# 06 Transit Network III: Operations

**CIVIL-324 Urban public transport systems**

- Transit network design problems discussed in this course
  - Stop location and line planning
    - where to put transit stations and how to connect them into transit lines?
  - Scheduling and pricing
    - how to design the timetable and coordinate multiple transit lines?
    - how to price transit trips under different operational objectives?
  - **Operations**
    - how to design the vehicle schedules given the transit time table?
    - how to manage the potential delay during the operations?

- Operations
  - How to design the vehicle schedules given the transit time table?
    - min fleet size
    - vehicle scheduling: heuristics and optimization method
  - How to manage the potential delay during the operations?
    - delay management

# Vehicle scheduling

- Single transit line with single terminal

# Vehicle scheduling

- Single transit line with single terminal

- Single transit line with single terminal
  - How many vehicles are needed to service transit line given its timetable?

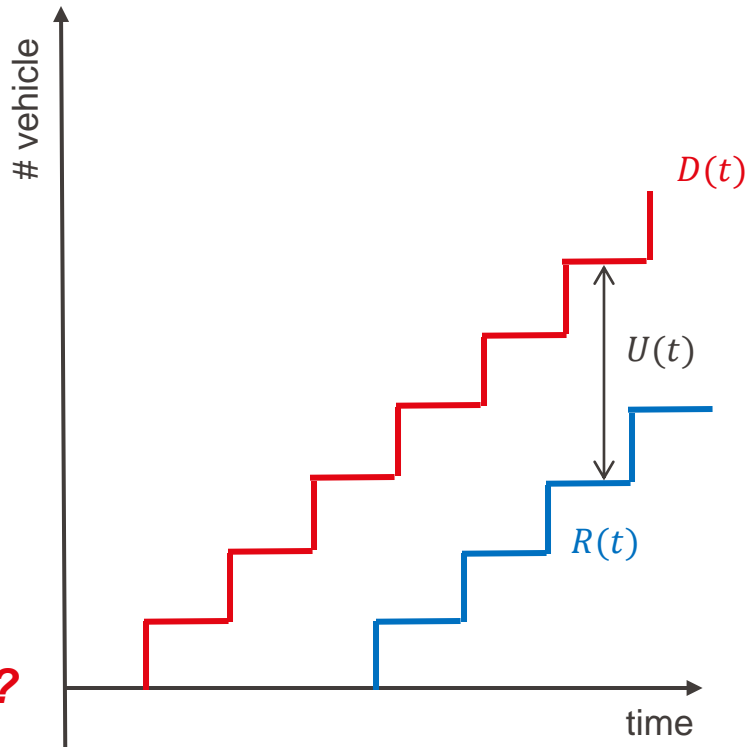

- Single transit line with single terminal
  - # departures  $D(t)$
  - # returns  $R(t)$
  - # in-service  $U(t) = D(t) - R(t)$

Min fleet size

$$M = \max U(t) = 3$$

- ***Q: How to approximate  $U(t)$  and  $M$ ?***

# Vehicle scheduling

- Single transit line with single terminal

- # departures  $D(t)$
- # returns  $R(t)$
- # in-service  $U(t) = D(t) - R(t)$
- Frequency  $f$
- Cycle time  $T$

Min fleet size

$$\begin{aligned} M &= \max U(t) = \max\{D(t) - R(t)\} \\ &= \max\{tf - (t - T)f\} \\ &= Tf \end{aligned}$$

- Q: What if frequency is time-varying?**

- Single transit line with single terminal

- # departures  $D(t)$
- # returns  $R(t)$
- # in-service  $U(t) = D(t) - R(t)$
- Frequency  $f$
- Cycle time  $T$

## Min fleet size

$$\begin{aligned}
 M &= \max U(t) \\
 &= \max_{i \geq j} \{D_i(t) - R_j(t)\} \\
 &= 2Tf
 \end{aligned}$$

# Vehicle scheduling

- Single transit line with two terminals

- # departures from A  $D_A(t)$
- # returns to B  $R_B(t)$

# Vehicle scheduling

- Single transit line with two terminals

- # departures from A  $D_A(t)$
- # returns to B  $R_B(t)$
- # departures from B  $D_B(t)$
- # returns to A  $R_A(t)$

- Q: How to compute # in-service?**

# Vehicle scheduling

- Single transit line with two terminals

- # departures from A/B  $D_A(t)/D_B(t)$
- # returns to A/B  $R_A(t)/R_B(t)$
- # in-service

$$\begin{aligned}
 U(t) &= (D_A(t) - R_B(t)) + (D_B(t) - R_A(t)) \\
 &= (D_A(t) - R_A(t)) + (D_B(t) - R_B(t)) \\
 &= U_A(t) + U_B(t)
 \end{aligned}$$

- Min fleet  $M = \max U(t)$

- Q: What if vehicles returning to B directly go back to A?**

# Vehicle scheduling

- Single transit line with two terminals

- # departures from A/B  $D_A(t)/D_B(t)$
- # returns to A/B  $R_A(t)/R_B(t)$
- # in-service

$$U(t) = U_A(t) + U_B(t) \\ = (D_A(t) - R_A(t)) + 0$$

- Min fleet  $M = \max U(t)$ 
  - reduce to the case of single terminal**

# Vehicle scheduling

- Multiple transit line with single terminal (Hub-spoke network)

- # departures of line  $l$   $D_l(t)$
- # returns line  $l$   $R_l(t)$
- # in-service

$$U(t) = \sum_l D_l(t) - \sum_l R_l(t) = \sum_l U_l(t)$$

- Min fleet size

$$M = \max U(t) = \max \sum_l U_l(t)$$

$$\leq \sum_l \max U_l(t)$$

*sum of single-line fleets*

# Vehicle scheduling

- Multiple transit line with single terminal (Hub-spoke network)

- # departures of line  $l$   $D_l(t)$
- # returns line  $l$   $R_l(t)$
- # in-service

$$U(t) = \sum_l D_l(t) - \sum_l R_l(t) = \sum_l U_l(t)$$

- Min fleet size

$$M = \max U(t) = \max \sum_l U_l(t)$$

$$\leq \sum_l \max U_l(t)$$

*sum of single-line fleets*

# Questions?

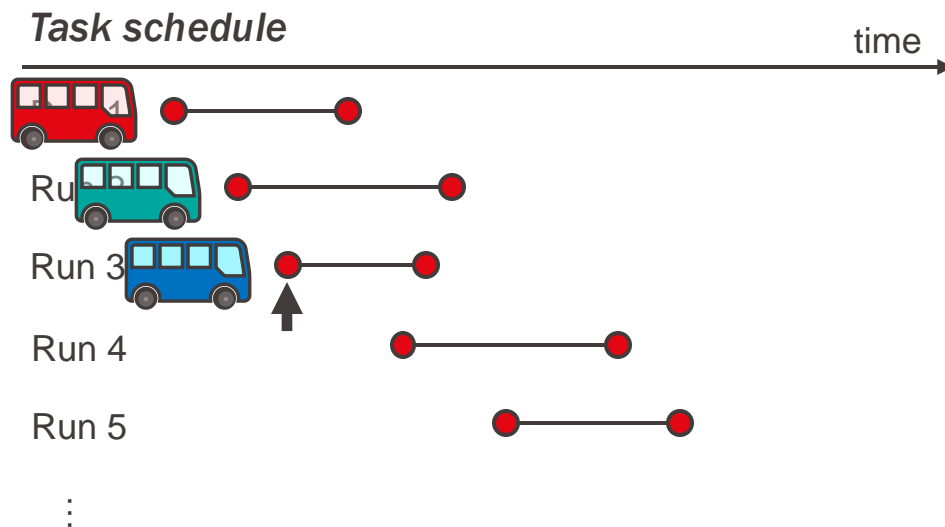

# Vehicle scheduling

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle

# Vehicle scheduling

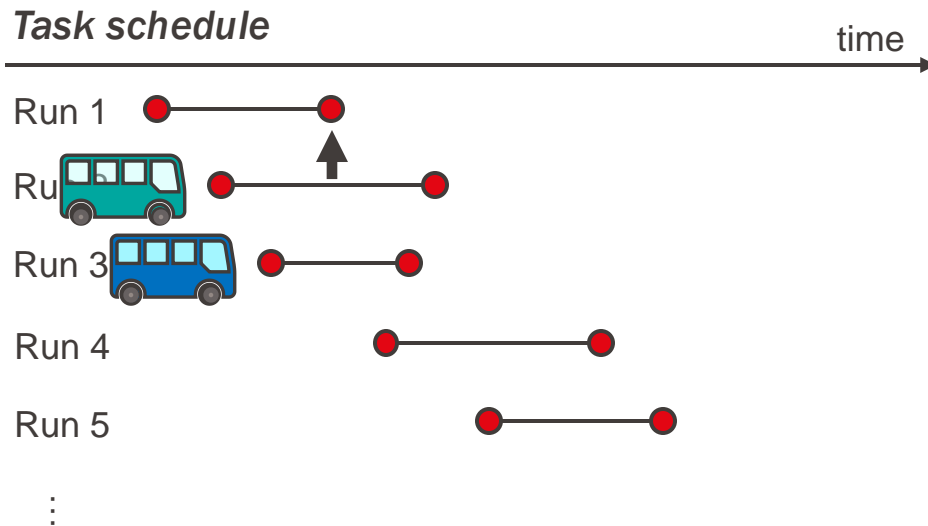

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle

- ***Q: What is the next vehicle movement?***

# Vehicle scheduling

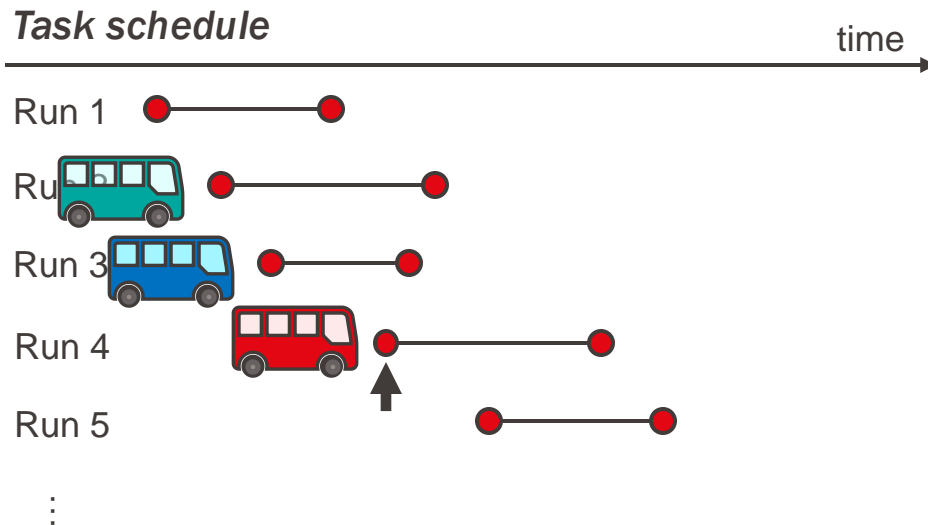

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle

- ***Q: How to assign the next vehicle based on LIFO?***

# Vehicle scheduling

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle

# Vehicle scheduling

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle

- ***Q: How to assign the next vehicle based on LIFO?***

# Vehicle scheduling

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle

- ***Q: How many vehicles are used to fulfill the five tasks?***

# Vehicle scheduling

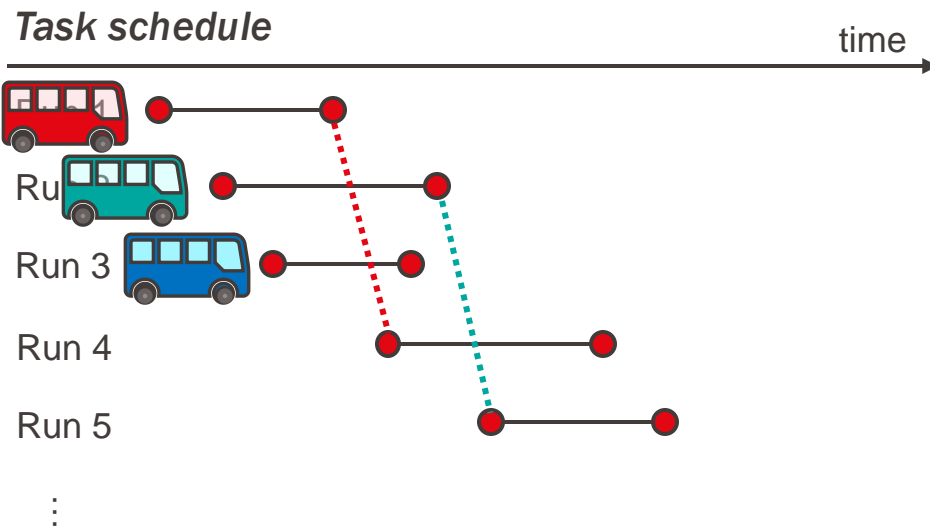

- Heuristic II: Greedy
  - Sequentially assign each vehicle's schedule
  - Min connection between tasks

- *Q: How to assign other vehicles based on the greedy principle?*

# Vehicle scheduling

- Heuristic II: Greedy
  - Sequentially assign each vehicle's schedule
  - Min connection between tasks

- ***Q: How many vehicles are used to fulfill the five tasks?***

# Vehicle scheduling

- Heuristic I: Last-in-first-out (LIFO)
  - Assign each run to the last idle vehicle
  
- Heuristic II: Greedy
  - Sequentially assign each vehicle's schedule
  - Min connection between tasks
  
- Both end up using the min fleet we derived before

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections
    - Step 2: link tasks to terminals and connect two terminals

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections
    - Step 2: link tasks to terminals and connect two terminals
    - Step 3: assign link costs

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections
    - Step 2: link tasks to terminals and connect two terminals
    - Step 3: assign link costs
    - Step 4: define link and node constraints

$0 \leq x_0 \leq 1$ : each run is served by either a new vehicle or a previously dispatched vehicle

$x_1 = 1$ : each run must be served by a vehicle

$0 \leq x_2 \leq 1$ : each feasible connection is taken by at most one vehicle

$0 \leq x_3 \leq 1$ : at most one vehicle returns after each run

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections
    - Step 2: link tasks to terminals and connect two terminals
    - Step 3: assign link costs
    - Step 4: define link and node constraints

$$\sum_{a \in A_i^-} x_a = \sum_{a \in A_i^+} x_a$$

- $A_i^-$ : set of links ending at node  $i$
- $A_i^+$ : set of links starting from node  $i$

- ***Q: What does this constraint mean?***

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections
    - Step 2: link tasks to terminals and connect two terminals
    - Step 3: assign link costs
    - Step 4: define link and node constraints

$$\text{total inflow} \quad \sum_{a \in A_i^-} x_a = \sum_{a \in A_i^+} x_a \quad \text{total outflow}$$

- $A_i^-$ : set of links ending at node  $i$
- $A_i^+$ : set of links starting from node  $i$

- *Q: How to express constraints in a more compact way?*

- Optimization method
  - Construct a circulation network
    - Step 1: link all feasible connections
    - Step 2: link tasks to terminals and connect two terminals
    - Step 3: assign link costs
    - Step 4: define link and node constraints

$$Mx = 0$$

$$L \leq x \leq U$$

- $M$ : node-link incidence matrix
$$M_{ia} = \begin{cases} 1, & \text{if link } a \text{ starts from node } i \\ -1, & \text{if link } a \text{ ends at node } i \\ 0, & \text{otherwise} \end{cases}$$
- $L, U$ : lower and upper bounds of link flows

- ***Q: How to solve vehicle schedules using the circulation network?***

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
  - Solve the circulation problem
    - min total cost, including vehicle dispatches and connection layovers
    - subject to schedule feasibility constraint

$$\begin{aligned}
 &\min_x c^T x \\
 &s.t. \quad Mx = 0 \\
 &\quad L \leq x \leq U
 \end{aligned}$$

- ***Q: How to interpret the optimal solution  $x^*$  ?***

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
  - Solve the circulation problem
    - min total cost, including vehicle dispatches and connection layovers
    - subject to schedule feasibility constraint

- Vehicle 1 serve 1<sup>st</sup> and 4<sup>th</sup> runs, then return

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
  - Solve the circulation problem
    - min total cost, including vehicle dispatches and connection layovers
    - subject to schedule feasibility constraint

- Vehicle 1 serve 1<sup>st</sup> and 4<sup>th</sup> runs, then return
- Vehicle 2 serve 2<sup>nd</sup> and 5<sup>th</sup> runs, then return

# Vehicle scheduling

- Optimization method
  - Construct a circulation network
  - Solve the circulation problem
    - min total cost, including vehicle dispatches and connection layovers
    - subject to schedule feasibility constraint

- Vehicle 1 serve 1<sup>st</sup> and 4<sup>th</sup> runs, then return
- Vehicle 2 serve 2<sup>nd</sup> and 5<sup>th</sup> runs, then return
- Vehicle 3 serve 3<sup>rd</sup> run, then return

# Questions?

# Delay management

- “Bus bunching” phenomenon
  - Multiple buses arrive at the stop at the same time
  - How does it happen?
    - when a bus runs late, its headway increases.
    - more travelers arrive at the next stop, causing longer stops.
    - the next bus has shorter headway and shorter stops

**“Once a bus gets behind schedule, it’s nearly impossible to get back on track.”**

**--- Gayah and Guler**

- “Bus bunching” phenomenon
  - Multiple buses arrive at the stop at the same time

# Delay management

- “Bus bunching” phenomenon
  - Multiple buses arrive at the stop at the same time

A simulation of bus bunching

<https://www.youtube.com/shorts/V9vjvfbM7ko>

- Solutions to bus-bunching
  - Schedule-based method
    - simple and static
  - Dynamic delay method
    - more robust but require real-time info
  - Bus-splitting method
    - enabled by modular vehicle technologies

# Delay management

- Schedule-based method
  - Add buffer time at some stops

## Strategy 1: add buffer $b$ to every stop

- essentially extend stop time from  $\omega$  to  $\omega + b$

..... scheduled w/o buffer  
..... scheduled w/ buffer  
— realized

# Delay management

- Schedule-based method
  - Add buffer time at some stops

## Strategy 1: add buffer $b$ to every stop

- essentially extend stop time from  $\omega$  to  $\omega + b$
- schedule is not much affected as long as delay is shorter than  $\omega + b$
- **Q: What is the disadvantage?**

..... scheduled w/o buffer  
- . . . scheduled w/ buffer  
— realized

# Delay management

- Schedule-based method
  - Add buffer time at some stops

## Strategy 1: add buffer $b$ to every stop

- essentially extend stop time from  $\omega$  to  $\omega + b$
- schedule is not much affected as long as delay is shorter than  $\omega + b$
- too conservative with much longer schedule

..... scheduled w/o buffer  
..... scheduled w/ buffer  
— realized

# Delay management

- Schedule-based method
  - Add buffer time at some stops

## Strategy 2: add buffer $b$ at control points

- stop time remains  $\omega$  expect for the control points

..... scheduled w/o buffer  
..... scheduled w/ buffer  
—— realized

# Delay management

- Schedule-based method
  - Add buffer time at some stops

## Strategy 2: add buffer $b$ at control points

- stop time remains  $\omega$  expect for the control points
- balance between schedule robustness and efficiency
- both control point and buffer time can be optimized

..... scheduled w/o buffer  
..... scheduled w/ buffer  
— realized

# Questions?

# Delay management

- Dynamic delay method
  - Instead of a constant buffer time, add a dynamic delay  $d_{i,j}$  for bus  $i$  at stop  $j$

$$d_{i,j} = [k_0 - k_1(h_{i,j} - H)]_+$$

where

- $k_0, k_1$ : constant parameters
- $h_{i,j}$ : realized headway
- $H$ : schedule headway
- $[x]_+ = \max\{0, x\}$

- Q: How to interpret the delay as function of realized headway?**

# Delay management

## ■ Dynamic delay method

- Instead of a constant buffer time, add a dynamic delay  $d_{i,j}$  for bus  $i$  at stop  $j$

$$d_{i,j} = [k_0 - k_1(h_{i,j} - H)]_+$$

where

- $k_0, k_1$ : constant parameters
- $h_{i,j}$ : realized headway
- $H$ : schedule headway
- $[x]_+ = \max\{0, x\}$

# Delay management

- Dynamic delay method

- Instead of a constant buffer time, add a dynamic delay  $d_{i,j}$  for bus  $i$  at stop  $j$ 
  - strategy proposed by Prof. Carlos Daganzo

$$d_{i,j} = [b - (\alpha + \beta)(h_{i,j} - H)]_+$$

where

- $b$ : stop-wise buffer time
- $\alpha$ : ratio of average inter-stop travel time to scheduled headway
- $\beta$ : extra inter-stop time per unit headway difference
- $h_{i,j}$ : realized headway
- $H$ : schedule headway
- $[x]_+ = \max\{0, x\}$

# Delay management

- Dynamic delay method
  - Instead of a constant buffer time, add a dynamic delay  $d_{i,j}$  for bus  $i$  at stop  $j$ 
    - an extension considering the real-time coordination

$$d_{i,j} = [k_0 + k_1(h_{i,j} - h) + k_2(h_{i+1,j} - h)]_+$$

- add more delay to bus  $i$  at stop  $j$  if bus  $i + 1$  comes late
- ***Q: Is  $h_{i+1,j}$  available when computing  $d_{i,j}$ ?***

# Delay management

- Dynamic delay method
  - Instead of a constant buffer time, add a dynamic delay  $d_{i,j}$  for bus  $i$  at stop  $j$ 
    - an extension considering the real-time coordination

$$d_{i,j} = [k_0 + k_1(h_{i,j} - h) + k_2(\tilde{h}_{i+1,j} - h)]_+$$

- add more delay to bus  $i$  at stop  $j$  if bus  $i + 1$  comes late
- approximate  $h_{i+1,j}$  by upstream headway of bus  $i + 1$ , e.g.,  $h_{i+1,j-1}$

# Questions?

# Delay management

- Autonomous modular vehicle (AMV)

Autonomous modular vehicle (NEXT Future Transportation)

<https://youtu.be/kJIQaCIUHTI?si=WlkiUsa1SBREugy6>

- Bus-splitting method
  - Baseline method: stop skipping
    - skip some stops to catch up the schedule
    - passengers at the skipped stop suffer from a doubled headway

(a) No control

(b) Stop-Skipping

- Bus-splitting method
  - Vehicle split into modules when a delay occurs
  - Each module only serves some stops but skips the others
  - Modules merge once catching up the schedule

(a) No control

(c) Bus-Splitting
