

**Mathematical Methods in Chemistry, Part I**  
**Symmetry and Group Theory**  
**Midterm Exam**

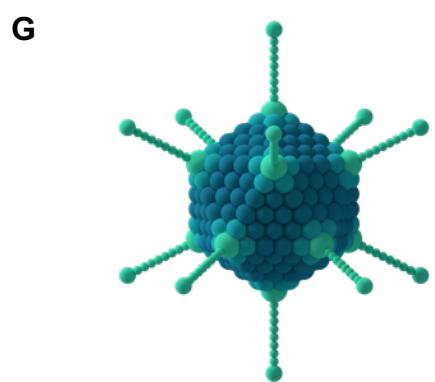

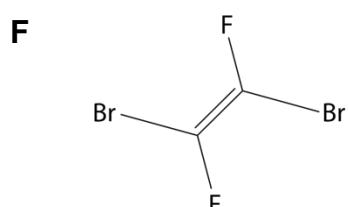

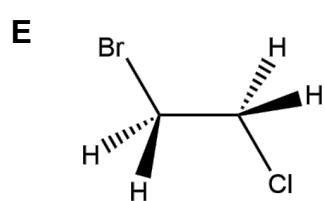

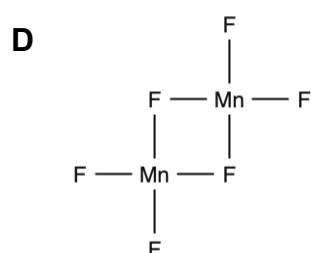

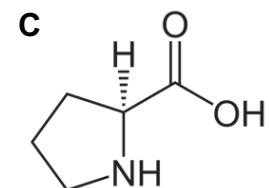

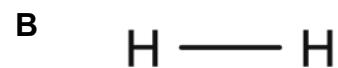

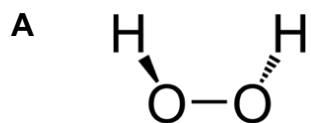

**April 17, 2024**

**Name:**

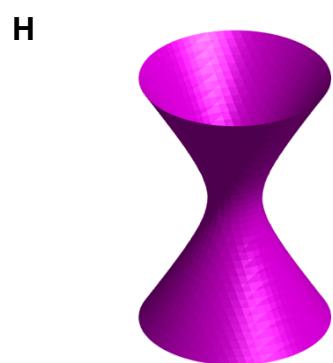

**2 h to complete the exam. Total number of points: 38.**

**Please note that this is not an open-book exam. Only the material handed out with the exam questions may be used. You are allowed to use a non-programmable calculator, but the calculator will be checked during the exam. Computers or molecular modeling kits are not permitted. Do not write with a pencil or a fountain pen that can be erased. Please have your photo ID ready.**

1) Determine the point group of the following molecules and objects. (12 points)

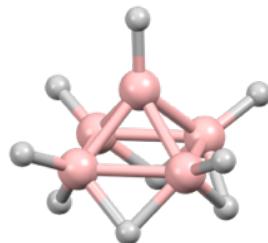

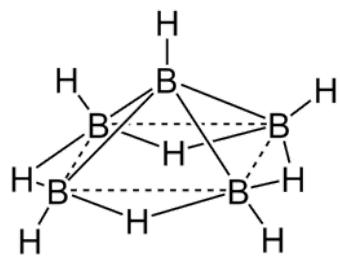

Adenovirus

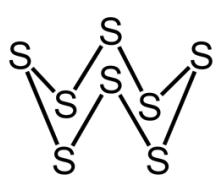

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$$

I

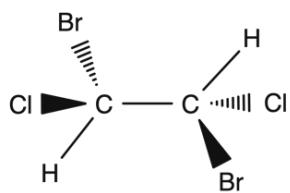

Pentaborane(9)

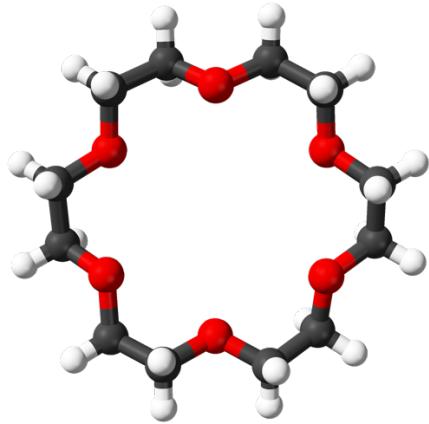

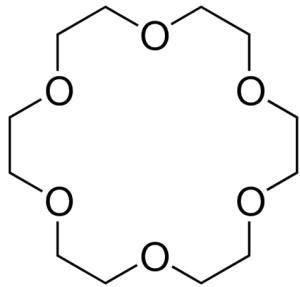

J

K

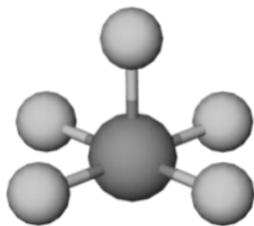

L

18-Crown-6

**2) Determine all subgroups of the points groups  $C_{4v}$ ,  $C_i$ ,  $C_{2h}$ ,  $D_{2h}$ . (2 points)**

3)  $\text{BrF}_5$  has a square pyramidal geometry. How many peaks do you expect to find in the IR and Raman spectrum? (10 points)

4) Assume that  $\{\psi_1, \psi_2\}$  is a basis of a representation  $\Gamma$  of the group  $G$  and consider the direct product  $\Gamma \otimes \Gamma$ . The symmetrized part of the direct product contains the following three functions

$$\left\{ \psi_1\psi_1, \frac{1}{2}(\psi_1\psi_2 + \psi_2\psi_1), \psi_2\psi_2 \right\},$$

which form a basis for another representation  $\Gamma_s$ .

Note that in this notation  $\psi_1\psi_2 = \psi_1(r_1)\psi_2(r_2)$  and  $\psi_2\psi_1 = \psi_2(r_1)\psi_1(r_2)$ , where  $r_1$  and  $r_2$  are coordinates in three-dimensional space.

Show that the character  $\chi_{\Gamma_s}$  of this representation for an operation  $R$  is given by the following formula

$$\chi_{\Gamma_s}(R) = \frac{1}{2}[\chi_{\Gamma}(R)^2 + \chi_{\Gamma}(R^2)],$$

where  $\chi_{\Gamma}$  represents the character of the representation  $\Gamma$ . (7 points)

5) In class, we have used symmetry to construct a qualitative MO diagram of  $\text{CH}_4$ . For the minimal basis, we used the 2s and 2p orbitals on the carbon atom. Show that we would have obtained the same result if we had instead used four  $\text{sp}^3$  hybridized orbitals on the carbon.

To this end, show that the  $\text{sp}^3$  orbitals give rise to SALCs of the same symmetry species as the 2s and 2p orbitals. Determine the SALCs of the  $\text{sp}^3$  orbitals. Finally, show that these SALCs are identical to the 2s and the 2p orbitals. (7 points total)
