

Deaf people, who cannot  
read/write natural  
language very fast and who  
have trouble  
communicating to service  
people even when they  
come to the site to help,

need a way to  
communicate  
accurate direction  
information  
quickly to 911  
from any location

because deaf people understand  
symbols (close to their sign  
language) much faster than NL  
text and it's much faster for  
them to select few symbols from  
a limited set of many to convey  
what happened than composing  
messages in text
