

# **Algorithms: Elementary Data Structures and Binary Search Trees**

Ola Svensson

**EPFL** School of Computer and Communication Sciences

Lecture 8, 12.03.2025

# Elementary Data Structures

Algorithm

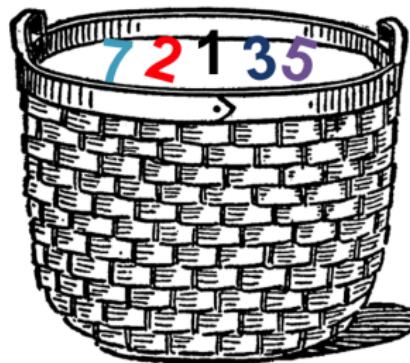

Algorithm

# Data structures = dynamic sets of items

## What kind of operations do we want to do?

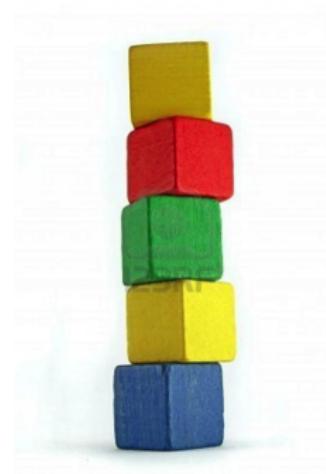

- ▶ Modifying operations: insertion, deletion, ...
- ▶ Query operations: search, maximum, minimum, ...

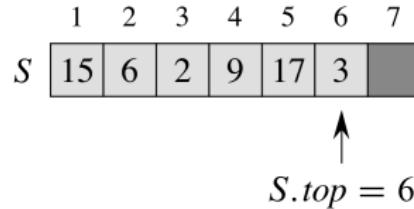

*Data structure containing numbers*

# Stacks (last-in, first-out)

- ▶ Insert operation called  $\text{PUSH}(S, x)$
- ▶ Delete operation called  $\text{POP}(S)$

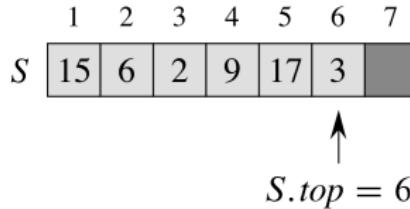

# Stacks Implementation

Implementation using arrays:  $S$  consists of elements  $S[1, \dots, S.top]$

- ▶  $S[1]$  element at the bottom
- ▶  $S[S.top]$  element at the top

# Stacks Implementation

What is the running time of these operations?  $O(1)$

STACK-EMPTY( $S$ )

1. **if**  $S.top = 0$
2. **return** TRUE
3. **else return** FALSE

PUSH( $S, x$ )

1.  $S.top \leftarrow S.top + 1$
2.  $S[S.top] \leftarrow x$

POP( $S$ )

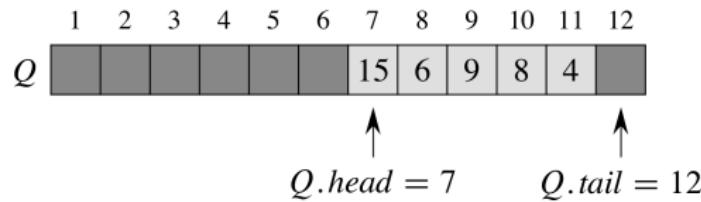

1. **if** STACK-EMPTY( $S$ )
2. **error** "underflow"
3. **else**
4.  $S.top \leftarrow S.top - 1$
5. **return**  $S[S.top + 1]$

# Queues (first-in, first-out)

- ▶ Insert operation called  $\text{ENQUEUE}(Q, x)$
- ▶ Delete operation called  $\text{DEQUEUE}(Q)$

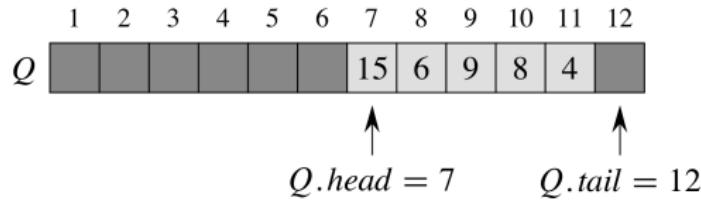

# Queue Implementation

Implementation using arrays:  $Q$  consists of elements  $S[Q.head, \dots, Q.tail - 1]$

- ▶  $Q.head$  points at the first element
- ▶  $Q.tail$  points at the next location where a newly arrived element will be placed

# Queue Implementation

What is the running time of these operations?  $O(1)$

ENQUEUE( $Q, x$ )

1.  $Q[Q.tail] = x$
2. **if**  $Q.tail = Q.length$
3.    $Q.tail \leftarrow 1$
4. **else**  $Q.tail \leftarrow Q.tail + 1$

DEQUEUE( $Q$ )

1.  $x = Q[Q.head]$
2. **if**  $Q.head = Q.length$
3.    $Q.head \leftarrow 1$
4. **else**  $Q.head \leftarrow Q.head + 1$
5. **return**  $x$

# Stacks and Queues

## Positives

- ▶ Very efficient
- ▶ Natural operations

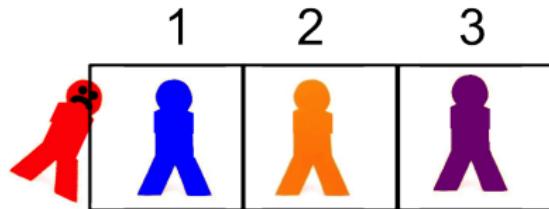

## Negatives

- ▶ Limited support: for example, no search
- ▶ Implementations using arrays have a *fixed* capacity

# Linked List

Objects are arranged in a linear order

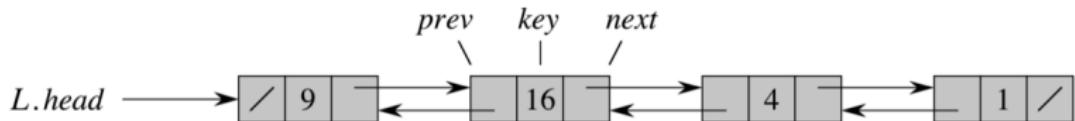

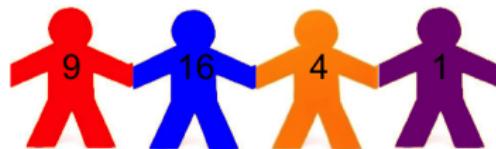

*Not indexes in array*

*But pointers in each object*

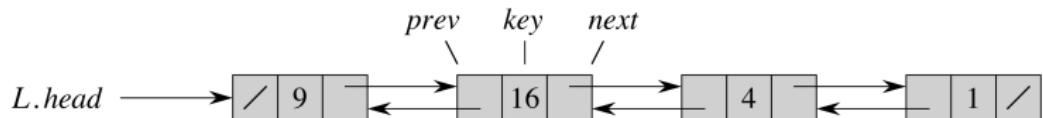

# Linked List

A list can be

- ▶ Single linked or double linked
- ▶ Sorted or unsorted
- ▶ etc.

# Searching a Linked List

Task: Given  $k$  return pointer to first element with key  $k$

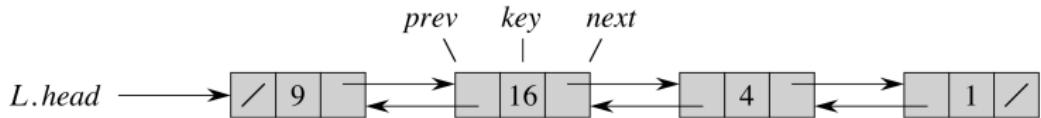

LIST-SEARCH( $L, k$ )

1.  $x \leftarrow L.\text{head}$
2. **while**  $x \neq \text{nil}$  and  $x.\text{key} \neq k$
3.      $x \leftarrow x.\text{next}$
4. **return**  $x$

Running time?  $O(n)$

What if no element with key  $k$  exists? **returns nil**

# Inserting into a Linked List

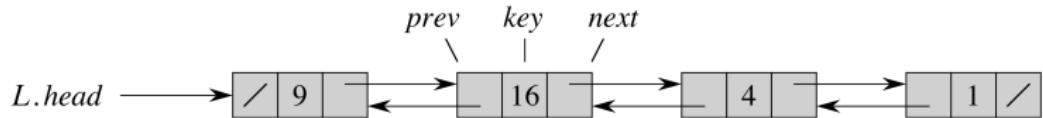

Task: Insert a new element  $x$

LIST-INSERT( $L, x$ )

1.  $x.next \leftarrow L.head$
2. **if**  $L.head \neq nil$
3.    $L.head.prev \leftarrow x$
4.    $L.head \leftarrow x$
5.  $x.prev = NIL$

Running time?

# Inserting into a Linked List

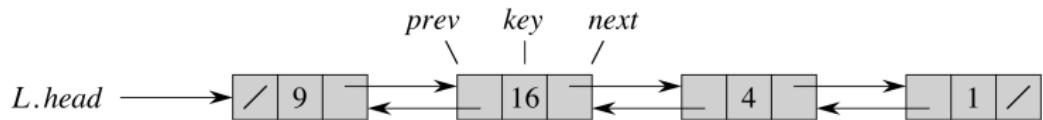

Task: Insert a new element  $x$

LIST-INSERT( $L, x$ )

1.  $x.next \leftarrow L.head$
2. **if**  $L.head \neq nil$
3.    $L.head.prev \leftarrow x$
4.    $L.head \leftarrow x$
5.  $x.prev = NIL$

Running time?  $O(1)$

# Deleting From a Linked List

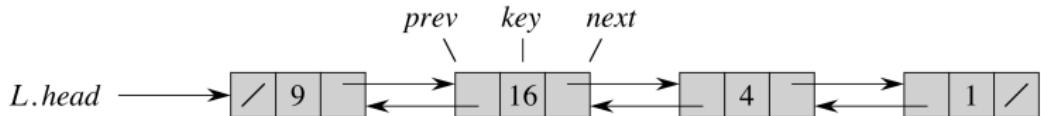

Task: Given a pointer to an element  $x$  remove it from  $L$

LIST-DELETE( $L, x$ )

1. **if**  $x.prev \neq nil$
2.    $x.prev.next \leftarrow x.next$
3. **else**  $L.head \leftarrow x.next$
4. **if**  $x.next \neq nil$
5.    $x.next.prev \leftarrow x.prev$

Running time?  $O(1)$

# Sentinels

Note: If  $x$  is in the middle of the list then

LIST-DELETE( $L, x$ )

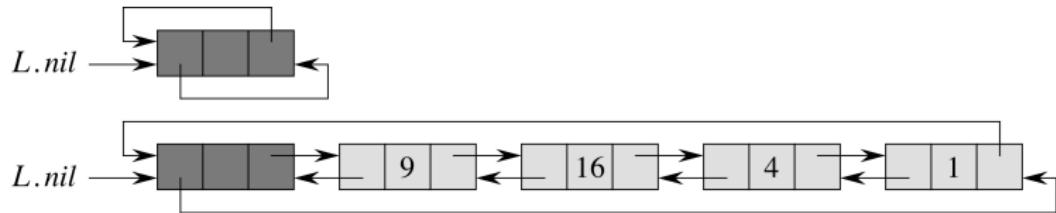

1. **if**  $x.\text{prev} \neq \text{nil}$
2.  $x.\text{prev}.\text{next} \leftarrow x.\text{next}$
3. **else**  $L.\text{head} \leftarrow x.\text{next}$
4. **if**  $x.\text{next} \neq \text{nil}$
5.  $x.\text{next}.\text{prev} \leftarrow x.\text{prev}$

simplified

LIST-DELETE'( $L, x$ )

1.  $x.\text{prev}.\text{next} \leftarrow x.\text{next}$
2.  $x.\text{next}.\text{prev} \leftarrow x.\text{prev}$

# Sentinels

LIST-DELETE( $L, x$ )

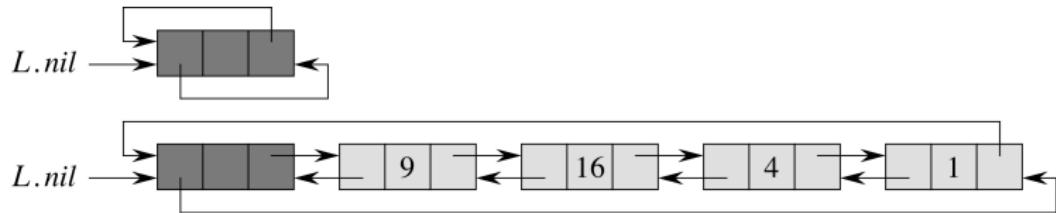

1. **if**  $x.\text{prev} \neq \text{nil}$
2.  $x.\text{prev}.\text{next} \leftarrow x.\text{next}$
3. **else**  $L.\text{head} \leftarrow x.\text{next}$
4. **if**  $x.\text{next} \neq \text{nil}$
5.  $x.\text{next}.\text{prev} \leftarrow x.\text{prev}$

simplified

LIST-DELETE'( $L, x$ )

1.  $x.\text{prev}.\text{next} \leftarrow x.\text{next}$
2.  $x.\text{next}.\text{prev} \leftarrow x.\text{prev}$

# Sentinels

LIST-INSERT( $L, x$ )

1.  $x.next \leftarrow L.head$
2. **if**  $L.head \neq nil$
3.    $L.head.prev \leftarrow x$
4.    $L.head \leftarrow x$
5.  $x.prev = NIL$

simplified

LIST-INSERT'( $L, x$ )

1.  $x.next \leftarrow L.nil.next$
2.  $L.nil.next.prev \leftarrow x$
3.  $L.nil.next \leftarrow x$
4.  $x.prev \leftarrow L.nil$

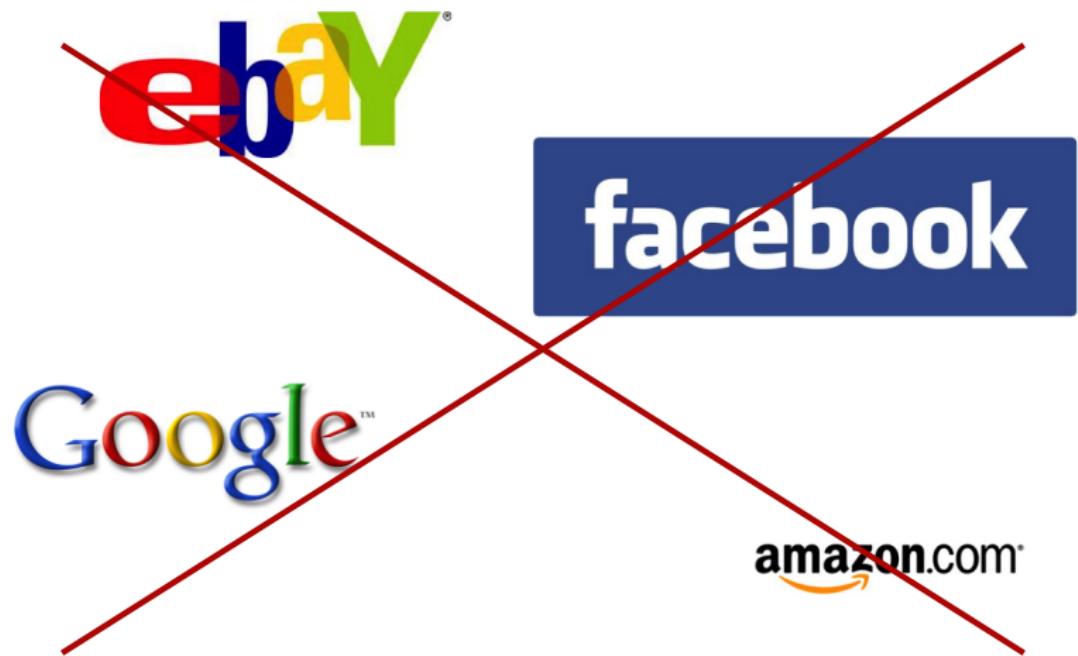

# Summary Linked List

- ▶ Dynamic data structure without predefined capacity
- ▶ Insertion:  $O(1)$
- ▶ Deletion:  $O(1)$  (if double linked)
  - ▶ Question in book: can you do it for single linked?
- ▶ Search:  $O(n)$

# Summary Linked List

- ▶ Dynamic data structure without predefined capacity
- ▶ Insertion:  $O(1)$
- ▶ Deletion:  $O(1)$  (if double linked)
  - ▶ Question in book: can you do it for single linked?
- ▶ Search:  $O(n)$

Search  $O(n)$  = no fun!

We will have fun: **Binary Search Trees**

# BINARY SEARCH TREES

# Idea

## Guessing Game:

- ▶ Ola thinks of an integer between 1 and 15
- ▶ When you guess a number, answer either *correct*, *smaller*, or *larger*
  - ▶ For example: is it 5? Ola: *larger*
- ▶ What is your best strategy to **minimize number of guesses**?

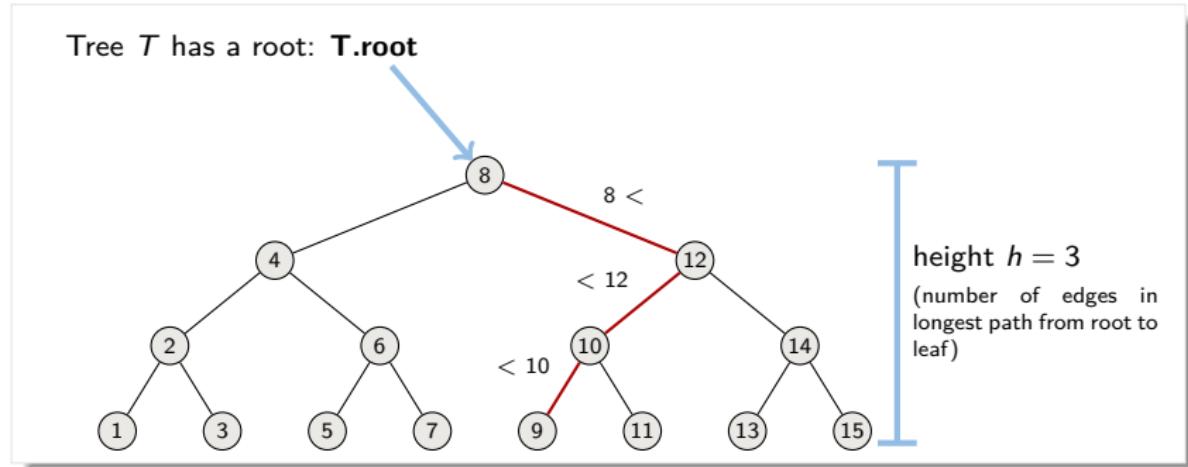

3 guesses

# Binary Search Trees

Encodes a strategy whatever number we look for

**Key property:**

- If  $y$  is in the left subtree of  $x$  then  $y.key < x.key$
- If  $y$  is in the right subtree of  $x$  then  $y.key \geq x.key$

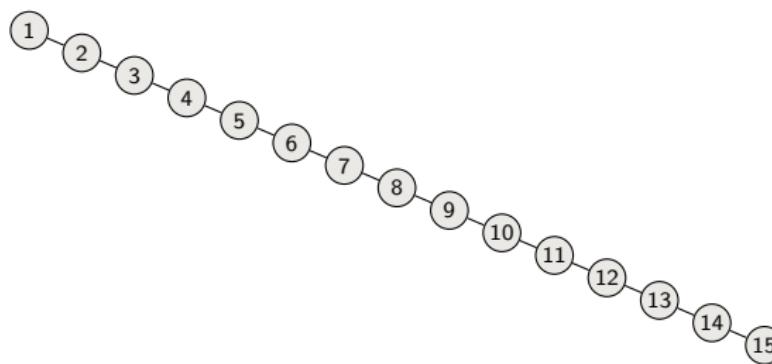

# Binary Search Trees

Encodes a strategy whatever number we look for

**Key property:**

- If  $y$  is in the left subtree of  $x$  then  $y.key < x.key$
- If  $y$  is in the right subtree of  $x$  then  $y.key \geq x.key$

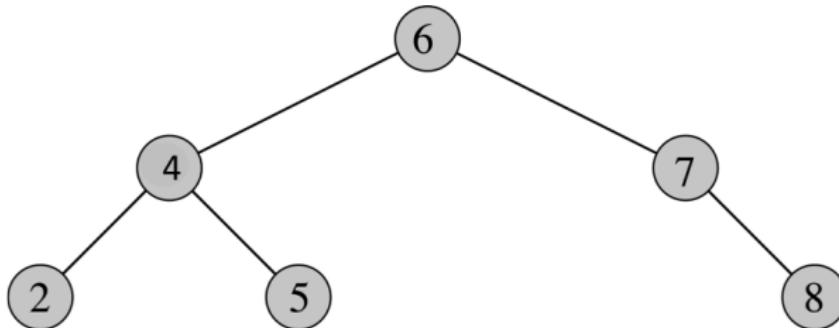

height  $h = 14$   
(number of edges in  
longest path from root to  
leaf)

Basic operations take time proportional to height:  $O(h)$

# QUERYING A BINARY SEARCH TREE

(Searching, Minimum, Maximum, Successor, Predecessor)

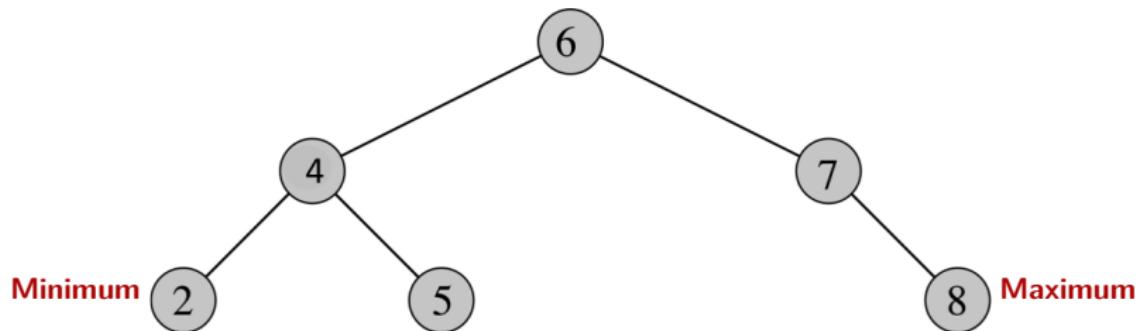

# Searching

What is the running time?  $O(h)$

```
TREE-SEARCH( $x, k$ )
  if  $x == \text{NIL}$  or  $k == \text{key}[x]$ 
    return  $x$ 
  if  $k < x.\text{key}$ 
    return TREE-SEARCH( $x.\text{left}, k$ )
  else return TREE-SEARCH( $x.\text{right}, k$ )
```

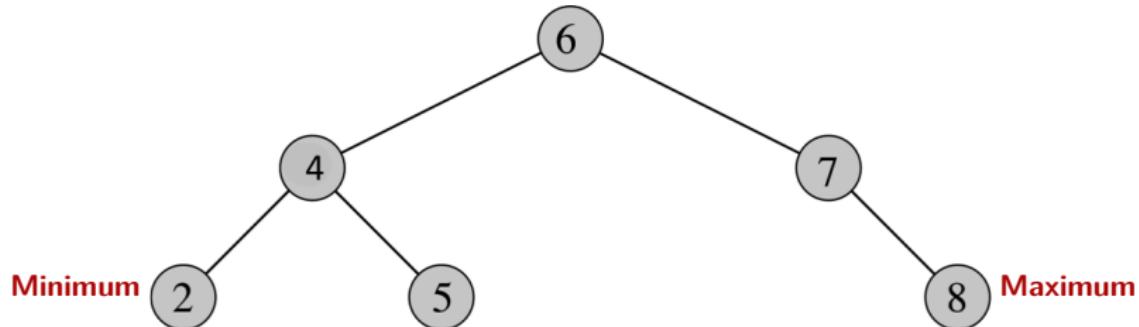

# Minimum and Maximum

By key property:

- ▶ Minimum is located in leftmost node
- ▶ Maximum is located in rightmost node

# Minimum and Maximum

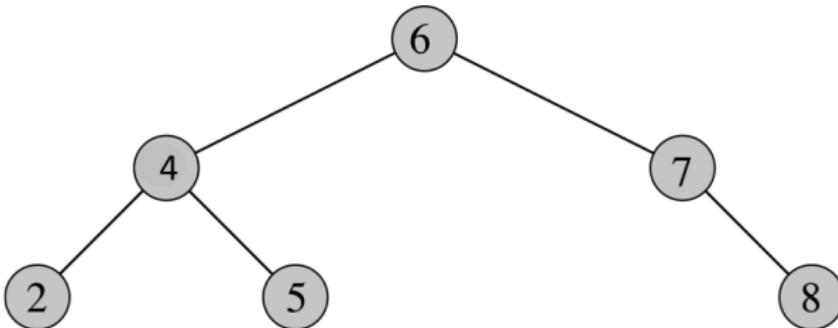

What is the running time?  $O(h)$

```
TREE-MINIMUM( $x$ )
  while  $x.left \neq \text{NIL}$ 
     $x = x.left$ 
  return  $x$ 
```

```
TREE-MAXIMUM( $x$ )
  while  $x.right \neq \text{NIL}$ 
     $x = x.right$ 
  return  $x$ 
```

# Successor

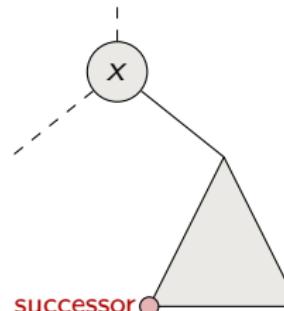

Successor of a node  $x$  is the node  $y$  such that  $y.key$  is the  
“smallest key”  $> x.key$

- ▶ What is the successor of 6?
- ▶ What is the successor of 5?

Two cases when finding successor of  $x$ :

Case 1:  $x$  has a non-empty right subtree

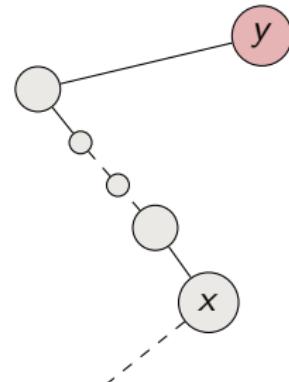

$x$ 's successor is the minimum in the right subtree

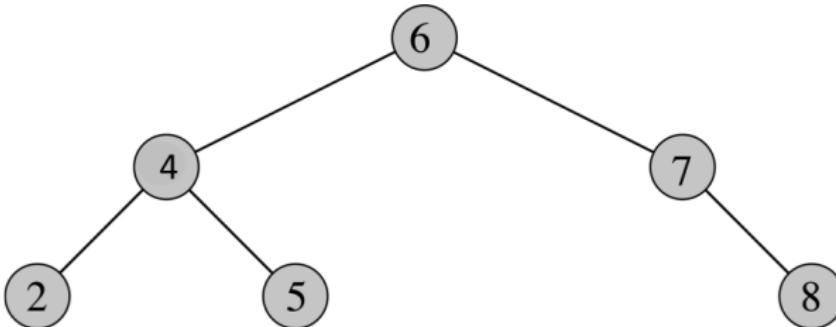

Case 2:  $x$  has an empty right subtree

As long as we go to the left up the tree we're visiting smaller keys

$x$ 's successor is  $y$  is the node that  $x$  is the predecessor of ( $x$  is the maximum in  $y$ 's left subtree)

# Successor (Predecessor is symmetric)

What is the running time?  $O(h)$

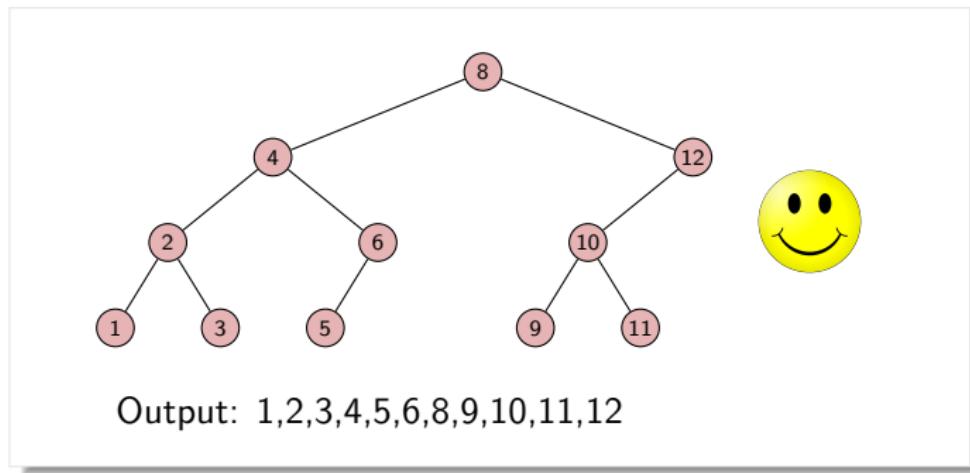

```
TREE-SUCCESSOR( $x$ )
  if  $x.right \neq \text{NIL}$ 
    return TREE-MINIMUM( $x.right$ )
   $y = x.p$ 
  while  $y \neq \text{NIL}$  and  $x == y.right$ 
     $x = y$ 
     $y = y.p$ 
  return  $y$ 
```

# PRINTING A BINARY SEARCH TREE

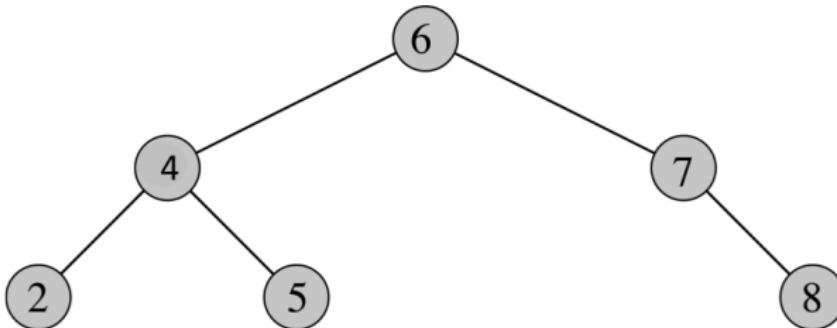

(Inorder, Preorder, Postorder)

# Printing Inorder (Idea)

- ▶ Print left subtree recursively
- ▶ Print root
- ▶ Print right subtree recursively

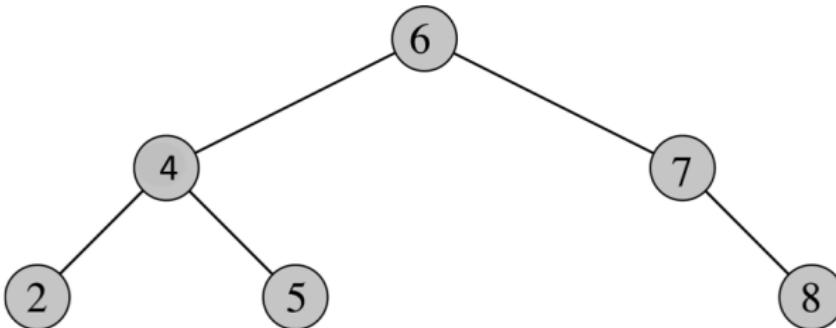

# Inorder tree walk

What is the running time?  $\Theta(n)$

```
INORDER-TREE-WALK( $x$ )
  if  $x \neq \text{NIL}$ 
    INORDER-TREE-WALK( $x.\text{left}$ )
    print  $\text{key}[x]$ 
    INORDER-TREE-WALK( $x.\text{right}$ )
```

# Printing Preorder and Postorder

PREORDER-TREE-WALK( $x$ )

1. **if**  $x \neq \text{NIL}$
2. **print**  $\text{key}[x]$
3. PREORDER-TREE-WALK( $x.\text{left}$ )
4. PREORDER-TREE-WALK( $x.\text{right}$ )

POSTORDER-TREE-WALK( $x$ )

1. **if**  $x \neq \text{NIL}$
2. POSTORDER-TREE-WALK( $x.\text{left}$ )
3. POSTORDER-TREE-WALK( $x.\text{right}$ )
4. **print**  $\text{key}[x]$

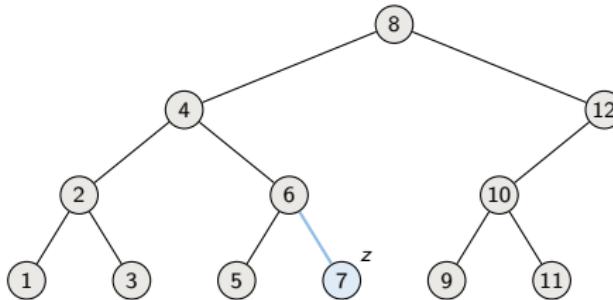

# MODIFYING A BINARY SEARCH TREE

(**Insertion and Deletion**)

# Idea of inserting $z$

- ▶ Search for  $z.key$
- ▶ When arrived at  $nil$  insert  $z$  at that position

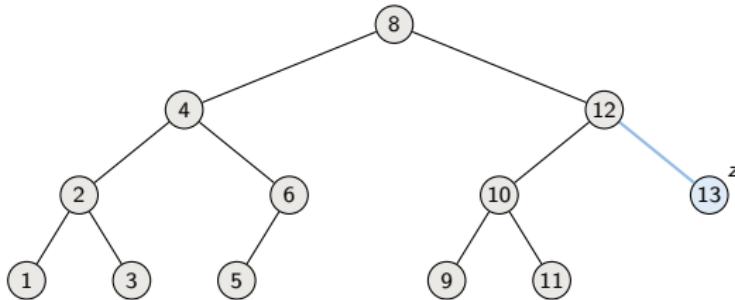

Ex: insert  $z$  with key 7

# Idea of inserting $z$

- ▶ Search for  $z.key$
- ▶ When arrived at  $nil$  insert  $z$  at that position

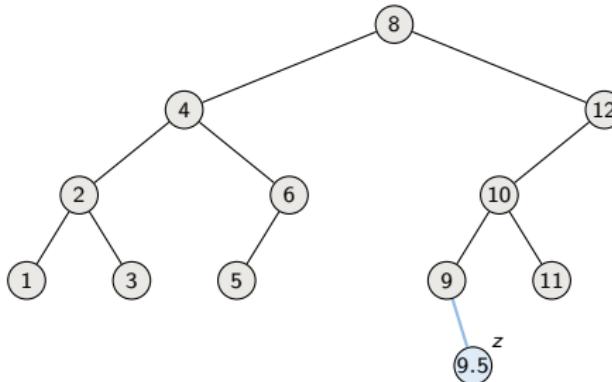

Ex: insert  $z$  with key 13

# Idea of inserting $z$

- ▶ Search for  $z.key$
- ▶ When arrived at  $nil$  insert  $z$  at that position

Ex: insert  $z$  with key 9.5

# Insertion

The diagram illustrates the execution flow of the `TREE-INSERT` algorithm. It is divided into two main phases: the "search" phase and the "insert" phase. The "search" phase is enclosed in a curly brace on the left, and the "insert" phase is enclosed in a curly brace below it. The algorithm itself is enclosed in a rectangular box.

```
TREE-INSERT( $T, z$ )
   $y = \text{NIL}$ 
   $x = T.\text{root}$ 
  while  $x \neq \text{NIL}$ 
     $y = x$ 
    if  $z.\text{key} < x.\text{key}$ 
       $x = x.\text{left}$ 
    else  $x = x.\text{right}$ 
   $z.p = y$ 
  if  $y == \text{NIL}$ 
     $T.\text{root} = z$       // tree  $T$  was empty
  elseif  $z.\text{key} < y.\text{key}$ 
     $y.\text{left} = z$ 
  else  $y.\text{right} = z$ 
```

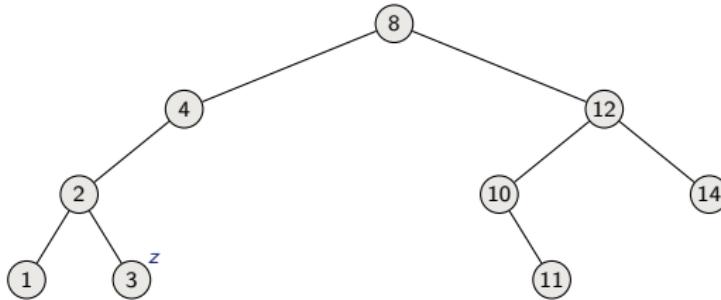

What is the running time?  $O(h)$

# Idea of deletion

Conceptually 3 cases:

- If  $z$  has no children, remove it

Ex: Delete  $z$

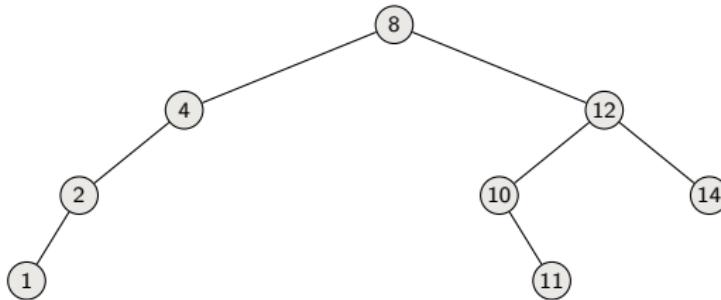

# Idea of deletion

Conceptually 3 cases:

- If  $z$  has no children, remove it

Ex: Delete  $z$

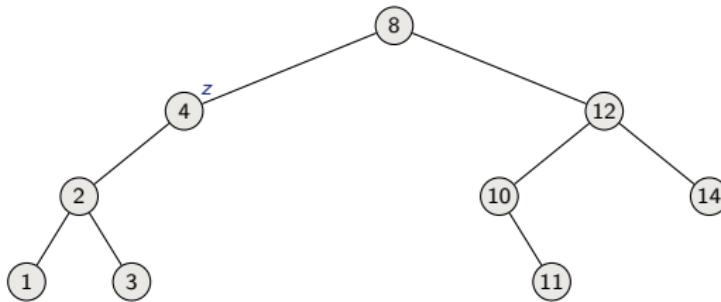

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree

Ex: Delete  $z$

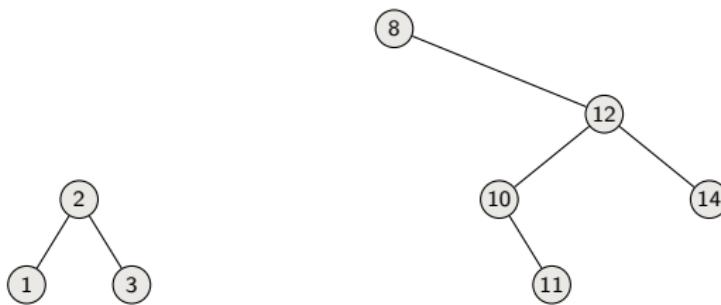

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree

Ex: Delete  $z$

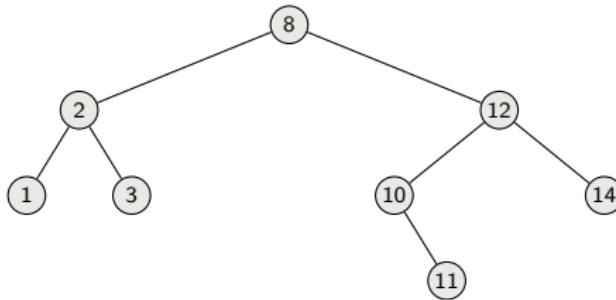

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree

Ex: Delete  $z$

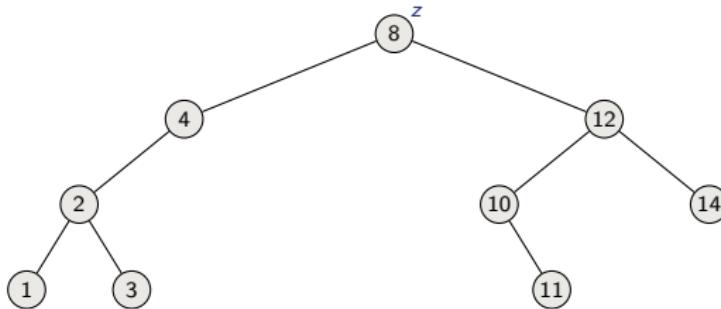

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree
- ▶ If  $z$  has two children, then find its successor  $y$  and replace  $z$  by  $y$

Ex: Delete  $z$

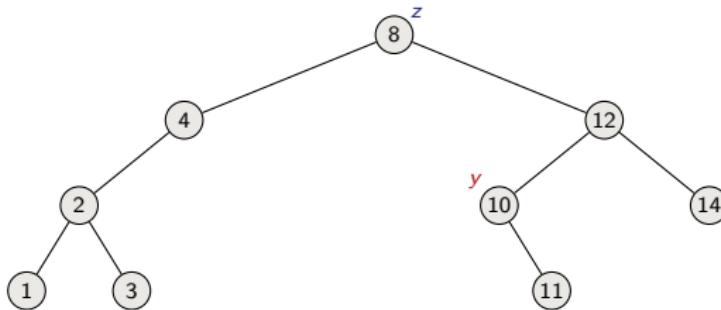

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree
- ▶ If  $z$  has two children, then find its successor  $y$  and replace  $z$  by  $y$

Ex: Delete  $z$

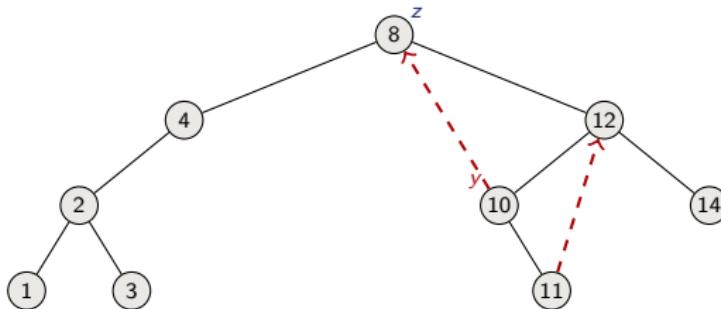

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree
- ▶ If  $z$  has two children, then find its successor  $y$  and replace  $z$  by  $y$

Ex: Delete  $z$

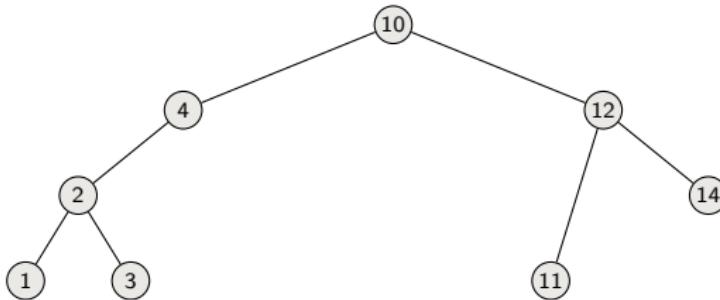

# Idea of deletion

Conceptually 3 cases:

- ▶ If  $z$  has no children, remove it
- ▶ If  $z$  has one child, then make that child take  $z$ 's position in the tree
- ▶ If  $z$  has two children, then find its successor  $y$  and replace  $z$  by  $y$

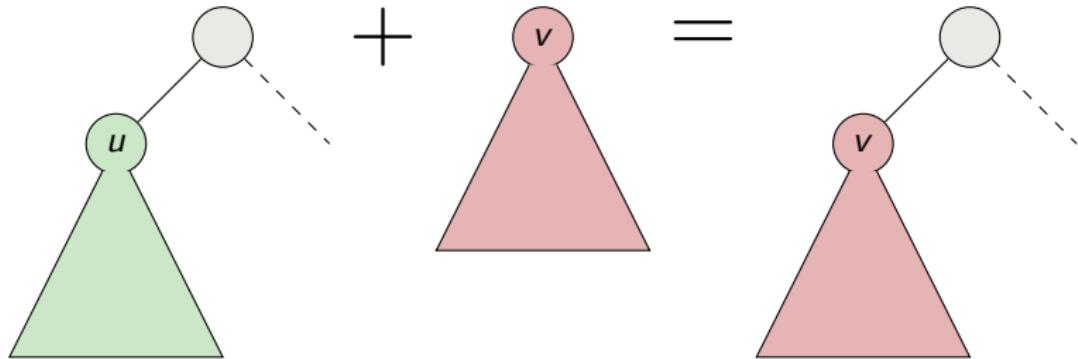

Ex: Delete  $z$

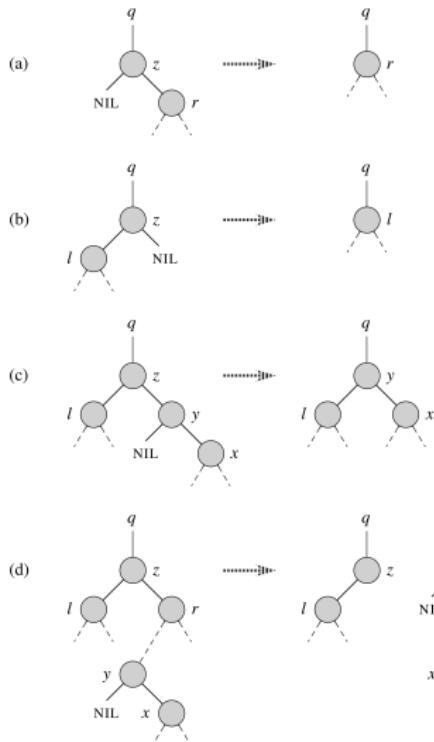

# Deletion Implementation: Transplant

```
TRANSPLANT( $T, u, v$ )
  if  $u.p == \text{NIL}$ 
     $T.root = v$ 
  elseif  $u == u.p.left$ 
     $u.p.left = v$ 
  else  $u.p.right = v$ 
  if  $v \neq \text{NIL}$ 
     $v.p = u.p$ 
```

$\text{TRANSPLANT}(T, u, v)$  replaces subtree rooted at  $u$  with that rooted at  $v$

# Deletion Procedure

TREE-DELETE( $T, z$ )

**if**  $z.left == \text{NIL}$

TRANSPLANT( $T, z, z.right$ )

*// z has no left child*

**elseif**  $z.right == \text{NIL}$

TRANSPLANT( $T, z, z.left$ )

*// z has just a left child*

**else** *// z has two children.*

$y = \text{TREE-MINIMUM}(z.right)$

*// y is z's successor*

**if**  $y.p \neq z$

*// y lies within z's right subtree but is not the root of this*

TRANSPLANT( $T, y, y.right$ )

$y.right = z.right$

$y.right.p = y$

*// Replace z by y.*

TRANSPLANT( $T, z, y$ )

$y.left = z.left$

$y.left.p = y$

# Summary

Query operations: Search, Max, Min, Predecessor, Successor:  **$O(h)$**  time

Modifying operations: Insertion, Deletion:  **$O(h)$**  time

Exist efficient procedures to keep tree balanced (AVL trees, red-black trees, etc.)
