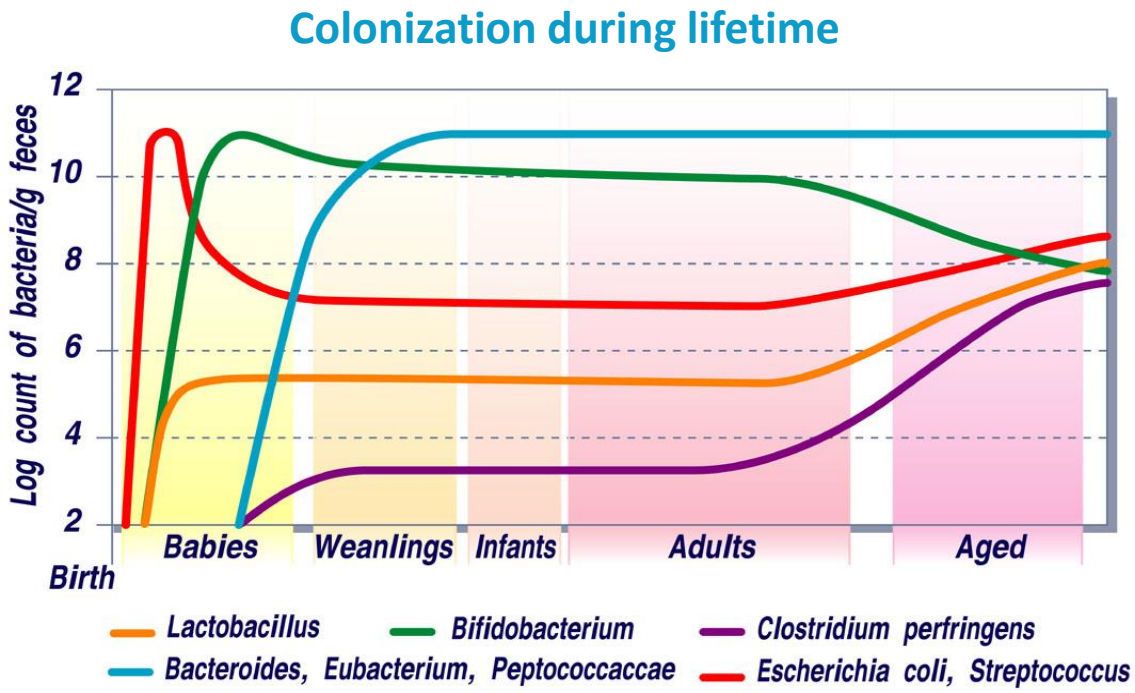
The gut microbiota

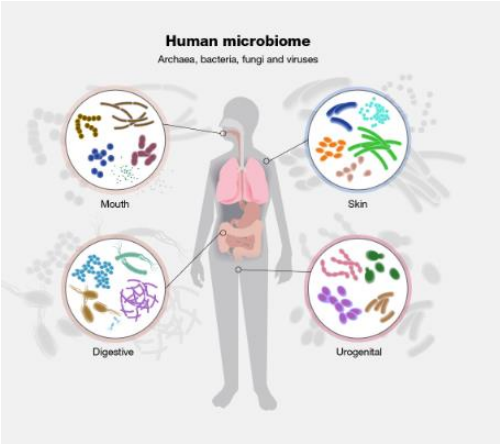
- Ecosystem comprising a roughly 1:3 - 10 ratio of bacteria as compared to human cells
- In addition, viruses, fungi (yeast)…
- Many more (~ 10 to 100x) genes in our gut than in our cells
- Antonie van Leeuwenhoek first began to study microorganisms back in the 17th century



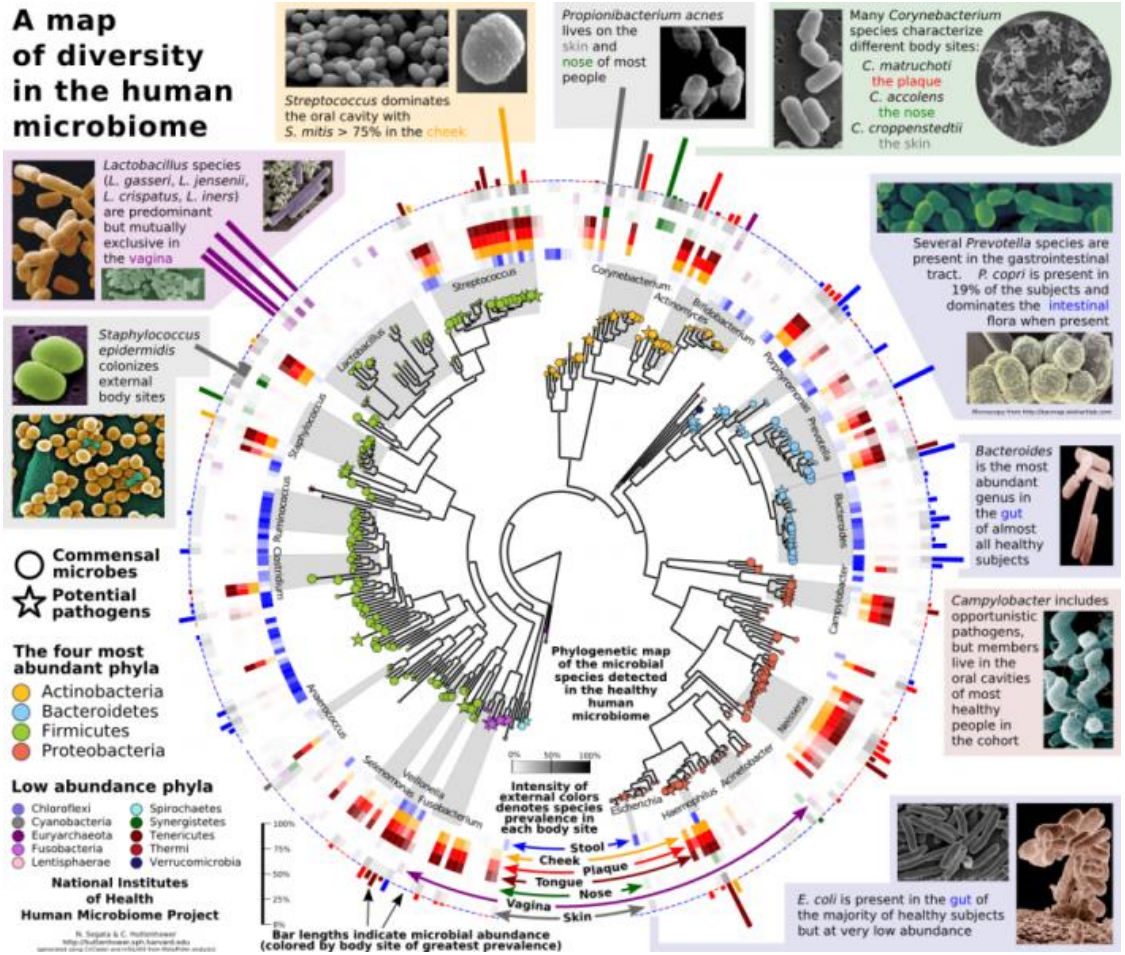
Adapted from Mitsuoka et al., Nutrition Review 1992

Many other sites where microbes are important

- Human body:
- Digestive system, skin, mouth, sexual organs…



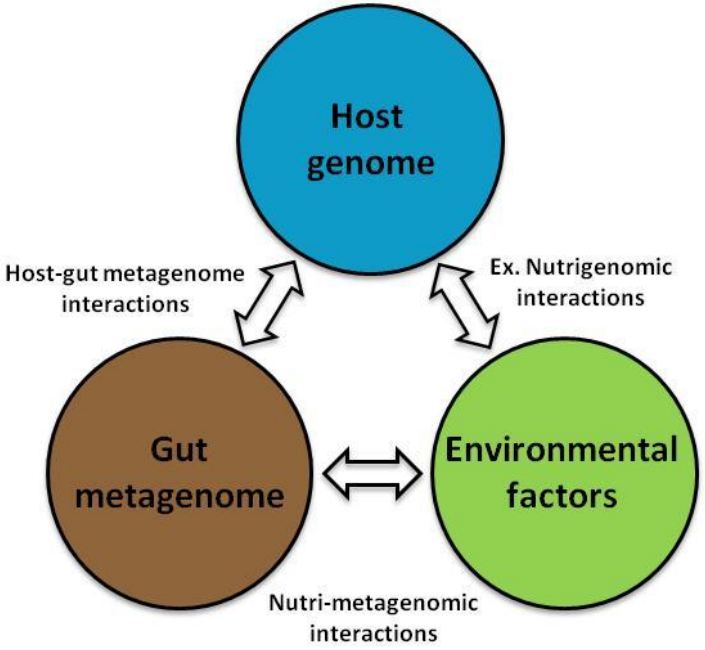
- Soil microbial ecology
- Marine microbial ecology
- Air
- Food (probiotics, spoilage, pathogens)
- Raw materials (cereals, vegetables, meat)
- Food/drinks fermentation



Gut microbiome & health

- Gut microbiome intimately linked to:
  - Digestion
  - Nutriment intake
  - Gut-brain axis

  Dysbiosis (desiquilibrium) associated with
  - Obesity
  - Diabetes
  - Autoimmune and inflamatory diseases
  - Cancer
  - Psychiatric disorders



Why is the microbiome beneficial?

- Key to provide metabolites (e.g. vitamins) that human cells can’t metabolize or produce
- Required from early life for development of the immune system and global growth and development
- Experiments in mice without microbiome demonstrate extensive development impairments (reduced growth and weight, deficient immunity)

- The microbiome can transfer benefits (or health issues) e.g. transplant of microbiome from obese mice lead top obesity in healthy mice

Characterization of the microbiota & activities

- Microbiota composition (who’s there?)
- Genes present (what’s going on there?)
- Metabolites (what’s produced or not?)

Association between human health and pathologies (obesity, diabetes, brain health, …)

- At the single bacteria level, complete genome characterization, activities., …

Examples of initiatives to characterize the microbiome

Various national and international initiatives as for example

- Human Microbiome Project launched in 2008
- https://hmpdacc.org/

- Million Microbiome of Humans Project (MMHP) (BGI, 2019)
- https://db.cngb.org/mmhp/

- WeGut, American Gut, LifeLines DEEP, Dutch Microbiome Project,….

Concept of healthy microbiome

- Is it possible to define a healthy microbiome, and on what basis?
  - Microbial composition?
  - Gene composition?
  - Metabolites produced by the microbiome?
- Is it possible to use this information to intervene and modify a «diseased/unhealthy» microbiome towards a healthy microbiome?
- Recent elements of definition of a healthy gut microbiota:
  - Redundant: many bacteria have similar functions
  - Temporarly stable and resistant to perturbations
  - Resilient: returns to healthy state after perturbation

How to intervene on the microbiome

- Nutrition (fibers, etc..)
- Probiotics: bacterial or yeast strain that are beneficial for our global microbiome balance and provide health benefits
- Prebiotics: non-digestible food ingredients that promotes the growth of beneficial microorganisms in the intestine
- Postbiotics: refers to the waste left behind after your body digests both prebiotics and probiotics. It comprises nutrients such as vitamins B and K, amino acids; antimicrobial peptides that help to slow down the growth of harmful bacteria and short-chain fatty acids
- Transplant of microbiome from healthy donors (*C. difficile* infections)
- Targeted depletion of pathobionts with bacteriophages

Various types of microbiome studies

- **Descriptive:** knowledge building and cataloging the constituants of the microbiome
- **Association:** finding correlations between a phenotype/symptom/disease and the presence or absence of one or a group of micro orgnanism in the gut
- **Causative:** identifying the micro organism(s) which causes the symptom/disease, and ideally show that the symptoms can be alleviated with treatment or by restoring «healthy» levels of the micro organim(s)

Various approaches to study the microbiome

qPCR/ddPCR

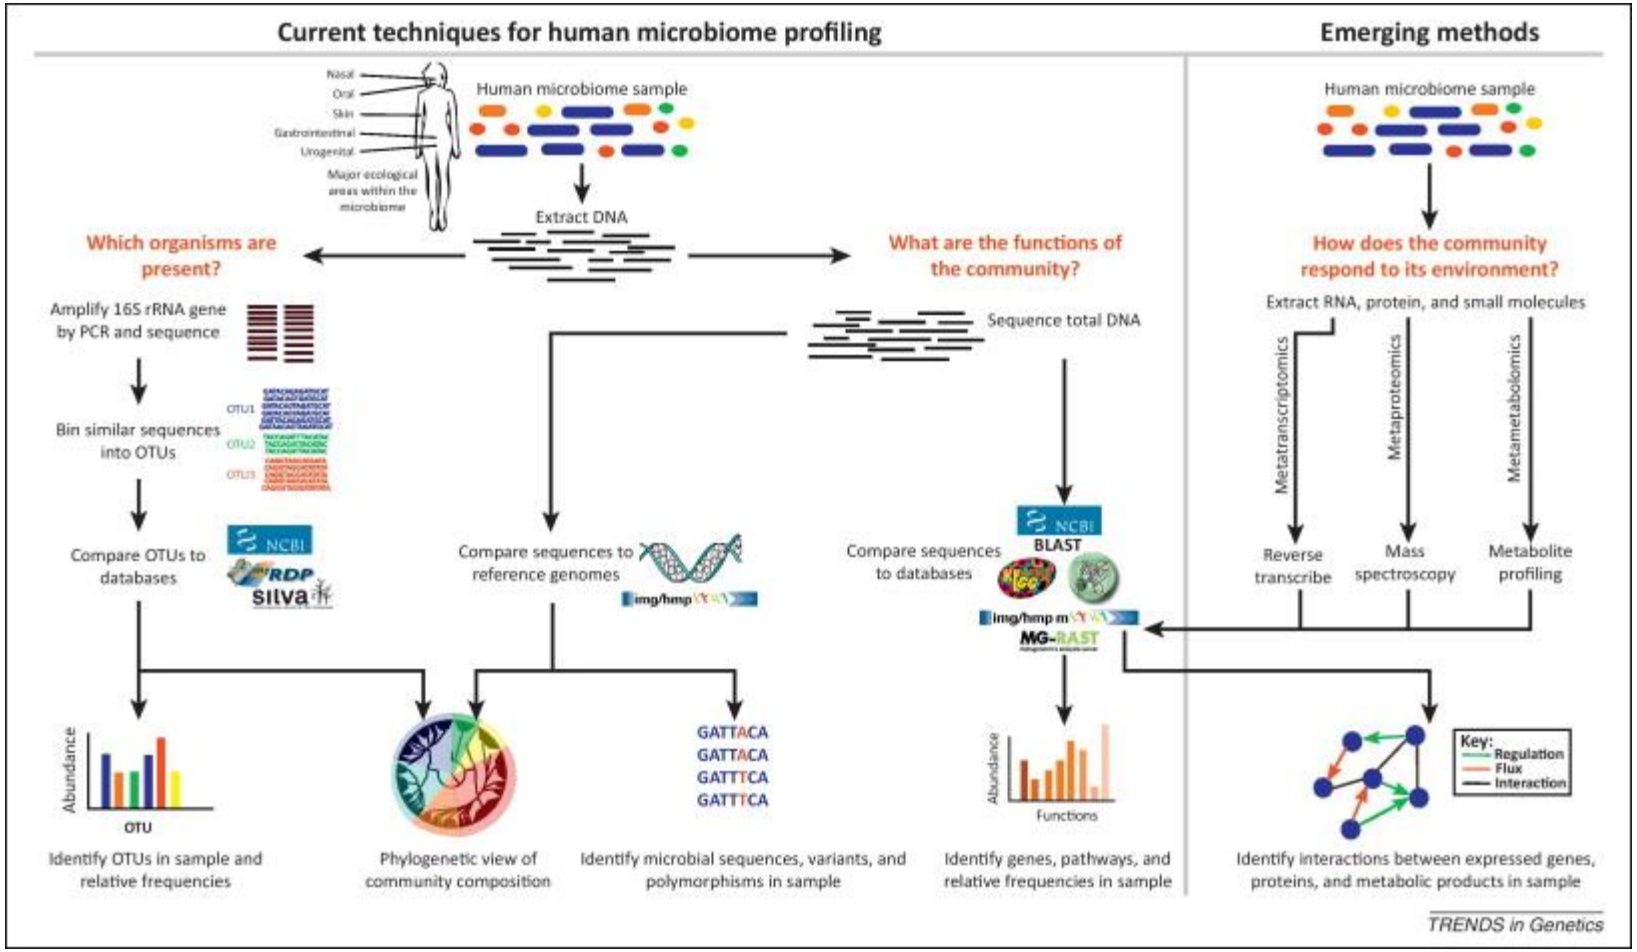
Targeted

Specific amplicon

Specific bacteria(s) of interest

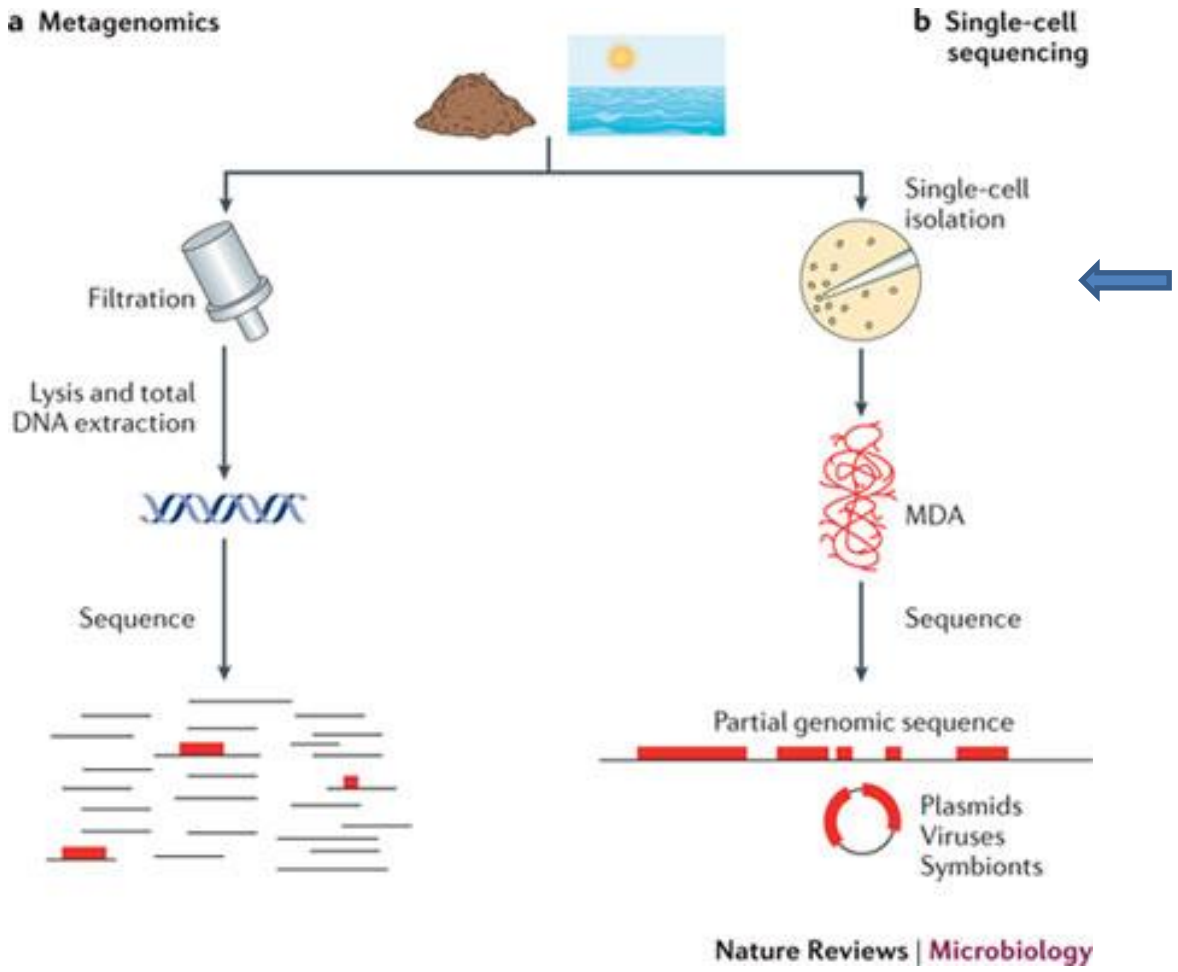
Requires new design for each new bacteria

Low throughput



Biodiversity and functional genomics in the human microbiome
Xochitl C. Morgan, Nicola Segata, Curtis Huttenhower
Trends in Genertics Volume 29, Issue 1, January 2013, Pages 51–58

Complex samples vs isolates



Potentially challenging for some micro organisms such as those growing under anaerobic conditions or in extreme conditions

Roger S. Lasken
Nature Reviews Microbiology 10, 631-640 (2012)

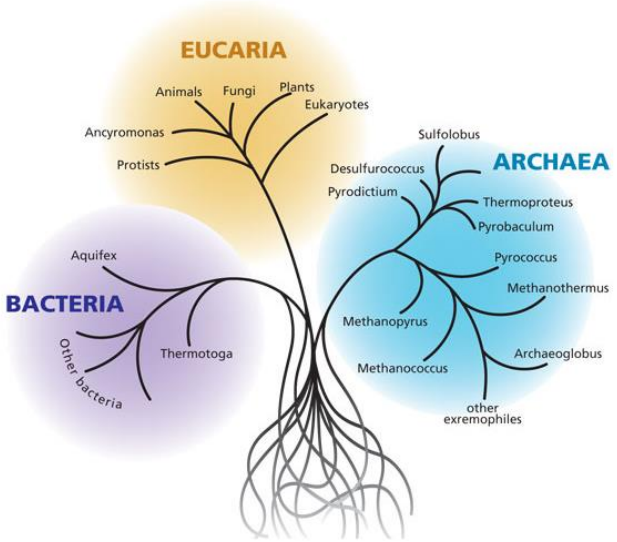
Methods – workflows applicable to other sources/matrixes

- Soil
- Water
- Food
- Raw material
- Factories
- Coffee or other goods fermentation

16S rRNA gene sequencing

- 16 S gene present in all Bacteria/Archaea
- Highly conserved regions alternate with variable regions -> good template for PCR amplification

- Well characterized and reliable database available for taxonomic analysis
- 16S genes allow to reconstruct phylogenetic trees



Targeted amplicon by PCR: partial 16S

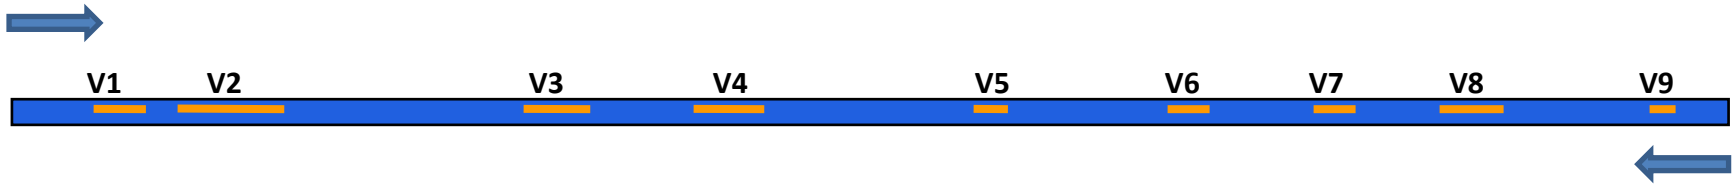
SHORT COMMUNICATION

Ultra-high-throughput microbial community analysis on the Illumina HiSeq and MiSeq platforms

J Gregory Caporaso[1], Christian L Lauber[2], William A Walters[3], Donna Berg-Lyons[2], James Huntley[4], Noah Fierer[2,5], Sarah M Owens[6], Jason Betley[7], Louise Fraser[7], Markus Bauer[7], Niall Gormley[7], Jack A Gilbert[6,8], Geoff Smith[7] and Rob Knight[9,10]

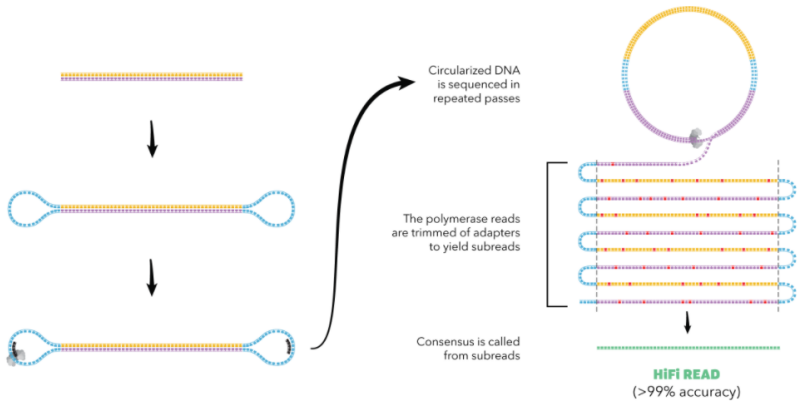
Targeted amplicon by PCR full-length 16S

Complete sequence of all variable regions and very high sequence accuracy increases significantly the discriminatory power



Data production:

PacBio HiFi reads or Oxford Nanopore

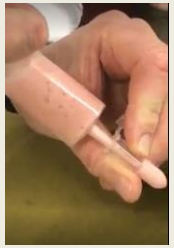


Bioinformatics:

Mapping reads onto 16SrRNA gene data base (e.g. Silva)
Quantify taxa /species/strains present

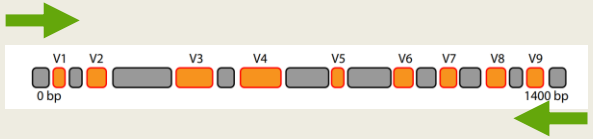
Our microbial ecology profiling Full-Length 16S workflow

Deployed in food safety, gut microbiome, coffee fermentation, …



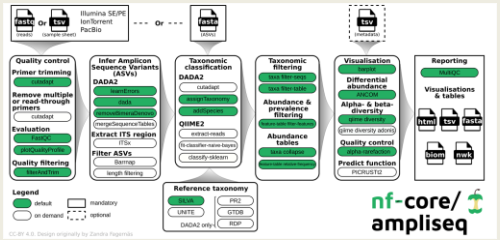
Samples

DNA

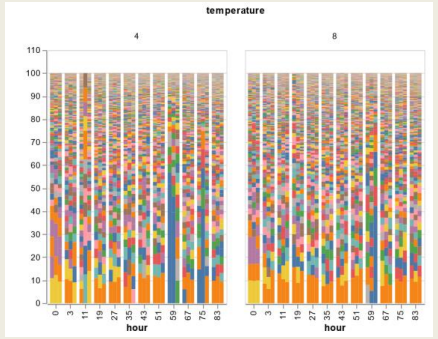


16S rRNA gene amplification

Sequencing



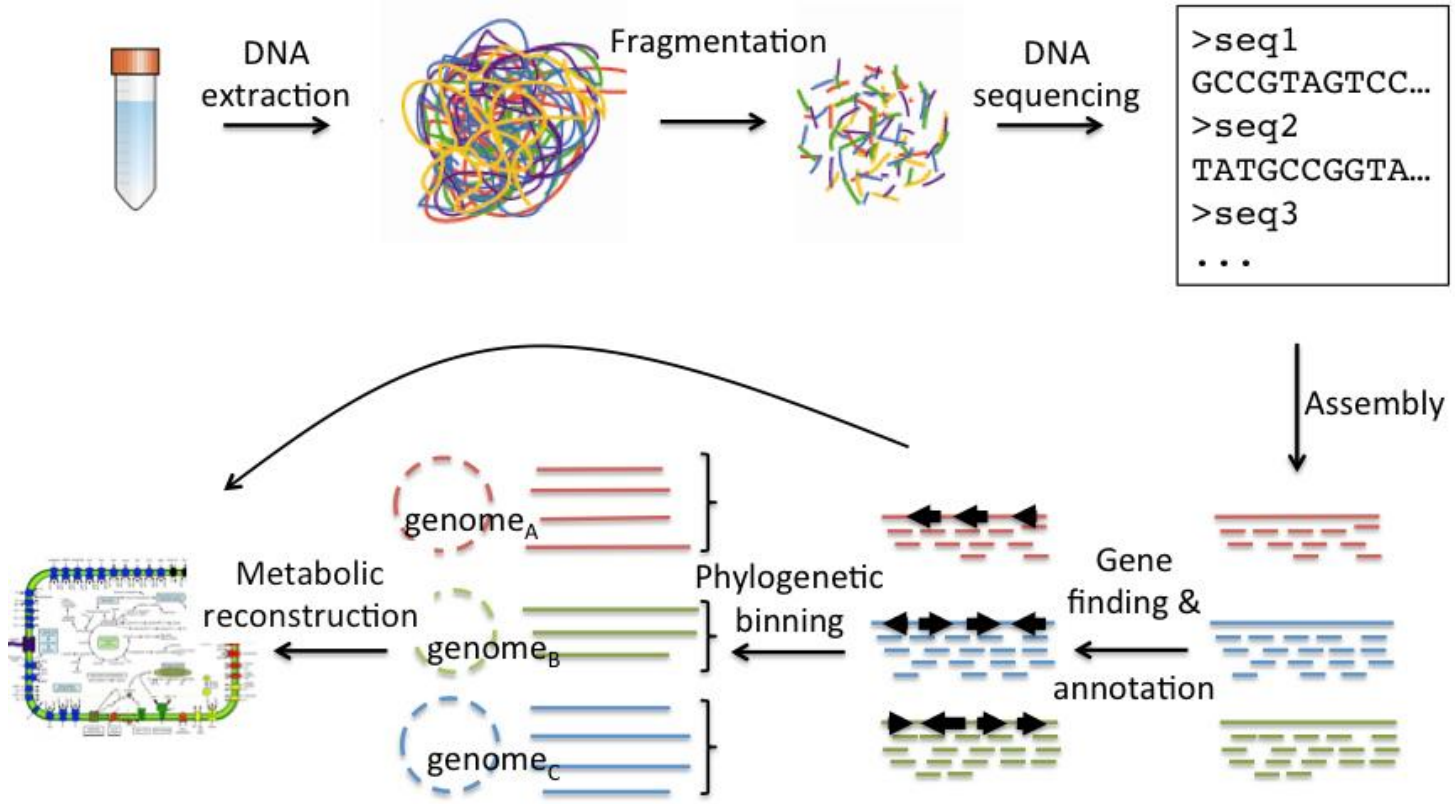
Bioinformatics analysis



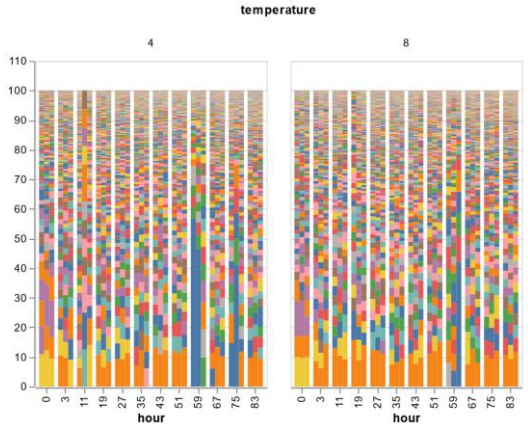
Taxonomic profile

Shotgun metagenomics

Greater information, more complex data analysis and interpretation, more expensive
Capture all DNA: bacteria, yeast and fungi, viruses, but also matrix DNA (e.g. human DNA)



Mapping ot bacterial genomes database to identify and quantify bacteria present



Source: http://envgen.github.io/metagenomics.html

Points to consider & laboratory procedures

- Sample collection & storage (-80°C)
- DNA extraction (key for long reads: DNA of greater size as possible)
- Library preparation
- Quantification of librarries & equimolar pooling
- Sequencing (read length, number of read/sample)
  - 16S: 10’000-100’000 reads per sample
  - shotgun metagenomics: 50 to 200 millions short reads per sample, or 100’000’s to millions long reads

- Data analysis choice of software

- Key current issue/limitation: lack of standardisation in methods!!

- Example of recent publication on standardization: Szotak et al, Scientific report 2022. The standardization of the approach to metagenomic human gut analysis: from sample collection to microbiome profiling

Shotgun Metagenomics with long reads

- HiFi sequencing or Nanopore for shotgun Metagenomics isolated DNA

- Advantages: improved quality of contigs and less ambiguity / errors in contig assemblies specially for highly similar sequences between strains
- Limits: lower sequencing depth due to higher costs (but new instruments solves this at least partially)

Choice of sequencing technology, short- vs long-reads

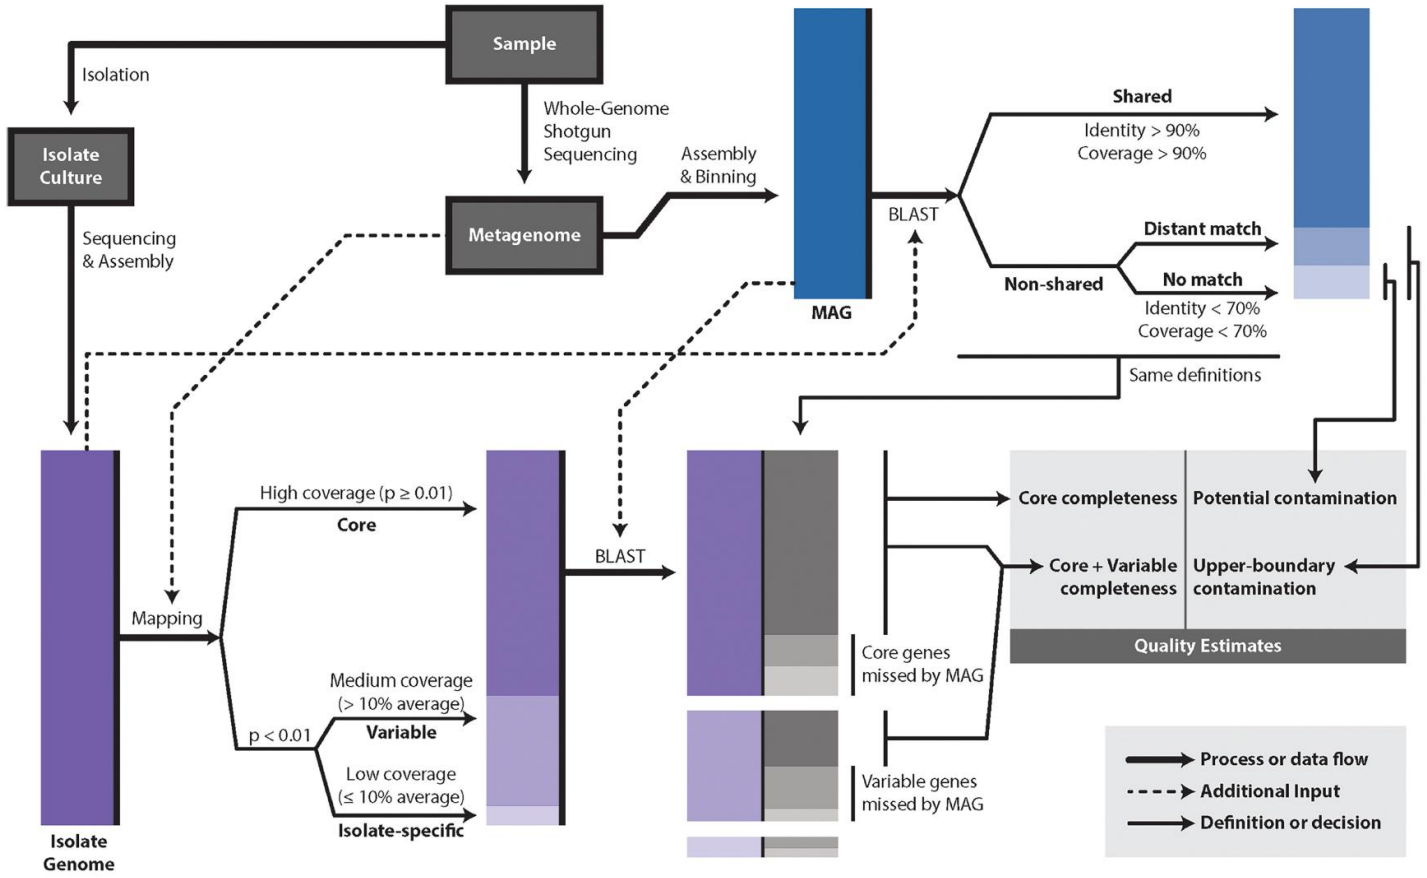
- Short reads
  - more accurate (lower error rate of the sequencing method)
  - greater depth as easier to generate high number of reads
  - Challenging to build contigs and assemble genomes

- Long reads
  - Slightly lower accuracy (improved with PacBio HiFi)
  - Longer contigs allow higher quality of assemblies
  - Lower depth reduces sensitivity

Importance of reference genomes & MAGs

Mapping reads requires reference, the more complete the better

Building references for metagenomics: Metagenomics Assembled Genomes (MAGs)



Meziti et al, Microbial Ecology 2021

Validation of the methods: MOCK community

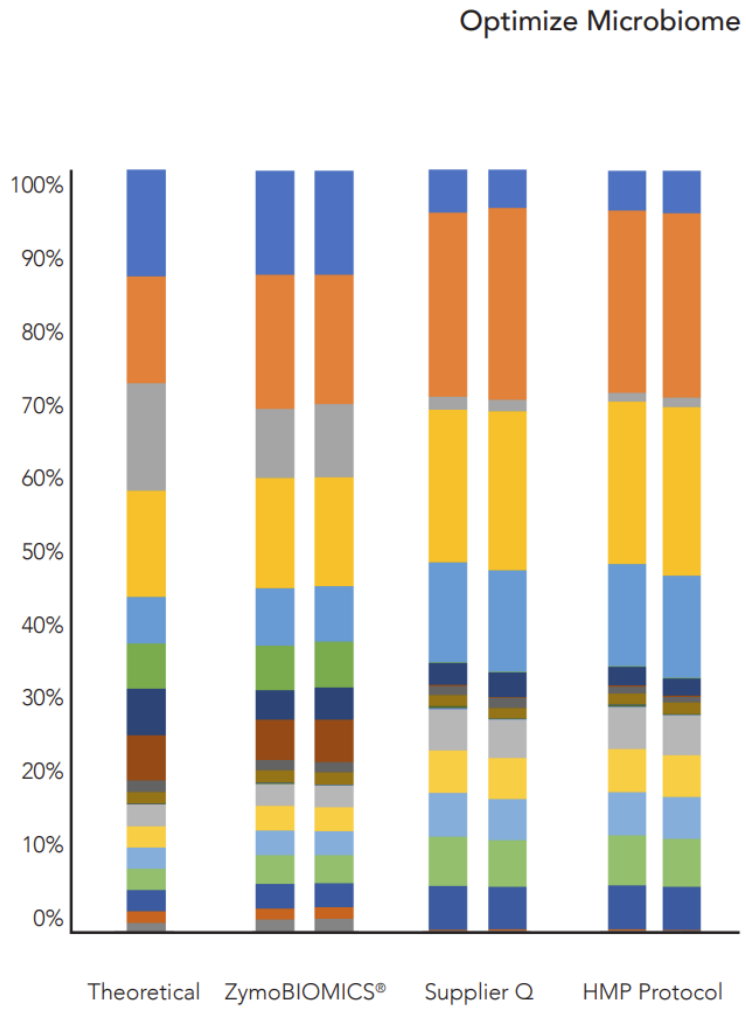
- Mix of bacterial strains (usually in the range of 20) of diverse species (either bacteria or isolated DNA) in known ratios

- Use in various technologies & protocols for library preparation & sequencing
- Use various methods for data analysis

- Evaluate outcome

- Caveats: complexity of gut microbiome is much greater than MOCK communities

Example: Zymo gut microbiome MOCK



Species	Theoretical Abun. (%)
Faecalibacterium prausnitzii	14
Veillonella rogosae	14
Roseburia hominis	14
Bacteroides fragilis	14
Prevotella corporis	6
Bifidobacterium adolescentis	6
Fusobacterium nucleatum	6
Lactobacillus fermentum	6
Clostridioides difficile	1.5
Akkermansia muciniphila	1.5
Methanobrevibacter smithii	0.1
Salmonella enterica	0.01
Enterococcus faecalis	0.001
Clostridium perfringens	0.0001
Escherichia coli (JM109)	2.8
Escherichia coli (B-3008)	2.8
Escherichia coli (B-2207)	2.8
Escherichia coli (B-766)	2.8
Escherichia coli (B-1109)	2.8
Candida albicans	1.5
Saccharomyces cerevisiae	1.4

Mix of hard-to-lyse bacteria, easy-to-lyse bacteria, two yeasts and an archaea species in ratios mimicking the human gut microbiome

Sampling specific intestine location

- Simba capsules sampling
- The Small Intestine Microbiome Aspiration (SIMBA) capsule is an ingestible, single-use capsule that enables passive sampling of small bowel luminal fluid.

Dominguez-Bello[9], Bas E. Dutilh[10,11], Stanislav D. Ehrlich[12,13], Tarini Shankar Ghosh[14], Colin Hill[1,2], Christophe Junot[15], Leo Lahti[16], Trevor D. Lawley[17], Tine R. Licht[18], Emmanuelle Maguin[19], Thulani P. Makhalanyane[20], Julian R. Marchesi[21], Jelle Matthijnssens[22], Jeroen Raes[22,23], Jacques Ravel[24,25], Anne Salonen[26], Pauline D. Scanlan[1,2], Andrey Shkoporov[1,2], Catherine Stanton[1,7], Ines Thiele[1,27], Igor Tolstoy[28], Jens Walter[1,2,29], Bo Yang[30,31], Natalia Yutin[28], Alexandra Zhernakova[32], Hub Zwart[33], Human Microbiome Action Consortium*, Joël Doré[12,19] & R. Paul Ross[1,2]

- Currently highly controversial
- Complicated by variability over compositional, spatial and temporal scales
- For example microbiome high plasticity in some communities with up to 100-fold changes in abundance of some species in individuals over short time

- Published 23rd October 2024

Recommandations / guidelines

- Epidemiological longitudinal population-scale studies (as opposed to case controls, where defining healthy controls is challenging)
- Importance of age speicifc microbiome, hence longitudinal sudies
- Cover all world-wide ethnicities/populations especially middle and low income
- Use shotgun metagenomics to capture complete gene set, but also non bacterial components (viruses, archae, fungi, parasites)
- Use metabolomics and metatranscriptomics to capture activities
- Standardize methods (e.g. sampling)
- Have complete metadata (health status, medication, execrise, nutrition,..)
- Share in large consortiums

Microbiome intro conclusions

- Microbiome reasearch still in its still young and moving fast thanks to technology developments
- Numerous challenges in particular for standardisation of analytical methods (genomics, but also metabolomics)
- Concept of healthy microbiome
- Numerous examples of beneficial impacts of modulating the microbiome
- Still we are far from fully understanding the complexity of the microbiome, and more importantly to be able to modulate it for impactful health benefits
- Additional work for underappreciated microorgansims such as yeast, fungi, viruses, parasites
- Additional work required to disentangle causes from consequences
