**4.13.** The  $x$  and  $y$  components of two different velocity fields are given by:

$$\text{Field 1: } u = \left(-\frac{V_o}{l}\right)x \text{ and } v = \left(\frac{V_o}{l}\right)y \text{ where } V_o \text{ and } l \text{ are constants, and}$$

$$\text{Field 2: } u = x^2y \text{ and } v = -xy^2$$

Determine the equations for the streamlines of the flow for both fields and compare the results. Is the flow the same in both cases? Explain.

**4.31.** As a valve is opened, water flows through the diffuser shown in Fig. P4.31 at an increasing flowrate so that the velocity along the centerline is given by

$$\mathbf{V} = u\hat{\mathbf{i}} = V_o(1 - e^{-ct})(1 - x/l)\hat{\mathbf{i}}$$

where  $V_o$ ,  $c$  and  $l$  are constants. Determine the acceleration as a function of  $x$  and  $t$ . If  $V_o=3.0$  m/s and  $l=1.5$  m, what value of  $c$  (other than  $c=0$ ) is needed to make the acceleration zero for any  $x$  at  $t=1$  s? Explain how the acceleration can be zero if the flowrate is increasing with time.

■ Figure P4.31

**4.36.** A nozzle is designed to accelerate the fluid from  $V_1$  to  $V_2$  in a linear fashion. That is,  $V=ax+b$ , where  $a$  and  $b$  are constants. If the flow is constant with  $V_1=10$  m/s at  $x_1=0$  m and  $V_2=25$  m/s at  $x_2=1$  m, determine the local acceleration, the convective acceleration, and the acceleration of the fluid at points (1) and (2).

**4.52.** Water flows steadily through the funnel shown in Fig. P4.52. Throughout most of the funnel the flow is approximately radial (along rays from  $O$ ) with a velocity of  $V = c/r^2$ , where  $r$  is the radial coordinate and  $c$  is a constant. If the velocity is 0.4 m/s when  $r=0.1$  m, determine the acceleration at points  $A$  and  $B$ .

■ Figure P4.52

- 4.54.** Air flows from a pipe into the region between two parallel circular disks as shown in Fig. P4.54. The fluid velocity in the gap between the disks is closely approximated by  $V = V_0 R/r$ , where  $R$  is the radius of the disk,  $r$  is the radial coordinate, and  $V_0$  is the fluid velocity at the edge of the disk. Determine the acceleration for  $r = 0.3, 0.6$ , or  $0.9$  m if  $V_0 = 1.5$  m/s and  $R = 0.9$  m.

■ Figure P4.54

- 4.68.** A layer of oil flows down a vertical plate as shown in Fig. P4.68 with a velocity of  $\mathbf{V} = (V_0/h^2)(2hx - x^2)\mathbf{j}$  where  $V_0$  and  $h$  are constants. **(a)** Show that the fluid sticks to the plate and that the shear stress at the edge of the layer ( $x = h$ ) is zero. **(b)** Determine the flowrate across surface  $AB$ . Assume the width of the plate is  $b$ . (Note: The velocity profile for laminar flow in a pipe has a similar shape.)
