

## Chapter 7:

From collaborative learning  
to classroom orchestration

# How do people learn ?

- by exploration, trial and error *Constructivism*
- by incremental mastery *mastery learning*
- by verbal elaboration *socio-constructivism*

If you were a school teacher, would you ask students to work in teams? Pick what <sup>\*</sup> you might decide and why.

- ☐ Yes, it might force them to deepen the contents of my lecture
- ☐ Yes, even if they won't necessarily learn more, they might at least learn to work together
- ☐ No, they can learn to work in teams in many activities outside school
- ☐ No, teamwork takes too much time, I have to move faster in the curriculum

If you would decide anyway to make teams, which size of the teams would you <sup>\*</sup> choose?

- ☐ Teams of 3, because the third can kind of arbitrate the disagreements between the two other ones, so the team would work better
- ☐ Teams of 2, because with larger teams, there is often one person that does not contribute much, which is unfair for the two other ones
- ☐ Teams of 5, so that I can detect which students take leadership
- ☐ Teams of 10, because that's often the size of the teams they will join later on in the workplace

Let's say that you finally decide to make teams of 2, what would be the best team <sup>\*</sup> composition?

- ☐ Two students with different viewpoints so that they produce multiple solutions
- ☐ Two students with a different backgrounds, so that they get used to handle diversity
- ☐ Two students with the same level, otherwise the better students will waste time with the weaker one
- ☐ Two students with different levels, so that one develops the skills of helping other students

If during their teamwork, three students start to argue loudly what would you do? <sup>\*</sup>

- ☐ Ask them to elaborate a list of pros and cons and connect it to what was taught in the last lecture
- ☐ Discuss with them to see if some opinions are scientifically incorrect
- ☐ Nothing, I will ask them to less loud then I will check who wins the argumentation
- ☐ Nothing, it may force them to deepen their understanding of the task

If you were a school teacher, would you ask students to work in teams? Pick what ★ you might decide and why.

- ☐ Yes, it might force them to deepen the contents of my lecture
- ☐ Yes, even if they won't necessarily learn more, they might at least learn to work together
- ☐ No, they can learn to work in teams in many activities outside school
- ☐ No, teamwork takes too much time; I have to move faster in the curriculum

If you would decide anyway to make teams, which size of the teams would you choose? \*

- ☐ Teams of 3, because the third can kind of arbitrate the disagreements between the two other ones, so the team would work better
- ☐ Teams of 2, because with larger teams, there is often one person that does not contribute much, which is unfair for the two other ones

collaboration as a **method**

cognition is  
**individual**

cognition is  
**social**

collaboration as a **skill**

If you were a school teacher, would you ask students to work in teams? Pick what you might decide and why.

- [2, -2] 'Yes, it might force them to deepen the contents of my lecture'
- [2, -2] 'Yes, even if they won't necessarily learn more, they might at least learn to work together '
- [2, -2] 'No, they can learn to work in teams in many activities outside school'
- [-2, 2] 'No, teamwork takes too much time; I have to move faster in the curriculum.'

If you would decide anyway to make teams, which size of the teams would you choose?

- [-1, -1] 'Teams of 3, because the third can kind of arbitrate the disagreements between the two other ones the team would work better'.
- [2, -2] 'Teams of 2, because with larger teams, there is often one person that does not contribute much, which is unfair for the two other ones''
- [-2, -2] 'Teams of 5, so that I can detect which students take leadership '
- [3, -2] 'Teams of 10, because that's often the size of the teams they will join later on in the workplace'

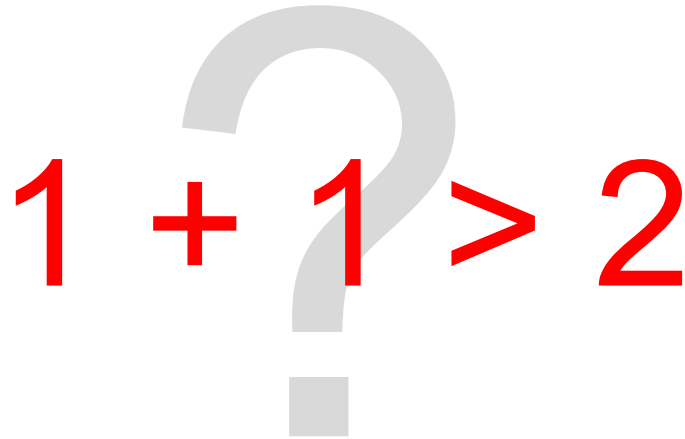

Let's say that you finally decide to make teams of 2, what would be the best team composition?

- [1, -2] 'Two students with different viewpoints so that they produce multiple solutions.'
- [2, -2] 'Two students with a different backgrounds, so that they get used to handle diversity'
- [-1, 2] 'Two students with the same level, otherwise the better students will waste time with the weaker one'
- [2, -2] 'Two students with different levels, so that one develops the skills of helping other students.'

If during their teamwork, three students start to argue loudly what would you do?

- [0, 2] 'Ask them to elaborate a list of pros and cons and connect it to what was taught in the last lecture''
- [-3, 2] 'Discuss with them to see if some opinions are scientifically incorrect.'
- [-2, -2] 'Nothing, I will ask them to less loud then I will check who wins the argumentation.'"
- [2, 2] "Nothing, it may force them to deepen their understanding of the task."

$$1 + 1 > 2$$

Is learning in teams  
more effective  
than learning alone ?

# Research Phase 1

## Is Collaborative Learning Effective ?

	Learning Gains		
Meta-analyses: collaborative versus individual	>	=	<
Slavin, 1983.	<b>26</b>	14	1
Johnson & Johnson, 1989	<b>829</b>	645	109

# Research Phase 1

## Is Collaborative Learning Effective ?

Springer, L., Stanne, M. E., & Donovan, S. S. (1999). Effects of small-group learning on undergraduates in science, mathematics, engineering, and technology: A meta-analysis. *Review of educational research*, 69(1), 21-51.

9 ^  
48 =  
95 >

Fig. 1. Forest plot with weighted effect sizes for all studies of the meta-analysis.

# Research Phase 1

## Is Collaborative Learning Effective ?

A **decision maker** could conclude that the probability that team learning is effective is high enough to use it.

A **learning scientist** would conclude that team learning is not effective per se, but depends on the **conditions**... see next slide

## Research Phase 2

**When** is collaborative learning effective ?

### Independent Variables

#### Factors:

- **Group** composition: number, level, gender, age, ...
- **Task** features: verbalizable, open, ...
- **Medium**: face-to-face, synchro/not, text/audio/video,...
- **Context**: school/work

The effects of collaborative depends upon so many variables (plus their interaction effects) that it is impossible to predict that a given teamwork in a specific context will be effective

# Pitfalls in Teamwork

‘social loafing’, ‘free rider effect’

# Pitfalls in Teamwork

- Free-rider / Social Loafing: some teams members let the others do the work
- ...

Meeting at the White House Cabinet Room  
during the Cuban Missile Crisis on October 29, 1962.

# GroupThink

[https://www.youtube.com/watch?v=glUUmsBb\\_58](https://www.youtube.com/watch?v=glUUmsBb_58)

# Pitfalls in Teamwork

- Free-rider / Social Loafing: some teams members let the others do the work
- 'GroupThink': as soon as they agree, learners return the solution to the teacher without checking if it is the optimal solution In education, as soon as they agree, learners return the solution to the teacher without checking if it is the best one
- In education, consensus to satisfy the teacher
- ....

Domination / Disengagement

# Pitfalls in Teamwork

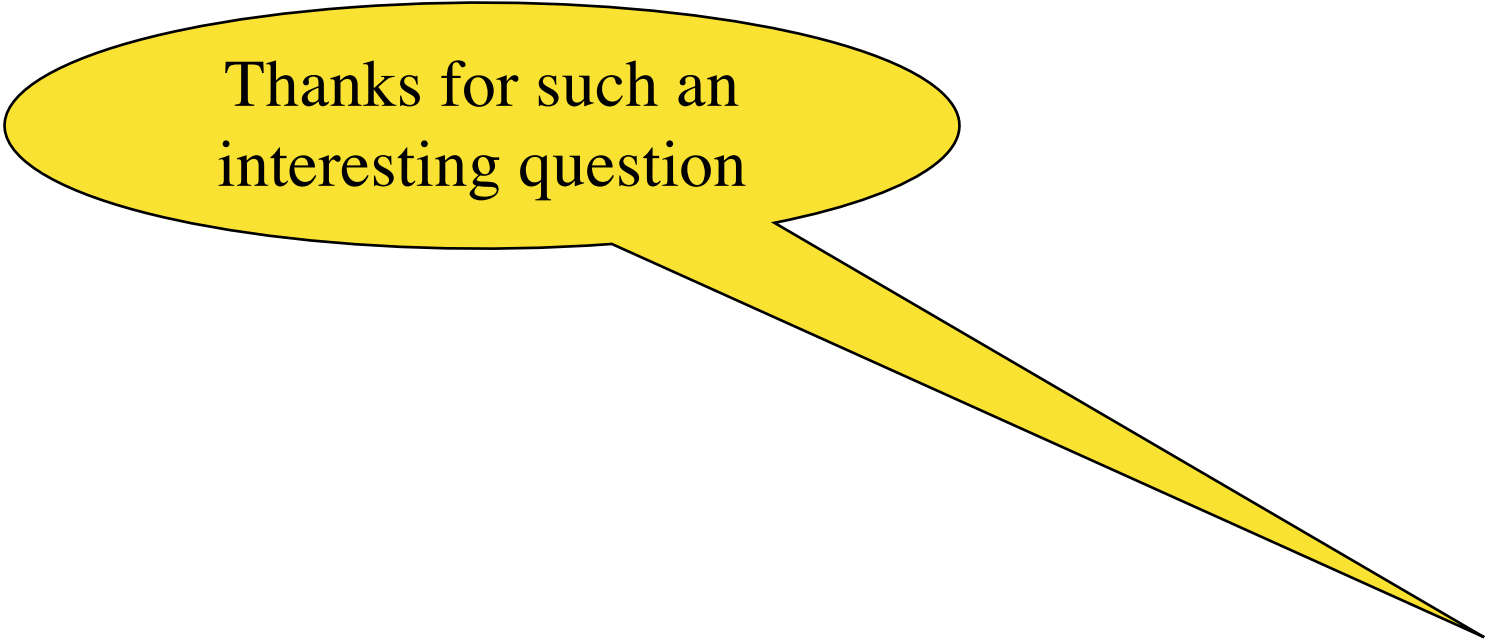

- Free-rider / Social Loafing: some teams members let the others do the work
- 'GroupThink': as soon as they agree, learners return the solution to the teacher without checking if it is the optimal solution In education, as soon as they agree, learners return the solution to the teacher without checking if it is the best one
- In education, consensus to satisfy the teacher
- Domination: some team members dominate verbal interactions; contributions from some members are rejected or not taken into consideration
- ~~Misunderstandings~~
- Emotional (vs epistemic) conflict: « your suggestion is so stupid ! »
- Lack of alignment on goals or commitment
- Lack of « collaboration skills » (one of the 'transversal skills ')

# Apprendre à collaborer ?

Thanks for such an  
interesting question

## Research Phase 3

Which **interactions** make collaborative learning effective ?

1. Elaborated **explanations**

# The (self-)explanation effect

A ball with mass 10kg on the desk is shooting at initial velocity of 10m/s. Calculate the velocity of the ball when it hits the ground.

20cm

Solution

When the ball leave from the desk, the ball is forced by weight force only. The object will keep constant velocity motion in X direction and constant acceleration motion in Y direction.

1) flight time  $t$

$$h = \frac{1}{2} \times g \times t^2 \longrightarrow t = \sqrt{\frac{2h}{g}} = 2s$$

2) velocity in X direction

$$v_x = v_{0x} = 10m/s$$

3) velocity in Y direction

$$v_y = v_{0y} + g \times t = 0 + 10 \times 2 = 20(m/s)$$

4) total velocity

$$v = \sqrt{v_x^2 + v_y^2} = 10\sqrt{5}m/s$$

Explaining aloud a  
worked out problem

# The (self-)explanation effect

Hedge's Effect size

- 3) Simulez 30 minutes de travail avec 1 gerbeur, et reportez les valeurs dans les cases prévues ci-contre.  
Combien faudrait-il de gerbeurs pour sortir 100 palettes en 1 heure?

### Exploitation

A votre avis, quel est le type de chariot le plus efficace dans cet entrepôt?

## *The « logistics » of education*

- How much time is lost before they really start?
- Does the teacher see what the students are doing?
- Can the teacher walk between the tables?
- How to cope with absences?
- Does the activity leave traces?

## Reasoning

Thinking is a dialogue with oneself .

The hardware is individual  
but the software is social

# Summary of chapter 7

1. Collaborative learning is often effective, but not systematically.
2. Effective tasks require some degree of **interdependence** among team members
3. It is effective when **rich verbal interactions** occur such as explanation, argumentation, mutual regulation
4. To make it more effective, **classroom scripts** increase the probability for students to produce these interactions by **integrating** team, individual and class wide activities
5. It takes a talented **teachers** to orchestrate these scenarios
6. The theory behind emphasizes that **cognition is inherently social** because thinking mostly relies on language.
