U_j} = 0$ . Since  $X$  is normal  $f_i/f_j \in \mathcal{O}_X(U_i \cap U_j)^*$ . So  $\{f_i \in \underline{K(X)^*} / \mathcal{O}_X^*(U_i)\}_i$

glue to give a global section  $s \in \Gamma(X, \underline{K(X)^*} / \mathcal{O}_X^*)$ .

By claim \*,  $\text{div}(s) = D$ .

• We examine surjectivity of  $\text{Cart}(X) \xrightarrow{\text{div}} \text{Weil}(X)$ .

The following Thm is crucial.

Thm. Let  $A$  be a noetherian ring.

$A$  is a unique factorization domain

$\iff A$  is normal and  $\text{Cl}(\text{Spec } A) = \{0\}$ .

Pf. See Prop 6.2, Hart.

Thm. Let  $X$  be a normal, noetherian scheme

$\text{Cart}(X) \xrightarrow{\text{div}} \text{Weil}(X)$  is surjective (eg. bijective)

• is local i.e. for every  $x \in X$ ,  $\mathcal{O}_{X,x}$  is a

Thm.  $L_{\mathcal{O}_x}$   $\xrightarrow{\text{div}}$   $\text{Weil}(X)$  is surjective (eg. bijective)  
 $\Leftrightarrow X$  is locally factorial, i.e. for every  $x \in X$ ,  $\mathcal{O}_{X,x}$  is a U.F.D.

$\Leftrightarrow \overline{\text{div}} : \text{CaCl}(X) \xrightarrow{\sim} \mathcal{C}(X).$

Pf. We only verify  $\Leftarrow$  of the top  $\Leftrightarrow$ .  
 We know  $\text{div}(\text{Cart}(X)) = \text{locally principal Weil divisors of } X$ .

So it's enough to check that any prime divisor  $D$  is locally principal. Since  $D|_{X \setminus D} = \text{div}(1)|_{X \setminus D}$ , we need to show around every  $x \in D$ ,  $D$  is locally principal.  $D$  corresponds to a ht 1 prime in  $\mathcal{O}_{X,x}$ , which is factorial as  $\mathcal{O}_{X,x}$  is a U.F.D. So  $\exists$  an affine nbhd  $U$  of  $x$  s.t. The prime ideal corresponding to  $D$  in  $\mathcal{O}_x(U)$  is also principal, say generated by  $f$ .  
 Then  $D|_U = \text{div } f|_U$ .

Thm. When  $X$  is regular,  $\text{div} : \text{Cart}(X) \xrightarrow{\sim} \text{Weil}(X)$   
 and  $\overline{\text{div}} : \text{CaCl}(X) \xrightarrow{\sim} \mathcal{C}(X)$ .

Pf. Regular local rings are U.F.D.

$\S$  Picard group and CaCl

The results of this section are true for any integral scheme, which are not necessarily locally noeth.

Thm.  $Y$  be an integral scheme. Given a

$\mathcal{K} \in \text{Cart}(Y)$ , define  
 $\mathcal{L}(\mathcal{K})(U) = \{ \frac{f}{\sum x_i} \in K(Y)^* \mid \frac{f}{\sum x_i} \in \mathcal{O}_{Y,x} \text{ for } \forall x \in U \} \cup \{0\}$   
 $\subseteq \underline{K(Y)}(U) = K(Y)$

Then 1)  $\mathcal{L}(\mathcal{K})$  is a sub  $\mathcal{O}_Y$ -mod sheaf of the sheaf of abelian grps  $(\underline{K(Y)}, +)$ .

Then 1)  $\mathcal{L}(S)$  is a sub  $\mathcal{O}_Y$ -mod sheaf of the sheaf of abelian grps  $(\underline{K(Y)}, +)$ .

2)  $\mathcal{L}(S)$  is invertible

Pf 1) is straight forward.

2) Claim Given  $s \in \text{Cart}(Y)$  - Choose a covering

$$Y = \bigcup_{i \in I} U_i \text{ s.t. } s|_{U_i} = \frac{f_i}{1} \in \Gamma(U_i, \underline{K(Y)}/\mathcal{O}_Y)$$

Then  $\mathcal{L}(S)|_{U_i} \xrightarrow{\sim} \mathcal{O}_{U_i}$ .

In particular  $\mathcal{L}(S)|_{U_i} = \frac{1}{f_i} \mathcal{O}_Y(U_i)$  and  $\mathcal{L}(S)|_{U_i} \xrightarrow{\sim} \frac{1}{f_i} \mathcal{O}_Y(U_i)$  when  $U_i$  is affine.

Pf  $\frac{1}{f_i} \in \Gamma(U_i, \mathcal{L}(S))$  as  $f_i \cdot \frac{1}{f_i} \in \mathcal{O}_{Y,Y}^*$   $\forall Y \in U_i$

$$\begin{array}{ccc} \mathcal{L}(S)|_{U_i} & \xrightarrow{\cdot f_i} & \mathcal{O}_{U_i} \\ \cup & & \cup \\ \underline{K(Y)} & \xrightarrow{\frac{f_i}{1}} & \underline{K(Y)} \end{array} \text{ gives the inverse.}$$

Thm. Let  $Y$  be an integral scheme.

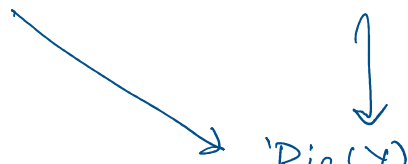

1) The map  $s \mapsto \mathcal{L}(S)$  gives a bijection  $\text{Cart}(Y) \longleftrightarrow \{ \text{invertible subsheaves of } \underline{K(Y)} \}$ .

2) The map in (1) induces an isom of groups  $\text{Coc}(Y) \xrightarrow{\sim} \{ \text{isom classes of invertible subsheaves of } \underline{K(Y)} \}$ .

where the group structure on the right again comes from  $\otimes \mathcal{O}_Y$

3) We have a commutative diag of isms of grps.

$$\text{Coc}(Y) \xrightarrow{(2)} \{ \text{isom classes of invertible subsheaves of } \underline{K(Y)} \}$$

↓  
Pic(Y)

Pf. 1) Injection: Assume  $s_\alpha, s_\beta \in \text{Cart}(Y)$  have the same image. Choose an open covering

$Y = \bigcup_{i \in I} U_i$   
such that  $\exists \varphi_i^\alpha, \varphi_i^\beta$  for each  $i$   
satisfying,  $s_\alpha|_{U_i} = \varphi_i^\alpha, s_\beta|_{U_i} = \varphi_i^\beta \forall i$ .

Thus  $\frac{1}{\varphi_i^\alpha} \mathcal{O}_Y(U_i) = \frac{1}{\varphi_i^\beta} \mathcal{O}_Y(U_i) \forall i$

$\Rightarrow \varphi_i^\beta / \varphi_i^\alpha, \varphi_i^\alpha / \varphi_i^\beta \in \mathcal{O}_Y(U_i) \forall i$

$\Rightarrow \varphi_i^\beta / \varphi_i^\alpha \in \mathcal{O}_Y(U_i)^\times \forall i$

$\Rightarrow s_\alpha = s_\beta \in \Gamma(Y, \underline{K(Y)}^\times / \mathcal{O}_Y^\times)$ .

Surjectivity: Given an invertible  $\mathcal{O}_Y$  submod  $\mathcal{F}$  of  $\underline{K(Y)}$ , choose an open covering  $Y = \bigcup_{i \in I} U_i$  such that  $\mathcal{F}|_{U_i} = \varphi_i \cdot \mathcal{O}_{U_i}$  for some  $\varphi_i \in \underline{K(Y)}^\times$

Since  $\varphi_i \cdot \mathcal{O}_{U_i}|_{U_i \cap U_j} = \varphi_j \cdot \mathcal{O}_{U_j}|_{U_i \cap U_j}$

$\varphi_i / \varphi_j \in \mathcal{O}_{U_i}(U_i \cap U_j)^\times$   
 $\Rightarrow \left\{ \varphi_i \in \Gamma(U_i, \underline{K(Y)}^\times / \mathcal{O}_Y^\times) \right\}_{i \in I}$  glue  
to give a section  $s \in \Gamma(Y, \underline{K(Y)}^\times / \mathcal{O}_Y^\times)$

By claim \*\*,  $\mathcal{L}(s) = \mathcal{F}$ .

2) By claim \*\*, we have  
 $\mathcal{L}(s_1) \otimes_{\mathcal{O}_Y} \mathcal{L}(s_2) \xrightarrow{\sim} \mathcal{L}(s_1 s_2)$

So we only need to check:

if  $\mathcal{L}(s) \rightarrow \mathcal{O}_Y$ , then  $\exists \varphi \in \underline{K(Y)}^\times$  such that  
 $s = \varphi$  in  $\Gamma(Y, \underline{K(Y)}^\times / \mathcal{O}_Y^\times)$ .

To that end, fix an isom  
 $\mathcal{O}_Y \xrightarrow{\sim} \mathcal{L}(s)$ .

... this isom

To that end,  $\tau_x \dots$

$$\mathcal{O}_Y \xrightarrow{\sim} \mathcal{L}(S).$$

Denote the image of  $1 \in \mathcal{O}_Y(Y)$  via this isom by  $g \in K(Y)^*$ .

$$\text{So } \mathcal{L}(S)(U) = g \cdot \mathcal{O}_Y(U) \quad \forall U \subseteq_{\text{open}} Y.$$

Choose an open cover  $Y = \bigcup_{i \in I} U_i$  s.t.  $s|_{U_i} = f_i$  for some  $f_i \in K(Y)^*$ .

$$\text{By claim } \dots, \mathcal{L}(S)(U_i) = \frac{1}{f_i} \mathcal{O}_Y(U_i)$$

$$\text{Then } \frac{1}{f_i} \mathcal{O}_Y(U_i) = g \cdot \mathcal{O}_Y(U_i) \quad \forall i \quad \begin{matrix} \frac{1}{f_i} = g \cdot x \\ g = \frac{1}{f_i} \cdot y \end{matrix}$$

$$\Rightarrow g / \frac{1}{f_i} \in \mathcal{O}_Y(U_i)^* \quad \forall i$$

$$\Rightarrow s = \frac{1}{g} \in \Gamma(Y, \frac{K(Y)^*}{\mathcal{O}_Y^*}) \quad \square.$$

3) follows once we show every invertible  $\mathcal{O}_Y$ -mod is isom to some invertible  $\mathcal{O}_Y$ -mod of  $\underline{K(Y)}$ . Given an invertible  $\mathcal{O}_Y$ -mod  $\mathcal{L}$ , we produce an injective  $\mathcal{O}_Y$ -mod map  $\mathcal{L} \rightarrow \underline{K(Y)}$ . The image will be the desired invertible  $\mathcal{O}_Y$ -submod isom to  $\mathcal{L}$ .

To that end, choose an isom  $\mathcal{L}_\eta \xrightarrow{\sim} \underline{K(Y)}$  where  $\eta$  is the gen pt of  $Y$ .

$$\text{For } U \subseteq_{\text{open}} Y, \text{ The canonical map composed with } \psi \text{ gives a map of } \mathcal{L}(U) \rightarrow \mathcal{L}_\eta \xrightarrow{\sim} \underline{K(Y)}$$

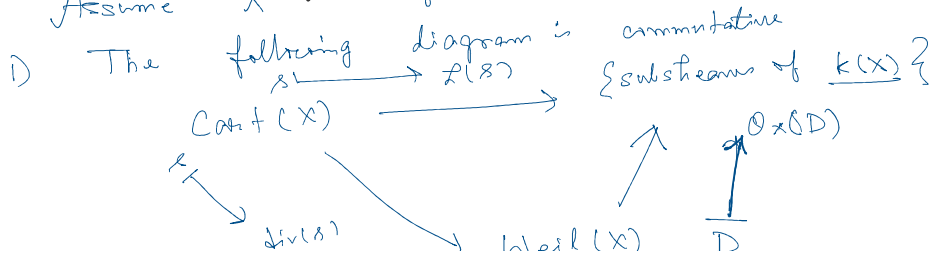

$$\psi_U: \mathcal{L}(U) \rightarrow \mathcal{L}_\eta \xrightarrow{\sim} \underline{K(Y)}(U) = K(Y)$$

$\psi_U$  induces a  $\mathcal{O}_Y$ -lin map  $\mathcal{L} \rightarrow \underline{K(Y)}$ .

Since  $Y$  is integral,  $\mathcal{L}(U) \rightarrow \mathcal{L}_\eta$  and hence

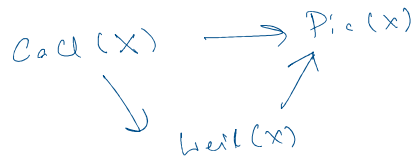

$\psi_U$  is inj  $\forall U$ .  $\square$ .

Thm: Assume  $X$  is integral and reg in codim 1.

2) When  $X$  is locally factorial, we have a commutative diag. of isom.

Cor.  $\mathbb{P}_k^n = \text{Proj}(k[x_0, \dots, x_n])$ . Any invertible sheaf on  $\mathbb{P}_k^n$  is isom to some  $\mathcal{O}(m)$  for some  $m \in \mathbb{Z}$ .

f. Cartier divisor associated to rational sections of an invertible sheaf.

Let  $X$  be an integral scheme,  $\eta$  be the generic pt.  $\mathcal{L}$  be an invertible  $\mathcal{O}_X$ -mod,  $0 \neq s \in \mathcal{L}_\eta$ . We are going to define  $\text{div}(s) \in \text{Cart}(X)$ .

Choose an open covering  $X = \bigcup_{i \in I} U_i$  s.t.  $\mathcal{L}|_{U_i} \cong \mathcal{O}_{U_i} \forall i \in I$ .

For each  $i \in I$ , fix an isom; let  $s_i$  be the image of  $s \in \mathcal{O}_X(U_i)$ .

Then  $s|_{U_i} = f_i \cdot s_i$  for some  $f_i \in K(X) - \{0\}$ .

Define  $\text{div}(s) \in \text{Cart}(X)$  by setting

$$\text{div}(s) = (U_i, f_i)_{i \in I}.$$

Prop/Def  $\text{div}(s)$  is independent of the choice  $(U_i, s_i \in \mathcal{L}|_{U_i})$

made above.

Pf: Exercise.  $s, s'$  on  $X$

Def. Two Cartier divisors are called linearly equivalent if they represent the same class in  $\text{Cald}(X)$ . We write  $s \sim s'$  to denote linear equivalence

Thm: ① For nonzero  $s, s' \in \mathcal{L}_\eta$ ,  $\text{div}(s) \sim \text{div}(s')$   
 ② For  $D \in \text{Cart}(X)$ . There is a bijection

Thm: ① for nonzero  $s, s' \in \mathcal{O}_\eta$ ,

② Let  $s \in \text{Cart}(X)$ . There is a bijection

$\{\text{Cartier divisors linearly equivalent to } s\}$

$\mathcal{L}(s)_\eta - \{0\}$   
 " Rational sections of  $\mathcal{L}(s)$ .

(Check that  $1 \in \mathcal{L}(s)$  is mapped to  $s$ ).

Now assume  $X$  is seg in codim 1 and noetherian.

Given an invertible sheaf  $\mathcal{L}$  and  $0 \neq s \in \mathcal{L}_\eta$ , one can consider

The Weil divisor corresponding to  $\text{div}(s) \in \text{Cart}(X)$ , denote it by  $\text{div}(\text{div}(s))$

Ex 1) Realize  $\text{div}(\text{div}(s))$  as the divisor of zeros and poles of the rational section.

2) Assume  $s \in H^0(X, \mathcal{L})$ . Show that the non-vanishing locus we defined  $D_s$  is the same as

$$X - \text{supp}(\text{div}(\text{div}(s))).$$

where,  $\text{supp}$  of an Weil divisor is defined as,

$$D = \sum_{D_i \text{ prime}} a_i D_i, a_i \in \mathbb{Z}.$$

$$\text{supp}(D) = \bigcup_{a_i \neq 0} D_i.$$
