

## Exercises – Serie 2 – Oscillations of a floating sphere

We want to study the oscillatory motion of a solid sphere of density  $\rho_s$  and radius  $R$  which is partially immersed under water (density  $\rho_f = 1000 \text{ kg/m}^3$ ).

We suppose that the sphere only moves in the vertical direction and we define the parameter  $q \in [0, 2R]$  as the distance between the free surface and the bottom of the sphere.  $\mathbf{g} = g\mathbf{e}_y$  is the gravitational acceleration constant equal to  $9.81 \text{ m/s}^2$ . The density of the sphere is considered smaller than the one of water and we neglect viscous and added mass effects.

- 1) Find the expression of the immersed volume  $V_f(q)$ .
- 2) Using the Newton's second law of motion, write the ordinary differential equation (ODE) characterizing the motion of the sphere  $\ddot{q} = f(q)$ . Why does it differ from the case of a rectangular floating object?
- 3) Express the algebraic equation at the equilibrium point  $0 = f(\bar{q})$ .
- 4) Solve this ODE numerically using *Matlab's* 'ode45' function for various values of  $R$  and  $\rho_s$  and different initial conditions  $[q(0), \dot{q}(0)]$ . Can you find a set of parameters for which the solution differs from a simple harmonic motion?
- 5) Linearize the ODE around the equilibrium point  $q = \bar{q} + q' \Rightarrow \ddot{q}' = f(q', \bar{q})$  (with  $q' \ll 1$ ) and find the expression of the natural frequency of the sphere  $\omega_0(\bar{q})$  around this point.
- 6) For a given set of parameters, compare the oscillation frequency found from the numerical solution with the natural frequency obtained in question 5. You can use *Matlab's* 'fsolve' function to find the equilibrium point  $\bar{q}$ .
- 7) At home: Set up a basic experiment using any common floating object (e.g. an ice cube, an apple, a half-filled water bottle, or any floating object you can think of). Find a simple way to measure the oscillation frequency of the object and compare it with the frequencies predicted by your numerical findings.
