Restricted Permission: This publication is protected by copyright law and international treaties and contains trade secrets and proprietary information owned by Cadence. Unauthorized reproduction or distribution of this publication, or any portion of it, may result in civil and criminal penalties. Except as specified in this permission statement, this publication may not be copied, reproduced, modified, published, uploaded, posted, transmitted, or distributed in any way, without prior written permission from Cadence. Unless otherwise agreed to by Cadence in writing, this statement grants Cadence customers permission to print one (1) hard copy of this publication subject to the following conditions:

1. The publication may be used only in accordance with a written agreement between Cadence and its customer.
2. The publication may not be modified in any way.
3. Any authorized copy of the publication or portion thereof must include all original copyright, trademark, and other proprietary notices and this permission statement.
4. The information contained in this document cannot be used in the development of like products or software, whether for internal or external use, and shall not be used for the benefit of any other party, whether or not for consideration.

Disclaimer: Information in this publication is subject to change without notice and does not represent a commitment on the part of Cadence. Except as may be explicitly set forth in such agreement, Cadence does not make, and expressly disclaims, any representations or warranties as to the completeness, accuracy or usefulness of the information contained in this document. Cadence does not warrant that use of such information will not infringe any third party rights, nor does Cadence assume any liability for damages or costs of any kind that may result from use of such information. Cadence is committed to using respectful language in our code and communications. We are also active in the removal and replacement of inappropriate language from existing content. This product documentation may however contain material that is no longer considered appropriate but still reflects long-standing industry terminology. Such content will be addressed at a time when the related software can be updated without end-user impact.

Restricted Rights: Use, duplication, or disclosure by the Government is subject to restrictions as set forth in FAR52.227-14 and DFAR252.227-7013 et seq. or its successor.

About This Manual

The Cadence® Innovus™ Implementation System family of products provides an integrated solution for an RTL-to-GDSII design flow. This manual describes the syntax for the Innovus Stylus Common UI text commands. The chapters are presented alphabetically by general command functionality. Within each chapter, the text commands appear alphabetically.

This document applies to the Innovus Stylus Common UI text commands, including syntax and examples. See the *Innovus Text Command Reference* document for Innovus text commands.

Audience

This manual is written for experienced designers of digital integrated circuits. Such designers must be familiar with design planning, placement and routing, block implementation, chip assembly, and design verification. Designers must also have a solid understanding of UNIX and Tcl/Tk programming.

Conventions Used in This Manual

This section describes the typographic and syntax conventions used in this manual.

`text`	Indicates text that you must type exactly as shown. For example: `set_message -severity info`
`text`	Indicates information for which you must substitute a name or value. In the following example, you must substitute the name of a specific file for *`file_name`*: `compare_release -out_file` *`file_name`*
text	Indicates the following: • Text found in the graphical user interface (GUI), including form names, button labels, and field names • Terms that are new to the manual, are the subject of discussion, or need special emphasis • Titles of manuals

`[ ]`	Indicates optional arguments. In the following example, you can specify none, one, or both of the bracketed arguments: `command [-arg1] [arg2 value]`
`[ | ]`	Indicates an optional choice from a mutually exclusive list. In the following example, you can specify any of the arguments or none of the arguments, but you cannot specify more than one: `command [arg1 | arg2 | arg3 | arg4]`
`{ | }`	Indicates a required choice from a mutually exclusive list. In the following example, you must specify one, and only one, of the arguments: `command {arg1 | arg2 | arg3}`
`{[ ] [ ]}`	Indicates a required choice of one or more items in a list. In the following example, you must choose one argument from the list, but you can choose more than one: `command {[arg1] [arg2] [arg3]}`
`{ }`	Indicates curly braces that must be entered with the command syntax. In the following example, you must type the curly braces: `command arg1 {x y}`
. . .	Indicates that you can repeat the previous argument.
. . .	Indicates an omission in an example of computer output or input.
Command - Subcommand	Indicates a command sequence, which shows the order in which you choose commands and subcommands from the GUI menu. In the following example, you choose *Power* from the menu, then *Power Planning* from the submenu, and then *Add Ring* from the displayed list: *Power - Power Planning - Add Ring* This sequence opens the *Add Rings* form.

Related Documents

For more information about the Innovus family of products, see the following documents. You can access these and other Cadence documents with the Cadence Help documentation system.

Innovus Product Documentation

- What's New in Innovus
  Provides information about new and changed features in this release of the Innovus family of products.
- Innovus User Guide
  Describes how to install and configure the Innovus software, and provides strategies for implementing digital integrated circuits.
- Innovus Text Command Reference
  Describes the Innovus text commands, including syntax and examples.
- Innovus Menu Reference
  Provides information specific to the forms and commands available from the Innovus graphical user interface.
- Innovus Database Access Command Reference
  Lists all the Innovus database access commands and provides a brief description of syntax and usage.
- Innovus Foundation Flows User Guide
  Describes how to use the scripts that represent the recommended implementation flows for digital timing closure with the Innovus software.
- Mixed Signal Interoperability Guide
  Describes the digital mixed-signal flow.
- README file
  Contains installation, compatibility, and other prerequisite information, including a list of Cadence Change Requests (CCRs) that were resolved in this release. You can read this file online at downloads.cadence.com.

Innovus Stylus Common UI Documentation

- Innovus Stylus Common UI Migration Guide
  Provides information on migrating from legacy to Innovus Stylus Common UI version of the Innovus software.
- What's New in Innovus Stylus Common UI
  Provides information about new and changed features in this release of the Innovus family of products.

Overview

The following lists the Advanced Timing Tcl Scripting commands. For each category of similar commands, we explain what they are used for followed by some simple examples.

all_* Commands

The `all_*` commands return a collection of all the items of a specific type. Several of the commands provide options to filter the collection based on certain properties:

- `all_clocks`
- `all_connected`
- `all_fanin`
- `all_fanout`
- `all_inputs`
- `all_instances`
- `all_outputs`
- `all_registers`

Examples

- To set all the clocks to propagated mode, use the following command:
  ```
  set_propagated_clock [all_clocks]
  ```
- To report the worst timing path that begins at a register and ends at an output port, use the following command:
  ```
  report_timing -from [all_registers] -to [all_outputs]
  ```
- To store a collection of pins that fanout from a specific port, use the following command:
  ```
  set clk1Fanout [all_fanout -from clk1 -pin_levels 1]
  ```

get_* Commands

The `get_*` commands return a collection of items filtered by name pattern or object type. Additionally, you can use the `-filter` option for most of the `get_*` commands to filter the collection by property value. See the get_property command for a list of all the properties.

The `filter_expression` for the `-filter` option can be created by combining several object properties using the following relational and logical operators: `>`, `<`, `==`, `!=`, `<=`, `>=`, `&&`, `||`, `=~`, `!~`, `AND`, and `OR`. You also can use parentheses to create expressions. The `get_*` commands include the following:

- `get_arcs`
- `get_cells`
- `get_clocks`
- `get_designs`
- `get_generated_clocks`
- `get_lib_arcs`
- `get_lib_cells`
- `get_lib_pins`
- `get_libs`
- `get_nets`
- `get_object_name`
- `get_path_groups`
- `get_pins`
- `get_ports`

Examples

- To return a collection of all input ports (same as running `[all_inputs]`), use the following command:
  ```
  get_ports -filter "direction==in"
  ```
- To return a collection of pins that match `*/D`, use the following command:

```
get_pins -hier -filter "hierarchical_name =~ */D"
```

- To return a collection of the libraries a cell belongs to, use the following command:
  ```
  get_lib_cells INVXL
  ```

property Commands

The report_object_property_names command lists the properties for the different object types. This command, without arguments, will list all the properties for all object types. Use the `-type` option to list properties for a specific object type. Legal option types are: `cell`, `clock`, `design`, `lib`, `lib_cell`, `lib_pin`, `lib_timing_arc`, `net`, `path_group`, `pin`, `port`, `timing_arc`, `timing_path`, or `timing_point`.

Examples

- The get_property command returns the value of the specified property. To report the clock period of clk1, use the following command:
  ```
  get_property [get_clocks clk1] period
  ```
- The report_property command returns the properties and their values for a specified object. To report the properties for clock clk1, use the following command:
  ```
  report_property [get_clocks clk1]
  ```
- For timing related properties such as properties for timing arcs, paths, and points run `report_timing -collection`. This will return the results in a collection of timing paths.
  - To report timing and store the top 10 paths as a collection in the variable `$paths`, use the following command:
    ```
    set paths [report_timing -collection -max_paths 10]
    ```
  - To filter `$paths` to include only those paths with slack between -0.806ns and 0ns, use the following command:
    ```
    set newPaths [filter_collection $paths {(slack > -0.806 && slack < 0.0)}]
    ```

collection Commands

Once you have the collection defined you can manipulate, filter, cycle through, and query it using the collection related commands:

- `add_to_collection`
- `append_to_collection`
- `compare_collections`
- `copy_collection`
- `filter_collection`
- `foreach_in_collection`
- `index_collection`

- `query_objects`
- `remove_from_collection`
- `sizeof_collection`
- `sort_collection`

Examples

- To list the contents of a collection, use the following command:

  ```
  query_objects $collectionName
  ```

- To cycle through the items of a collection, use the following command:

  ```
  foreach_in_collection iCell [get_cells *] {
  Puts "Cell = [get_property $iCell hierarchical_name]"
  }
  ```

add_to_collection

```
add_to_collection
base_collection
second_collection_or_list
[-unique]
```

Creates a new collection by adding objects from one collection to another collection. The following rules apply:

- If all of the objects in the base collection are of the same type, only the objects in the second collection that are the same type as those in the base collection are added to the new collection. If you specify an object list instead, all of the objects in the list must be the same type as those in the base collection.
- If the base collection contains different types of objects, all objects in the second collection are added. In this situation, you cannot specify an object list.

If the software finds no objects to add, an empty collection is returned.

Parameters

base_collection	Specifies the base collection of objects. Objects from the second collection or object list are added to this collection to create the new collection.
second_collection_or_list	Specifies the second object collection, or a list of objects.
-unique	Removes any duplicate objects from the new collection.

Related Information

- append_to_collection
- compare_collections
- copy_collection
- filter_collection

all_clocks

`all_clocks`

Creates a collection of all the clocks in the current design. If no clocks were defined, an empty string `""` is returned.

To filter clocks, use the `get_clocks` command to create a collection of clocks matching a specific pattern. Assign these clocks to a variable or pass them using another command.

Examples

- The following example applies the `set_propagated_clock` command to all the clocks in the design:

  ```
  set_propagated_clock [all_clocks]
  ```

Related Information

- `create_clock`
- `get_clocks`
- `set_propagated_clock`
- `all_inputs`

all_connected

`all_connected [-leaf] obj`

Returns a collection of all of the objects connected to the specified net, pin, or port.

Parameters

`-leaf`	Returns only the flattened connection points (leaf pins) for the specified net. *Default:* Returns all hierarchical ports connected to the specified net
obj	Specifies the net, pin, or port for which to return the collection of connected objects. You can specify an object name, or a single-object collection.

Examples

- The following command returns a collection of all of the objects connected to the pin `b1_Sin1`:
  all_connected Sin1

  The software returns the following information:

  Sin1
- The following command returns a collection of all of the objects connected to a pin contained in the single collection object i_block1/b1_Sin1:
  all_connected [get_pins {i_block1/b1_Sin1}]

  The software returns the following information:

  Sin1
- The following command returns a collection of all of the hierarchical ports connected to the net `net_1`:
  all_connected [get_nets net_1]

  The software returns the following information:

  TL2/I2_in TL1/I1_out
- The following command returns a collection that contains only the flattened connection points for the net `net_1`:
  all_connected -leaf [get_nets net_1]

  The software returns the following information:

  TL2/L1/RX/D TL1/RX/Q

all_fanin

```
all_fanin
[-help]
[-hpin]
[-only_cells]
[-startpoints_only]
-to {collection | object_list}
[-trace_through {case_disable |user_disable | all | clocks | loop_snipped}]
[-view view_name]
[-levels value | -pin_levels value]
[ > | >> ]
```

Returns a collection of pins, ports, or cells that exist in the fanin cone of the specified objects.

Note: The `all_fanin` command does not work on netlist traversal but on timing graph traversal.

Parameters

`-help`	Prints out the command usage.
`> | >>`	Stores the generated collection in the specified file. You can add the `.gz` extension to the file name to generate a compressed report. **Note:** The file name must be the last parameter specified.
`-hpin`	Returns hierarchical pins along with the flat pins.
`-levels` *value*	Specifies the number of gate levels to go back from a specific pin object to create the collection.
`-only_cells`	Returns a collection only of the cells in the fanin zone.
`-pin_levels` *value*	Specifies the number delay arcs to go back from a specific pin object to create the collection.
`-startpoints_only`	Returns a collection only of valid start points in the fanin zone.
`-trace_through {case_disable |user_disable | all | clocks | loop_snipped}`	You can specify one of the following options: • `case_disable`: Allows traversal of arcs disabled using `set_case_analysis` command. Arcs disabled using `set_disable_timing` are not traversed. • `user_disable`: Allows traversal of arcs disabled using `set_disable_timing` command, but arcs disabled using `set_case_analysis` command are not traversed. • `all`: Allows traversal through all the arcs • `clocks`: Allows traversal through pins for which clock constraints (such as, `create_clock`, `create_generated_clock`) are applied. The pins that are disabled using the `set_case_analysis` and `set_disable_timing` commands are not traversed. • `loop_snipped`: Allows trace through the loop snipped arcs.
`-to {`*collection | object_list*`}`	Specifies the objects for which to return the collection. You can specify a list of objects, or a collection of objects.
`-view` *view_name*	Specifies the view name for which fan cone traversal is to be performed.

Examples

- The following command returns the collection of cells in the fanin zone of the output port OUT1:
  ```
  all_fanin -to OUT1 -only_cells
  ```
- The following command returns all the valid startpoints (sequential elements and/or input ports) in the fanin zone of OUT1, allowing the traversal through arcs disabled by `set_case_analysis` and `set_disable_timing`:
  ```
  all_fanin -to OUT1 -startpoints_only -trace_through all
  ```

Related Information

- `all_fanout`

all_fanout

```
all_fanout
[-help]
[-endpoints_only]
[-hpin]
[-only_cells]
[-trace_through {case_disable | user_disable | all | clocks | loop_snipped}]
[-view view_name]
[-levels value | -pin_levels value]
{-from {collection | object_list} }
[ > | >> ]
```

Returns a collection of pins, ports, or cells that exist in the fanout cone of the specified objects.

Note: The `all_fanout` command does not work on netlist traversal but on timing graph traversal.

Parameters

`-help`	Prints out the command usage.
`-endpoints_only`	Returns a collection only of valid end points in the fanout zone.
`-hpin`	Returns hierarchical pins along with the flat pins.
`> | >>`	Stores the generated collection in the specified file. You can add the `.gz` extension to the file name to generate a compressed report. **Note:** The file name must be the last parameter specified.
`-from {`*`collection | object_list`*`}`	Specifies the objects for which to return the collection. You can specify a list of objects, or a collection of objects.
`-levels` *`value`*	Specifies the number of gate levels to go forward from a specific pin object to create the collection.
`-only_cells`	Returns a collection only of the cells in the fanout zone.
`-pin_levels` *`value`*	Specifies the number delay arcs to go forward from a specific pin object to create the collection.
`-trace_through {case_disable |user_disable | all | clocks | loop_snipped}`	Allows traversal through disabled arcs. You can specify one of the following options: • `case_disable`: Arcs which are disabled using the `set_case_analysis` command and through physical constant are traversed. The arcs disabled using `set_disable_timing` are not traversed. • `user_disable`: Arcs disabled using `set_disable_timing` command are traversed but those disabled using `set_case_analysis` command are not traversed. • `all`: Enables trace through all arcs • `clocks`: Allows traversal through pins for which clock constraints (such as, `create_clock`, `create_generated_clock`) are applied. The pins that are disabled using the `set_case_analysis` and `set_disable_timing` commands are not traversed. • `loop_snipped`: Allows trace through the loop snipped arcs.
`-view` *`view_name`*	Specifies the view name for which fan cone traversal is to be performed.

Examples

- The following command returns the collection of cells in the fanout zone of the input port IN1:
  ```
  all_fanout -from IN1 -only_cells
  ```
- The following command returns all the valid endpoints (sequential elements and/oroutput ports) in the fanout zone of IN1, allowing the traversal through arcs disabled by `set_case_analysis` and `set_disable_timing`:
  ```
  all_fanout -from IN1 -endpoints_only -trace_through all
  ```

Related Information

- `all_fanin`

all_inputs

```
all_inputs
[-clock list_of_clocks]
[-no_clocks]
[-edge_triggered]
[-level_sensitive]
```

Creates a collection of all the input ports in the current design. To filter inputs, use the `get_ports` command to create a collection of ports matching certain criteria. Assign these ports to a variable or pass them using another command. You can limit the contents of the collection to ports with input delay relative to a specific clock.

Parameters

`-help`	Prints out the command usage.
`-clock` *`list_of_clocks`*	Considers only input ports with input delay relative to the specified list of clocks.
`-edge_triggered`	Returns a collection of input ports with the `set_input_delay -clock` constraint.
`-level_sensitive`	Returns a collection of input ports with the `set_input_delay -level_sensitive` constraint.
`-no_clocks`	Returns primary input ports that do not have create_clock or create_generated_clock constraints.

Example

- The following command returns the names all of the input ports with input delay relative to an `ideal_clk`:
  all_inputs -clock ideal_clk

Related Information

- `get_ports`
- `report_ports`
- `set_input_delay`

all_instances

```
all_instances
obj
[-hierarchical]
```

Returns a collection of all instances available in a design, or all instances of a specified library cell existing in the current design.

You cannot use the `all_instances` command on the top level of the design (`all_instances [get_design top]`).

However, you can use the command for hierarchical modules inside the top level. For example, if `SUB` is a hierarchical module in the top level of the design, you can specify the following command to return all instances of that module: `all_instances [get_design SUB]`.

Parameters

`-hierarchical`	Specifies that the patterns should be matched hierarchically. If the hierarchical name of an instance at a particular hierarchical level matches the patterns, it is included in the result.
obj	Specifies the name of a design or a library cell in the current design. You can specify a pattern for the design or library cell name, or a single collection of a design or library cell.

all_outputs

```
all_outputs
[-clock list_of_clocks
[-edge_triggered]
[-level_sensitive]
```

Creates a collection of all output ports in the current design. To filter outputs, use the `get_ports` command to create a collection of ports matching certain criteria. Assign these ports to a variable or pass them using another command. You can limit the contents of the collection to ports with output delay relative to a specific clock.

Parameters

`-help`	Prints out the command usage.
`-clock` *`list_of_clocks`*	Considers only output ports with an output delay relative to a specific list of clocks.
`-edge_triggered`	Returns a collection of output ports with the `set_output_delay -clock` constraint.
`-level_sensitive`	Returns a collection of output ports with the `set_output_delay -level_sensitive` constraint.

Example

- The following command returns the names all of the output ports with an output delay relative to an `ideal_clk`:

  ```
  all_outputs -clock ideal_clk
  ```

Related Information

- `get_ports`
- `report_ports`
- `set_output_delay`

all_registers

```
all_registers
[-clock {clock_list}]
[-cells]
[-rise_clock {clock_list}]
[-fall_clock {clock_list}]
[-flops | -edge_triggered]
[-no_hierarchy]
[-latches | -level_sensitive]
[-macros]
[-master_slave]
[-data_pins]
[-clock_pins]
[-output_pins]
[-async_pins]
[-slave_clock_pins]
```

Returns a collection of instances and pins of flip-flops, latches, or sequential macros in the design. A cell is considered sequential if the library cell defines trigger or timing check arcs.

Note: The following options can be used only after building the timing graph:

- `-clock`
- `-rise_clock`
- `-fall_clock`

Parameters

`-async_pins`	Returns a collection of async preset or clear pins.
`-cells`	Creates a collection of cells. This is the default option.
`-clock {clock_list}`	Specifies the name of a clock or a list of clocks. The `all_registers` command creates a collection of registers clocked by the specified *`clock_list`*.
`-clock_pins`	Returns a collection of register clock pins. You can use other parameters to further filter this collection.
`-data_pins`	Returns a collection of register data input pins. You can use other parameters to further filter this collection.
`-fall_clock {clock_list}`	Specifies the name of a clock or a list of clocks. The `all_registers` command creates a collection of registers opened by the falling edge of the clocks specified in the *`clock_list`*.

`-flops	-edge_triggered`	Returns a collection of edge-triggered sequential instances. Both the `-flops` and `-edge_triggered` options return the same collection. The `-flops` option is provided for backward compatibility.
`-latches	-level_sensitive`	Returns a collection of level-sensitive sequential instances. Both `-latches` and `-level_sensitive` options return the same collection. The `-latches` option is provided for backward compatibility.
`-macros`	Returns sequential instances that are neither flip-flops nor latches.
`-master_slave`	Returns a collection of master-slave register cells.
`-no_hierarchy`	Searches the current instance only; does not descend the hierarchy.
`-output_pins`	Returns a collection of register output pins.
`-rise_clock` {*`clock_list`*}	Specifies the name of a clock or a list of clocks. The `all_registers` command creates a collection of registers opened by the rising edge of the clocks specified in the *`clock_list`*.
`-slave_clock_pins`	Returns a collection of slave clock pins of the master-slave registers. You can specify the slave clock pins as `clocked_on_also` in the library.

Example

- The following command reports the10 worst paths going to registers in the design: report_timing -to [all_registers] -max_paths 10
- the following script using the `all_registers` command along with other Innovus commands can be used to get number of flops in the design:
  set flopName [all_registers -flops]

  set flopCount [sizeof_collection $flopName]

  puts "Number of flops in the design is $flopCount"

Related Information

- `get_cells`
- `get_pins`

append_to_collection

```
append_to_collection
var_name
second_collection_or_list
[-unique]
```

Appends objects from one collection to another collection. The following rules apply:

- If all of the objects in the base collection are of the same type, only the objects in the second collection that are the same type as those in the base collection are appended to the base collection.
- If the base collection contains different types of objects, all objects in the second collection are appended to it. In this situation, you cannot specify an object list.

If the software finds no objects to add, an empty collection is returned.

Parameters

var_name	Specifies a pointer to the base collection of objects. Objects in the second collection or object list are appended to this collection. If you specify a pointer that does not refer to an existing base collection, the software creates a new collection that uses the pointer as a reference.
second_collection_or_list	Specifies the second collection of objects, or an object list.
-unique	Retains any duplicate objects that already exist in the base collection, but does not append duplicate objects from the second collection to the base collection.

Examples

- The following command appends the nets in the specified collection to the collection `newVar`:
  ```
  append_to_collection newVar [get_nets {CLK1}]
  ```
- The following command appends the specified nets to the collection `newVar`:
  ```
  append_to_collection newVar {Sin1 CLK1 Sout1}
  ```
- You can use the following commands to create another collection:
  ```
  tempus 6> set base_clock [get_clocks sbw_clk]
  0xe50
  tempus 7> set top_clock [get_clocks aclk]
  0xe51
  tempus 8> set base_top_clock ""
  tempus 13> append_to_collection base_top_clock $base_clock
  0xe54
  tempus 14> append_to_collection base_top_clock $top_clock
  0xe54
  ```

```
tempus 15> get_clocks $base_top_clock
sbw_clk aclk
0xe55
tempus 16> get_clocks $base_clock
sbw_clk
0xe56
tempus 17> get_clocks $top_clock
aclk
0xe57
```

Note: If a new collection variable is defined with an existing collection, then both point to the same object set. Any modifications made into either collection will be visible in both cases - because they reference each other.

Related Information

- remove_from_collection
- compare_collections
- copy_collection
- filter_collection

compare_collections

`compare_collections` *`collection1 collection2`* `[-order_dependent]`

Compares two collections, and returns a value of `0` if all of the objects contained in both collections are the same. If the objects contained in both collections are different, the software returns a value of `1`.

Parameters

`collection1`	Specifies the first collection.
`collection2`	Specifies the second collection.
`-order_dependent`	Specifies that the order of the objects in both collections must be the same for the collections to be considered the same.

Related Information

- `remove_from_collection`
- `copy_collection`
- `filter_collection`

copy_collection

`copy_collection` *`base_collection`*

Returns a collection that is an exact copy of the specified base collection.

Parameter

`base_collection`	Specifies the base collection of objects.

Related Information

- `add_to_collection`
- `append_to_collection`
- `remove_from_collection`
- `compare_collections`
- `filter_collection`

define_property

```
define_property
-object_type string
-type data_type
[-lower_bound val]
[-upper_bound val]
[-string_values {values}]
property_name
```

Defines a new property.

Design objects can be associated with user-defined commands that can be used for analysis and debugging purposes.

You can use the `define_property` command if a define statement is not used for the specified property value(s). To read property values from the library, the command must be issued before the timing library is read.

Parameters

`-lower_bound val`	Specifies a lower range - integer, float, or double.
`-object_type <string>`	Specifies the type of object on which the property is to be defined.
property_name	Specifies the name of the property.
`-string_values values`	Specifies the values that can be defined for the property.
`-type data_type`	Specifies the type of property.
`-upper_bound val`	Specifies a higher range - integer, float, or double.

Examples

- The following example defines property having object type `pin` and type of property `int`:
  ```
  define_property -object_type pin -type int slk
  ```
- The following example defines a property on a library arc:
  ```
  define_property -object_type lib_arc -type int libArcProperty
  ```
- The following example defines `aocv_weight` property on a library arc:
  ```
  define_property -type float -object_type lib_arc aocv_weight
  ```

Related Information

- get_property
- set_property
- reset_property

filter_collection

```
filter_collection
[-help]
base_collection
{filter_expression}
[-nocase]
[-quiet]
[-regexp]
```

Returns a collection of objects that were filtered from the specified collection of objects based on user-specified criteria (*filter_expression*). The following rules apply:

- The *filter_expression* can be created by combining several object properties using the following relational and logical operators: >, <, ==, !=, <=, >=, &&, ||, =~, !~, AND, OR. You also can use parentheses to create expressions.
- You can use the defined and undefined existence operators to determine whether an attribute is defined for an object.
- All design object properties supported through the get_property command can be used for filtering the base collection.

Note: You also can perform filtering operations by specifying the -filter parameter with the get_* commands.

Parameters

-help	Prints out the command usage.
base_collection	Specifies the collection of objects from which to filter objects for the new collection.
filter_expression	Specifies the criteria with which to filter objects. The software adds any objects in the base collection that match *filter_expression* to the new collection.
-nocase	Specifies that pattern matching is not case sensitive. **Note:** You must specify -regexp in order to use this parameter.
-quiet	Suppresses all the error and warning messages that are generated when the filter_collection command is run.
-regexp	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as a wildcard.

Examples

- The following command returns a single-object collection containing the pin with the hierarchical name lat_3/Q:
  ```
  filter_collection [get_pins] {hierarchical_name == lat_3/Q}
  ```

- The following command returns a collection of pins that have a maximum slew that is greater than 0.1:

  ```
  filter_collection [get_pins] {slew_max_rise > 0.1}
  ```

- The following commands create a new collection called `newPaths` that contains all of the paths from the collection `paths` that have a slack value that is greater than -0.806 and less than 0.0:

  ```
  set paths [report_timing -collection -max_paths 10]
  set newPaths [filter_collection $paths {(slack > -0.806 && slack < 0.0)}]
  ```

- The following example applies some values to a few register clock pins:

  ```
  set_property [get_pin hier1/reg1/clock] useful_skew 1.5
  set_property [get_pin hier1/hier2/reg2/clock] useful_skew 2.5
  ```

  In the script, you can look for pin objects that have (or does not have) this attributed applied:

  ```
  find clock pins without useful skew
  set pins_without_useful [filter_collection [all_registers -clock_pins] \
  "undefined(useful_skew)"]
  count the number of registers with useful skew applied
  set pins_with_useful [filter_collection [all_registers -clock_pins] \
  "defined(useful_skew)"]
  ```

Related Information

- add_to_collection
- append_to_collection
- remove_from_collection
- compare_collections

foreach_in_collection

`foreach_in_collection` *`var_name collection body`*

Iterates through all objects in the specified collection and executes the commands in the specified script.

Parameters

`body`	Specifies the script of commands to execute during each iteration.
`collection`	Specifies the collection of objects through which to iterate.
`var_name`	Specifies the iterator variable. During each iteration, *`var_name`* is set to a collection of exactly one object. Any command that accepts collections can accept *`var_name`* as a value.

Examples

- A script with the following commands would print out the hierarchical names of all of the cells in the design:

```
foreach_in_collection iCell [get_cells *] {
puts "Cell = [get_property $iCell hierarchical_name]"

    }
    Cell = ck_0
    Cell = ck_1
    Cell = ck_2
    Cell = ck_4
```

- The following example shows a more complex use of the `foreach_in_collection` command.

```
set cellCollection [get_cells temp1_reg]
set libCellCollection [get_lib_cells -of_objects $cellCollection]
set libArc [get_lib_arcs -of_objects $libCellCollection]

foreach_in_collection arc $libArc {
set fpin [get_property $arc from_lib_pin]

set tpin [get_property $arc to_lib_pin]
set sense [get_property $arc timing_type]

set from_pin_name [get_property $fpin name]
set to_pin_name [get_property $tpin name]

puts [format "%25s -> %25s %-20s" $from_pin_name $to_pin_name $sense]

}
CK -> D           setup_rising
CK -> D           hold_rising
CK -> CK          minimum_period
CK -> CK          minimum_period
CK -> CK          min_pulse_width
```

```
foreach_in_collection.txt

CK -> CK          min_pulse_width
RN -> RN          min_pulse_width
CK -> RN          recovery_rising

get_activity

```
get_activity
[-help]
[-out_file filename]
[-net netname]
[-pin pinname]
[-port portname]
[-summary]
[-tcl_list]
[-list_of_nets_based_on_driver {primary_inputs | sequential | combinational | memory | ICG | black_box}]
[-list_of_nets_based_on_source_of_activity_info
{activity_file|set_switching_activity|propagated|default}]
[-report_average_switching_activity]
[-report_cell_group_activity_summary]
[-inst inst_name]
```

Determines the source of activity for the specified nets/pins/ports. The power analysis engine has various sources from where activities can be annotated from, such as switching activity specification (input/sequential/global/clock gate), clock definitions/constants through SDC/TWF, activity files (VCD/TCF/SAF), user defined activity and/or propagated values.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_activity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_activity`
`-inst inst_name`	
	Specifies the top/hierarchy instance or the leaf level instance name for which average activity is to be reported. *Data_type*: string, optional
`-list_of_nets_based_on_driver {primary_inputs | sequential | combinational | memory | ICG | black_box}`	
	Specifies to output the list of nets based on the specified net driver. You can specify one or more net drivers at a time, as shown below: `get_activity -list_of_nets_based_on_driver primary_inputs|combinational| sequential | ICG | memory | black_box` To specify multiple drivers, you can use **/** (means 'or') or **&** (means 'and') between two drivers, without a space. *Data_type*: string, optional
`-list_of_nets_based_on_source_of_activity_info {activity_file|set_switching_activity|propagated|default}`	

	Specifies to output the list of nets based on the specified activity source information. *Data_type*: string, optional
`-net` *netname*	Specifies the name of the net. **Note:** You can use the `get_nets` command to determine the activity source for a collection of nets. *Data_type*: string, optional
`-out_file` *filename*	Specifies the output file into which the activity sources are to be written. The format of the report is: <*net_name/pin_name*> <*activity_source*> <*duty_cycle*> <*transition_density*> For more information, refer to the "Static Power Analysis Overview" section of the Power Analysis and Reports chapter in *Innovus System User Guide*. *Data_type*: string, optional
`-pin` *pinname*	Specifies the name of the pin. **Note:** You can use the `get_pins` command to determine the activity source for a collection of pins. *Data_type*: string, optional
`-port` *portname*	Specifies the name of the port. **Note:** You can use the `get_ports` command to determine the activity source for a collection of ports. *Data_type*: string, optional
`-report_average_switching_activity`	
	Specifies to report the average activity of the given instance/hierarchy/top-level. *Data_type*: bool, optional
`-report_cell_group_activity_summary`	
	Specifies to give a summary of cell group activity. *Data_type*: bool, optional

`-summary`	Generates a detailed activity annotation report of the specified nets, pins, and ports. This report contains the following information: • Primary Inputs • Sequential Outputs • Memory/Macro Outputs • Tristate Outputs **Note:** Use the `get_activity -summary` command to report activity annotation summary without printing information for nets/pins/ports. *Data_type*: bool, optional
`-tcl_list`	Produces the report in the Tcl list format instead of a tabular format. The `-tcl_list` and `-out_file` parameters are mutually exclusive; you cannot specify them together. *Data_type*: bool, optional

Examples

- The following example returns the activity sources of all nets that match the specified pattern and writes the output information to a file named `nets.rpt`:

  ```
  get_activity -net [get_nets n*] -out_file nets.rpt
  ```

  The following is the example output of the nets.rpt file:

  ```
  int3 activity_file 0.5 5e+07
  int2 sequential_activity 0.5 2.5e+07
  int1 user_defined_activity 0.5 1e+07
  nt3 global_activity 0.5 5e+07
  nt3 input_activity 0.5 5e+07
  int5 clock_gate_activity 0.5 2.5e+07
  int1 user_defined_activity 0.5 1e+07out
  sequential_activity 0.5 2.5e+07
  clk sdc/twf 0.5 5e+08
  c_int2 propagation 0.5 5e+08
  ```

- The following example returns the activity source of the pin `i_4/A1` and writes the output information to a power report file named `pin.rpt`:

  ```
  get_activity -pin i_4/A1 -out_file pin.rpt
  ```

- The following command report the average activity of all nets:

  ```
  get_activity -report_average_switching_activity
  ```

  The following is the example output:

  ```
  Avg Switching activity of all nets 4.727e+17
  ```

- The following command gives a summary of cell group activity:
  ```
  get_activity -report_cell_group_activity_summary
  ```
  The following is the example output:
  ```
  Group Activity Summary Report:
  Source ->                    activity file            set_switching_activity
  propagated              default                  Total
  All nets                     2                        1
  2                       5                        10
  Break-up based on net driver:
  Primary Input                2(40%)                   0(0%)
  0(0%)                   3(60%)                   5
  Sequential                   0(0%)                    1(33.33%)
  0(0%)                   2(66.67%)                3
  Combinational                0(0%)                    0(0%)
  2(100%)                 0(0%)                    2
  Memory                       0(0%)                    0(0%)
  0(0%)                   0(0%)                    0
  ICG                          0(0%)                    0(0%)
  0(0%)                   0(0%)                    0
  Black Box                    0(0%)                    0(0%)
  0(0%)                   0(0%)                    0
  ```
- The following command gives the list of nets based on primary inputs:
  ```
  get_activity -list_of_nets_based_on_driver primary_inputs
  ```
  The following is the example output:
  ```
  D2 D1 CP2 CP1 dummy0
  ```
- The following command gives the list of nets based on primary inputs or sequential driver:
  ```
  get_activity -list_of_nets_based_on_driver primary_inputs|sequential
  ```
  The following is the example output:
  ```
  Q2 Q1 D2 D1 CP2 CP1 n1 dummy0
  ```
- The following command gives the list of nets based on primary inputs or sequential driver for the instance `ff1b`:
  ```
  get_activity -list_of_nets_based_on_driver primary_inputs|sequential -instance ff1b
  ```
- The following command gives the list of nets based on the propagated source for the instance `i2`:
  ```
  get_activity -list_of_nets_based_on_source_of_activity_info propagated -instance i2
  ```
- The following command gives a summary of cell group activity for the instance `i2`:
  ```
  get_activity -instance i2 -report_cell_group_activity_summary
  ```
- The following command gives the list of nets based on the default activity:
  ```
  get_activity -list_of_nets_based_on_source_of_activity default
  ```

  The following is the example output:
  ```
  rst shutdown isolate coef_ld start bypass test_mode se sdi Xn_in[3] Xn_in[2] Xn_in[1] Xn_in[0]
  Yn_in[15] Yn_in[14] Yn_in[13] Yn_in[12] Yn_in[11] Yn_in[10] Yn_in[9] Yn_in[8] Yn_in[7] Yn_in[6]
  ```
- The following command gives the list of nets based on the activity file:
  ```
  get_activity -list_of_nets_based_on_source_of_activity activity_file
  ```

  The following is the example output:

```
ref_clk test_clk pll_clk
```

- The following command gives the list of nets based on the switching activity:
  ```
  get_activity -list_of_nets_based_on_source_of_activity set_switching_activity
  ```

  The following is the example output:
  ```
  rst ref_clk shutdown isolate coef_ld start bypass test_clk test_mode se sdi sdo Xn_in[3] Xn_in[2]
  Xn_in[1] Xn_in[0] Yn_in[15] Yn_in[14] Yn_in[13]
  ```

get_arcs

```
get_arcs
{ [-to to_list] [-from from_list]
 | -of_objects object_list}
[-filter expr]
[-quiet]
```

Creates a collection of timing arcs. Assign these arcs to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Note: The timing graph must be built before you can use this command. A warning message is issued indicating that the timing graph is not generated.

Parameters

`-filter` *expr*	Filters a collection based on the specified expression. For any arcs that match the pattern, the software evaluates the expression based on the attribute of the arc.
`-from` *from_list*	Adds all timing arcs that fan in directly to the specified pins or ports to the collection. You can specify a list of pins or a list of ports, but you cannot specify a list that contains both pins and ports. You can specify a pattern for the pin or port name, a collection of pins or ports, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-of_objects` parameter.
`-of_objects` *object_list*	Adds all timing arcs that are associated with the specified cells or nets to the collection. You can specify a list of cells or a list of nets, but you cannot specify a list that contains both cells and nets. You can specify a pattern for the cell or net name, a collection of cells or nets, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-to` or `-from` parameters.
`-quiet`	Suppresses all error and warning messages generated when the `get_arcs` command is run.
`-to` *to_list*	Adds all timing arcs that fan out directly from the specified list of pins or ports to the collection. You can specify a list of pins or a list of ports, but you cannot specify a list that contains both pins and ports. You can specify a pattern for the pin or port name, a collection of pins or ports, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-of_objects` parameter.

Examples

- The following command returns a collection of the timing arcs fan in directly to the pin `dff1/CP`:
  get_arcs -from dff1/CP
- The following command creates a collection of the timing arcs that are associated with the nets in the specified

collection:
get_arcs -of_objects [get_nets {n1}]

get_cells

```
get_cells
[-help]
[-filter expr]
[-hierarchical]
[-hsc char]
[-leaf]
[-nocase]
[-quiet]
[-regexp]
[patterns | -of_objects object_list]
```

Creates a collection of instances in the current design whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument in another command.

Parameters

`-filter` *expr*	Filters the collection with the specified expression. For any cells that match the pattern, the software evaluates the expression based on the attribute of the cell. You can filter cells using any of the cell properties supported through the `get_property` command.
`-hierarchical`	Specifies that the patterns should be matched hierarchically. If the flat name of an instance at a particular hierarchical level matches the patterns, it is included in the result. For example. if there is top level hierarchical instance `Top` and it contains another sub-instance called `FF1`, then the following command can be used to get the instance `Top/FF1` (since the given pattern will be matched with instance flat name `FF1`): get_cells -hier FF* However, the following command will display an error: get_cells -hier Top/FF*
`-hsc` *char*	Specifies the hierarchical delimiter for patterns. For example, if the hierarchical delimiter is `@`, the `sub/I1@I2` pattern matches instance `I2` within the hierarchy limited at `sub/I1`.
`-leaf`	Returns leaf cells only. When the `-leaf` parameter is not specified, the `get_cells` command returns the hierarchical instances present on a net along with the flat instances at the same hierarchical level as the specified object. **Note:** The `-leaf` parameter can only be specified with the `-of_objects` parameter.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.

`-of_objects` *object_list*	Creates a collection of all cells associated with the specified pins, nets, library cells, or design cells.
	You can specify a list of pins or a list of nets, but you cannot specify a list that contains both pins and nets. You can specify patterns for the pin or net names, a collection of pins or nets, or a combination of patterns and a collection.
	The `-of_objects` parameter supports `get_designs` and `get_lib_cells` as valid collection objects.
	The use model is as follows:
	`get_cells -of_objects [get_designs` *object_list*`]`
	`get_cells -of_objects [get_lib_cells` *object_list*`]`

patterns	Specifies patterns for instance names. Patterns include the `*` and `?` wildcard characters and collections of instances. The `get_cells` command returns a collection of instances that match the patterns. If no such instance is found, an empty collection is returned.
`-quiet`	Suppresses all error and warning messages generated when the `get_cells` command is run.

`-regexp`	Treats the specified patterns as a regular expression patterns.
	When this parameter is specified, the given patterns `start` and `end` are assumed to be matching with the start and end part of the complete object name.
	For example, the following can be used to retrieve the hierarchical instance `Top/block1/block2/FF1`:
	`get_cells Top/*/*/FF1`
	`get_cells -regexp Top/.*/FF1`
	However, the following command will display an error :
	`get_cells Top/*/FF1`
	If this parameter is specified with `-hier` parameter, the given pattern will be matched with the complete hierarchical name of objects instead of only the flat name and all the successful matches are included in the result.
	For example, if there is a top level hierarchical instance `Top` and it contains another sub-instance called `FF1`, then either of these can be used to retrieve `Top/FF1` instance:
	`get_cells -hier FF1`
	`get_cells -hier -regexp Top/FF1`
	However, the following commands will display an error :
	`get_cells -hier Top/FF1`
	`get_cells -hier -regexp FF1`

Example

- The following command searches for pins within the hierarchy limited at `B`:

  ```
  get_cells -hsc @ B@*
  ```

- The following command searches for cells with set pattern and filter:

  ```
  get_cells "o*" -filter "@ref_lib_cell_name != FD2 && @is_black_box==false"
  ```

Related Information

- `get_lib_pins`
- `get_pins`

get_clocks

```
get_clocks
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns]
```

Creates a collection of clocks whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command.

`The get_clocks` command reports all clocks, including inactive clocks.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any clocks that match the pattern, the software evaluates the expression based on the attribute of the clock. You can filter clocks using any of the clock properties supported through the get_property command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
patterns	Specifies patterns for clock names. Patterns include the `*` and `?` wildcard characters, and collections of instances and clocks.
`-quiet`	Suppresses all error and warning messages generated when the `get_clocks` command is run.
`-regexp`	Treats the specified patterns as a regular expression patterns. *Default:* Treats the specified pattern as a wild card

Example

- The following example returns all clocks beginning with the name `CK`: get_clocks CK*

Related Commands

- all_clocks
- create_clock
- get_pins
- get_ports
- report_clocks

get_designs

```
get_designs
[-quiet]
patterns
```

Creates a collection of modules and assigns this collection to a variable or pass it as an argument to an another command. The software uses this information during timing analysis.

Parameters

patterns	Specifies patterns for module names. Patterns include the * and ? wildcard characters and collections of modules. The get_designs command returns a collection of modules that match the patterns. If no such module is found, an empty collection is returned.
-quiet	Suppresses all error and warning messages generated when the get_design command is run.

Example

- The following command returns a complete list of modules:

```
get_designs *
```

get_generated_clocks

```
get_generated_clocks
[-filter expr]
[-regexp | -exact]
[-nocase]
[patterns]
```

Creates a collection of generated clocks whose name matches the supplied pattern list. Assign this collection to a variable, or pass it as an argument to another command.

Parameters

`-exact`	Performs exact pattern matching against the object name, instead of wild card or regular expression matching. Use this parameter when the object name includes special characters such as `*`, `?`, and `+`. **Note:** If you specify this parameter, you cannot specify `-regexp`.
`-filter expr`	Filters the collection with the specified expression. For any clocks that match the pattern, the software evaluates the expression based on the attribute of the clock.
`-nocase`	Specifies that pattern matching is not case sensitive.
patterns	Specifies patterns for generated clock names. Patterns include the `*` and `?` wildcard characters, and collections of generated clocks.
`-regexp`	Treats the specified pattern as a regular expression. *Default:* Treats the specified pattern as a wild card **Note:** If you specify this parameter, you cannot specify `-exact`.

Related Information

- `create_generated_clock`

get_lib_arcs

```
get_lib_arcs
{ [-to to_lib_pins] [-from from_lib_pins]
  | -of_objects {lib_cell_list | timing_arcs} }
[-filter expr]
[-quiet]
```

Creates a collection of library timing arcs. Assign these library timing arcs to a variable, or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-filter` *expr*	Filters the collection with the specified expression. For any library arcs that match the pattern, the software evaluates the expression based on the attribute of the library arc
`-from` *from_lib_pins*	Creates a collection of all library arcs that originate from the specified library pins. You can specify a pattern for the pin name, a collection of pins, or a pattern and a collection. If you specify this parameter with the `-to` parameter, the software creates a collection of all library arcs that exist between the "to" and "from" library pins. **Note:** You cannot specify this parameter with the `-of_objects` parameter.
`-of_objects` {*lib_cell_list* | *timing_arcs*}	Creates a collection of all library arcs that are associated with the specified library cells or timing arcs. You can specify a list of library cells or a list of timing arcs, but you cannot specify a list that contains both library cells and timing arcs. You can specify a pattern for the library cell or timing arc name, a collection of library cells or timing arcs, or a pattern and a collection. **Note:** You cannot specify this parameter with the `-to` or `-from` parameters.
`-quiet`	Suppresses all error and warning messages generated when the `get_lib_arcs` command is run.
`-to` *to_lib_pins*	Creates a collection of all library arcs that terminate at the specified library pins. You can specify a pattern for the pin name, a collection of pins, or a pattern and a collection. If you specify this parameter with the `-from` parameter, the software creates a collection of all library arcs that exist between the "to" and "from" library pins. **Note:** You cannot specify this parameter with the `-of_objects` parameter.

Related Information

- report_lib_arcs
- get_lib_cells
- get_lib_pg_pins
- get_lib_pins
- get_libs

get_lib_cells

```
get_lib_cells
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{pattern_list | -of_objects object_list}
```

Creates a collection of library cells from the loaded libraries whose name matches the supplied pattern list. Assign these library cells to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-filter expr`	Filters the collection with the specified expression. For any library cells that match the pattern, the software evaluates the expression based on the attribute of the library cell. You can filter library cells using any of the library cell properties supported through the get_property command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all library cells associated with the specified library pins or cells or libs. You can specify a list of library pins or a list of cells or a list of libs, but you cannot specify a list that contains mixed of library pins and cells and libs. You can specify patterns for the library pin or cell or lib names, a collection of library pins or cells or libs, or a combination of patterns and a collection.

pattern_list	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the *pattern_list* argument. The characters ? and * are wild cards. The ? character matches any one character while the * character matches zero or more characters. If a library matches multiple patterns, it appears multiple times in the collection. A pattern can have only one hierarchical separator character. The left part of the pattern is the library name pattern and the right part is the cell name pattern. If there is no separator character, the pattern is compared to cell names in all the libraries. A pattern can have only one hierarchical separator character, dividing the pattern into one or two parts. If the hierarchical separator is /, the alternatives are: • *cell_name_pattern* Selects all cells whose name matches the *cell_name_pattern* from all libraries. • *lib_name_pattern/cell_name_pattern* Selects all cells whose name matches the *cell_name_pattern* from all libraries whose name matches the *lib_name_pattern*.
-quiet	Suppresses all error and warning messages generated when the get_lib_cells command is run.
-regexp	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard

Examples

- The following command prints all cells for all libraries: get_lib_cells *
- The following command prints a collection with all cells in the lca500kv lib library: get_lib_cells lca500kv/*
- The following command prints a collection with all cells whose names starts with AN in all libraries starting with lca: get_lib_cells lca*/AN*
- The following command disables delay arcs on the EF11L050032A library cell. The set_disable_cell_timing command effects all instantiations of the specified cell, and lets you disable delay arcs from and to internal pins. set_disable_timing -from WACLK -to RBO1 [get_lib_cells {EF11L050032A}]

Related Information

- get_cells
- get_libs
- get_lib_pins

get_lib_pg_pins

```
get_lib_pg_pins
[-help]
[-filter expr]
{-of_objects object_list}
```

Returns a collection of library-level PG pins from the loaded libraries. An empty collection is returned if no PG pin definitions are found in the loaded library.

Parameters

`-help`	Prints out the command usage.
`-filter expr`	Filters the collection with the specified expression. For any library pg pins that match the specified expression, the software evaluates the expression based on the attribute of the library pg pin. You can filter library pg pins along with the `-of_objects` parameter - using the library pg pin properties of `lib_pg_pin` object type (supported through the `get_property` command).

`-of_objects object_list`	Creates a collection of all library PG pins associated with the specified library cells.
	The `-of_objects` parameter supports `get_lib_cells` as valid objects.
	For example,
	`get_lib_pg_pins -of_objects [get_lib_cells sc9_cmos32lp/DFFQ_X1M] VDD VSS`
	`get_lib_pg_pins *`
	`**ERROR: (TCLCMD-1420): Currently only -of_objects option is supported`

Examples

- The following command gets the collection of all the library-level pg pins of the specified library cell:
  `get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]`
- The following command filters the collection of all library-level pg pins of the library cell to return only the library pg pins containing the string name defined with the lib_pg_pin name attribute:
  `get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X] -filter "name =~ *VDD*"`

Related Information

- get_lib_cells
- get_lib_pins
- get_libs
- get_property

get_lib_pins

```
get_lib_pins
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
{pattern_list | -of_objects object_list}
```

Creates a collection of library cell pins from the loaded libraries whose name matches the supplied pattern list. Assign these library cell pins to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-filter expr`	Filters the collection with the specified expression. For any library cell pins that match the pattern, the software evaluates the expression based on the attribute of the library cell pin. You can filter library pins using any of the library pin properties supported through the get_property command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of all library pins associated with the specified library cells or pins. You can specify a list of cells or a list of pins, but you cannot specify a list that contains both cells and pins. You can specify patterns for the cell or pin names, a collection of cells or pins, or a combination of patterns and a collection.
pattern_list	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the *pattern_list* argument. The characters `?` and `*` are wild cards; The `?` character matches any one character while the `*` character matches zero or more characters. If a library cell matches multiple patterns, it appears multiple times in the collection. A pattern can have only two hierarchical separator characters, dividing the pattern into one, two, or three parts. If the hierarchical separator is `/`, the alternatives are: • *pin_name_pattern* Selects all pins whose name matches the *pin_name_pattern* from all cells in the libraries. • *cell_name_pattern/pin_name_pattern* Selects all pins whose name matches the *pin_name_pattern* from all cells whose name matches the *cell_name_pattern* in all libraries. • *lib_name_pattern/cell_name_pattern/pin_name_pattern* Select all pins whose name matches the *pin_name_pattern* from all cells whose name matches the *cell_name_pattern* from all libraries whose name matches the *lib_name_pattern*.

`-quiet`	Suppresses all error and warning messages generated when the `get_lib_pins` command is run.
`-regexp`	Treats the specified patterns as a regular expression patterns. *Default:* Treats the specified pattern as a wild card

Examples

- The following command returns all pins in all cells for all libraries:
  ```
  get_lib_pins *
  ```
- The following command returns a collection with all pins for cell `AO1` in any library:
  ```
  get_lib_pins AO1/*
  ```
- The following command returns a collection with all pins whose name starts with `Z` or `Q` for the `AO1` cell in any library:
  ```
  get_lib_pins {AO1/Z* AO1/Q*}
  ```
- The following command returns a collection with all pins for the `AO1` cell in the `lca500kv` lib library:
  ```
  get_lib_pins lca500kv/AO1/*
  ```
- The following command returns a collection with all pins starting with `Z` in all cells whose names starts with `AN` in all libraries starting with `lca`:
  ```
  get_lib_pins lca*/AN*/Z*
  ```

Related Information

- `get_lib_cells`

get_libs

```
get_libs
[-filter expr]
[-quiet]
[-regexp]
[-nocase]
{-of_objects object_list | pattern_list}
```

Creates a collection of loaded libraries whose name matches those specified in the pattern list. Assign these libraries to a variable or pass them to another command. If no objects match the criteria, an empty collection is returned.

Parameters

`-filter expr`	Filters the collection with the specified expression. For any libraries that match the pattern, the software evaluates the expression based on the attribute of the library. You can filter libraries using any of the library properties supported through the get_property command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects object_list`	Creates a collection of libraries that belong to the library cells in a given object list.
pattern_list	Returns only those libraries in the collection whose name matches one or more of the patterns specified in the *pattern_list* argument. The characters `?` and `*` are wild cards; The `?` character matches any one character while the `*` character matches zero or more characters. If a library matches multiple patterns, it appears multiple times in the collection.
`-quiet`	Suppresses all error and warning messages generated when the `get_lib_cells` command is run.
`-regexp`	Treats the specified patterns as a regular expression patterns. *Default:* Treats the specified pattern as a wild card

Examples

- The following command displays a list of loaded libraries starting with a or l: get_libs {a* l*}
- The following command queries all libraries beginning with the letter `1`: get_libs 1*
- The following command creates a collection of libraries that are associated with the library cells in the specified object list:
  get_libs -of_objects [get_lib_cells *]

Related Information

- get_lib_cells
- get_lib_pins

get_nets

```
get_nets
[-hierarchical]
[-hsc char]
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns | -of_objects object_list]
```

Creates a collection of nets in the current design whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to an another command. If no such net is found, an empty collection is returned.

When you use the `get_nets` command to specify hierarchical nets, the software matches the specified pattern and returns the top level net connected to it.

Parameters

`-filter` *expr*	Filters the collection with the specified expression. For any nets that match the pattern, the software evaluates the expression based on the attribute of the net. You can filter nets using any of the net properties supported through the get_property command.
`-hierarchical`	Specifies that the patterns should match hierarchically. If the hierarchical name of a net at any hierarchical level matches the patterns, it is included in the result.
`-hsc` *char*	Specifies the hierarchical delimiter for patterns.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects` *object_list*	Creates a collection of all nets associated with the specified cells, pins, or ports. You can specify a list of cells, a list of pins, or a list of ports, but you cannot specify a list that contains cells, pins, and ports together. You can specify patterns for the cell, pin, or port names, a collection of cells, pins, or ports, or a combination of patterns and a collection.
patterns	Specifies patterns for net names. Patterns include the `*` and `?` wildcard characters and collections of nets.
`-quiet`	Suppresses all error and warning messages generated when the `get_nets` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard.

Examples

- The following command returns all nets within the hierarchy limited at `A`:

  ```
  get_nets -hsc @ A@*
  ```

- The following command returns all patterns that match hierarchy and identifies nets to be excluded from optimization.

  ```
  get_nets * -hierarchical -filter "@dont_touch== true"
  ```

Related Information

- `get_pins`

get_object_name

`get_object_name` *`collection`*

Returns the name of the object(s) contained in the specified collections.

By default, the command hides escape characters in the output. To enable printing of escape characters in the output, you can set `timing_enable_get_obj_escaped_name_backward_compatible` attribute to `true`.

Parameters

`collection`	Specifies multiple object collection that contain the objects.

Examples

- The following command returns a tcl list of names which can match the collection inputs:

  ```
  get_object_name [get_cells and*]
  ```

- The following command defines a variable called `endpoint_list` to store endpoints with the ten worst slacks:

  ```
  set endpoint_list [get_object_name [get_property \
        [report_timing -collection -max_points 10] capturing_point]]
  ```

Related Information

- `query_objects`

get_path_groups

```
get_path_groups
[-help | {[-nocase ] [ -regexp ] patterns}]
```

Returns a collection of path groups whose names match *patterns*. If no path groups match the criteria, an empty collection is returned.

Parameters

`-nocase`	Specifies that pattern matching is not case sensitive.
patterns	Creates a collection of path groups whose name matches one or more of the specified patterns. Patterns include the `*` and `?` wildcard characters and collections of path groups. If a path group matches multiple patterns, it appears multiple times in the collection.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard.

Examples

- Iterate through all the path groups in the path group collection: `foreach_in_collection thePathGroup [ get_path_groups ] { ... }`
- Iterate through all path group **DPObjects**: `foreach thePathGroupDPO [ get_db [ get_path_groups ] ] { ... [ get_db $thePathGroupDPO ... ]; ... }`

get_pg_nets

```
get_pg_nets
[-help]
[-filter expr]
[-of_objects object_list]
```

Creates a collection of netlist-level instance PG nets of leaf cells/pins in the current design. An empty collection is returned if no PG net definitions/connections are found in the design netlist.

Parameters

`-help`	Prints out the command usage.
`-filter` *expr*	Specifies the filters for the collection with the specified expression. For any pg nets that match the pattern, the software evaluates the expression based on the attribute of the net. You can filter pg nets along with the `-of_objects` parameter - using any of the pg net properties of object type `pg_net` (supported through the `get_property` command).

`-of_objects` *object_list*	Creates a collection of all the PG nets, or PG nets associated with the specified cells or PG pins.
	You can specify a list of cells or a list of pg pins, but you cannot specify a list that contains cells and pg pins together.
	The `-of_objects` parameter supports `get_cells` and `get_pg_pins` as valid objects.
	For example,
	`get_pg_nets -of_objects [get_cells iA/out_reg] VSS VDD2`
	`get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg]] VSS VDD2`
	`get_pg_nets *`

Examples

- The following command filters the collection of all pg nets of the cell instance object to return only the pg nets containing the string name defined with the pg_net hierarchical_name attribute:
  ```
  get_pg_nets -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*"
  ```
- The following command gets the collection of all pg nets of the cell instance object:
  ```
  get_pg_nets -of_objects [get_cells iA/out_reg]
  ```
- The following command gets the collection of all pg nets of the pg_pins of the cell instance object:
  ```
  get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg]]
  ```

Related Information

- get_property
- get_nets

get_pg_pins

```
get_pg_pins
[-help]
[-filter expr]
[-of_objects object_list]
```

Returns a collection of netlist-level instance PG pins in the current design. An empty collection is returned if no PG pin definitions are found in the design netlist.

Parameters

`-help`	Prints out the command usage.
`-filter` *expr*	Specifies the filters for the collection with the given expression. For any pg pins that match the pattern, the software evaluates the expression based on the attribute of the pin. You can filter pg pins along with the `-of_objects` parameter - using the pg pin properties of object type `pg_pin` (supported through the `get_property` command).

`-of_objects` *object_list*	Specifies the collection of all the pins associated with the specified cells or nets.
	The `-of_objects` parameter supports `get_cells` as valid objects.
	For example:
	`get_pg_pins -of_objects [get_cells iA/out_reg] iA/out_reg/VSS iA/out_reg/VDD`
	`get_pg_pins iA/out_reg/VDD`
	`**ERROR: (TCLCMD-1420): Currently only -of_objects option is supported.`

Examples

- The following command filters the collection of all the pg_pins of the cell instance object to return only the pg pins containing the string name defined with the pg_pin hierarchical_name attribute:
  ```
  get_pg_pins -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*"
  ```
- The following command gets the collection of all pg pins of the cell instance object:
  ```
  get_pg_pins -of_objects [get_cells iA/out_reg]
  ```

Related Information

- `get_pg_nets`

get_pins

```
get_pins
[-hierarchical]
[-hsc char]
[-filter expr]
[-leaf]
[-regexp]
[-nocase]
[-quiet]
{patterns | -of_objects object_list}
```

Creates a collection of instance pins whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command. If no such pin is found, an empty collection is returned.

Parameters

`-filter` *expr*	Filters the collection with the specified expression. For any pins that match the pattern, the software evaluates the expression based on the attribute of the pin. If the expression is set to true, the pin is included in the result. You can filter pins using any of the pin properties supported through the get_property command.
`-hierarchical`	Specifies that patterns should match hierarchically. If the hierarchical name of a pin at any hierarchical level matches the patterns, it is included in the result.
`-hsc` *char*	Specifies the hierarchical delimiter for patterns.
`-leaf`	Returns leaf pins only. When the `-leaf` parameter is not used, the `get_pins` command returns the hierarchical pins present on a net along with the flat pins at the same hierarchical level as the specified object.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects` *object_list*	Creates a collection of all pins associated with the specified cells or nets. You can specify a list of cells or a list of nets, but you cannot specify a list that contains both cells and nets. You can specify patterns for the cell or net names, a collection of cells or nets, or a combination of patterns and a collection.
patterns	Specifies patterns for pin names. Patterns include the `*` and `?` wildcard characters and collections of pins.
`-quiet`	Suppresses all error and warning messages generated when the `get_pins` command is run.

`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard.

Examples

- The following command returns all instance pins within the hierarchy limited at `A`: get_pins -hsc @ A@*
- The following command filters the collection for `pin_direction` pin attribute. get_pins "in*" -filter "@pin_direction == in"

Related Information

- `create_clock`
- `get_cells`
- `get_ports`

get_ports

```
get_ports
[-filter expr]
[-regexp]
[-nocase]
[-quiet]
[patterns | -of_objects object_list]
```

Creates a collection of ports whose name matches the supplied pattern list. Assign this collection to a variable or pass it as an argument to another command.

Note: The `get_ports` command always creates a collection of top level ports irrrespective of the current instance set using the `current_instance` command.

Parameters

`-filter` *`expr`*	Filters the collection with the specified expression. For any ports that match the pattern, the software evaluates the expression based on the attribute of the port. If the expression is set to true, the port is included in the result. You can filter ports using any of the port properties supported through the `get_property` command.
`-nocase`	Specifies that pattern matching is not case sensitive. **Note:** You must specify `-regexp` in order to use this parameter.
`-of_objects` *`object_list`*	Creates a collection of all ports associated with the specified nets. You can specify patterns for the net names, a collection of nets, or a combination of patterns and a collection.
`patterns`	Specifies patterns for port names. Patterns include the `*` and `?` wildcard characters and collections of ports.The command returns a collection of ports that match the patterns. If no such port is found, an empty collection is returned.
`-quiet`	Suppresses all error and warning messages generated when the `get_ports` command is run.
`-regexp`	Treats the specified patterns as regular expression patterns. *Default:* Treats the specified pattern as wildcard.

Example

- The following example returns all ports beginning with the name `inb`: get_ports inb*
- The following command filters the collection for `port_direction` port attribute. get_ports "mode*" -filter {port_direction == in}

get_power

```
get_power
[-help]
[-out_file filename ]
[-nets nets_list | -pins pins_list | -insts instances_list ]
[-attribute attributes_list ]
[-include_unit]
[-tcl_list ]
[-pg_net {pg_net_name_list | all}]
```

Queries various power related properties of design objects like nets, pins, and instances. Using this command, you can retrieve power attributes, such as internal power, switching power, leakage power, total power, and toggle rate. This command is very useful for writing custom scripts.

Note: This command outputs toggle rates as N.A. if the clock domain information for a given net/pin/instance is not found.

Use this command after running the `report_power` or `restore_power_database` command.

Note: The `-nets`, `-pins`, and `-insts` parameters are mutually exclusive. You must specify only one of the parameters.

Parameters

`-attribute` *attributes_list*	Specifies a list of power attributes. If an attribute is not available for the specified design object, the software returns its value as NA. See List of Power Attributes for a mapping of the list of available attributes with the design objects. This is a required parameter. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `get_power` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_power`
`-include_unit`	Specifies to include the units for the power attributes. *Data_type*: bool, optional
`-insts` *instances_list*	Specifies a list of instance names. The `-nets`, `-pins`, and `-insts` parameters are mutually exclusive. You must specify one, and only one, of the parameters. **Note:** You can use the `get_cells` command to determine the power attributes for a collection of instances. *Data_type*: string, optional

`-nets nets_list`	Specifies a list of net names. The `-nets`, `-pins`, and `-insts` parameters are mutually exclusive. You must specify one, and only one, of the parameters. **Note:** You can use the `get_nets` command to determine the power attributes for a collection of nets. *Data_type*: string, optional
`-out_file filename`	Specifies the output file into which the power related properties are to be written. The `-tcl_list` and `-out_file` parameters are mutually exclusive; you cannot specify them together. *Data_type*: string, optional
`-pg_net {pg_net_name_list | all}`	
	Specifies to query various power-related properties of a specified power net for an instance. This parameter supports the argument all to query properties of all power nets connected to the instance. You must use the `-insts` parameter in conjunction with the `-pg_net` parameter. The `-pg_net` parameter supports the following attributes: `switching_power`, `internal_power`, `leakage_power`, `total_power`, and `dynamic_power`. *Data_type*: string, optional
`-pins pins_list`	Specifies a list of pin names. The `-nets`, `-pins`, and `-insts` parameters are mutually exclusive. You must specify one, and only one, of the parameters. **Note:** You can use the `get_pins` command to determine the power attributes for a collection of pins. *Data_type*: string, optional
`-tcl_list`	Produces the report in Tcl list format instead of a tabular format. The `-tcl_list` and `-out_file` parameters are mutually exclusive; you cannot specify them together. *Data_type*: bool, optional

The following power attributes can be queried for the design objects:

List of Power Attributes - Attribute Description

- `switching_power (net, inst)`: switching power of a net or instance
- `internal_power (inst)`: internal power of an instance
- `dynamic_power (inst)`: switching and internal power of an instance
- `leakage_power (inst)`: leakage power of an instance
- `total_power (inst)`: total power of an instance
- `toggle_rate (net, pin, inst)`: Toggle rate - Number of toggles in the specified VCD/TCF in the duration
- `duty_cycle (net, pin)`: Static probability of the signal to stay high
- `ref_clock (net, pin, inst)`: Reference clock name (Fastest clock for multi clock domains)
- `ref_clock_period (net, pin, inst)`: Reference clock period
- `transition_density (net, pin)`: toggle_rate*ref_clock_period
- `loading_cap (net, pin, inst)`: Loading capacitance
- `voltage (net, pin, inst)`: Operating voltage for a net or pin. For MSMV instance, this attribute can be used to get breakdown of domain specific power.
- `rise_slew (net, pin)`: Rise slew
- `fall_slew (net, pin)`: Fall slew
- `glitch_rate (net, pin)`: Glitch rate - Number of glitches per duration. Applies only to the vector-driven flow.
- `glitch_power (net, pin, inst)`: Glitch power. Applies only to the vector-driven flow.
- `activity_source (net, pin)`: Source of activity annotation. The options are: propagated, user_annotated, and constant.
- `pin_direction (pin)`: [input | output | inout]
- `cell_type (inst)`:Lists cell type as memory, standard cell, IO, sequential, and so on
- `all_attributes (net, pin, inst)`: Lists all related power attributes for the specified design object.

Examples

- The following command returns the specified power attributes for the net clock1:

  ```
  get_power -nets clock1 -attribute {switching_power internal_power toggle_rate}
  ```

  The following is the sample output:

  ```
  clock1 0.04 NA 2
  ```

- The following command returns the specified power attributes for all nets that match the specified pattern `master*`:

  ```
  get_power -nets [get_nets master*] -attribute {switching_power toggle_rate activity_source
  ```

```
duty_cycle} -include_unit
```

The following is the sample output:

```
masterin[1] 0.001mW 0.2 user_annotated 0.5
masterin[2] 0.002mW 0.2 user_annotated 0.5
masterin[3] 0.003mW 0.1 propagated 0.5
masterin[4] 0.005mW 1 constant 1
```

- The following command returns power-related properties of all power nets connected to the instance `clk_buf_1`:

  ```
  get_power -pg_net all -insts clk_buf_1 -attribute {switching_power internal_power leakage_power}
  ```

  The following is the sample output:

  ```
  clk_buf_1 VDD 0.002 0.001 0.000001
  clk_buf_1 VDDL 0.0001 0.0001 0.0000001
  ```

get_property

```
get_property
var_name
property
[-clock clock_name]
[-view view_name]
[-quiet]
```

Retrieves the attribute value for the specified object(s) property.

You can query the following:

- Cell Properties
- Clock Properties
- Design Properties
- Library Properties
- Library Cell Properties
- Library Pin Properties
- Library Pin Properties for Power/Ground Objects
- Library Timing Arc Properties
- Net Properties
- Net Properties for Power/Ground Objects
- Path Group Properties
- Pin Properties
- Pin Properties for Power/Ground Objects
- Port Properties
- Timing Arc Properties
- Timing Path Properties
- Timing Point Properties
- si_victim Properties
- si_attacker Properties
- User-Defined Properties

The `get_property` command supports DRV constraints (`set_min_fanout`, `set_max_fanout`, `set_min_transition`, `set_max_transition`, `set_min_capacitance`, and `set_max_capacitance`) applied on library pins.

The `get_property` command does not work with partial property names. You are now required to specify the full name of the property.

Parameters

`-clock` *clock_name*	Specifies the clock for which to query certain object properties.
property	Specifies the property for which to retrieve the attribute value.
`-quiet`	Suppresses all error and warning messages generated when the `get_property` command is run.
var_name	Specifies a pointer to a collection containing the object. **Note:** If the collection contains more than one object, the `get_property` command returns the property values for each object in the specified collection.
`-view` *view_name*	Specifies the analysis view in which to query the object attribute. You can query properties only for the following objects in an analysis view: library cells, library pins, ports, cells, pins, timing arcs, and nets. You can specify this parameter only when the software is in multi-mode multi-corner timing analysis mode. **Note**: The properties (described in the tables below), which are related to slack, delay, arrival, slew, transition, capacitance, uncertainty and latency, depend on the specified view. When the `-view` parameter is not specified, the maximum (or minimum) value for all the views is returned.

Cell Properties

`area`	Returns the area of the cell. If the cell is hierarchical, also includes the net area. *Return type:* float
`early_cell_check_derate_factor`	Returns the derating factor for early paths specified through the `set_timing_derate` command with the `-early` parameter. *Return type:* float
`early_cell_check_mean_derate_factor`	Returns the derating factor for early paths on the instance – when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`early_clock_check_incremental_derate_factor`	Returns the early clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type:* float

`early_data_check_incremental_derate_factor`	Returns the early data path instance's incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type:* float
`early_cell_check_sigma_derate_factor`	Returns the derating factor for early paths on the instance - when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`early_clk_cell_derate_factor`	Returns the derating factor for early clock paths specified through the `set_timing_derate` command with the `-early` parameter. *Return type:* float
`early_clk_cell_mean_derate_factor`	Returns the derating factor for early clock paths – when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`early_clk_cell_sigma_derate_factor`	Returns the derating factor for early clock paths – when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`early_data_cell_derate_factor`	Returns the derating factor for early paths specified through the `set_timing_derate` command with the `-early` parameter. *Return type:* float
`early_data_cell_mean_derate_factor`	Returns the derating factor for early paths – when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`early_data_cell_sigma_derate_factor`	Returns the derating factor for early paths – when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`early_fall_cell_check_derate_factor`	Returns the early cell check derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`early_fall_cell_check_mean_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -cell_check` and -mean parameters are specified. *Return type:* float

`early_fall_cell_check_sigma_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -cell_check` and `-sigma` parameters are specified. *Return type:* float
`early_fall_clk_cell_derate_factor`	Returns the early clock path derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`early_fall_clk_cell_mean_derate_factor`	Returns the early clock path derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`early_fall_clk_cell_sigma_derate_factor`	Returns the early clock path derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`early_fall_clock_incremental_derate_factor`	Returns the early clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return type*: float
`early_fall_data_cell_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -fall` parameter is specified. *Return type:* float
`early_fall_data_cell_mean_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`early_fall_data_cell_sigma_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`early_fall_data_incremental_derate_factor`	Returns the early data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return type*: float

`early_rise_cell_check_derate_factor`	Returns the early cell check derating factor specified through the `set_timing_derate` command with the `-rise` and `-cell_check` parameter. *Return type:* float
`early_rise_cell_check_mean_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`early_rise_cell_check_sigma_derate_factor`	Returns the early cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`early_rise_clk_cell_derate_factor`	Returns the early clock cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`early_rise_clk_cell_mean_derate_factor`	Returns the early clock cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`early_rise_clk_cell_sigma_derate_factor`	Returns the early clock cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`early_rise_clock_incremental_derate_factor`	Returns the early clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`early_rise_data_cell_derate_factor`	Returns the early data cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`early_rise_data_cell_mean_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`early_rise_data_cell_sigma_derate_factor`	Returns the early data cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float

`early_rise_data_incremental_derate_factor`	Returns the early data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`hierarchical_name`	Returns the complete hierarchical name of the cell. *Return type:* string
`instance_model`	Reports the model type of an instance. The Instance model type can be ecsmn, ccsn, cdb, udn, or nldm. In case a noise model does not exist, the software returns 'NA'. For example, `get_property [get_cells inst1/buf22 ] instance_model` *Return type:* string
`is_black_box`	Returns a value of `true` if the cell is a black box cell. A cell is considered as a black box if the "function" definition of the cell is missing from the library. *Return type:* boolean
`is_buffer`	Returns a value of `true` if the associated library cell is recognized as a buffer cell. For example, `get_property [get_cells mmu/IB1] is_buffer` *Return type:* boolean
`is_clock_gating_check`	Returns a value of true if the cell is gated. *Return type:* boolean
`is_combinational`	Returns a value of `true` if the cell is a combinational cell (not a sequential cell). *Return type:* boolean
`is_disable_timing`	Returns a value of `true` if the cell's timing has been disabled using the `set_disable_timing` command. *Return type:* boolean
`is_dont_touch`	Returns a value of `true` if the cell definition includes `dont_touch:true`. *Return type:* boolean

`is_fall_edge_triggered`	Returns a value of `true` if the cell is triggered by the falling edge of the clock. *Return type:* boolean
`is_hierarchical`	Returns a value of `false` if the cell is a leaf or library cell. *Return type:* boolean
`is_integrated_clock_gating_cell`	Returns a value of `true` if the cell is an integrated clock gating cell. *Return type:* boolean
`is_interface_timing`	Returns a value of true if a library cell has interface timing specified for that cell. *Return Type*: boolean
`is_memory_cell`	Returns a value of `true` if the cell is a memory cell. *Return type:* boolean
`is_negative_level_sensitive`	Returns a value of `true` if the cell is used as a negative level-sensitive sequential element, such as a negative level-sensitive latch. *Return type:* boolean
`is_pad_cell`	Returns a value of `true` if the Liberty library `is_pad_cell` attribute is set to `true` for this pad cell. *Return type:* boolean
`is_positive_level_sensitive`	Returns a value of `true` if the cell is used as a positive level-sensitive sequential element, such as a positive level-sensitive latch. *Return type:* boolean
`is_rise_edge_triggered`	Returns a value of `true` if the cell is triggered by the rising edge of the clock. *Return type:* boolean
`is_sequential`	Returns a value of `true` if the cell is a latch or flip-flop, or if the cell has sequential timing checks. *Return type:* boolean
`is_tristate`	Returns a value of `true` if the cell definition includes `three_state:true`. *Return type:* boolean

`late_cell_check_derate_factor`	Returns the derating factor for late paths specified through the `set_timing_derate` command with the `-late` parameter. *Return type:* float
`late_cell_check_mean_derate_factor`	Returns the derating factor for late paths – when the `set_timing_derate -late` and `-mean` parameters are specified. *Return type:* float
`late_cell_check_sigma_derate_factor`	Returns the derating factor for late paths – when the `set_timing_derate -late` and `-sigma` parameters are specified. *Return type:* float
`late_clk_cell_derate_factor`	Returns the derating factor for late clock paths specified through the `set_timing_derate` command with the `-late` parameter. *Return type:* float
`late_clk_cell_mean_derate_factor`	Returns the derating factor for late clock paths – when the `set_timing_derate -late` and `-mean` parameters are specified. *Return type:* float
`late_clk_cell_sigma_derate_factor`	Returns the derating factor for late clock paths – when the `set_timing_derate -late` and `-sigma` parameters are specified. *Return type:* float
`late_clock_check_incremental_derate_factor`	Returns the late clock path instance's incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type*: float
`late_data_cell_derate_factor`	Returns the derating factor for late data paths specified through the `set_timing_derate` command with the `-late` parameter. *Return type:* float
`late_data_cell_sigma_derate_factor`	Returns the derating factor for late data paths – when the `set_timing_derate -late` and `-sigma` parameters are specified. *Return type:* float
`late_data_check_incremental_derate_factor`	Returns the late data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return type*: float

`late_fall_cell_check_derate_factor`	Returns the late cell check derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`late_fall_cell_check_mean_derate_factor`	Returns the late cell check derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`late_fall_cell_check_sigma_derate_factor`	Returns the late cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`late_fall_clk_cell_derate_factor`	Returns the late clock cell check derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`late_fall_clk_cell_mean_derate_factor`	Returns the late clock cell check derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`late_fall_clk_cell_sigma_derate_factor`	Returns the late clock cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`late_fall_clock_incremental_derate_factor`	Returns the late clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return type*: float
`late_fall_data_cell_derate_factor`	Returns the late data cell check derating factor specified through the `set_timing_derate` command with the `-fall` parameter. *Return type:* float
`late_fall_data_cell_mean_derate_factor`	Returns the late data cell check derating factor – when the `set_timing_derate -fall` and `-mean` parameters are specified. *Return type:* float
`late_fall_data_cell_sigma_derate_factor`	Returns the late data cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float

`late_fall_data_incremental_derate_factor`	Returns the late data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. Return type: float
`late_rise_cell_check_derate_factor`	Returns the late cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`late_rise_cell_check_mean_derate_factor`	Returns the late cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`late_rise_cell_check_sigma_derate_factor`	Returns the late cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`late_rise_clk_cell_derate_factor`	Returns the late clock cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`late_rise_clk_cell_mean_derate_factor`	Returns the late clock cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float
`late_rise_clk_cell_sigma_derate_factor`	Returns the late clock cell check derating factor – when the `set_timing_derate -fall` and `-sigma` parameters are specified. *Return type:* float
`late_rise_clock_incremental_derate_factor`	Returns the late clock path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`late_rise_data_cell_derate_factor`	Returns the late data cell check derating factor specified through the `set_timing_derate` command with the `-rise` parameter. *Return type:* float
`late_rise_data_cell_mean_derate_factor`	Returns the late data cell check derating factor – when the `set_timing_derate -rise` and `-mean` parameters are specified. *Return type:* float

`late_rise_data_cell_sigma_derate_factor`	Returns the late data cell check derating factor – when the `set_timing_derate -rise` and `-sigma` parameters are specified. *Return type:* float
`late_rise_data_incremental_derate_factor`	Returns the late data path instances' incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return type*: float
`lib_cell`	Returns a collection of all the library cell objects associated with the specified library pins/cells. For example, `get_property [get_cells AAA] lib_cell -view VIEW1` *Return type*: collection
`name`	Returns the leaf-level name of the cell. *Return type:* string
`object_type`	Returns the object type `cell`. *Return type:* string
`pin_count`	Returns the total number of signal pins. *Return type:* integer
`ref_lib_cell_name`	Returns the name of reference module of the given cell. The reference module of the cell can be a Verilog module or a leaf library cell. *Return type:* string
`threshold_voltage_group`	Returns name of a group/category – that is specified based on the cell's threshold voltage (high or low) characteristics. For example, `get_property [get_lib_cells AND2_X1] threshold_voltage_group` *Return type:* string
`timing_model_type`	Returns the model type for a given cell or instance. The supported values are `abstracted`, `extracted`, and `qtm`. *Return type:* string
`x_coordinate_max`	Returns the maximum x coordinate of the cell. *Return type:* float
`x_coordinate_min`	Returns the minimum x coordinate of the cell. *Return type:* float

`y_coordinate_max`	Returns the maximum y coordinate of the cell. *Return type:* float
`y_coordinate_min`	Returns the minimum y coordinate of the cell. *Return type:* float

Cell Properties for Power/Ground Objects	
`is_always_on`	Returns a value of `true` if a cell instance is an always-on cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_always_on`
`is_inverter`	Returns a value of `true` if a cell instance is an inverter cell. *Return type*: boolean For example, `get_property [get_cells mmu/INV1] is_inverter`
`is_isolation_cell`	Returns a value of `true` if a cell instance is an isolation cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_isolation_cell`
`is_level_shifter`	Returns a value of `true` if a cell instance is a level-shifter cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_level_shifter`
`is_power_switch`	Returns a value of `true` if a cell instance is a power switch cell. Return type: boolean For example, `get_property [get_cells mmu/U1] is_power_switch`
`is_retention`	Returns a value of `true` if a cell instance is a retention cell. *Return type*: boolean For example, `get_property [get_cells mmu/U1] is_retention`
`level_shifter_type`	Returns the type of level-shifter (e.g., LH, HL, or HL_LH) that a cell instance is. *Return type*: string For example, `get_property [get_cells mmu/U1] level_shifter_type`
`pg_pins`	Returns a collection of the PG pins that are present in a cell instance. *Return type*: collection For example, `get_property [get_cells mmu/U1] pg_pins`

`power_switch_type`	Returns the type of power switch (e.g., coarse-grain, fine-grain) that a cell instance is. *Return type*: string For example, `get_property [get_cells mmu/U1] power_switch_type`
`std_cell_main_rail_name`	Returns the name of the main power rail driving the power pins of a cell instance that is the `pg_pin`, which has the `std_cell_main_rail` library attribute set as `true` for the instance cell. *Return type*: string For example, `get_property [get_cells mmu/U1] std_cell_main_rail_name`

Clock Properties

`clock_network_pins`	Returns a collection of all pins on the clock network for the clock. *Return type:* collection
`delay_max_fall`	Returns the maximum falling delay value for the clock. *Return type:* float
`delay_max_rise`	Returns the maximum rising delay value for the clock. *Return type:* float
`delay_min_fall`	Returns the minimum falling delay value for the clock. *Return type:* float
`delay_min_rise`	Returns the minimum rising delay value for the clock. *Return type:* float
`generated_clocks_extended`	Returns generated clocks derived from the regular clock. *Return type:* collection
`hierarchical_name`	Returns the complete hierarchical name of the clock. *Return type:* string
`ideal_transition_max_fall`	Returns the ideal clock transition asserted on clock waveforms specified with the `set_clock_transition` command using the `-fall` and `-max` parameters. *Return type:* float
`ideal_transition_max_rise`	Returns the ideal clock transition asserted on clock waveforms specified with the `set_clock_transition` command using the `-rise` and `-max` parameters. *Return type:* float

`ideal_transition_min_fall`	Returns the ideal clock transition asserted on clock waveforms specified with `set_clock_transition` command using the `-fall` and `-min` parameters. *Return type:* float
`ideal_transition_min_rise`	Returns the ideal clock transition asserted on clock waveforms specified with `set_clock_transition` command using the `-rise` and `-min` parameters. *Return type:* float
`is_active`	Returns a value of `true` if the clock specified is active in the current view. *Return type:* boolean
`is_generated`	Returns a value of `true` if the clock is a generated clock. *Return type:* boolean
`is_propagated_clock`	Returns a value of `true` if the clock is in propagated mode. *Return type:* boolean
`latency_fall_max`	Returns the maximum fall latency for the clock. *Return type:* float
`latency_fall_min`	Returns the minimum fall latency for the clock. *Return type:* float
`latency_rise_max`	Returns the maximum rise latency for the clock. *Return type:* float
`latency_rise_min`	Returns the minimum rise latency for the clock. *Return type:* float
`max_capacitance_clock_path_fall`	Returns fall max_capacitance value on clock paths. *Return type:* float
`max_capacitance_clock_path_rise`	Returns rise max_capacitance value on clock paths. *Return type:* float
`max_capacitance_data_path_fall`	Returns fall max_capacitance value on data paths. *Return type:* float
`max_capacitance_data_path_rise`	Returns rise max_capacitance value on data paths. *Return type:* float
`max_transition_clock_path_fall`	Returns fall max_transition value on clock paths. *Return type:* float

`max_transition_clock_path_rise`	Returns rise max_transition value on clock paths. *Return type:* float
`max_transition_data_path_fall`	Returns fall max_transition value on data paths. *Return type:* float
`max_transition_data_path_rise`	Returns rise max_transition value on data paths. *Return type:* float
`name`	Returns the name of the clock. *Return type:* string
`object_type`	Returns the object type `clock`. *Return type:* string
`period`	Returns the clock period. *Return type:* float
`source_latency_early_fall_max`	Returns the early source latency for the falling transition at the max corner. *Return type:* float
`source_latency_early_fall_min`	Returns the early source latency for the falling transition at the min corner. *Return type:* float
`source_latency_early_rise_max`	Returns the early source latency for the rising transition at the max corner. *Return type:* float
`source_latency_early_rise_min`	Returns the early source latency for the rising transition at the min corner. *Return type:* float
`source_latency_late_fall_max`	Returns the late source latency for the falling transition at the max corner. *Return type:* float
`source_latency_late_fall_min`	Returns the late source latency for the falling transition at the min corner. *Return type:* float
`source_latency_late_rise_max`	Returns the late source latency for the rising transition at the max corner. *Return type:* float
`source_latency_late_rise_min`	Returns the late source latency for the rising transition at the min corner. *Return type:* float
`sources`	Returns a collection of the clock's source pins or ports. *Return type:* collection

`view_name`	In multi-mode multi-corner mode, returns the analysis view name associated with a given clock. *Return type*: string
`waveform`	Returns the rising and falling edge times of the waveform. *Return type:* string

Design Properties

`analysis_type`	Returns the analysis mode: `single`, `bc_wc`, or `on_chip_variation`. *Return type:* string
`capacitance_unit_in_farad`	Returns the capacitance unit specified in the library. *Return type:* float
`chip_size`	Returns the chip size. The chip size can be specified with the `timing_aocv_chip_size` attribute. If this attribute is not set, then the software will calculate the chip size from the design node locations. This setting takes precedence over the software setting. *Return type:* float
`current_unit_in_amp`	Returns the current unit specified in the library. *Return type:* float
`hierarchical_name`	Returns the complete hierarchical name of the design. *Return type:* string
`is_dont_touch`	Returns `true` if the design is specified through the `set_dont_touch` command. *Return type:* boolean
`is_max_transition_asserted`	Returns a value of `true` if a maximum transition value (set using the `set_max_transition` command) is defined in the design. *Return type:* boolean
`is_min_transition_asserted`	Returns a value of `true` if a minimum transition value (set using the `set_min_transition` command) is defined in the design. *Return type:* boolean
`max_capacitance`	Returns the maximum capacitance value for the design. *Return type:* float

`max_fanout`	Returns the maximum fanout value for the design. *Return type:* float
`max_transition`	Returns the maximum transition design rule limit for the design. *Return type:* float
`min_capacitance`	Returns the minimum capacitance value for the design. *Return type:* float
`object_type`	Returns the object type `design`. *Return type: string*
`operating_condition_max`	Returns the name of the maximum operating condition specified for the design. *Return type:* string
`operating_condition_min`	Returns the name of the minimum operating condition specified for the design. *Return type:* string
`process_max`	Returns the process value of the maximum operating condition specified for the design. *Return type:* float
`process_min`	Returns the process value of the minimum operating condition specified for the design. *Return type:* float
`resistance_unit_in_ohm`	Returns the resistance value from the library. *Return type:* float
`slew_threshold_percent_fall_high`	Returns the upper slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_fall_low`	Returns the lower slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_high`	Returns the upper slew trip point for rising waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_low`	Returns the lower slew trip point for rising waveforms, specified as a percent. *Return type:* float
`temperature_max`	Returns the temperature value of the maximum operating condition for the design. *Return type:* float

`temperature_min`	Returns the temperature value of the minimum operating condition for the design. *Return type:* float
`time_unit_in_second`	Returns the time units of the design, in seconds. that is, time unit of the design is 1.000000ns, the property returns 1.000000e-09. *Return type:* float
`tree_type_max`	Returns the value of the `tree_type` attribute for the specified maximum operating condition. *Return type:* string
`tree_type_min`	Returns the value of the `tree_type` attribute for the specified minimum operating condition. *Return type:* string
`voltage_max`	Returns the voltage value of the maximum operating condition for the design. *Return type:* float
`voltage_min`	Returns the voltage value of the minimum operating condition for the design. *Return type:* float
`voltage_unit_in_volt`	Returns the voltage units specified in the library for the design. *Return type:* float

Library Properties

`default_max_transition`	Returns the default maximum transition time limit specified for a given library. *Return type:* float
`hierarchical_name`	Returns the hierarchical path name for the library. *Return type:* string
`input_threshold_pct_fall`	Returns the value of threshold point on an input pin signal falling from 1 to 0, which is used in modelling the delay of a signal transmitting from an input pin to an output pin. *Return type:* integer
`input_threshold_pct_rise`	Returns the value of threshold point on an input pin signal rising from 0 to 1, which is used in modelling the delay of a signal transmitting from an input pin to an output pin. *Return type:* integer

`lib_file_path`	Reports full on-disk path of a library. In case of a library database (LDB) file, the property will return the full on-disk path of the original library from which LDB was compiled. *Return type:* string
`lib_version`	Returns the software version in which the library file (LDB) was generated. *Return type:* integer
`nominal_process`	Returns a value of the process either modeled as nominal process or as the process in default operating condition in the library. *Return Type:* float For example, `get_property [get_libs sc_cmoslp] nominal_process`
`nominal_temperature`	Returns a value of the temperature either modeled as nominal temperature or as the temperature in default operating condition in the library. *Return Type:* float For example, `get_property [get_libs sc_cmoslp] nominal_temperature`
`nominal_voltage`	Returns a value of the voltage either modeled as nominal voltage or as the voltage in default operating condition in the library. *Return Type:* float For example, `get_property [get_libs sc_cmoslp] nominal_voltage`
`object_type`	Returns the object type `library`. *Return type:* string
`output_threshold_pct_fall`	Returns the value of threshold point on an output signal falling from 1 to 0, which is used in modelling the delay of a signal transmitting from an input pin to an output pin. *Return type:* integer
`output_threshold_pct_rise`	Returns the value of threshold point on an output signal rising from 0 to 1, which is used in the modelling of a signal transmitting from an input pin to an output pin. *Return type:* integer
`slew_derate_from_library`	Specifies how the transition times found in the library need to be derated to match the transition times between the characterization trip points. *Return type:* float
`slew_lower_threshold_pct_fall`	Returns the value of lower threshold point used in modeling the delay of a pin falling from 1 to 0. *Return type:* float

`slew_lower_threshold_pct_rise`	Returns the value of lower threshold point used to model the delay of a pin rising from 0 to 1. *Return type:* float
`slew_upper_threshold_pct_fall`	Returns the value of upper threshold point used to model the delay of a pin falling from 1 to 0. *Return type:* float
`slew_upper_threshold_pct_rise`	Returns the value of upper threshold point used to model the delay of a pin rising from 0 to 1. *Return type:* float
`source_file_name`	Returns the full path of all library files that contain the specified library name. The use model is given below: `get_property [get_libs libname] source_file_name [-view viewName]` If the `-view` parameter is specified, the property returns the path of the library files in the given analysis view. If this parameter is not specified, the command returns the path of all library files in all the analysis views. *Return Type:* string
Library Properties for Power/Ground Objects	

`power_rails`	Returns the name of the power rails along with their corresponding voltages as defined in the `voltage_map` attribute in the library.
	Return Type: string
	For example,
	`get_property [get_libs sc_cmoslp] power_rails`
	`Output: Is a list of lists, each list showing the power rail name along with its associated voltage.`
	`{ {VDDG 1.045} {VDD 1.045} {VSS 0} }`

Library Cell Properties

`area`	Returns the area of the library cell. *Return Type:* float

`early_clock_check_incremental_derate_factor`	Returns the early clock path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return Type:* float
`early_data_check_incremental_derate_factor`	Returns the early data path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return Type*: float
`early_fall_clock_incremental_derate_factor`	Returns the early clock path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return Type*: float
`early_fall_data_incremental_derate_factor`	Returns the early data path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return Type*: float
`early_rise_clock_incremental_derate_factor`	Returns the early clock path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return Type*: float
`early_rise_data_incremental_derate_factor`	Returns the early data path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return Type*: float
`has_spatial`	Returns a value of `true` if a spatial derate exists for a library cell. *Return type:* boolean
`hierarchical_name`	Returns the complete hierarchical name of the library cell (the library name followed by the library cell name). *Return Type:* string
`is_black_box`	Returns a value of `true` if the cell is a black box cell. A cell is considered as a black box if the "function" definition of the cell is missing from the library. *Return type:* boolean

`is_combinational`	Returns a value of `true` if the library cell is a combinational cell (not a sequential cell). *Return type:* boolean
`is_dont_touch`	Returns a value of `true` if the library cell definition includes `dont_touch:true`. *Return Type:* boolean
`is_dont_use`	Returns a value of `true` if the library cell description includes `dont_use:true`. *Return Type:* boolean
`is_fall_edge_triggered`	Returns a value of `true` if the library cell is triggered by the falling edge of the clock. *Return Type:* boolean
`is_interface_timing`	Returns a value of `true` if a library cell has interface timing specified for that cell.

`is_memory_cell`	Returns a value of `true` if the cell is a memory cell.
	Return type: boolean
	Note: The library cells that have a memory group defined in the dotlib are considered as memory cells. For example:
	`cell ( ) {`
	`:`
	`memory() {`
	`type : ram ;`
	`address_width : 10 ;`
	`word_width : 7 ;`
	`}`
	`}`

`is_negative_level_sensitive`	Returns a value of `true` if the library cell is used as a negative level-sensitive latch. *Return type:* boolean
`is_pad_cell`	Returns a value of `true` if the Liberty library `is_pad_cell` attribute is set to `true` for this pad cell. *Return type:* boolean

`is_pll_cell`	Returns a value of `true` if the Liberty library `is_pll_cell` attribute is set to `true` for this library cell. *Return type:* boolean
`is_positive_level_sensitive`	Returns a value of `true` if the library cell is used as a positive level-sensitive latch. *Return type:* boolean
`is_rise_edge_triggered`	Returns a value of `true` if the library cell is triggered by the rising edge of the clock. *Return Type:* boolean
`is_sequential`	Returns a value of `true` if the library cell is a latch or flip-flop, or if the cell has sequential timing checks. *Return type:* boolean
`is_tristate`	Returns a value of `true` if the library cell definition includes `three_state:true`. *Return type:* boolean
`late_clock_check_incremental_derate_factor`	Returns the late clock path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return Type*: float
`late_data_check_incremental_derate_factor`	Returns the late data path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter. *Return Type*: float
`late_fall_clock_incremental_derate_factor`	Returns the late clock path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the -fall parameter is specified. *Return Type*: float
`late_fall_data_incremental_derate_factor`	Returns the late data path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-fall` parameter is specified. *Return Type*: float
`late_fall_clock_period_derate_factor`	Returns the derate factor for the clock period when the `set_timing_derate -late` and `-fall` parameters are specified. *Return type:* float

`late_fall_clock_period_mean_derate_factor`	Returns the late/fall derate factor for the clock period when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`late_fall_clock_period_sigma_derate_factor`	Returns the late/fall derate factor for the clock period when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`late_fall_pulse_width_derate_factor`	Returns the late/fall derate factor for the pulse width when the `set_timing_derate` -late and -fall parameters are specified. *Return type:* float
`late_fall_pulse_width_mean_derate_factor`	Returns the late/fall derate factor for the pulse width when the `set_timing_derate` -mean parameter is specified. *Return type:* float
`late_fall_pulse_width_sigma_derate_factor`	Returns the late/fall derate factor for the pulse width when the `set_timing_derate` -sigma parameter is specified. *Return type:* float
`late_rise_clock_incremental_derate_factor`	Returns the late clock path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return Type*: float
`late_rise_data_incremental_derate_factor`	Returns the late data path library cell check incremental derating factor specified through the `set_timing_derate -incremental_adjust` parameter - when the `-rise` parameter is specified. *Return Type*: float
`late_rise_clock_period_derate_factor`	Returns the derate factor for the clock period when the `set_timing_derate` -late and -rise parameters are specified. *Return type:* float
`late_rise_clock_period_mean_derate_factor`	Returns the late/rise derate factor for the clock period when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`late_rise_clock_period_sigma_derate_factor`	Returns the late/rise derate factor for the clock period when the `set_timing_derate -sigma` parameter is specified. *Return type:* float

`late_rise_pulse_width_derate_factor`	Returns the derate factor for the pulse width check when the `set_timing_derate -late` and `-rise` parameters are specified. *Return type:* float
`late_rise_pulse_width_mean_derate_factor`	Returns the late/rise derate factor for the pulse width when the `set_timing_derate -mean` parameter is specified. *Return type:* float
`late_rise_pulse_width_sigma_derate_factor`	Returns the late/rise derate factor for the pulse width when the `set_timing_derate -sigma` parameter is specified. *Return type:* float
`name`	Returns the leaf-level name of the library cell. *Return Type:* string
`object_type`	Returns the object type `lib_cell`. *Return Type:* string
`receiver_capacitance_type`	Returns the value of input capacitance group being used for delay calculations – C1C2 (2-piece model) or C1CN (n-piece model). *Return Type:* string
`retention_cell`	Returns the value of the retention_cell attribute specified in the liberty. *Return type*: string
`timing_model_type`	Returns the model type for a given cell or instance. The supported values are `abstracted`, `extracted`, and `qtm`. *Return type*: string
Library Cell Properties for Power/Ground Objects	
`ground_pins`	Returns a collection of the ground pins of a library cell. *Return type*: collection For example, `get_property [get_lib_cells sc_cmoslp/AO22X] ground_pins`
`is_always_on`	Returns a value of `true` if the `always_on` attribute of a library cell is set to `true` indicating that the library cell is an always-on cell. *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/AON22_X4M] is_always_on`

`is_isolation_cell`	Returns a value of `true` if the library cell is an isolation cell. *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/ISO22_X4M] is_isolation_cell`
`is_power_switch`	Returns a value of `true` when the `switch_cell_type` attribute is defined for a library cell indicating that the library cell is a power-switch cell. *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/AO22X] is_power_switch`
`is_retention`	Returns a value of `true` when the `retention_cell` attribute is defined for a library cell indicating that the library cell is a retention cell. *Return type*: boolean For example, `get_property [get_lib_cells sc_cmoslp/RET22_X4M] is_retention`
`level_shifter_type`	Returns the type of level-shifter (e.g., LH, HL, or HL_LH) as defined by the `level_shifter_type` attribute of a library cell. *Return type*: string For example, `get_property [get_lib_cells sc_cmoslp/A2LVLD_X4M] level_shifter_type`
`lib_pg_pins`	Returns a collection of all PG pins (both power and ground) defined in the library of a library cell. *Return type*: collection For example, `get_property [get_lib_cells sc_cmoslp/AO22X] lib_pg_pins`
`power_pins`	Returns a collection of the power pins of a library cell. *Return type*: collection For example, `get_property [get_lib_cells sc_cmoslp/AO22X] power_pins`
`power_switch_type`	Returns the type of power-switch (e.g., coarse-grain, fine-grain) as defined by the `switch_cell_type` attribute of library cells. *Return type*: string For example, `get_property [get_lib_cells sc_cmoslp/AO22X] power_switch_type`

`std_cell_main_rail_name`	Returns the name of a power rail that has the `std_cell_main_rail` library attribute defined as `true` for a library cell. *Return type*: string For example, `get_property [get_lib_cells sc_cmoslp/AO22X] std_cell_main_rail_name`

Library Pin Properties

`capacitance`	Returns the capacitance for the library pin. *Return type:* float
`capacitance_max_fall`	Returns the maximum value of the falling capacitance range. *Return type:* float
`capacitance_max_rise`	Returns the maximum value of the rising capacitance range. *Return type:* float
`capacitance_min_fall`	Returns the minimum value of the falling capacitance range. *Return type:* float
`capacitance_min_rise`	Returns the minimum value of the rising capacitance range. *Return type:* float
`direction`	Returns the direction of the library pin: `in`, `out`, or `inout`. *Return type:* string
`fanout_load`	Returns the fanout load value of the library pin. *Return type:* float
`hierarchical_name`	Returns the hierarchical name of the library pin. *Return type:* string
`is_async`	Returns a value of `true` if the library pin is an asynchronous preset pin, or an asynchronous clear pin. *Return type:* boolean
`is_clear`	Returns a value of `true` if the pin is an asynchronous clear pin. *Return type:* boolean

`is_clock`	Returns a value of `true` if the library pin definition includes `clock:true`. *Return type:* boolean
`is_data`	Returns a value of `true` if the library pin with defined sequential arcs is the data pin of a flip-flop. *Return type:* boolean
`is_fall_edge_triggered_clock`	Returns a value of `true` if the library pin is the clock pin of a falling edge triggered device. *Return type:* boolean
`is_fall_edge_triggered_data`	Returns a value of `true` if the library pin is the data pin of a falling edge triggered device. *Return type:* boolean
`is_negative_level_sensitive_clock`	Returns a value of `true` if the library pin is an enable pin of an active low level-sensitive device. *Return type:* boolean
`is_negative_level_sensitive_data`	Returns a value of `true` if the pin is a data pin of an active low level-sensitive device. *Return type:* boolean
`is_pll_feedback_pin`	Returns a value of `true` if the Liberty library `is_pll_feedback_pin` attribute is set to `true` for this library pin. *Return type:* boolean
`is_pll_output_pin`	Returns a value of `true` if the Liberty library `is_pll_output_pin` attribute is set to `true` for this library pin. *Return type:* boolean
`is_pll_reference_pin`	Returns a value of `true` if the Liberty library `is_pll_reference_pin` attribute is set to `true` for this library pin. *Return type:* boolean
`is_positive_level_sensitive_clock`	Returns a value of `true` if the library pin is an enable pin of an active high level-sensitive device. *Return type:* boolean
`is_positive_level_sensitive_data`	Returns a value of `true` if the pin is a data pin of an active high level-sensitive device. *Return type:* boolean

`is_preset`	Returns a value of `true` if the pin is a preset pin. *Return type:* boolean
`is_rise_edge_triggered_clock`	Returns a value of `true` if the library pin is the clock pin of a rising edge triggered device. *Return type:* boolean
`is_rise_edge_triggered_data`	Returns a value of `true` if the library pin is the data pin of a rising edge triggered device. *Return type:* boolean
`is_tristate`	Returns a value of `true` if the library pin definition includes `three_state:true`. *Return type:* boolean
`max_capacitance`	Returns the maximum capacitance limit for the library pin. *Return type:* float
`max_fanout`	Returns the maximum fanout value for the library pin. *Return type:* float
`max_transition`	Returns the maximum transition time limit specified for a given library pin. If the limit is not specified for a library pin, then the limit specified at the corresponding library level will be used. *Return type:* float
`min_transition`	Returns the minimum transition time limit specified for a given library pin. If the limit is not specified for a library pin, then the limit specified at the corresponding library level will be used. *Return type:* float
`min_capacitance`	Returns the minimum capacitance limit for the library pin. *Return type:* float
`min_fanout`	Returns the minimum fanout value for the library pin. *Return type:* float
`name`	Returns the leaf-level name of the library cell pin. *Return type:* string
`object_type`	Returns the object type; in this case, `lib_pin`. *Return type:* string

`related_ground_pin_name`	Returns related ground pin names for the corresponding library pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin_name`
`related_power_pin_name`	Returns related power pin names for the corresponding library pins. *Return type:* string
`slew_threshold_percent_fall_high`	Returns the upper slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_fall_low`	Returns the lower slew trip point for falling waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_high`	Returns the upper slew trip point for rising waveforms, specified as a percent. *Return type:* float
`slew_threshold_percent_rise_low`	Returns the lower slew trip point for rising waveforms, specified as a percent. *Return type:* float
Library Signal Pin Properties for Power/Ground Objects	
`input_signal_level_voltage`	Returns the voltage value corresponding to the power rail name/signal which is defined for the library-cell input pin. This voltage value is the full rail-to-rail voltage value that is associated with the relative power rail name through the `voltage_map` attribute defined in the library. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] input_signal_level_voltage`
`is_always_on`	Returns a value of `true` if the `always_on` attribute of a library signal pin is set to `true` indicating that the library cell signal pin is an always-on pin. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_always_on`

`is_isolated`	Returns a value of `true` if the `is_isolated` attribute of a library signal pin is set to `true` indicating that the library cell signal pin is an internally isolated pin. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolated`
`is_isolation_cell_data`	Returns a value of `true` if the `isolation_cell_data_pin` attribute of a library signal pin is set to `true` indicating that the library cell signal pin is a data pin of an isolation library cell. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolation_cell_data`
`is_isolation_cell_enable`	Returns a value of `true` if the `isolation_cell_enable_pin` attribute of a library signal pin is set to `true` indicating that the library cell signal pin is an enable or control pin of an isolation library cell. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolation_cell_enable`
`is_level_shifter_data`	Returns a value of `true` if the `level_shifter_data_pin` attribute of a library signal pin is set to `true`, indicating that the library cell signal pin is a data pin of a library level-shifter cell. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_level_shifter_data`
`is_level_shifter_enable`	Returns a value of `true` if the `level_shifter_enable_pin` attribute of a library signal pin is set to be `true` indicating that the library-cell signal pin is an enable pin of a library level shifter cell. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_isolation_cell_enable`
`is_power_switch_enable`	Returns a value of `true` if the `switch_cell_type` attribute of the corresponding library cell is defined and the `switch_pin` attribute of the given library-cell signal pin is defined to be `true`. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_power_switch_enable`

`is_retention_cell_enable`	Returns a value of `true` if the `retention_pin` attribute of a signal pin is defined. *Return type:* boolean For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] is_retention_cell_enable`
`output_signal_level`	Returns the power rail name/signal that is defined for a library cell output and inout pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] output_signal_level`
`output_signal_level_high`	Returns the upper/higher limit of partial voltage swing value that is defined for a library cell output and inout pins. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] output_signal_level_high`
`output_signal_level_low`	Returns the lower limit of partial voltage swing value that is defined for a library cell output and inout pins. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] output_signal_level_low`
`related_ground_pin`	Returns the related ground pins as a collection for the corresponding library cell pins. *Return type:* collection For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin`
`related_ground_pin_name`	Returns the related ground pin names for the corresponding library cell pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin_name`
`related_ground_pin_rail_voltage`	Returns the voltage value corresponding to the ground rail name defined for the `related_ground_pin` attribute of the library cell pin. This voltage value is the full rail-to-rail value that is associated with the relative ground rail name through the `voltage_map` attribute defined in the library. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_ground_pin_rail_voltage`

`related_power_pin`	Returns the related power pins as a collection for the corresponding library cell pins. *Return type:* collection For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_power_pin`
`related_power_pin_name`	Returns the related power pin names for the corresponding library cell pins. *Return type:* string For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_power_pin_name`
`related_power_pin_rail_voltage`	Returns the voltage value corresponding to the power rail name defined for the `related_power_pin` attribute of a library cell pin. This voltage value is the full rail-to-rail value that is associated with the relative power rail name through the `voltage_map` attribute defined in the library. *Return type:* float For example, `get_property [get_lib_pins sc_cmoslp/AO22X/I1] related_power_pin_rail_voltage`

Library Pin Properties for Power/Ground Objects

`is_std_cell_main_rail`	Returns a value of true if the library power pg_pin is the main rail of the library cell. It is determined by the std_cell_main_rail library attribute of library pg_pin. *Return type*: boolean For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] is_std_cell_main_rail`
`name`	Returns the name of the library pg pin as defined in the library and associated with the pg_pin library attribute. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] name`
`object_type`	Returns lib_pg_pin as the object type for a library pg pin. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] object_type`

`pg_type`	Returns the type of the library pg pin as associated with the pg_type attribute of the corresponding library pg pin.
	Return type: string
	
	For example,
	`get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] pg_type`
	`get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X] -filter " name =~ *VDD*" ] pg_type`

`rail_name`	Returns the name of the rail to which the pg-pin is connected and is associated with the voltage_name attribute of the library pg-pin. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] rail_name`
`rail_voltage`	Returns the voltage from the voltage_map association of the rail to which the library pg-pin is connected. *Return type*: float For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] rail_voltage`
`tied_to`	Returns the library pg pin which is connected to substrate-bias pg pin. *Return type*: string For example, `get_property [get_lib_pg_pins -of_objects [get_lib_cells sc_cmoslp/AO22X]] tied_to`

Library Timing Arc Properties

`from_lib_pin`	Returns a collection of the source library pins of the library timing arc. *Return type:* collection
`is_disabled`	Return a value of `true` if a `set_disable_timing` constraint exists for a an arc. *Return type:* boolean
`object_type`	Returns the object type `lib_timing_arc`. *Return type:* string
`sdf_cond`	Returns the `sdf_cond` expression specified for the timing library arc in the library. *Return type:* string
`sense`	Returns the `timing_sense` specified for the timing library arc in the library. *Return type:* string
`to_lib_pin`	Returns a collection of the sink library pins of the library timing arc. *Return type:* collection
`timing_type`	Returns the type specified for the timing library arc in the library. *Return type:* string
`when`	Returns the `when` condition specified for the library timing arc in the library. *Return type:* string

Net Properties

`attackers`	Reports the parasitic data on a net - capacitance, resistance, or cross-coupling. *Return type:* collection
`capacitance_max`	Returns the total capacitance of the net for maximum conditions. *Return type:* float
`coupling_capacitance_max`	Returns the maximum value of coupling capacitance of a net over all the views. *Return type:* float
`capacitance_min`	Returns the total capacitance of the net for minimum conditions. *Return type:* float

`coupling_capacitance_min`	Returns the minimum value of coupling capacitance of a net over all the views. *Return type:* float
`driver_pins`	Returns a collection of the driver pins of the net. *Return type:* collection
`early_fall_clk_net_derate_factor`	Returns the early fall clock net derating factor specified through `set_timing_derate` command. *Return type:* float
`early_fall_clk_net_delta_derate_factor`	Returns the early fall clock delta delay net derating factor specified through the `set_timing_derate` command. *Return type:* float
`early_fall_data_net_delta_derate_factor`	Returns the early fall data delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`early_fall_data_net_derate_factor`	Returns the early fall data net derating factor specified through `set_timing_derate` command. *Return type:* float
`early_rise_clk_net_delta_derate_factor`	Returns the early rise clock delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`early_rise_clk_net_derate_factor`	Returns the early rise clock net derating factor specified through the `set_timing_derate` command. *Return type:* float
`early_rise_data_net_delta_derate_factor`	Returns the early rise data delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`early_rise_data_net_derate_factor`	Returns the early rise data net derating factor specified through the `set_timing_derate` command. *Return type:* float
`has_detailed_parasitics`	Returns a value of `true` if the net, or one of its parts, has detailed parasitics associated with it from either RC extraction or SPEF annotation. *Return type:* boolean

`hierarchical_name`	Returns the complete hierarchical name of the net. *Return type:* string
`is_ideal`	Returns a value of true if `set_ideal_latency`, `set_ideal_transition`, or `set_ideal_network` constraints exist for the net. *Return type*: Boolean
`late_fall_clk_net_delta_derate_factor`	Returns the late fall clock delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_fall_clk_net_derate_factor`	Returns the late fall clock net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_fall_data_net_delta_derate_factor`	Returns the late fall data delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_fall_data_net_derate_factor`	Returns the late fall data net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_rise_clk_net_delta_derate_factor`	Returns the late rise clock delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_rise_clk_net_derate_factor`	Returns the late rise clock net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_rise_data_net_delta_derate_factor`	Returns the late rise data delta net derating factor specified through the `set_timing_derate` command. *Return type:* float
`late_rise_data_net_derate_factor`	Returns the late rise data net derating factor specified through the `set_timing_derate` command. *Return type:* float
`is_dont_touch`	Returns a value of `true` if a `set_dont_touch` constraint exists for the net. *Return type:* boolean
`load_pins`	Returns a collection of the load pins of the net. *Return type:* collection

`lumped_capacitance_max`	Returns the maximum value of capacitance of a net based on the input library and parasitic model. *Return type:* float
`lumped_capacitance_min`	Returns the minimum value of capacitance of a net based on the input library and parasitic model. *Return type:* float
`name`	Returns the name of the net. *Return type:* string
`num_driver_pins`	Returns the number of driver pins on a net. *Return type*: integer
`num_load_pins`	Returns the number of load pins on the net. *Return type*: collection
`object_type`	Returns the object type `net`. *Return type:* string
`pin_capacitance_max`	Returns the sum of all pin capacitances of the net for maximum conditions. *Return type:* float
`pin_capacitance_max_fall`	Returns the sum of all pin capacitances of the net for the maximum value of the rising capacitance range. *Return type:* float
`pin_capacitance_max_rise`	Returns the sum of all pin capacitances of the net for the maximum value of the falling capacitance range. *Return type:* float
`pin_capacitance_min`	Returns the sum of all pin capacitances of the net for minimum conditions. *Return type:* float
	Note: For all the `pin_capacitance_*` properties (described above), the pin capacitance matches with the capacitance displayed under the `pin_load` column of the `report_timing` output.
`resistance_max`	Returns the maximum value of resistance of a net. *Return type*: float
`resistance_min`	Returns the minimum value of resistance of a net. *Return type*: float

`total_lumped_capacitance_max_fall`	Returns the maximum value of falling capacitance of a net based on the input library and parasitic model. *Return type:* float
`total_lumped_capacitance_max_rise`	Returns the maximum value of rising capacitance of a net based on the input library and parasitic model. *Return type:* float
`total_lumped_capacitance_min_fall`	Returns the minimum value of falling capacitance of a net based on the input library and parasitic model. *Return type:* float
`total_lumped_capacitance_min_rise`	Returns the minimum value of rising capacitance of a net based on the input library and parasitic model. *Return type:* float
`wire_capacitance_max`	Returns the wire capacitance of the net for maximum conditions. *Return type:* float
`wire_capacitance_min`	Returns the wire capacitance of the net for minimum conditions. *Return type:* float

Net Properties for Power/Ground Objects

`hierarchical_name`	Returns the name of the PG net connected to the corresponding PG pin.
	Return type: string
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] hierarchical_name`
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] -filter "is_power == true" ] hierarchical_name`

`is_ground`	Returns a value of `true` if the PG net is a ground net.
	Return type: boolean
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] is_ground`
	`get_property [get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/out_reg] ]] is_ground`

`is_power`	Returns a value of `true` if the PG net is a power net.
	Return type: boolean
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] is_power`
	`get_property [get_pg_nets -of_objects [get_cells iA/out_reg] -filter "name =~ *VDD*" ] is_power`

`voltage_max`	Returns the maximum voltage of a given PG net. This could be voltage associated with a driver term of a net, power intent or CPF, `related_pg_pins` attribute in Liberty, or the operating voltage of a power domain or system default voltage. *Return type*: float For example, `get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] voltage_max`
`voltage_min`	Returns the minimum voltage of a given PG net. This could be voltage associated with a driver term of a net, power intent or CPF, `related_pg_pins` attribute in Liberty or the operating voltage of a power domain or system default voltage. *Return type*: float For example, `get_property [get_pg_nets -of_objects [get_cells iA/out_reg] ] voltage_min`
`object_type`	Returns `pg_net` as the object type for a library PG pin. *Return type*: string For example, `get_property [get_pg_nets -of_objects [get_cells iA/out_reg]] object_type`

`parent_pg_net`	Returns a collection of a parent power net that is the net powering the power switch that drives the PG net. In case of designs that do not have any power switches powering the instances, this property will always return the net directly powering those instances. It therefore be noted that the usage of this property is more relevant for designs in which the leaf cell instances are powered through power switch cells.
	Return type: Collection
	
	For example,
	`get_property [get_pg_nets mmu/U1/vdd] parent_pg_net`
	`get_property [get_pg_nets -of_objects [get_cells iA/pwr_swtch] ] parent_pg_net`

`top_pg_net`	Returns a collection of the top most un-switched power net of the current PG net. Even in the case of a cascading of power switches present in a design, the software traces through all power switches back to the un-switched top-level primary power net. The top-most un-switched power net will be returned - switched output power net will not be returned.
	Return type: Collection
	
	For example,
	`get_property [get_pg_nets -of_objects [get_cells iA/pwr_swtch] ] top_pg_net`
	`get_property [get_pg_nets -of_objects [get_pg_pins -of_objects [get_cells iA/pwr_swtch] ]] top_pg_net`

Path Group Properties

`name`	Returns the name of the path group. *Return type:* string
`hierarchical_name`	Returns the hierarchical name of the path group. *Return type:* string
`object_type`	Returns the object type `path_group`. *Return type:* string

Pin Properties

`actual_latency_early_fall_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early fall insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early fall insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_early_fall_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early fall insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early fall insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float

`actual_latency_early_rise_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early rise source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_early_rise_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual early rise source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual early rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_fall_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late fall source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late fall source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_fall_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late fall source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late fall source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float

`actual_latency_late_rise_max`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late rise source insertion delay in setup mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`actual_latency_late_rise_min`	When specified with the `set_clock_latency -clock` parameter, returns the worst actual late rise source insertion delay in hold mode for the specified clock at the given pin. The latency reported is ideal or propagated, depending on the clock phase. When specified without the `-clock` parameter, returns the worst actual late rise source insertion delay on the pin. If multiple clocks reach the pin, the reported latency is the worst among all the clocks. When specified with the `-view` parameter, returns the worst latency for the given view. *Return type:* float
`arrival_clocks`	Returns the data phases, clock source data phases, and latency phases. *Return type:* collection The following attributes support these phases: • `timing_property_arrival_clocks_consider_clock_source_data_phase`: Considers the clock source data phases. • `timing_property_arrival_clocks_consider_data_phase`: Considers the pure data phase. • `timing_property_arrival_clocks_consider_latency_phase`: Considers the latency phase. By default, these attributes are set to `true`.
`arrival_max_fall`	Returns the arrival time for the falling transition at the max corner. *Return type:* float
`arrival_max_rise`	Returns the arrival time for the rising transition at the max corner. *Return type:* float

`arrival_mean_max_fall`	Returns the mean component of the arrival time for the falling transition at the max corner. *Return type:* float
`arrival_mean_max_rise`	Returns the mean component of the arrival time for the rising transition at the max corner. *Return type:* float
`arrival_mean_min_fall`	Returns the mean component of the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_mean_min_rise`	Returns the mean component of the arrival time for the rising transition at the min corner. *Return type:* float
`arrival_min_fall`	Returns the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_min_rise`	Returns the arrival time for the rising transition at the min corner. *Return type:* float
`arrival_sigma_max_fall`	Returns the sigma component of the arrival time for the falling transition at the max corner. *Return type:* float
`arrival_sigma_max_rise`	Returns the mean component of the arrival time for the rising transition at the max corner. *Return type:* float
`arrival_sigma_min_fall`	Returns the sigma component of the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_sigma_min_rise`	Returns the sigma component of the arrival time for the falling transition at the min corner. *Return type:* float
`arrival_window`	Returns the arrival times for the earliest and latest rising and falling transitions in timing window format. *Return type:* string

`attacker_fall_slew`	Returns the minimum falling slew of an attacker driver pin. For example: `get_property [get_pins inst1/y] attacker_fall_slew` *Return type:* float
`attacker_rise_slew`	Returns the minimum rising slew of an attacker driver pin. For example: `get_property [get_pins inst1/y] attacker_rise_slew` *Return type:* float
`capacitance_max_fall`	Returns the maximum value of the falling capacitance range of the corresponding library pin. *Return type:* float
`capacitance_max_rise`	Returns the maximum value of the rising capacitance range of the corresponding library pin. *Return type:* float
`capacitance_min_fall`	Returns the minimum value of the falling capacitance range of the corresponding library pin. *Return type:* float
`capacitance_min_rise`	Returns the minimum value of the rising capacitance range of the corresponding library pin. **Note**: For the `capacitance_max_*` and `capacitance_min_*` properties (described above), the capacitance value does not match with the `pin_load` (`report_timing -format`) in the timing report because the pin load is a sum of all pin capacitances of a net. *Return type:* float
`clock_sources`	Returns a collection of the source pins of all the clocks arriving at the pin. *Return type:* collection
`clocks`	Returns a collection of all of the clocks arriving at the pin. *Return type:* collection
`constant_value`	Returns a constant value of `0` or `1`. *Return type:* integer
`delay_max_fall`	Returns the maximum falling delay - specified using the `set_max_delay -fall` command. *Return type:* float

`delay_max_rise`	Returns the maximum rising delay - specified using the `set_max_delay -rise` command. *Return type:* float
`delay_min_fall`	Returns the minimum falling delay - specified using the `set_min_delay -fall` command. *Return type:* float
`delay_min_rise`	Returns the minimum rising delay - specified using the `set_min_delay -rise` command. *Return type:* float
`direction`	Returns the direction of the pin: `in`, `out`, or `inout`. *Return type:* string
`fanin`	Returns the number of sources connected with net of the specified pin. *Return type:* integer
`fanout`	Returns the number of sinks connected with the net of the specified pin. *Return type:* integer
`fanout_load`	Returns the fanout load for the pin. *Return type:* float
`hierarchical_name`	Returns the complete hierarchical name of the pin. *Return type:* string
`hold_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the pin. *Return type:* float

`holding_resistance_high`	Returns the highest holding resistance of a pin.
	For example,
	`foreach pin $pinList {`
	`set vicArray [get_property [get_pins $pin] noise_victim]`
	`foreach_in_collection vic $vicArray {`
	`get_property $vic holding_resistance_high`
	`}`
	Return type: float

`holding_resistance_low`	Returns the lowest holding resistance of a pin. *Return type:* float

`interp_info_max`	Returns information for late analysis. When specified, the report output will show the data for interpolation, extrapolation, and/or matched information for late analysis, along with the library details. *Return type:* string
`interp_info_min`	Returns information for early analysis. When specified, the report output will show the data for interpolation, extrapolation, and/or matched information for early analysis, along with the library details. *Return type:* string
`is_async`	Returns a value of `true` if the pin is an asynchronous clear or preset pin. *Return type:* boolean
`is_clear`	Returns a value of `true` if the pin is an asynchronous clear pin. *Return type:* boolean
`is_clock`	Returns a value of `true` if the pin has the Liberty pin attribute: `clock`. *Return type:* boolean
`is_clock_gating`	Returns a value of `true` if the pin is defined as a pin of a clock gating cell. *Return type:* boolean
`is_clock_gating_clock`	Returns a value of `true` if the pin is defined as a clock pin of a clock gating cell. *Return type:* boolean
`is_clock_gating_enable`	Returns a value of `true` if the pin corresponds to the enable pin of a clock gating cell. *Return type:* boolean
`is_clock_used_as_clock`	Returns a value of `true` if the pin lies in the clock network and at least one of the clocks arriving at the pin is used as a clock in the downstream network of the pin. When the `-clock` parameter is specified, this property returns `true` if the above condition is satisfied for the specified clock. *Return type*: boolean

`is_clock_used_as_data`	Returns a value of `true` if the pin lies in the clock source path and at least one of the clocks arriving on the pin is used as data in the downstream network of the pin. When the `-clock` parameter is specified, this property returns `true` if the above condition is satisfied for the specified clock. *Return type*: boolean
`is_data`	Returns a value of `true` if the pin is a data pin of a flip-flop (that is, is not a clock pin). *Return type:* boolean
`is_disable_timing`	Returns a value of `true` if the pin's timing has been disabled. Return type: boolean **Note**: This property checks if the associated arc for the pin is active for propagation and analysis.
`is_fall_edge_triggered_clock`	Returns a value of `true` if the pin is a clock pin of a flop, and is triggered by the falling edge of a clock. *Return type:* boolean
`is_fall_edge_triggered_data`	Returns a value of `true` if the pin corresponds to the data pin of a fall edge triggered device. *Return value:* boolean
`is_hierarchical`	Returns a value of `true` if the pin is a pin of a hierarchical module. *Return type:* boolean
`is_isolated`	Returns a value of `true` when a pin is connected to an isolated instance. The `is_isolation` attribute indicates that the isolation cell is inside a module. So if the module is used as macro or black-box, the software will interpret the pin to be already isolated and no additional isolation will be required. *Return type:* boolean
`is_multiple_clock_fanin_point`	Returns a value of `true` if multiple clock phases converge at the pin. *Return type:* boolean
`is_negative_level_sensitive_clock`	Returns a value of `true` if the library pin is an enable pin of an active low level-sensitive device. *Return type:* boolean
`is_negative_level_sensitive_data`	Returns a value of `true` if the pin is a data pin of an active low level-sensitive device. *Return type:* boolean

`is_pin`	Returns a value of `true`. The `is_pin` and `is_port` queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. `is_port` always returns `false` for pins. `is_pins` always returns `false` for ports. *Return type:* boolean
`is_port`	Returns a value of `false`. The `is_pin` and `is_port` queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. `is_port` always returns `false` for pins. `is_pins` always returns `false` for ports. *Return type:* boolean
`is_positive_level_sensitive_clock`	Returns a value of `true` if the library pin is an enable pin of an active high level-sensitive device. *Return type:* boolean
`is_positive_level_sensitive_data`	Returns a value of `true` if the pin is a data pin of an active high level-sensitive device. *Return type:* boolean
`is_preset`	Returns a value of `true` if the pin is a preset pin. *Return type:* boolean
`is_propagated_clock`	Returns a value of `true` if there is an explicit `set_propagated_clock` assertion at the pin. *Return type:* boolean
`is_rise_edge_triggered_clock`	Returns a value of `true` if the pin is a clock pin of a flop, and is triggered by the rising edge of a clock. *Return type:* boolean
`is_rise_edge_triggered_data`	Returns a value of `true` if the pin corresponds to the data pin of a rise edge-triggered device. *Return type:* boolean
`is_tristate`	Returns a value of `true` if the pin has the `three_state` attribute in the Liberty timing library. *Return type:* boolean

`is_tristate_enable`	Returns a value of `true` if the pin is the source pin of timing arcs with either the `three_state_enable` or `three_state_disable` attribute in the Liberty timing library. *Return type:* boolean
`is_tristate_output`	Returns a value of `true` if the pin corresponds to a three-state output pin. *Return type:* boolean
`latency_fall_max`	Returns the maximum fall insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`latency_fall_min`	Returns the minimum fall insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`latency_rise_max`	Returns the maximum rise insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`latency_rise_min`	Returns the minimum rise insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`max_capacitance`	Returns the maximum capacitance limit for the pin. *Return type:* float
`max_fanout`	Returns the maximum fanout load that the pin can drive. This value is set using the `set_max_fanout` command or the `default_max_fanout` library attribute. *Return type:* float
`max_transition`	Returns the maximum transition time limit specified for the pin. *Return type:* float
`min_fanout`	Returns the minimum fanout design rule limit of the corresponding library pin. *Return type:* float
`net_name`	Returns the name of the net connected to the specified pin. *Return type:* string
`noise_victim`	Returns a collection of `si_victim` objects that can be used to query glitch attributes. *Return type:* collection

`object_type`	Returns the object type `pin`. *Return type:* string
`power_rail_voltage_bidir_input_max`	Reports power rail voltage for input part of bidi pins/ports for maximum operating condition. *Return type:* float
`power_rail_voltage_bidir_input_min`	Reports power rail voltage for input part of bidi pins/ports for minimum operating condition. *Return type:* float
`power_rail_voltage_max`	Reports power rail voltage for maximum operating condition for bidirectional, input and output pins. For bidirectional pins, the power rail voltage for output signal is reported. *Return type:* float
`power_rail_voltage_min`	Reports power rail voltage for minimum operating condition for bidirectional, input and output pins. For bidirectional pins, the power rail voltage for output signal is reported. *Return type:* float
`receiver_ccc_type`	Returns the type of receiver cell model. The return values can be udn, single_ccc, dual_ccc, multi_ccc, or black_box. This attribute applies to receiver pins only. For example, `get_property [get_pins inst1/a] receiver_ccc_type` *Return type:* string
`ref_lib_pin_name`	Returns the name of the library pin associated with the instance pin. *Return type:* string
`setup_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the pin. *Return type:* float
`si_victim`	Returns a collection of the `si_victim` objects that can be used to query graph-based SI delay attributes. *Return type:* collection
`slack_max_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified pin in late mode. *Return type:* string
`slack_max_fall`	Returns the slack time for the falling transition at the max corner. *Return type:* float

`slack_max_rise`	Returns the slack time for the rising transition at the max corner. *Return type:* float
`slack_mean_max_fall`	Returns the mean component of the slack time for the falling transition at the max corner. *Return type:* float
`slack_mean_max_rise`	Returns the mean component of the slack time for the rising transition at the max corner. *Return type:* float
`slack_mean_min_fall`	Returns the mean component of the slack time for the falling transition at the min corner. *Return type:* float
`slack_mean_min_rise`	Returns the mean component of the slack time for the rising transition at the min corner. Return type: float
`slack_min_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified pin in early mode. *Return type:* string
`slack_min_fall`	Returns the slack time for the falling transition at the min corner. *Return type:* float
`slack_min_rise`	Returns the slack time for the rising transition at the min corner. *Return type:* float
`slack_sigma_max_fall`	Returns the sigma component of the slack time for the falling transition at the max corner. *Return type:* float
`slack_sigma_max_rise`	Returns the sigma component of the slack time for the rising transition at the max corner. *Return type:* float
`slack_sigma_min_fall`	Returns the sigma component of the slack time for the falling transition at the min corner. *Return type:* float
`slack_sigma_min_rise`	Returns the sigma component of the slack time for the rising transition at the min corner. *Return type:* float

`slew_max_fall`	Returns the slew time for the falling transition at the max corner. *Return type:* float
`slew_max_rise`	Returns the slew time for the rising transition at the max corner. *Return type:* float
`slew_mean_max_fall`	Returns the mean component of the slew time for the falling transition at the max corner. *Return type:* float
`slew_mean_max_rise`	Returns the mean component of the slew time for the rising transition at the max corner. *Return type:* float
`slew_mean_min_fall`	Returns the mean component of the slew time for the falling transition at the min corner. *Return type:* float
`slew_mean_min_rise`	Returns the mean component of the slew time for the rising transition at the min corner. *Return type:* float
`slew_min_fall`	Returns the slew time for the falling transition at the min corner. *Return type:* float
`slew_min_rise`	Returns the slew time for the rising transition at the min corner. *Return type:* float
`slew_sigma_max_fall`	Returns the sigma component of the slew time for the falling transition at the max corner. *Return type:* float
`slew_sigma_max_rise`	Returns the sigma component of the slew time for the rising transition at the max corner. *Return type:* float
`slew_sigma_min_fall`	Returns the sigma component of the slew time for the falling transition at the min corner. *Return type:* float
`slew_sigma_min_rise`	Returns the sigma component of the slew time for the falling transition at the min corner. *Return type:* float

`source_latency_early_fall_max`	Returns the maximum early fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_early_fall_min`	Returns the minimum early fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_early_rise_max`	Returns the maximum early rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_early_rise_min`	Returns the minimum early rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_fall_max`	Returns the maximum late fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_fall_min`	Returns the minimum late fall source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_rise_max`	Returns the maximum late rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`source_latency_late_rise_min`	Returns the minimum late rise source insertion delay specified by an explicit `set_clock_latency` at the pin. *Return type:* float
`stolen_slack`	Returns the slack stolen at the specified pin. This property can be queried only for pins in late mode. **Note:** The specified pin must be the endpoint of a transparent latch flush arc. *Return type:* float
`user_constant_value`	Returns constant values from netlist or constraints. *Return type*: integer
`x_coordinate`	Returns the x coordinates of the placed pin. *Return type:* float

`y_coordinate`	Returns the y coordinates of the placed pin. *Return type:* float

Pin Properties for Power/Ground Objects	
`input_signal_level`	Returns the rail name of the `related_power_pin` of an input signal pin. *Return type:* string For example, `get_property [get_pins mmu/U1/I] input_signal_level`
`input_signal_level_voltage`	Returns the rail voltage of a rail of the `related_power_pin` attribute of the input signal pin. *Return type:* float For example, `get_property [get_pins mmu/U1/I] input_signal_level_voltage`
`is_always_on`	Returns a value of `true` if an instance pin is an always-on pin. *Return type:* boolean For example, `get_property [get_pins mmu/U1/AON] is_always_on`
`is_isolation_cell_data`	Returns a value of `true` if the instance signal pin is the data pin of an isolation cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/U2/ISO] is_isolation_cell_data`
`is_isolation_cell_enable`	Returns a value of `true` if the instance signal pin is the enable pin of an isolation cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/U2/ISO_EN] is_isolation_cell_enable`
`is_level_shifter_data`	Returns a value of `true` if the instance signal pin is the data pin of a level-shifter cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/LVL/IN] is_level_shifter_data`

`is_level_shifter_enable`	Returns a value of `true` if the instance signal pin is the enable pin of a level-shifter cell instance. *Return type:* boolean For example, `get_property [get_pins mmu/LVL/EN] is_level_shifter_enable`
`output_signal_level`	Returns the rail name of the `related_power_pin` attribute of the output/inout signal pin. *Return type:* string For example, `get_property [get_pins mmu/U1/Y] output_signal_level`
`related_ground_pin`	Returns the related ground pins as a collection for the corresponding instance pins. *Return type:* collection For example, `get_property [get_pins mmu/U1/I] related_ground_pin`
`related_power_pin`	Returns the related power pins as a collection for the corresponding instance pins. *Return type:* collection For example, `get_property [get_pins mmu/U1/I] related_power_pin`

Pin Properties for Power/Ground Objects

`hierarchical_name`	Returns the complete hierarchical name of the PG pin.
	Return type: string
	
	For example,
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg] ] hierarchical_name`
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg] -filter "pg_type == primary_power" ] hierarchical_name`

`voltage_max`	Returns the maximum voltage of a given PG pin. This could be the voltage associated with a pin, power intent or CPF, `related_pg_pins` attribute in Liberty, or the operating voltage of a power domain or system default voltage. *Return type:* float For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] voltage_max`

`voltage_min`	Returns the minimum voltage of a given PG pin. This voltage may be associated with a pin, power intent or CPF, `related_pg_pins` attribute in Liberty, or the operating voltage of a power domain or system default voltage. *Return type*: float For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] voltage_min`
`net`	Returns the immediate PG net(s) connected to the corresponding PG pin objects, as a collection. *Return type*: Collection For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] net`

`pg_type`	Returns the type of PG pin.
	Return type: string
	
	For example,
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] pg_type`
	`get_property [get_pg_pins -of_objects [get_cells iA/out_reg] -filter "hierarchical_name =~ *VDD*" ] pg_type`

`ref_lib_pin_name`	Returns the name of the library PG pin associated with an instance PG pin. *Return type*: string For example, `get_property [get_pg_pins -of_objects [get_cells iA/out_reg]] ref_lib_pin_name`

Port Properties

`arrival_max_fall`	Returns the worst arrival on the port for a falling signal. *Return type:* float
`arrival_max_rise`	Returns the worst arrival on the port for a rising signal. *Return type:* float
`arrival_min_fall`	Returns the best arrival on the port for a falling signal. *Return type:* float
`arrival_min_rise`	Returns the best arrival on the port for a rising signal. *Return type:* float
`arrival_window`	Returns the arrival times for the earliest and latest rising and falling transitions in timing window format. *Return type:* string

`clock_sources`	Returns a collection of the source pins of all the clocks arriving at the port. *Return type:* collection
`clocks`	Returns a collection of all of the clocks arriving at the port. *Return type:* collection
`constant_value`	Returns a constant value of `0` or `1`. *Return type:* integer
`capacitance_max`	Returns the maximum pin capacitance for the port. *Return type:* float
`capacitance_min`	Returns the minimum pin capacitance for the port. *Return type:* float
`delay_max_fall`	Returns the maximum falling delay value for the port. *Return type:* float
`delay_max_rise`	Returns the maximum rising delay value for the port. *Return type:* float
`delay_min_fall`	Returns the minimum falling delay value for the port. *Return type:* float
`delay_min_rise`	Returns the minimum rising delay value for the port. *Return type:* float
`direction`	Returns the direction of the port: `in`, `out`, or `inout`. *Return type:* string
`drive_resistance_fall_max`	Returns the falling linear drive resistance at the port for the max condition. *Return type:* float
`drive_resistance_fall_min`	Returns the falling linear drive resistance at the port for the min condition. *Return type:* float
`drive_resistance_rise_max`	Returns the rising linear drive resistance at the port for the max condition. *Return type:* float
`drive_resistance_rise_min`	Returns the rising linear drive resistance at the port for the min condition. *Return type:* float
`driving_cell_fall_max`	Returns the name of the library cell used to compute max falling delays and transitions at the port. *Return type:* string

`driving_cell_fall_min`	Returns the name of the library cell used to compute min falling delays and transitions at the port. *Return type:* string
`driving_cell_from_pin_fall_max`	Returns the input pin of the driving cell used in the max fall delay calculation at the port. *Return type:* string
`driving_cell_from_pin_fall_min`	Returns the input pin of the driving cell used in the min fall delay calculation at the port. *Return type:* string
`driving_cell_from_pin_rise_max`	Returns the input pin of the driving cell used in max rise delay calculation at the port. *Return type:* string
`driving_cell_from_pin_rise_min`	Returns the input pin of the driving cell used in min rise delay calculation at the port. *Return type:* string
`driving_cell_library_fall_max`	Returns the name of the library used to compute max falling delays and transitions at the port. *Return type:* string
`driving_cell_library_fall_min`	Returns the name of the library used to compute min falling delays and transitions at the port. *Return type:* string
`driving_cell_library_rise_max`	Returns the name of the library used to compute max rising delays and transitions at the port. *Return type:* string
`driving_cell_library_rise_min`	Returns the name of the library used to compute min rising delays and transitions at the port. *Return type:* string
`driving_cell_max_fall_itrans_fall`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the max falling delay calculation at the port. *Return type:* float
`driving_cell_max_fall_itrans_rise`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the max rising delay calculation at the port. *Return type:* float

`driving_cell_max_rise_itrans_fall`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the max falling delay calculation at the port. *Return type:* float
`driving_cell_max_rise_itrans_rise`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the max rising delay calculation at the port. *Return type:* float
`driving_cell_min_fall_itrans_fall`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the min falling delay calculation at the port. *Return type:* float
`driving_cell_min_fall_itrans_rise`	Returns the falling input transition of the `from_pin` of the driving cell, which is used for the min rising delay calculation at the port. *Return type:* float
`driving_cell_min_rise_itrans_fall`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the min falling delay calculation at the port. *Return type:* float
`driving_cell_min_rise_itrans_rise`	Returns the rising input transition of the `from_pin` of the driving cell, which is used for the min rising delay calculation at the port. *Return type:* float
`driving_cell_pin_fall_max`	Returns the name of the output pin used for max fall delay calculation at the port. *Return type:* string
`driving_cell_pin_fall_min`	Returns the name of the output pin used for min fall delay calculation at the port. *Return type:* string
`driving_cell_pin_rise_max`	Returns the name of the output pin used for max rise delay calculation at the port. *Return type:* string
`driving_cell_pin_rise_min`	Returns the name of the output pin used for min rise delay calculation at the port. *Return type:* string
`driving_cell_rise_max`	Returns the name of the library cell used to compute max rising delays and transitions at the port. *Return type:* string

`driving_cell_rise_min`	Returns the name of the library cell used to compute min rising delays and transitions at the port. *Return type:* string
`fanin`	Returns the number of sources connected with net of the specified port. *Return type:* integer
`fanout`	Returns the number of sinks connected with the net of the specified port. *Return type:* integer
`fanout_load`	Returns the fanout load for ports. (For input ports, the value is the sum of all fanout loads of all connected pins. For output ports, the value is set using `set_fanout_load`.) *Return type:* float
`hierarchical_name`	Returns the complete hierarchical name of the port. *Return type:* string
`hold_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the port. *Return type:* float
`input_slew_max_fall`	Returns the max falling slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`input_slew_max_rise`	Returns the max rising slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`input_slew_min_fall`	Returns the min falling slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`input_slew_min_rise`	Returns the min rising slew for the input or inout ports. (This value is set with the `set_input_transition` command.) *Return type:* float
`is_disable_timing`	Returns a value of `true` if the timing of the port has been disabled using the `set_disable_timing` command. *Return type:* boolean
`is_hierarchical`	Returns a value of `true` if the port is a port of a hierarchical module. *Return type:* boolean

`is_pin`	Returns a value of `false`. The `is_pin` and `is_port` queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. `is_port` always returns `false` for pins. `is_pins` always returns `false` for ports. *Return type:* boolean
`is_port`	Returns a value of `true`. The `is_pin` and `is_port` queries are provided for both pin and port objects to provide a quick way of determining the object type of an identifier. `is_port` always returns `false` for pins. `is_pins` always returns `false` for ports. *Return type:* boolean
`is_propagated_clock`	Returns a value of `true` if there is an explicit `set_propagated_clock` assertion at the port. *Return type:* boolean
`latency_fall_max`	Returns the maximum fall insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`latency_fall_min`	Returns the minimum fall insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`latency_rise_max`	Returns the maximum rise insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`latency_rise_min`	Returns the minimum rise insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`max_fanout`	Returns the maximum fanout load that the port can drive. (This value is set using `set_max_fanout`, or the `default_max_fanout` library attribute.) *Return type:* float
`max_transition`	Returns the maximum transition time limit specified for the port. *Return type:* float
`net_name`	Returns the name of the net connected to the specified port. *Return type:* string

`noise_victim`	Returns a collection of `si_victim` objects that can be used to query glitch attributes. *Return type:* collection
`object_type`	Returns the object type `port`. *Return type:* string
`setup_uncertainty`	Returns the most conservative uncertainty of all possible uncertainty assertions associated with the port. *Return type:* float
`si_victim`	Returns a collection of the `si_victim` objects that can be used to query graph-based SI delay attributes. *Return type:* collection
`slack_max_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified port in late mode. *Return type:* string
`slack_max_fall`	Returns the worst setup slack for a falling signal at the port endpoint. *Return type:* float
`slack_max_rise`	Returns the worst setup slack for a rising signal at the port endpoint. *Return type:* float
`slack_min_edge`	Returns the edge (rise or fall) of the worst slack-causing path at the specified port in early mode. *Return type:* string
`slack_min_fall`	Returns the worst hold slack for a falling signal at the port endpoint. *Return type:* float
`slack_min_rise`	Returns the worst hold slack for a rising signal at the port endpoint. *Return type:* float
`slew_max_fall`	Returns the maximum falling slew from all of the incoming signals on the port. *Return type:* float
`slew_max_rise`	Returns the maximum rising slew from all of the incoming signals on the port. *Return type:* float
`slew_min_fall`	Returns the minimum falling slew from all of the incoming signals on the port. *Return type:* float

`slew_min_rise`	Returns the minimum rising slew from all of the incoming signals on the port. *Return type:* float
`source_latency_early_fall_max`	Returns the maximum early fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_early_fall_min`	Returns the minimum early fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_early_rise_max`	Returns the maximum early rise source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_early_rise_min`	Returns the minimum early rise source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_fall_max`	Returns the maximum late fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_fall_min`	Returns the minimum late fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_rise_max`	Returns the maximum late rise source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`source_latency_late_rise_min`	Returns the minimum late fall source insertion delay specified by an explicit `set_clock_latency` at the port. *Return type:* float
`user_constant_value`	Returns constant values from netlist or constraints. *Return type*: integer
`x_coordinate`	Returns the x coordinates of the placed port. *Return type:* float
`y_coordinate`	Returns the y coordinates of the placed port. *Return type:* float

Timing Arc Properties

`aocv_derate_capture_clock_early_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early capture clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_capture_clock_early_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early capture clock paths with rise sink pin transitions. *Return type:* float
`aocv_derate_capture_clock_late_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late capture clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_capture_clock_late_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late capture clock paths with rise sink pin transitions. *Return type:* float
`aocv_derate_data_early_fall`	Returns AOCV derate values for a timing arc on an early data path with fall transitions. *Return type:* float
`aocv_derate_data_early_rise`	Returns AOCV derate values for a timing arc on an early data path with rise transitions. *Return type:* float
`aocv_derate_data_late_fall`	Returns AOCV derate values for a timing arc on a late data path with fall transitions. *Return type:* float
`aocv_derate_data_late_rise`	Returns AOCV derate values for a timing arc on a late data path with rise transitions. *Return type:* float
`aocv_derate_launch_clock_early_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early launch clock paths with fall sink pin transitions. *Return type:* float

`aocv_derate_launch_clock_early_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of early launch clock paths with rise sink pin transitions. *Return type:* float
`aocv_derate_launch_clock_late_fall`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late launch clock paths with fall sink pin transitions. *Return type:* float
`aocv_derate_launch_clock_late_rise`	Returns graph based AOCV derate factors in AOCV mode for a given timing arc that is a part of late launch clock paths with rise sink pin transitions. *Return type:* float
`aocv_stage_count_capture_clock_early`	Returns graph based AOCV stage count values in AOCV mode for a given timing arc that is a part of early capture clock paths. *Return type:* float
`aocv_stage_count_capture_clock_late`	Returns graph based AOCV stage count values in AOCV mode for a given timing arc that is a part of late capture clock paths. *Return type:* float
`aocv_stage_count_data_early`	Returns AOCV stage count values for a timing arc on an early data path. *Return type:* float
`aocv_stage_count_data_late`	Returns AOCV stage count values for a timing arc on a late data path. *Return type:* float
`aocv_stage_count_launch_clock_early`	Returns AOCV stage count values in AOCV mode for a given timing arc that is a part of early launch clock paths. *Return type:* float
`aocv_stage_count_launch_clock_late`	Returns AOCV stage count values in AOCV mode for a given timing arc that is a part of late launch clock paths. *Return type:* float
`arc_type`	Returns the Liberty `timing_type` attribute of the arc. *Return type:* string
`delay_max_fall`	Returns the fall delay for the max corner. *Return type:* float
`delay_max_rise`	Returns the rise delay for the max corner. *Return type:* float

`delay_mean_max_fall`	Returns the mean component of the maximum falling delay value for the timing arc. *Return type*: float
`delay_mean_max_rise`	Returns the mean component of the maximum rising delay value for the timing arc. *Return type*: float
`delay_mean_min_fall`	Returns the mean component of the minimum falling delay value for the timing arc. *Return type*: float
`delay_mean_min_rise`	Returns the mean component of the minimum rising delay value for the timing arc. *Return type*: float
`delay_min_fall`	Returns the fall delay for the min corner. *Return type:* float
`delay_min_rise`	Returns the rise delay for the min corner. *Return type:* float
`delay_sigma_max_fall`	Returns the 1-sigma variation component of the maximum falling delay for the specified timing arc. *Return type*: float
`delay_sigma_max_rise`	Returns the 1-sigma variation component of the maximum rising delay for the specified timing arc. *Return type*: float
`delay_sigma_min_fall`	Returns the 1-sigma variation component of the minimum falling delay for the specified timing arc. *Return type*: float
`delay_sigma_min_rise`	Returns the 1-sigma variation component of the minimum rising delay for the specified timing arc. Return type: float
`delta_delay_max_fall`	Returns the delta fall delay for the max corner. *Return type:* float
`delta_delay_max_rise`	Returns the delta rise delay for the max corner. *Return type:* float
`delta_delay_min_fall`	Returns the delta fall delay for the min corner. *Return type:* float

`delta_delay_min_rise`	Returns the delta rise delay for the min corner. *Return type:* float
`is_cellarc`	Returns a value of `true` if the arc belongs to a cell. *Return type:* boolean
`is_disabled`	Returns a value of true if a `set_disable_timing` has been applied on the supplied library timing arc. *Return type:* boolean
`mode`	Returns the mode specified for the timing arc in the library. *Return type:* string
`object_type`	Returns the object type `timing_arc`. *Return type:* string
`sdf_cond`	Returns the `sdf_cond` expression specified for the timing arc in the library. *Return type:* string
`sdf_cond_end`	Returns the `sdf_cond_end` expression specified for the timing arc in the library. *Return type:* string
`sdf_cond_start`	Returns the `sdf_cond_start` expression specified for the timing arc in the library. *Return type:* string
`sense`	Returns the sense of the timing arc. *Return type:* string
`sink_pin`	Returns the sink pin of the delay arc, or the reference pin of the check arc. *Return type:* collection
`source_pin`	Returns the source pin of the delay arc, or the signal pin of the check arc. *Return type:* collection
`when`	Returns the `when` condition specified for the timing arc in the library. *Return type:* string

Timing Path Properties

`arrival`	Returns the arrival time at the timing path. *Return type*: float
`arrival_mean`	Returns the mean component of the arrival time for the timing path. *Return type*: float
`arrival_sigma`	Returns the sigma component of the arrival time for the timing path. *Return type*: float
`capture_clock_path`	Returns the capturing clock path of the timing path. This property can be used only for `path_type full_clock`. *Return type:* collection
`capturing_clock`	Returns the capturing clock of the timing path. *Return type:* collection
`capturing_clock_close_edge_time`	Returns the closing edge time of the capturing clock. *Return type:* float
`capturing_clock_close_edge_type`	Returns the capturing clock edge direction: `rise` or `fall`. *Return type:* string
`capturing_clock_is_inverted`	Returns a value of true if the phase of the clock at the end point of the capture clock path is opposite to the phase of the capturing clock at the source. *Return type:* boolean
`capturing_clock_is_propagated`	Returns a value of `true` if the capturing clock is in the propagated mode, at the clock end point. *Return type:* boolean
`capturing_clock_latency`	Returns the ideal or propagated latency of the capturing clock. *Return type:* float
`capturing_clock_open_edge_type`	Returns the opening edge time of the capturing clock. *Return type:* string
`capturing_clock_pin`	Returns the name of the capturing clock pin. *Return type:* collection

`capturing_clock_source_arrival_time`	Returns the capturing clock arrival time at the clock root pin/port of the capturing clock path. This value is a sum of the clock edge time and the source latency constraints specified at the clock root. **Note:** You must specify `report_timing -path_type full_clock` in order to return capturing clock arrival time information. *Return type:* float
`capturing_clock_source_arrival_time_mean`	Returns the mean component of the capturing clock arrival time at the clock root pin/port of the capturing clock path. *Return type:* float
`capturing_clock_source_arrival_time_sigma`	Returns the sigma component of the capturing clock arrival time at the clock root pin/port of the capturing clock path. *Return type:* float
`capturing_point`	Returns a pointer to the end point of the timing path. *Return type:* collection
`capturing_point_is_level_sensitive`	Returns a value of `true` if the end point of the data path is level sensitive. *Return type:* boolean
`check_delay`	Returns the check delay value for the timing path. *Return type:* float
`check_delay_mean`	Returns the mean component of the check delay value for the timing path. *Return type:* float
`check_delay_sigma`	Returns the sigma component of the check delay value for the timing path. *Return type:* float
`clock_path_end_point`	Returns the last point in the capture clock path of the timing path. *Return type:* collection
`clock_uncertainty`	Returns the clock uncertainty of the timing path. *Return type:* float
`cppr_adjustment`	Returns the CPPR adjustment of the timing path. *Return type:* float

`cppr_adjustment_mean`	Returns the mean component of the CPPR adjustment of a timing path. *Return type:* float
`cppr_adjustment_sigma`	Returns the sigma component of the CPPR adjustment of a timing path. *Return type:* float
`cppr_branch_point`	Returns the CPPR branch point of the given timing path. *Return Type*: collection
`drive_adjustment`	Returns the drive adjustment value for the timing path. Return type: float
`drive_adjustment_mean`	Returns the mean component of the drive adjustment value for the timing path. Return type: float
`drive_adjustment_sigma`	Returns the sigma component of the drive adjustment value for the timing path. Return type: float
`external_delay`	Returns the value of the `set_output_delay` constraint at the end point of the path. *Return type:* float
`gba_slack`	Returns the original slack time for the timing path – before PBA retiming is performed. *Return type:* float
`gba_slack_mean`	Returns the mean component of the slack time for the timing path – before PBA retiming is performed. *Return type:* float
`gba_slack_sigma`	Returns the sigma component of the slack time for the timing path – before PBA retiming is performed. *Return type:* float
`hold`	Returns the hold time at the end point of the path. *Return type:* float
`is_clock_gating_hold`	Returns a value of `true` if the path is a clock gating hold check. *Return type*: boolean
`is_clock_gating_setup`	Returns a value of `true` if the path is a clock gating setup check. *Return type*: boolean

`is_transparent_latch`	Returns a value of `true` if the path is a transparent latch path. *Return type:* boolean
`launch_clock_path`	Returns the launching clock path of the timing path. This property can be used only for path_type full_clock. *Return type:* collection
`launching_clock`	Returns the launching clock of the timing path. *Return type:* collection
`launching_clock_is_inverted`	Returns a value of true if the phase of the clock at the start point of the launch clock path is opposite to the phase of the launch clock at the source. *Return type:* boolean
`launching_clock_is_propagated`	Returns a value of `true` if the launching clock is in the propagated mode, at the clock end point. *Return type:* boolean
`launching_clock_latency`	Returns the ideal or propagated latency of the launching clock. *Return type:* float
`launching_clock_latency_mean`	Returns mean component of latency of the launching clock. *Return type:* float
`launching_clock_latency_sigma`	Returns sigma component of latency of the launching clock. *Return type:* float
`launching_clock_open_edge_time`	Returns the opening edge time of the launching clock. *Return type:* float
`launching_clock_open_edge_type`	Returns the launching clock's open edge type at the launching point of the timing path. In case of input delay path with respect to a clock it will return the clock edge type, which is triggering the path. *Return type:* string
`launching_clock_source_arrival_time`	Returns the launching clock arrival time at the clock route pin/port of the launching clock path. This value is the sum of the clock edge time plus any source latency constraint specified at the clock root. **Note:** You must specify `report_timing -path_type full_clock` in order to return launching clock arrival time information. *Return type:* float
`launching_clock_source_arrival_time_mean`	Returns the mean component of the launching clock arrival time at the clock route pin/port of the launching clock path.

`launching_clock_source_arrival_time_sigma`	Returns the sigma component of the launching clock arrival time at the clock route pin/port of the launching clock path. *Return type:* float
`launching_input_delay`	Returns the input delay if the timing path starts from an input or output port. This value is set using `set_input_delay`. *Return type:* float
`launching_point`	Returns a pointer to the start point of the timing path. *Return type:* collection
`launching_point_is_level_sensitive`	Returns a value of `true` if the begin point of the data path is level sensitive. *Return type:* boolean
`object_type`	Returns the object type `timing_path`. *Return type:* string
`other_end_arrival`	Returns the capture clock path's begin time, In case of SOCV analysis, mean+N*sigma quantile value is reported. *Return type:* float
`other_end_arrival_mean`	Returns the mean component of capture clock path's begin time. *Return type:* float
`other_end_arrival_sigma`	Returns the sigma component of capture clock path's begin time. *Return type:* float
`path_delay`	Returns the delay of data path component of a timing path. In case of SOCV analysis, mean+N*sigma quantile delay is reported. *Return type:* float
`path_delay_mean`	Returns the mean delay component of data path of a timing path. *Return type:* float
`path_delay_sigma`	Returns the sigma delay component of data path of a timing path. *Return type:* float
`path_group`	Returns a collection of path groups associated with the timing path. *Return type:* collection
`path_group_name`	Returns the name of the path group for the timing path. *Return type:* string

`path_type`	Returns a value of `max` if the path is for setup, or `min` if the path is for hold. *Return type:* string
`period`	Returns the time duration between the launching clock edge and capturing clock edge of the path. The launching clock edge indicates the launching clock time when the signal at the start point of the path is launched, and the capturing clock edge indicates the capturing clock time when the signal at the path end point is captured. For both of these edges, their ideal clock cycle times are considered for calculating the path period. For those paths, where either the launching or capturing clock is absent or asynchronous, the property prints NA. The property works for both setup (late) paths, and hold (early) paths. Usually the path period is decided by a simple subtraction of effective launching edge from the effective capturing edge of the path. Under certain scenario, these edges are moved back or ahead in time, and accordingly the path period is also affected. The following factors impact period: a) Multicycle paths: The launch or capture edge will move by the cycle factor depending on the type of multi cycle exception, and this cycle factor is taken into account while computing the period. b) Max delay paths: Any max_delay specification overrides the relationship between capturing and launching edges and sets it to the max_delay value. The period of the path is thus returned as equal to the specified max delay value for sequential max delay paths. Note that a combinational max delay path has at least one of the launch or capture clocks either absent or asynchronous, and hence the effective period is not calculated for them. c) Clock uncertainty: The uncertainties applicable to the interaction of launch and capture clocks for this particular path also affect the effective edges, but this factor is not taken into consideration while computing the period. d) Unconstrained paths: The unconstrained paths have no capture clock and hence period can not be calculated for them. The property will return NA. *Return value*: float For more information, see "Examples".
`recovery`	Returns the recovery time at the end point of the path. *Return type:* float

`removal`	Returns the removal time at the end point of the path. *Return type:* float
`required_time`	Returns the required time for the timing path. *Return type:* float
`required_time_mean`	Returns the mean component of the required time for the timing path. *Return type:* float
`required_time_sigma`	Returns the sigma component of the required time for the timing path. *Return type:* float
`setup`	Returns the setup time at the end point of the path. *Return type:* float
`skew`	Returns the latency difference between the capturing clock latency and launching clock latency of the path (after considering the effect of CPPR factor). *Return type:* float
`slack`	Returns the slack time for the timing path. *Return type:* float
`slack_mean`	Returns the mean component of the slack time for the timing path. *Return type:* float
`slack_sigma`	Returns the sigma component of the slack time for the timing path. *Return type:* float
`slack_stddev`	Returns standard deviation of the slack. *Return type:* float
`spatial_distance`	Reports the bounding box distance for spatial derating applied on a timing path. *Return type:* float
`time_borrowed`	Returns the amount of time borrowed from the timing end point. *Return type:* float
`time_lent`	Returns the amount of time lent to the timing start point. *Return type:* float

`timing_points`	Returns a collection of the timing points that make up the path. *Return type:* collection
`underated_slack`	Returns the underated slack time for the timing path. The underated slack value is available with timing path object only if it is generated using the `-derate` parameter. *Return type:* float
`view_name`	Returns the analysis view name associated with the timing path. *Return type*: string

Timing Point Properties

`arrival`	Returns the arrival time at the timing point. *Return type*: float
`arrival_mean`	Returns the mean component of the arrival time at the timing point. *Return type*: float
`arrival_sigma`	Returns the sigma component of arrival time at the timing point. *Return type*: float
`delay`	Returns the delay value for the timing point. *Return type:* float
`delay_mean`	Returns the mean component of the delay value for the timing point. *Return type:* float
`delay_sigma`	Returns the sigma component of the delay value for the timing point. *Return type:* float
`fanin_arc`	Returns the delay arc for the corresponding timing point. *Return type*: collection
`object_type`	Returns the `timing_point` object type. *Return type:* string
`pin`	Returns a collection of pins or ports of the timing point. *Return type:* collection

`si_object`	Returns the `si_victim` object type that can be used to query SI delay attributes. **Note**: To enable SI objects, you can set the `timing_report_enable_si_debug` global variable to `true`.
`slew`	Returns the path-specific slew of the timing point. *Return type:* float
`slew_mean`	Returns the mean component of the path-specific slew of the timing point. *Return type:* float
`slew_sigma`	Returns the sigma component of the path-specific slew of the timing point. *Return type:* float
`transition_type`	Returns the transition type of the timing point - rise or fall. *Return type:* string

Signal Integrity Attributes

The signal integrity attributes can be queried using the following object types:

- `si_victim`
- `si_attacker`
- `noise_victim`: Returns a collection of `si_victim` objects that can be used to query glitch attributes.
  Return type: collection

These are explained below.

si_victim Properties

The following information is saved under the `si_victim` object type:

		Valid for Properties		
Property Name	**Description**	**si_victim**	**si_object**	**noise_victim**
`annotated_glitch`	Reports the annotated glitch. *Return type:* float	N	N	Y

`attackers`	Returns a collection of `si_attacker` objects that can be used to query attacker attributes. *Return type:* collection	Y	Y	Y
`capacitance`	Returns the total capacitance of victim net. *Return type:* float	Y	Y	Y
`coupling_capacitance`	Returns the total coupling capacitance of a victim net. *Return type:* float	Y	Y	Y
`glitch_area`	Returns the glitch area. *Return type:* float	N	N	Y
`glitch_width`	Returns the glitch width. *Return type:* float	N	N	Y
`hierarchical_name`	Returns the hierarchical name of a victim net. *Return type:* string	Y	Y	Y
`input_peak`	Returns the Receiver Input Peak (RIP) value. *Return type:* float	N	N	Y
`input_failure_threshold`	Returns the failure threshold at RIP. This will always be reported irrespective of whether failure happens at RIP or ROP. *Return type:* float	N	N	Y
`level`	Returns the noise level - VL or VH. *Return type:* string	N	N	Y
`num_active_attackers`	Returns the number of active attackers. *Return type:* float	Y	Y	Y

`num_attackers`	Returns the number of total attackers (distinct + accumulated small attacker - as 1). The attackers that are dropped from the accumulated small attackers will not be included with the total attackers. *Return type:* float	Y	Y	Y
`object_type`	Returns the object type `si_victim`. *Return type:* string	Y	Y	Y
`prop_glitch`	Reports the propagated glitch seen at the victim driver output. *Return type:* float	N	N	Y
`receiver_peak`	Returns the Receiver Output Peak (ROP) value. *Return type:* float	N	N	Y
`receiver_peak_threshold`	Returns the failure threshold at ROP. This will always be reported irrespective of whether failure happens at RIP or ROP. *Return type:* float	N	N	Y
`resistance`	Returns the total resistance of a victim net. *Return type:* string	Y	Y	Y
`transition`	Returns the victim transition direction (rise or fall). *Return type:* string	Y	Y	N
`view_type`	Returns the type of analysis (early or late). *Return type:* string	Y	Y	N

si_attacker Properties

The following Information is saved under the `si_attacker` object type for each attacker of the victim net in the path:

Property Name (for each attacker retrieved from a victim)	Description
`coupling_capacitance`	Returns the coupling of a victim net. *Return type:* float
`hierarchical_name`	Returns the hierarchical name of an attacker. *Return type:* string
`is_active`	Returns whether an attacker is active or not. *Return type:* string
`noise_peak`	Returns the Xtalk delay bump induced by an attacker. *Return type:* float
`object_type`	Returns the `si_attacker` object type. *Return type:* string
`slew`	Returns the slew of attackers. *Return type:* float
`state`	Returns the status of attackers. The status descriptions are given below: • SY: Synchronous • INF: Attacker with infinite timing window • PE: Filtered due to physical exclusion • UF: Filtered by user • CN: Filtered because it is a constant net • SB: Filtered due to small bump • TA: Filtered because of timing window does not overlap • LC: Filtered due to logical correlation • NA: Attacker status is not known *Return type:* string

Examples

The following `get_property` example shows the usage of SI attributes to query noise information:

```
source pinlist.tcl
set chan [open attribute.log w]
foreach pin $pinList {
   set vicArray [get_property [get_pins $pin] noise_victim]
   foreach_in_collection vic $vicArray {
       set input_peak [ get_property $vic input_peak]
       #if { $input_peak > 250 } {}

       set vic_name [ get_property $vic hierarchical_name ]
       set x [ get_property [get_net -of_objects $vic_name ] name ]
       set level [ get_property $vic level]
       set ccap [ get_property $vic capacitance]
       set vdd [get_property [get_pins $vic_name] power_rail_voltage_max]
       set libs [get_libs -of_objects [get_lib_cells -of_objects [get_cells -of_objects [get_pins
$vic_name]]]]
       foreach_in_collection libName $libs {set library [get_property $libName hierarchical_name]}
       set prop_glitch [ get_property $vic prop_glitch]
       set cap [format %.2f $ccap]
       set annotated_glitch [ get_property $vic annotated_glitch]
       set receiver_peak [ get_property $vic receiver_peak]
       set input_peak_threshold [ get_property $vic input_failure_threshold ]
       set receiver_peak_threshold [ get_property $vic receiver_peak_threshold]
       puts $chan "-------------------------------------------------------------------------------"
         puts $chan "Peak(mV) Level TotalCap(fF) Vdd(V) Library VictimNet"
         puts $chan "$input_peak $level $cap $vdd $library $vic_name {$x}"

         if { $receiver_peak > 0 } {
           puts $chan "Receiver output peak:"
           puts $chan "Value ReceiverNet"
           puts $chan "$receiver_peak ( $receiver_peak_threshold) $vic_name (CELL)"
         }

         if { $input_peak > 0 } {
           puts $chan "Receiver Input peak:"
           puts $chan "Value ReceiverNet"
           puts $chan "$input_peak ( $input_peak_threshold) $vic_name (CELL)"
         }

         puts $chan "\nConstituents:"
         puts $chan "Source Peak(mV) Offset(ps) Slew(ps) Xcap(fF) Vdd(V) Edge Status Net"
         set aggs [ get_property $vic attackers ]
         foreach_in_collection current_agg $aggs {

           set hierarchical_name [ get_property $current_agg hierarchical_name ]
           set noise_peak [ get_property $current_agg noise_peak]
           set state [ get_property $current_agg state]
           set slew [ get_property $current_agg slew]
           set edge [ get_property $current_agg transition]
```

```
            if {[string match ~* $hierarchical_name]} {
            set vdd [get_property [get_pins $vic_name] power_rail_voltage_max]
            } else {
            set vdd [get_property [get_pins -of_objects [get_nets $hierarchical_name]]
power_rail_voltage_max]
            }
            set coupling_capacitance [ get_property $current_agg coupling_capacitance]

            puts $chan "Cpl: $noise_peak $slew $edge $vdd $coupling_capacitance $state $hierarchical_name"
            }
          if { $prop_glitch > 0 } {
            puts $chan "Prp: $prop_glitch"
           }

}
close $chan
```

User-Defined Properties

The user-defined properties allow you to define certain properties which can be interpreted by the software in a predefined way. When these properties are not specified, the software will revert to the default behavior, as applicable.

Property Name	Type	Description
`capacitive_load_unit`	lib	Provides the load unit mentioned in the library.
`time_unit`	lib	Provides the time unit mentioned in the library.
`aocv_weight`	lib_cell	Defines AOCV weight for a given cell.
`k_input_switching_window_fall*`	lib	Defines the switching window threshold for fall signal during the application of SSI (simultaneous switching input) derating feature. *Default*: 1
`k_input_switching_window_rise*`	lib	Defines the switching window threshold for rise signal during the application of SSI (simultaneous switching input) derating feature. *Default*: 1

* When the above properties are defined in SSI derating environment, the delay of the respective cell multiplied by the above factor will be compared with the difference in (rise/fall) signal arrivals at two inputs to determine if switching derate needs to be applied to cell delay.

Examples

- The following command returns the hierarchical name for the pin contained in the collection referenced by `$pin`:

  ```
  get_property $pin hierarchical_name
  ```

- The following example shows how you can query a user-defined property from `stage_weighting` library at the cell level:

```
set_property [get_lib_arcs -of fast/BUFX2] stage_weighting 3 // sets the value
get_property [get_lib_arcs -of fast/BUFX2] stage_weighting
```

- The following example shows power and ground pins for the corresponding library pins:

```
get_property [get_lib_pins CELLA/A] related_power_pin
get_property [get_lib_pins CELLA/A] related_ground_pin
```

- The following example shows active clocks:

```
get_property [get_clocks Iclk1] is_active true
```

- The following commands define the switching window threshold for rise signal:

```
define_property -type float -object_type lib k_input_switching_window_rise
set_property [get_libs slow] k_input_switching_window_rise 1.1
```

- The following example shows that the phase shift is 2.0 ns, as returned by the "period" property:

```
report_timing -clock_to CLK_W_3 -clock_from CLK_W_3
```

```
  Path 1: MET Setup Check with Pin seg3/u14/CK
  Endpoint: seg3/u14/D (^) checked with leading edge of 'CLK_W_3'
  Beginpoint: seg3/u9/Q (^) triggered by leading edge of 'CLK_W_3'
  Path Groups: {CLK_W_3}
  Other End Arrival Time 0.621
  - Setup 0.186
  + Phase Shift 2.000
  = Required Time 2.434
  - Arrival Time 2.062
  = Slack Time 0.372
  Clock Rise Edge 0.000
  + Clock Network Latency (Prop) 0.682
  = Beginpoint Arrival Time 0.682
  ……..
  > set path [rt -clock_to CLK_W_3 -clock_from CLK_W_3 -collection]
  0x14
  > get_property $path period
  2.000
```

- In this following example, there is a clock reference for launch clock (Null phase- @), so the software does not show any clock period for this path:

```
report_timing -clock_to CLK_W_3 -early
```

```
  Path 1: VIOLATED Hold Check with Pin seg3/u3/CK
  Endpoint: seg3/u3/D (v) checked with leading edge of 'CLK_W_3'
  Beginpoint: IN3 (v) triggered by leading edge of '@'
  Path Groups: {CLK_W_3}
  Other End Arrival Time 0.682
  + Hold -0.034
```

```
+ Phase Shift 0.000
= Required Time 0.648
Arrival Time 0.117
Slack Time -0.531
Clock Rise Edge 0.000
+ Input Delay 0.000
+ Drive Adjustment -0.014
= Beginpoint Arrival Time -0.014

```

Related Commands

- report_property
- set_property
- define_property
- report_object_property_names

index_collection

`index_collection` *`base_collection index`*

Returns a collection containing the object that exists at the specified index of the specified object collection.

Parameters

`base_collection`	Specifies the base collection.
`index`	Specifies the index number. You can specify a number from `0` to *`collection_size-1`*.

Examples

- The following command returns the object that exists at the index number `2` in the object collection referenced by `$nets`:
  index_collection $nets 2

query_objects

`query_objects` *`collection`* `[-limit` *`value`*`]`

Displays the names of the objects contained inside the specified collection.

⚠ `query_objects` displays object names only. To return a tcl list of object names, the `get_object_name` command may be used instead.

Parameters

`collection`	Specifies the object collection for which to print names.
`-limit` *`value`*	Specifies the maximum number of object names to print. Specify a value of `0` to query the names of all of the objects in the collection. *Default*: Prints the first 100 object names in the collection.

Examples

- The following commands create collections of pins and nets, add them together to create a new collection, and prints the names of the objects in the collection:

```
set pins [get_pins {i_block1/b1_Sin1 i_block1/b1_CLK1 i_block1/b1_Sout1}]
set nets [get_nets {Sin1 CLK1 Sout1}]

add_to_collection newVar $pins
add_to_collection newVar $cells

query_objects $newVar
```

  The software returns the following information:

```
i_block1/b1_Sin1 i_block1/b1_CLK1 i_block1/b1_Sout1 Sin1 CLK1 Sout1
```

Related Information

- `get_object_name`

range_collection

```
range_collection
[-help]
base_collection
from
to
```

Returns a sub-collection of the base collection. The sub-collection range lies between the ‘from’ and ‘to’ (including ‘from’ and ‘to’) index numbers specification of this command.

Parameters

`-help`	Prints out the command usage.
`base_collection`	Specifies the base collection.
`from`	Specifies the ‘from’ index number.
`to`	Specifies the ‘to’ index number.

The index number can be an integer or an expression, such as, “end OR end-integer” (with no spaces within the expression).

If the specified to/from value is negative (less than 0), then the software will change this value to 0. If the value is greater than the “collection_size – 1”, then it will be changed to “collection_size – 1”.

Examples

- The following example sets `$points` as the base collection:

```
> set points [get_cells *]
0x13
> sizeof_collection $points
22
```

- The following example returns the sub-collection of the base collection `$points` between the index number range from 2 to 4:

```
> range_collection $points 2 4
clk_buf2 clk_buf3 clk_buf4
0x16
> range_collection $points 4 2
clk_buf2 clk_buf3 clk_buf4
0x17
```

- The following example returns a sub-collection starting from index number 0 till the end of the base collection:

```
> range_collection $points 0 end
clk_buf1 pad1 clk_buf2 clk_buf3 clk_buf4 buf1 buf2 buf3 buf4 mem dff1 dff2 clkand2 pu_cell_1
```

```
pu_lat_1 u1 cg4 genLoop comboLoop pad2 dff3 latch1
0x18
```

- The following example returns a sub-collection starting from end-integers 4 to 2:

```
> range_collection $points end-4 end-2
genLoop comboLoop pad2
0x19
```

- The following example shows a range starting from a negative value to a value greater than the collection size. The following warning messages are displayed:

```
> range_collection $points -5 100
**WARN: (TCLCMD-1419): 'from' index with value -5 is less than start index, so it is changed to 0 .
**WARN: (TCLCMD-1419): 'to' index with value 100 is greater than end index, so it is changed to 21 .
clk_buf1 pad1 clk_buf2 clk_buf3 clk_buf4 buf1 buf2 buf3 buf4 mem dff1 dff2 clkand2 pu_cell_1
pu_lat_1 u1 cg4 genLoop comboLoop pad2 dff3 latch1
0x1a
```

- The following example shows the warning message displayed for a negative start index number:

```
> range_collection $points end-25 end-20
**WARN: (TCLCMD-1419): 'from' index with value -4 is less than start index, so it is changed to 0 .
clk_buf1 pad1
0x1b
```

- The following command shows an error if the specified index number is not an integer:

```
> range_collection $points s end
**ERROR: (TCLCMD-1418): Bad index 's': must be integer? or end?[-]integer?
```

Related Commands

- index_collection

remove_from_collection

```
remove_from_collection
base_collection
[-intersect]
collection_or_obj_list
```

Creates a new collection by removing the objects specified in one collection from another collection.

Parameters

base_collection	Specifies the base collection of objects. Objects from the second collection or object list are removed from this collection to create the new collection.
-intersect	Provides intersection of base collection elements with second collection of objects or lists.
collection_or_obj_list	Specifies the collection or list of objects that should be removed from the base collection to create the new collection.

Examples

- The following commands create a collection of pins that does not include clock pins:

  ```
  set allP [get_pins *]
  set all_pin_no_clock [remove_from_collection $allP [get_pins -filter "is_clock == true"]]
  ```

  You can use the `sizeof_collection` command to see that the `all_pin_no_clock` collection contains fewer objects (that is, no clock pins) than the original `allP` collection:

  ```
  sizeof_collection $allP
  50
  sizeof_collection $all_pin_no_clock
  47
  ```

Related Information

- add_to_collection

report_object_property_names

```
report_object_property_names [-help]
[-obj_type {cell clock design lib lib_cell lib_pin lib_timing_arc net path_group pin port timing_arc
timing_path timing_point}]
```

Lists all of the properties associated with the specified object type.

If you do not specify any object type, this command lists all the supported object types, and all the properties associated with those object types.

Parameters

`-help`	Prints out the command usage.
`-obj_type`	Lists the properties associated with the specified object type. The following object types are supported: cell, clock, design, lib, lib_cell, lib_pg_pin, lib_pin, lib_timing_arc, net, path_group, pg_net, pg_pin, pin, port, si_attacker, si_victim, timing_arc, timing_path, or timing_point Additional SI properties can be included with the `timing_point` object. To enable SI properties, you can set `timing_report_enable_si_debug` global variable to `true`.

Related Commands

- `define_property`
- `get_property`
- `report_property`
- `reset_property`
- `set_property`

report_property

```
report_property
[-help]
{collection | list_of_collections}
[-property_list list of properties]
[{> | >>} filename]
```

Reports the properties associated with each object in the specified collection.

For properties that return a populated collection, the command output displays `{...}`. For any empty collections,`{}` will be displayed.

Parameters

`-help`	Prints out the command usage.
*collection	list_of_collections*	Specifies a collection, or a list of collections to report. The collections can contain any of the following object types: cell, clock, design, lib, lib_cell, lib_pin, lib_pg_pin, pg_net, pg_pin, lib_timing_arc, net, path_group, pin, port, timing_arc, timing_path, or timing_point
`-property_list` *list of properties*	Specifies a list of valid property names to report. **Note**: If the `-property_list` parameter is not specified, then all the properties associated with a collection of objects will be reported.
{`>` | `>>`} *filename*	When specified with >, the software writes the report to the specified file name. If the file already exists, the software overwrites it. When specified with >>, the software writes the report to the specified file name. If the file already exists, the software concatenates the report to the end of the file. You can add the `.gz` extension to the file name to generate a compressed report. **Note:** The file name must be the last argument in the list.

Examples

- The following command shows the values of the specified properties:

```
report_property [get_pins TU11/A] -property_list {name direction clocks}

property | value
name | TU11/A
direction | in
clocks | {...}
```

Related Commands

- get_property
- define_property
- report_object_property_names
- set_property
- reset_property

sizeof_collection

`sizeof_collection` *`collection`*

Returns the total number of objects contained in the specified collection. If the collection contains different types of objects, `sizeof_collection` returns the sum of all the objects of different types in the collection.

Parameters

`collection`	Specifies the collection.

sort_collection

```
sort_collection
[-help]
collection
[-dictionary]
{property_or_list_of_properties}
[-descending]
```

Returns a sorted collection of objects based on the property.

Parameters

`-help`	Prints out the command usage.
collection	Specifies the collection to sort. The collection must be a homogenous collection of any one of the following object types: `cell`, `clock`, `design`, `lib`, `lib_cell`, `lib_pin`, `lib_timing_arc`, `net`, `path_group`, `pin`, `port`, `timing_arc`, `timing_path`, or `timing_point`.
`-descending`	Sorts the objects in the collection by descending order. *Default:* Sorts the collection in ascending order.
`-dictionary`	Sorts the objects in a collection by dictionary order.
property | *list_of_properties*	Sorts the collection by the specified property. You can specify any property associated with the object type. You can specify one or more properties. If you specify more than one property, the software sorts the collection in the order by which you specified the properties.

Examples

- The following command returns a collection of all the input ports in the design sorted on the basis of their hierarchical names:

```
> sort_collection [all_inputs] hierarchical_name

CLK1 CLK2 CLK3 CLK4 IN1 IN2 IN3 IN4
```

2

ART Based Flow Commands

- clear_active_logic_view
- create_active_logic_view
- get_module_view
- set_module_view

clear_active_logic_view

```
clear_active_logic_view
[-help]
```

Resets the reduced timing graph created by `clear_active_logic_view` back to the original timing graph.

Parameters

`-help`	Outputs a brief description of the `clear_active_logic_view` command. For a detailed description of the command, use the `man` command: `man clear_active_logic_view`

create_active_logic_view

```
create_active_logic_view
[help]
[-type {flat_top timing_budget}[-set_dont_touch | -unset_dont_touch ]]
```

Trims the timing graph to ignore logic inside the first level registers in partitions to improve runtime for timing-related commands.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_active_logic_view` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_active_logic_view`.
`-set_dont_touch`	Sets the dontTouch value as `true`. This freezes I/O interfaces (Interface logics and interface nets) and prevents the opt_design `-post_cts -hold` from optimizing the block interface logics. The ILM ECO data can be loaded back.
`-type {flat_top timing_budget}`	• `flat_top`: Used to mark the top-level timing graph to mask all logic inside the interface logic of each partition. • `timing_budget`: Instructs the command to use the same settings as `create_timing_budget` when marking the top-level timing graph. This option should be specified if you plan to run `time_design` or `opt_virtual` with ART based and later on run `create_timing_budget` based on the resulted timing graph.
`-unset_dont_touch`	Sets dontTouch value as `false`. This resets the dontTouch on I/O logics before reading the ECO data.

get_module_view

```
get_module_view
[-help]
[-top_read_only]
[-hinsts list_of_partition_hinsts]
[-partitions list_of_paritions]
[-tcl_list]
```

Verifies the FlexView mode.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_module_view` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_module_view`
`-hinsts` *`list_of_partition_hinsts`*	Lists partition hinsts.
`-partitions` *`list_of_paritions`*	Lists partitions.
`-top_read_only`	Specifies if top level is readOnly.
`-tcl_list`	Displays the current settings for the specified parameters in Tcl list format only. If you specify `-tcl_list` without any parameters, the software displays the current settings of all `set_module_view` parameters in Tcl list format.

Examples

- The following command verifies the FlexView mode:

```
get_module_view

{TOP all}
{coreinst/ks_core1/amba_dsp1/ram2p_78kx32 readOnly}
{coreinst/ks_core1/leon1 interface}
```

set_module_view

```
set_module_view
[-help]
[-top_read_only {true | false}]
[-hinsts {list_of_partition_hinsts}]
[-partitions {list_of_paritions}]
[-type {read_only|interface|all}]
```

Specifies the FlexView (`read_only|interface|all`) for the top level and each of the partitions. This way optimization can be limited to the selected sections of the partitions and the top-level logic.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_module_view` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_module_view`.
`-top_read_only {true | false}`	Sets the top level to the read-only mode. By default, optimization can change the logic at the top level to improve timing. By setting this option to `true`, no change will be done to the entire top-level logic. Note: *Default*: `false`
`-hinsts` *list_of_partition_hinsts*	Applies the selected FlexView mode to the instance name or list of instance names of partitions.
`-partitions` *list_of_partitions*	Applies the selected FlexView mode to a partition or list of partitions. You have a choice to either specify the instance name of the partition or just the partition itself.
`-type {read_only|interface|all}`	Specifies the FlexView mode for the specified partition(s). • `read_only` : Specifies that the optimization will not be performed inside the partition. • `interface`: Specifies that optimization will be restricted only to the interface logic of the partition. • `all` : Specifies that optimization will be done for the entire partition. **Note**: The read_only status of the parent partition is not inherited by the child partition.

add_line_end_track

```
add_line_end_track
[-help]
[-eol_width float]
[-except_eol_spacing float [-within float]]
-layer string
-offset float
[-track_distance float]
[-track_pitch float]
```

Creates a line-end track.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `add_line_end_track` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man add_line_end_track`
`-eol_width` *float*	Specifies the width of the line-end track. *Data_type*: float, optional
`-except_eol_spacing` *float*	Specifies the spacing of the line-end track. *Data_type*: float, optional
`-layer` *string*	Specifies the layer on which the track is to be created. *Data_type*: string, required
`-offset` *float*	Specifies the offset to the core boundary. *Data_type*: float, required
`-track_distance` *float*	Specifies the distance between two sets of tracks. *Data_type*: float, optional
`-track_pitch` *float*	Specifies the track pitch. *Data_type*: float, optional
`-within` *float*	Specifies the extension in the orthogonal direction to find a neighbor wire. *Data_type*: float, optional

commit_global_net_rules

```
commit_global_net_rules [-help]
```

Applies or restores the global net connectivity rules to the design and creates the necessary connections between instances and these global nets.

This command will reset all the power connections based on the current global net rules, and is only needed if somehow the PG connectivity is inconsistent with them (due to reading inconsistent DEF connections, bugs, etc).

Parameters

`-help`	Prints a brief description of the `commit_global_net_rules` command usage. For a detailed description of the command, use the `man` command: `man commit_global_net_rules`

compress_special

```
compress_special
[-help]
[-area {x1 y1 x2 y2}]
[-incremental]
[-layers layer+]
[-nets net+]
```

Compresses Power-Grid (PG) based on the specified area, layer, or net.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `compress_special` parameter. For a detailed description of the command and all its parameters, use the man command: `man compress_special`
`-area {x1 y1 x2 y2}`	Specifies the coordinates for the area from which PG needs to be compressed. The `compress_special` command compresses only those special wires and special vias, which exist within the area specified by this parameter. *Default*: All PG structures are compressed. *Data_type*: rect, optional
`-incremental`	Recompresses the PG after editing the PG wires or vias. This parameter can only be specified when the current design is in compressed mode. *Data_type*: bool, optional
`-layers layer+`	Specifies the layers on which PG compression is needed. This parameter requires either LEF layer names or a routing layer index value (for example, `1` for the first routing layer, `2` for the second routing layer, and so on). *Data_type*: (layer)+, optional
`-nets net+`	Specifies the nets from which PG compression is needed. If the specified net does not have any special route on it, it is ignored. *Data_type*: (net)+, optional

Example

The following command compresses `%s special_wires` and `%s special_vias`:

```
compress_special -area {100 100 120 120} -net VDD -incremental
```

`decompress_special`

connect_global_net

```
  connect_global_net
[-help]
global_net_name
{{-type pg_pin -pin_base_name pinNamePattern |
-type tie_hi [-pin_base_name pinNamePattern] |
-type tie_lo [-pin_base_name pinNamePattern]}
{{-single_inst | -singleInst | -sinst} instName |
[{-inst_base_name | -instBasename} instBasenamePattern]
[{-hinst | -hierInst | -module} hierInstName |
-region x1 y1 x2 y2 |
-power_domain powerDomainName | -all]} |
-type net -net_base_name netBasenamePattern
[{-hinst | -hierInst | -module} hierInstName |
-power_domain powerDomainName | -all]}
[-override]
[-verbose]
[-auto_tie]
[-disconnect]
[-netlist_override]
[-non_hierarchical]
```

Adds a new global net connection to the specified global net.

You can use the `connect_global_net` syntax in three general design situations. The three design situations, and the suggested usage for the `connect_global_net` syntax, appear below:

- Connecting pins in a single instance to a global net. In the example below, *`instName`* represents an instance's complete hierarchical name, without any wildcard characters:

  ```
  connect_global_net
  global_net_name
  {-type pg_pin -pin_base_name pinNamePattern | -type tie_hi [-pin_base_name pinNamePattern]
  | -type tie_lo [-pin_base_name pinNamePattern]}
  -single_inst instName
  [-override]
  [-verbose]
  ```

- Connecting pins in multiple instances, or pins in a region, to a global net:

  ```
  connect_global_net
  global_net_name
  {-type pg_pin -pin_base_name pinNamePattern | -type tie_hi [-pin_base_name pinNamePattern]
  | -type tie_lo [-pin_base_name pinNamePattern]}
  [-inst_base_name instBasenamePattern]
  [-hinst hierInstName | -region x1 y1 x2 y2 | -all]
  [-override]
  [-verbose]
  ```

- Connecting nets to a global net:

  ```
  connect_global_net
  global_net_name
  -type net -net_base_name netBasenamePattern
  [-hinst hierInstName | -all]
  [-override]
  [-verbose]
  ```

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `connect_global_net` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man connect_global_net`
`-all`	Applies the global net connection to all instances in the design. *Data_type*: bool, optional
`-auto_tie`	Support supply/ground sensitivity. In a command for PG-pin_base_name connections, the option can only be specified together with `-type pg_pin`. In addition to connecting power pin VDD to global net VDD for each instance, all the instance tie-high pins whose related power pin (as specified in CPF, .lib, or LEF) is VDD, will automatically be tied to global net VDD. For example, `connect_global_net VDD -type pg_pin -pin_base_name VDD -auto_tie` *Data_type*: bool, optional
`-disconnect`	Disconnect p/g net connection. The option works only with `-sinst`, `-type pg_pin` and `-pin_base_name` options. **Note:** This option is mutually exclusive with `global_net_name` argument. *Data_type*: bool, optional
`global_net_name`	The name of the global net to which the specified pins, modules, or nets connect. *Data_type*: string, optional
`-hinst` *`hierInstName`*	Applies the global net connection to instances under *`hierInstName`*. Only the pins of the instances or the local nets under the specified module or hierarchical instance are connected. This parameter is mutually exclusive with the `-region` parameter. **Note:** You can also use the following spelling variations for this argument: • `-hierInst` • `-module` *Data_type*: string, optional
`-inst_base_name` *`instBasenamePattern`*	
	Specifies the names of leaf instances for which pins are to be connected to the global net. You can use the wildcard (`*`) character to specify a pattern of instance basenames. An instance basename cannot contain the "`/`" character. This parameter is used in conjunction with the `-type pg_pin` parameter, or with the `-type tie_hi` or `-type tie_lo` parameters. **Note:** You can also use the `-instBasename` spelling variations for this argument. *Data_type*: string, optional
`-net_base_name` *`netBaseName`*	Specifies the basenames of nets to connect to the global net. You can use the wildcard (`*`) character to specify a pattern of net basenames. An net basename cannot contain the "`/`" character. This parameter is used in conjunction with the `-type net` parameter. *Data_type*: string, optional
`-netlist_override`	Overrides previous global net connections. The option is similar to the option `-override`. However, in addition to overriding previous global net connections, `-netlist_override` also overrides netlist-specified P/G-pin_base_name connections if applicable, which the option `-override` can't do. *Data_type*: bool, optional
`-non_hierarchical`	Invokes the non hierarchical cell instance. The option is of type boolean and is optional. *Data_type*: bool, optional

`-override`	Specifies that the values that used with the `connect_global_net` command override global net connection values that have been set previously. *Data_type*: bool, optional
`-pin_base_name` *pinNamePattern*	Specifies the pins to connect to the global net. You can use the wildcard (`*`) character to specify a pattern of pin names. This parameter is used in conjunction with the `-type pg_pin` parameter, or optionally with the `-type tie_hi` or `-type tie_lo` parameters. *Data_type*: string, optional
`-power_domain` *powerDomainName*	Applies the global net connection to instances within the specified power domain. *Data_type*: string, optional
`-region` *x1 y1 x2 y2*	Applies the global net connection to instances inside the specified region. The region is specified by the x and y coordinates of the lower left and upper right boundary. This parameter is mutually exclusive with the `-module` parameter. *Data_type*: rect, optional
`-single_inst` *instName*	Connects pins in a single instance to a global net. *-instName* is the instance's complete hierarchical name, without any wildcard characters. **Note:** You can also use the following spelling variations for this argument: • `-sinst` • `-singleInst` *Data_type*: string, optional
`-type {net | pg_pin | tie_lo | tie_hi}`	Specifies the type of connection to be made to the global net. Use one of the following values: • `net`: Specifies that the nets listed with the `-net_base_name` parameter are to be connected. • `pg_pin`: Specifies that the power and ground pins listed with the `-pin_base_name` parameter are to be connected. • `tie_lo`: Specifies that tie low pins be connected. • `tie_hi`: Specifies that tie high pins be connected. *Data_type*: enum, optional
`-verbose`	Specifies that connection statistics and warning messages are displayed in the console. This parameter can be useful during troubleshooting. *Data_type*: bool, optional

Example

The following command connects the vdd! net with the VDD global net:

```
connect_global_net VDD -type net -net_base_name vdd!
```

convert_dbu_to_um

```
convert_dbu_to_um
[-help]
[-unit number]
{int | {int_list}}
```

Takes an arbitrary list of ints and returns it in the same form, with each database integer int converted to its user unit floating point equivalent.

Parameters

`-help`	Prints a brief description that includes type and default information for each `convert_dbu_to_um` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man convert_dbu_to_um`
`-unit number`	Specifies the convert factor by which to divide the database integer int. *Value:* One of `100`, `200`, `400`, `800`, `1000`, `2000`, `4000`, `8000`, `10000`, or `20000` *Default:* Uses the LEF `UNITS DATABASE MICRONS` int from the Innovus database technology file, or the OpenAccess equivalent. *Data_type*: enum, optional
`{int | {int_list}}`	
	Specifies the int or int list to convert. You can specify a single int, or an arbitrary list of ints, including points, rectangles and coordinates. *Data_type*: integer or list of integers, required

Examples

- The following command converts the database int `100` into its equivalent user unit int, based on a convert factor of `2000`:
  ```
  convert_dbu_to_um -unit 2000 100
  ```
  The software returns the following information:
  ```
  0.0500
  ```
- The following command converts the database ints for the list of numbers `{1000 1000 2000 2000}` into their equivalent user unit ints, based on a convert factor of `1000`:
  ```
  convert_dbu_to_um -unit 1000 {1000 1000 2000 2000}
  ```
  The software returns the following information for the list of numbers. The list is implied, but not shown.
  ```
  1.000 1.000 2.000 2.000
  ```

Related Topics

`convert_um_to_dbu`

convert_um_to_dbu

```
convert_um_to_dbu
[-help]
[-unit number]
{double | {double_list}}
```

Takes an arbitrary list of doubles and returns it in the same form, with each user unit floating point double converted to its database integer double equivalent.

Parameters

`-help`	Prints a brief description that includes type and default information for each `convert_um_to_dbu` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man convert_um_to_dbu`
`-unit number`	Specifies the convert factor by which to multiply the user unit double. *Value:* One of `100`, `200`, `1000`, `2000`, `10000`, or `20000` Default: Uses the LEF `UNITS DATABASE MICRONS` double from the Innovus database technology file, or the OpenAccess equivalent. *Data_type*: enum, optional
`{double | {double_list}}`	
	Specifies the double or double list to convert. You can specify a single double, or an arbitrary list of doubles, including points, rectangles and coordinates. *Data_type*: float or list of floats, required

Examples

- The following command converts the user unit double `30` into its equivalent database integer double, based on a convert factor of `2000`:
  ```
  convert_um_to_dbu -unit 2000 30
  ```
  The software returns the following information:
  ```
  60000
  ```
- The following command converts the user unit doubles for the list of numbers {`30 40`} into their equivalent database unit doubles, based on a convert factor of `200`:
  ```
  convert_um_to_dbu -unit 200 {30 40}
  ```
  The software returns the following information for the list of numbers. The list is implied, but not shown.
  ```
  6000 8000
  ```

`convert_dbu_to_um`

create_cell_obs

```
create_cell_obs
[-help]
-cell base_cell
[-ignore_pg_net]
-layer layer
[-mask int_value]
{-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...} | -polygon {x1 y1 x2 y2 x3 y3 ...}}
[-spacing value | -design_rule_width value]
```

Helps in adjusting the database. The added obs is saved in the database by its own. You do not need to resource it after restoring the database. It adds an obstruction geometry to a cell on the specified layer and is helpful when you want to add a temporary cell obstruction without changing the cell's LEF and reloading the Innovus.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `create_cell_obs` parameter. For a detailed description of the command and all its parameters, use the man command: `man create_cell_obs`
`-cell base_cell`	Specifies the base cell or ilm cell to be modified. *Data_type*: (base_cell|design|module), required
`-design_rule_width value`	Specifies the design rule width. *Data_type*: float, optional
`-ignore_pg_net`	Ignores the Power/Ground routing while checking for DRC violations (including shorts) involving the added obs. This parameter is equivalent to `LEF MACRO OBS LAYER # EXCEPTPGNET`. *Data_type*: float, optional
`-layer layer`	Specifies the layer for the OBS. *Data_type*: (layer), required
`-mask int_value`	Specifies the integer value of the mask (within the mask range) for the created OBS. *Default:* `0`, which means that the mask is uncolored. *Data_type*: uint, optional
`-polygon {x1 y1 x2 y2 x3 y3 ...}`	Specifies the polygon shape. *Data_type*: (point)+, optional
`-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...}`	Specifies the Obs rect list for adding obstruction geometries. *Data_type*: (rect)+, optional
`-spacing value`	Specifies the spacing value. *Data_type*: float, optional

Example

Following is an example of the `create_cell_obs` command usage:

```
create_cell_obs -layer M3 -cell tdsp_core -spacing 0 -rect {40 40 50 50}
```

Related Topics

`delete_cell_obs`

create_via

```
create_via
[-help]
-location {x y}
[-net net]
[-shape {blockring |
blockagewire | blockwire | corewire | drcfill | fillopc | fillwire | followpin | iowire | none | padring | ring | stripe}]
[-shield_net net]
[-status {routed | fixed | cover | shield}]
[-user_class value]
-via_def via_def
```

Adds a new special-route via instance to the design. A DB pointer is returned to the via, if successful. You can use the command at any point in the design flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_via` parameter. For a detailed description of the command and all its parameters, use the man command: `man create_via`
`-location {x y}`	Specify the placement location (in microns) of the via instance. *Data_type*: point, required
`-net net`	Specifies the name or pointer of the net to associate with the via instance. If not specified, the via is assigned as a floating fillwire via. *Data_type*: (net), optional
`-shape {blockring | blockagewire | blockwire | corewire | drcfill | fillopc | fillwire | followpin | iowire | none | padring | ring | stripe}`	
	Specifies the special route shape (`DEF SPECIALNETS wiring+ SHAPE`). If not given, the default is none unless `-net` is not specified. If `-net` is specified, the shape is set to `fillwire`. *Data_type*: enum, optional
`-shield_net net`	Specifies the name or pointer of the net to be shielded by the via instance. Only valid when `-status` is set to shield. *Data_type*: (net), optional
`-status {routed | fixed | cover | shield}`	
	Specifies the special route (`DEF SPECIALNETS`) wiring status. *Default*: `routed` *Data_type*: enum, optional
`-user_class value`	Specifies the user-defined string to be added to the via instance that is created. *Data_type*: string, optional
`-via_def via_def`	
	Specify the via-master name or pointer of the via-master to place. *Data_type*: (via_def), optional

Example

- The following command adds a via with via-master name of `my_via1`:
  ```
  create_via -via_def my_via1 -location {100.1 200.5} -net VSS -shape followpin
  ```
- To add a parameterized via you can look up the via-master with `create_via_definition` (in this case a 1x2 cut via with all the other parameters the default value).
  It will either return an existing via-master with the same parameters, or create it. Then use it to create an instance of the via.
  ```
  set myvia [create_via_definition -via_def_rule via1_rule -row_col {1 2}]
  create_via -via $myvia -pt {10.5 10.5} -net VS
  ```

create_via_definition

```
create_via_definition
[-help]
[-bottom_layer_masks int+]
[-cut_masks int+]
[-name via_name]
{{-via_rule via_def_rule
    [[-cut_size {x y}][-cut_spacing {x y}]
     [-top_enclosure {x y}]
     [-bottom_enclosure {x y}]
     [-top_offset {x y}][-bottom_offset {x y}]
     [-row_column {x y}]
     [-origin {x y}]
     [-pattern pattern]]} |
  {{-cut_layer layer -cut_rects {{x1 y1}{x2 y2}...}}
  {[-top_layer layer] {-top_rects {{x1 y1}{x2 y2}...} |
    -top_polygon {{x1 y1}{x2 y2}...}}}
  {[-bottom_layer layer] {-bottom_rects {{x1 y1}{x2 y2}...} |
    -bottom_polygon {{x1 y1} {x2 y2}...}}}}}
[-top_layer_masks int+]
```

Creates a via definition (master) from the specified parameters or list of shapes. The via masters created are design (DEF) vias and are for use in DEF SPECIALNETS wiring, unless the modify_ndr command is used to add them the list of valid vias for a NONDEFAULTRULE.

There are two types of via-master definitions:

- Parameterized vias that require a `-via_rule name`, and a set of row, column, spacing and enclosure parameters. These are equivalent to LEF/DEF VIAs defined with VIARULE GENERATE or OpenAccess standardViaDef. Applications normally check the via parameters for comparing and finding via-masters. But for LEF/DEF and reporting purposes, the via-master name is automatically generated using the `-via_rule name` as a prefix with a "_1", "_2", etc. suffix added to make it unique so it will not collide with any existing via-master names. The auto-generated name is only valid during the current session, and may be different after save/restore and opening it in another session. If a via-master already exists with the same parameters, the existing via-master is returned instead of creating a redundant via-master. Hence, this command can also be used to "lookup" any equivalent via-master previously created.
- Fixed vias that require a `-name` and a list of rectangles and polygons. These are equivalent to LEF/DEF VIAs using the RECT and POLYGON statements, or OpenAccess customViaDefs. The via name is the only way to lookup the via-master, and must be unique. The name cannot collide with an existing via-master. These types of via-masters are normally not recommended for design specific or DEF vias, because other blocks may create via-master names that collide. These types of vias are normally only in the library (LEF or OA techfile) so they are shared with all block of the same chip.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_via_definition` parameter. For a detailed description of the command and all its parameters, use the man command: `man create_via_definition`
`-bottom_enclosure {x y}`	
	Specifies the bottom layer enclosure around the cut array. The enclosure measures the distance from the cut-array-edge to the metal-edge that encloses the cut-array. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default:* Derived from `-via_rule`. *Data_type*: point, optional
`-bottom_layer layer`	
	If not specified the first layer below the `-cut_layer` is assumed. Requires `-name` option for a fixed via. *Data_type*: (layer), optional
`-bottom_layer_masks int+`	
	Specifies the masks for the `rects` on the bottom layer for a `via_def`. The mask values and `rects` must be in the same order and there must be the same number of mask values as `rects`. *Data_type*: string, optional

`-bottom_offset {x y}`	
	Specifies the *x,y* offset for bottom layer in the via. After the “non-shifted via” is computed, the bottom layer rectangle is offset by adding the x,y to the `-origin` offset. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: {0 0}. *Data_type*: point, optional
`-bottom_polygon {{x1 y1} {x2 y2}...}`	
	Specifies the polygon to create on the bottom layer. Values are specified in microns. Requires `-name` option for a fixed via. *Data_type*: (point)+, optional
`-bottom_rects {{x1 y1}{x2 y2}...}`	
	Specifies the list of rectangles to create on the bottom layer. Values are specified in microns. Requires `-name` option for a fixed via. *Data_type*: (point)+, optional
`-cut_layer layer`	
	Specifies the name or pointer of the cut layer. The top/bottom layers of the via are derived from the routing layers above/below the cut layer. Requires `-name` option for a fixed via. *Data_type*: (layer), optional
`-cut_masks int+`	
	Specifies the masks for the `rects` on the cut layer for a `via_def`. The mask values and `rects` must be in the same order and there must be the same number of mask values as `rects`. A mask pattern cannot be specified for parameterized via cuts. For parameterized via cuts, only three types of mask color patterns are allowed using the LEF VIA PATTERN statement - checker-board (default), alternating columns, and alternating rows. *Data_type*: string, optional
`-cut_rects {{x1 y1}{x2 y2}...}`	
	Specifies the list of rectangles to create on the cut layer. Values are specified in microns. Requires `-name` option for a fixed via. *Data_type*: (point)+, optional
`-cut_size {x y}`	Specifies the size (x=width, y=height) of the cut rectangles. Values are specified in microns and must be greater than 0. Requires `-via_rule` option for a parameterized via. *Default*: Derived from `-via_rule`. *Data_type*: point, optional
`-cut_spacing {x y}`	Specifies the spacing between the cuts. The spacing is measured from cut-edge to the next cut-edge. Values are specified in microns and must be greater than 0. Requires `-via_rule` option. *Default*: Derived from `-via_rule`. *Data_type*: point, optional
`-name via_name`	Specifies the name of via to create. For parameterized via definition creation, a new via name is derived from the `-via_rule` name unless `-name` is specified. The name cannot collide with any existing via-master names. *Data_type*: string, optional
`-origin {x y}`	Specifies the x,y offset for all shapes in the via. By default the 0,0 origin of the via is the center of the cut-array and the center of the enclosing metal rectangles. After the “non-shifted via” is computed, all the cut and metal rectangles are offset by adding these values. size (x=width, y=height) of the cut rectangles. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: {0 0}. *Data_type*: point, optional
`-pattern pattern`	Specifies the cut pattern encoded as an ASCII string. This parameter is only required when some of the cuts are missing from the array of cuts. Requires `-via_rule` option for a parameterized via. *Data_type*: string, optional

`-row_column {x y}`	Specifies the number of cut rows and columns to create. Values must be greater than 0. Requires `-via_rule` option for a parameterized via. *Default*: {1 1}. *Data_type*: integer, optional
`-top_enclosure {x y}`	Specifies the top layer enclosure around the cut array. The enclosure measures the distance from the cut-array-edge to the metal-edge that encloses the cut-array. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: Derived from `-via_rule`. *Data_type*: point, optional
`-top_layer layer`	If not specified the first layer above the `-cut_layer` is assumed. Requires `-name` option for a fixed via. *Data_type*: (layer), optional
`-top_layer_masks int+`	Specifies the masks for the `rects` on the top layer for a `via_def`. The mask values and `rects` must be in the same order and there must be the same number of mask values as `rects`. *Data_type*: string, optional
`-top_offset {x y}`	The x,y offset for top layer in the via. After the "non-shifted via" is computed, the top layer rectangle is offset by adding the x,y to the `-origin` offset. Values are specified in microns. Requires `-via_rule` option for a parameterized via. *Default*: {0 0}. *Data_type*: point, optional
`-top_polygon {{x1 y1}{x2 y2}...}`	
	Specifies the polygon to create on the top layer. Values are specified in microns. Requires `-name` option for a fixed via. *Data_type*: (point)+, optional
`-top_rects {{x1 y1}{x2 y2}...}`	
	Specifies the list of rectangles to create on the top layer. Values are specified in microns. Requires `-name` option for a fixed via. *Data_type*: (point)+, optional
`-via_rule via_def_rule`	
	Specifies the name or pointer of the via-rule (from LEF VIARULE GENERATE or OpenAccess standardViaDef) to use for the via master being created. Layers and default values are derived from the specified `via_rule`. When using `-via_rule`, a parameterized via master is created. *Data_type*: (via_def_rule), optional

Examples

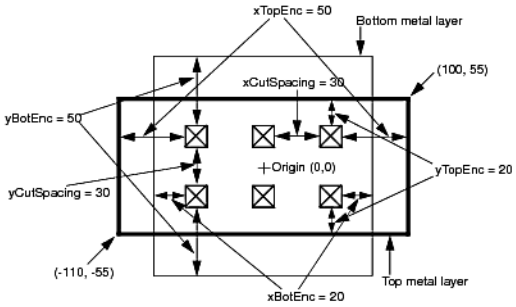
Example 1

Create a 1x2 cut via with default parameters.

```
set myvia [create_via_definition -via_rule via1_rule -row_column {1 2}]
dbGet $myvia.name #returns the via-master name
```

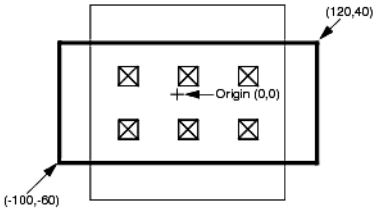
The following parameterized via-master describes a non-shifted via with two rows and three columns of via cuts.
In this example, all the size, spacing, and enclosure rules are given explicitly. In typical usage, they would not be specified and would use the default values in the via-rule.

```
create_via_definition -via_rule via1_rule -row_column {2 3} -cut_size {20 20} \
-cut_spacing {30 30} -bottom_enclosure {20 50} -top_enclosure {50 20}
```



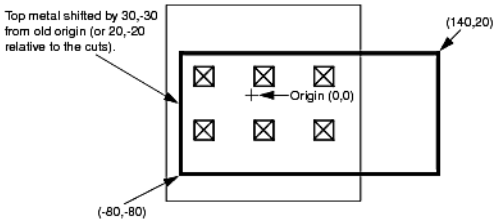
The same via rule with the –origin shifts all of the metal and cut rectangles by 10 in the x direction, and by -10 in the y direction.

```
create_via_definition -via_rule via1_rule -row_column {2 3} -cut_size {20 20} \
-cut_spacing {30 30} -bottom_enclosure {20 50} -top_enclosure {50 20} \
-origin (10 -10)
```



If the same via contains the following –origin and –top_offset parameters, all of the rectangles shift by 10, -10.
In addition, the top layer metal rectangle shifts by 20, -20, which means that the top metal shifts by a total of 30, -30.

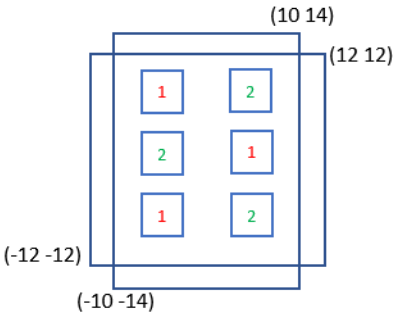
```
create_via_definition -via_rule via1_rule -row_column {2 3} -cut_size {20 20} \
-cut_spacing {30 30} -bottom_enclosure {20 50} -top_enclosure {50 20} \
-origin (10 -10) -top_offset {20 -20}
```



Example 2

The following command adds a `3x2` fixed via to the cut layer mask pattern `{1 2 1 2 1 2}`:

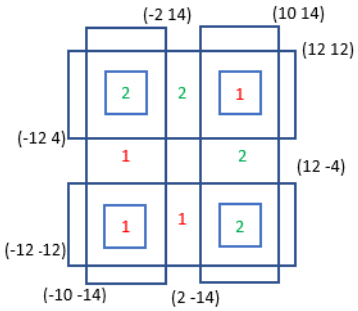
```
create_via_definition  -name my_fixed_via -cut_layer VIA23 \
-bottom_rects {{-10 -14 10 14}} \
-cut_rects {{-6 -10 -2 -6} {-6 -2 -2 2} {-6 6 -2 10} {2 -10 6 -6} {2 -2 6 2} {2 6 6 10}} \
-top_rects {{-12 -12 12 12}} \
-cut_masks {1 2 1 2 1 2}
```



Example 3

The following command adds a `2x2` fixed via to the bottom and top layer mask pattern `{1 2}` and cut layer mask pattern `{1 2 1 2}`:

```
create_via_definition -name my_fixed_via2 -cut_layer VIA23 \
-bottom_rects {{-10 -14 -2 14} {2 -14 10 14}} \
-cut_rects{{-8 -10 -4 -6} {-8 6 -4 10} {4 -10 8 -6} {4 6 8 10}} \
-top_rects {{-12 -12 12 -4} {-12 4 12 12}} \
-bottom_layer_masks {1 2} \
-top_layer_masks {1 2} \
-cut_masks {1 2 1 2}
```



create_virtual_shape_on_pg_wires

```
create_virtual_shape_on_pg_wires
[-help]
-layers {{virtual_layer, power_layer [mask_num]} ...}
[-name string]
[-pg_width_list {list_of_supported_width_values} | -pg_width_range {min_width max_width}]
```

Generates additional virtual shapes and creates markers on PG wires, when the existing trim shapes overlap with PG wires. The generated virtual shapes are routing blockages on the specified layer. These virtual shapes can be based on the output of the `write_def` and `write_stream` commands, and edited by the wire editing commands.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_virtual_shape_on_pg_wires` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_virtual_shape_on_pg_wires`
`-layers {{virtual_layer, power_layer [mask_num]} ...}`	Specifies the pair of layers, which need to create the virtual shapes. You can specify the optional argument `mask_num` with this parameter to select the PG wires. *Data_type*: string, required
`-name string`	Specifies the name of the marker shape to be generated. *Default*: `defLayerBlkName` *Data_type*: string, optional
`-pg_width_list {list_of_supported_width_values}`	Creates virtual shapes on PG pin only for the specified width values. **Note:** This parameter cannot work with the `-pg_width_range` parameter. It means that you can define either a range of width, or a list of width. You can use the `-pg_width_list` parameter with the `-layer` and `-name` parameters. *Data_type*: string, optional
`-pg_width_range {min_width max_width}`	Specifies the PG width range in which the virtual shapes are needed. *Default*: All the PG wires. *Data_type*: string, optional

decompress_special

```
decompress_special
[-help]
[-area {x1 y1 x2 y2}]
[-layers layer+]
[-nets net+]
```

Decompresses Power-Grid (PG) objects within the specified area, layer, or net. This command decompresses only the overlapped part in case of partial overlapping. The rest of the part is regrouped.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `decompress_special` parameter. For a detailed description of the command and all its parameters, use the man command: `man decompress_special`
`-area {x1 y1 x2 y2}`	Specifies the coordinates for the area from which PG needs to be decompressed. The `decompress_special` command decompresses only those special wires and special vias, which exist within the area specified by this parameter. *Default*: All PG structures are decompressed. *Data_type*: rect, optional
`-layers layer+`	Specifies the layers on which PG decompression is needed. This parameter requires either LEF layer names or a routing layer index value (for example, `1` for the first routing layer, `2` for the second routing layer, and so on). *Data_type*: (layer)+, optional
`-nets net+`	Specifies the nets from which PG decompression is needed. *Data_type*: (net)+, optional

Example

The following command decompresses `%s special_wires` and `%s special_vias`:

```
decompress_special -area {100 100 120 120} -layer Via56
```

Related Topics

`compress_special`

delete_cell_obs

```
delete_cell_obs
[-help]
-cells {base_cell | design | module}+
{-obs_shapes shape+ | [{-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...} | -polygon {x1 y1 x2 y2 x3 y3 ...}] -layers layer+}
```

Helps in deleting an obstruction geometry or library obstruction for a cell on the specified layer. This command deletes only the obstruction geometry added by the `add_cell_obs` command or library obstruction (`SPACING 0 OBS`).

Parameters

`-help`	Prints a brief description that includes the type and default information for each `delete_cell_obs` parameter. For a detailed description of the command and all its parameters, use the man command: `man delete_cell_obs`
`-cells {base_cell | design | module}+`	Specifies the cell name or DPO name. *Data_type*: (base_cell|design|module)+, required
`-layers layer+`	Specifies the layer name or DPO name. *Data_type*: (layer)+, optional
`-obs_shapes shape+`	Specifies the cell obstruction shape pointers. **Note:** This parameter must be used with the `-cells` parameter, and cannot be specified with any other parameter except than `-help`. *Data_type*: (shape)+, optional
`-polygon {x1 y1 x2 y2 x3 y3 ...}`	Specifies the polygon shape. *Data_type*: (point)+, optional
`-rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}...}`	Specifies the Obs rect list for deleting obstruction geometries. *Data_type*: (rect)+, optional

Examples

Following is an example of using the `-obs_shapes` parameter for specifying the cell obstruction shape pointer:

- The `BUFX1` cell has multiple obs shapes on different layers:
  ```
  get_db base_cell:BUFX1 .obs_layer_shapes.shapes
  shape:0x7f7f50db3b00 shape:0x7f7f50db3ae0 shape:0x7f7f50db3ac0 shape:0x7f7f50db3aa0 shape:0x7f7f50db3a80
  ```
- The following command deletes the first two shapes in the list:
  ```
  delete_cell_obs -obs_shapes {shape:0x7f7f50db3b00 shape:0x7f7f50db3ae0} -cells BUFX1
  ```

delete_floating_nets

```
delete_floating_nets
```

The `delete_floating_nets` command deletes all the nets with zero terms except for assign nets and p/g nets. It supports zero-term net deletion in multiple instantiated cells.
This command takes no parameters and can be used whenever the design is read in.

After the command is executed, it reports the following:

- Total number of dangling nets `nrDnet`
- Total number of deleted dangling nets `nrDdnet`
- Total number of nets `ntNet`
- Ratio of `nrDdnet` over `nrNet`
- Ratio of `nrDnet` over `nrNet`
- `nrDdnet` over `nrDnet`

Related Topics

`report_floating_nets`

delete_global_net_connections

```
delete_global_net_connections [-help]
```

Resets the global net as well as all of the tie-high and tie-low nets. Use this command after you issue the `globalNetConnections` command.

Parameters

`-help`	Prints a brief description of the `delete_global_net_connections` command usage. For a detailed description of the command, use the `man` command: `man delete_global_net_connections`

Power Planning and Routing chapter in the *Innovus User Guide*.

get_computed_shapes

```
get_computed_shapes
[-help]
[-dbu]
[-step step]
[-output {polygon|rect|hrect|area}]
shape_list [AND shape_list | ANDNOT shape_list | OR shape_list | XOR shape_list
| INSIDE shape_list | OUTSIDE shape_list | ENCLOSE shape_list | STRADDLE shape_list
| BBOX | HOLES | NOHOLES | BBOX_CIRCLE | BBOX_OCTAGON | MOVE {dx  | SIZE value | SIZEX value | SIZEY value] ...
```

Performs geometric (SIZE and BBOX) and logical (such as AND and ANDNOT) operations on shape (polygon or a rectangle or a list of rectangles and polygons).

Parameters

`-help`	Prints a brief description that includes the type and default information for each `get_computed_shapes` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_computed_shapes`
`-dbu`	Specifies values in database units, specified in integers. All `shape_list` values as well as values for MOVE, SIZE, and step should The output units are the same as the input units. *Default:* Specifies values in user units, in microns. *Data_type*: bool, optional
`-step`	Specifies step size if output format is rect, required to convert non-orthogonal shapes into series of rectangles. *Default*: minwidth value of first routing layer. The option is coord, and is optional. *Data_type*: coord, optional
`-output` *polygon|rect|hrect|area*	
	Specifies the output format. • `polygon`: Polygon shape • `rect`: Vertical rectangles **Note:** This value works only for the orthogonal shapes. • `hrect`: Horizontal rectangles **Note:** This value works only for the orthogonal shapes. • `area`: Total area of final shape *Default:* `rect` (string) *Data_type*: enum, optional
`shape_list`	A polygon or rectangle or a list of polygon and rectangle. • polygon: `{{x y} {x y} {x y} ... }`; • rect: `{x1 y1 x2 y2}` This option is a required list. *Data_type*: list, required
`AND` *shape_list*	Is a binary operator that is the intersection of `shape_lists`.
`ANDNOT` *shape_list*	Is a binary operator which defines the initial `shape_list` minus `shape_list`.
`OR` *shapelist*	Is a binary operator of the union of shapelists.
`XOR` *shape_list*	Is a binary operator of the `shape_list`: OR minus AND. *Data_type*: string, optional

`INSIDE shape_list`	Is a binary operator for initial shapes that are inside (including touching) of one of the shapes from the second list.
`OUTSIDE shape_list`	Is a binary operator for initial shapes that are outside (including touching) of one of the shapes from the second list.
`ENCLOSE shape_list`	Is a binary operator for initial shapes that completely enclose at least one shape from the second list.
`STRADDLE shape_list`	Is a binary operator for initial shapes that are partially inside and partially outside at least one shape from the second list.
`MOVE {dx dy}`	Is a unary operator that moves the shape {`dx dy`}.
`BBOX`	Is a unary operator that computes the bounding box of `shape_list`. *Data_type*: string, optional
`BBOX_CIRCLE`	Is a unary operator that creates a circle shape. For example, the following command creates a circle within the specified coordinat `get_computed_shapes {0 0 10 10} BBOX_CIRCLE -output {polygon}` Following is the output of the above command: `BBOX_OCTAGON`	Is a unary operator that creates an octagon shape. For example, the following command creates an octagon within the specified co `get_computed_shapes {0 0 10 10} BBOX_OCTAGON -output {polygon}` Following is the output of the above command: `HOLES`	Is a unary operator that gives list of new shapes that fill holes in the original `shape_list`.
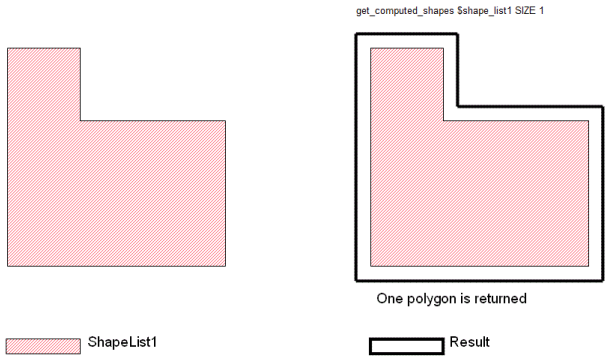
`NOHOLES`	Is a unary operator that gives list of new shapes that include filled holes in the original `shape_list`. This is same as `get_computed_shapes shape_list HOLES` OR `shape_list`.
`SIZE value`	Is a unary operator that increases the size of `shape_list` by `value`.
`SIZEX value`	Is a unary operator that increases the size of the shapes in the list in the X-direction by `value`. This parameter works only for the ort `-step` parameter to convert the shape into series of rectangles first.
`SIZEY value`	Is a unary operator that increases the size of the shapes in the list in the Y-direction by `value`. This parameter works only for the ort `-step` parameter to convert the shape into series of rectangles first.

Note: All shapes processed by `get_computed_shapes` must be non-zero area. If a *shape_list* contains a list of rectangles and one of them is zero-area, it will be dropped.
Also, during negative sizing or other operations, if a zero-area shape is created, it will be dropped from the output (or intermediate results).

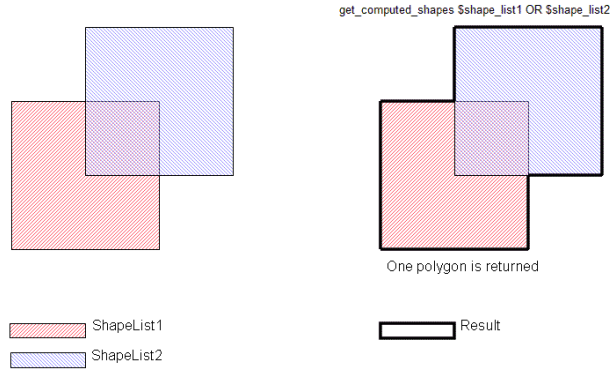
For example, a rectangle that is 4x4 or smaller will disappear when using `get_computed_shapes $rect SIZE -2 SIZE 2` while shapes larger than 4 will be returned to their original state.
The same is true for protrusions with width less than 4.

Examples

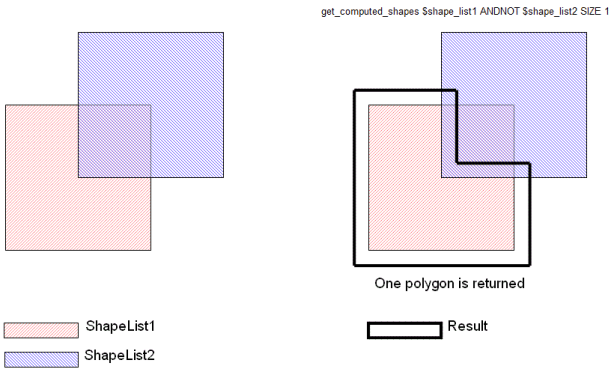
- **Unary**:



- **Binary**:



- **Combination**:



Example: Area calculation

`get_computed_shapes $shapes1 AND $shapes2`
Returns intersection (as a list of rectangles) between the shapes in the `$shapes1` and `$shapes2` lists.

`get_computed_shapes -output area $shapes1 AND $shapes2`
Returns intersection area between the shapes in the `$shapes1` and `$shapes2` lists.

get_edge

```
get_edge
[-help]
[-clockwise | -counterclockwise]
[{shape_list} [-direction direction] [-db_units]]
[-index index_number]
```

Returns edges of a polygon of a shape along with the direction list (N, S, E, W and NE, NW, SE, SW). This helps you identify not only all the edges but also the direction in which the edges are pointing. At a time you can observe one polygon with 'n' number of points.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `dbedge` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_edge`
`-clockwise`	Sorts the returned list of edges clockwise. *Data_type*: bool, optional
`-counterclockwise`	Sorts the returned list of edges counterclockwise. *Data_type*: bool, optional
`-db_units`	Returns the specified values in database units. Default is `microns`. *Data_type*: bool, optional
`-direction {n s e w ne nw se sw}`	Specifies the types of edges needed. This can be n, s, e, w, ne, nw, se, sw. It can also be a list. For example: `get_edge -direction {n s nw ne} {10 20 30 40}` *Data_type*: (enum)+, optional
`-index index_number`	Specifies the index number of the edge to be returned. The index number starts with `0` as the first edge specified in the shape list, and increases gradually along with the shape list. This number may range from `0` to '*number_of_edges* `- 1`'. *Data_type*: int, optional

`{shape_list}`	Can be a rect like `{x1 y1 x2 y2}` or a polygon like `{{x1 y1}{x2 y2}{x3 y3}.....}`. Only one rect or polygon is accepted.
	Examples
	Using a simple L-shape polygon
	`set shape_list {{0 0} {2 0} {2 1} {1 1} {1 2} {0 2}}`
	• All edges
	`get_edge $shape_list`
	`{{S{0 0}{2 0}} {E{2 0}{2 1}} {N{2 1}{1 1}} {E{1 1}{1 2}} {N{1 2}{0 2}} {W{0 2}{0 0}}}`
	• Only E facing edges
	`get_edge -direction E $shape_list`
	`{{E{2 0} {2 1}} {E{1 1} {1 2}}}`
	The format of the output is
	`{{<direction> <edge_vertex_1> <edge_vertex_2 }....}`
	Data_type: string, required

get_obj_in_area

```
get_obj_in_area
[-help]
[-areas {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2} ...}
[-bbox_overlap]
[-dbu]
[-layers {layer1 layer2 ...} [-strict_via_inst_layer_check]]
[-obj_type {bump bus_guide inst inst_all_shapes pin port port_shape marker net place_blockage patch_wire pg_pin route_blockage routes
resize_blockage row special special_via special_wire via wire what_if_wire what_if_via partition}]
[-abut_only] | [-enclosed_only] | [-overlap_only]
[-polygons {x11 y11 x12 y12 x13 y13 ...}]
```

Returns a list of objects based on an area query without needing to select them. This command supports all types of routing blockages such as partial, fill, and slot.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_obj_in_area` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_obj_in_area`
`-abut_only`	Returns only those objects that abut the search area. No part of the object polygon overlaps the search area, but at least one point or line of intersection occurs between the object polygon and the search area. A single point of abutment (such as a corner or crossing edges) is also considered as abutted. When multiple areas are specified, the object is returned as long as it abuts one of the search areas. *Data_type*: bool, optional
`-areas {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2} ...}`	
	Specifies the search areas, where `ll` = lower left, `ur` = upper right. By default, all the objects overlapping or abutting these areas are returned, unless `-abut_only`, `-enclosed_only`, or `-overlap_only` is specified. The polygon shape of the object is used for the overlap check. The units are in microns (unless `-d` is specified). The input can be in either a single `rect {llx1 lly1 urx1 ury1}`, or a list of `rects {{llx1 lly1 urx1 ury1} {llx2 lly2 urx2 ury2}}`. A `rect` using "two points" format like `{{{llx1 lly1} {urx1 ury1}} {{llx2 lly2} {urx2 ury2}}}` is also allowed. But input format like `{llx1 lly1 urx1 ury1 llx2 lly2 urx2 ury2}` or `{{llx1 lly1} {urx1 ury1} {llx2 lly2} {urx2 ury2}}` is illegal and not allowed. The resulting area to check for overlap can be a rectangle, line, or a point. When one object intersects multiple search areas, it will only be returned once. *Data_type*: (rect)+, optional
`-bbox_overlap`	
	Uses bounding-box of the object rather than the polygon shape of the object for overlap for overlap, abut, or enclosure check. For example, an `inst` that is of L-shape, will not be returned if the `-areas` parameter overlaps only the upper-right of the bounding-box without touching any part of the L-shaped, unless the `-bbox_overlap` parameter is included. *Data_type*: bool, optional
`-dbu`	Specifies the `-areas` values that are in database units rather than microns. *Default*: `um` *Data_type*: bool, optional
`-enclosed_only`	Returns only those objects, which are completely enclosed inside the search area. The object polygon is fully enclosed by the search area. No part of the object polygon sticks outside the search area, although it may abut the search area edges. When multiple areas are specified, the object will be returned as long as it is enclosed in one of the search areas. *Data_type*: bool, optional
`-layers {layer1 layer2 …}`	

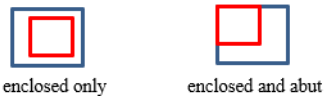
	Returns all the objects with the layer information for the specified layers. This parameter applies only to object types: `port_shape`, `patch_wire`, `route_blockage`, `regular`, `special`, `special_via`, `special_wire`, `via`, `wire`, `what_if_wire`, and `what_if_via`. A `via`, `special_via`, or `what_if_via` object will be returned if any of the via's bottom layer, cut layer, or top layer matches with one of the specified layers. Other object types ignore this parameter and will always be returned. *Data_type*: (layer)+, optional
`-obj_type` *objTypeList*	
	Specifies a list of object types to search for overlaps in the area. Multiple object types can be searched at the same time. The objects currently supported include: `bump bus_guide inst inst_all_shapes pin port port_shape marker net place_blockage patch_wire pg_pin route_blockage routes resize_blockage row special special_via special_wire via wire what_if_wire what_if_via partition` Here: • `routes` is the union of `wire`, `patch_wire`, and `via`. • `special` is the union of `special_via` and `special_wire`. Objects with multiple shapes or non-rectangular shapes use a polygon to check for overlap, as described below. • `bump` has no placement overlap area, so it uses the polygon of all the OBS and PIN shapes. • `inst` uses the polygon of its placement overlap checks (for example the LEF SIZE or OVERLAP shapes), including any placement halo (if there is any) but not any routing halo. OBS shapes or PIN shapes (like standard-cell power-pins) that stick outside the placement overlap area are not included. • `inst_all_shapes` is the same as `inst`, except that it includes all OBS shapes and PIN shapes even if they stick outside the placement overlap area. • `pin` uses the polygon of all the pin-shapes of the `pin`. • `pg_pin` uses the polygon of all the pin-shapes of the `pg_pin`. • `port_shape` uses the polygon of all the shapes of the top-level `port_shape`. • `net` uses the polygon of all the regular routing shapes on the net. Pin-shapes or special-route shapes attached to the net are not included. • `port` uses the polygon of all the pin-shapes of the top-level port. • `port_shape` uses the polygon of all the pin-shapes of the top-level port shape. • `via` uses the polygon of all the shapes of the via. • `special_via` uses the polygon of all the shapes of the via. • `partition` uses the polygon of all the shapes of the partition. *Default*: `inst` *Data_type*: (enum)+, optional
`-overlap_only`	Returns only those objects, which are partially overlapped with the search area. Some part of the object polygon overlaps the search area, whereas some of its part is outside the search area. A single point of contact is not considered as an overlap. When multiple areas are specified, the object is returned as long as it overlaps with one of the search areas. *Data_type*: bool, optional
`-polygons {`*x11 y11 x12 y12 x13 y13 ...*`}`	
	Specifies a polygon search area. By default, all the objects overlapping or abutting this area are returned on using the `-polygons` parameter, unless the `-abut_only`, `-enclosed_only`, or `-overlap_only` parameter is specified. The units are in microns (unless `-d` is specified, which indicates the database units). The format can be in either like `{x11 y11 x12 y12 x13 y13 ...}` or `{{x11 y11} {x12 y12} {x13 y13} ...}`. The polygon must be well-formed, not have zero area, and not have crossing edges. *Data_type*: polygon, optional
`-strict_via_inst_layer_check`	
	Returns only those objects on the specified layer, which match with one of the via's bottom, cut, or top layers. This parameter does not return the objects of the via on the unmatched layers. It works only for `special_via` and `via`. *Data_type*: bool, optional

Examples

- The following command returns all the instances and routing-blockages on the `metal6` and `metal7` layers that are partially overlapped, abutted, or enclosed in the given triangle area:
  ```
  get_obj_in_area -obj_type {inst route_blockage} -polygons {100 100 110 110 100 110} -layers {Metal6 Metal7}
  ```
- The following command returns all the instances and routing-blockages on the `metal6` and `metal7` layers that are partially overlapped, abutted, or enclosed in the given triangle area using the bounding-box of the objects:
  ```
  get_obj_in_area -obj_type {inst route_blockage} -polygons {100 100 110 110 100 110} -layers {Metal6 Metal7}} -bbox_overlap
  ```
- The following command returns all the instances and regular wires on the `metal6` and `metal7`layers that are abutted in the give search areas:
  ```
  get_obj_in_area -obj_type {inst wire} -areas {{0 0 100 100} {150 100 200 200}} -layers {Metal6 Metal7}} -abut_only
  ```
- The following command returns all the instances and regular wires on the `metal6` and `metal7`layers that are abutted in the given search areas using the bounding-box of the objects:
  ```
  get_obj_in_area -obj_type {inst wire} -areas {{0 0 100 100} {150 100 200 200}} -layers {Metal6 Metal7}} -abut_only -bbox_overlap
  ```
- Following are the figures to illustrate each position relation. The instances presented by the red rectangles are returned with the specified parameter when the search area presented in the blue rectangle are specified.
  - **`-abut_only`**

    
  - **`-overlap_only`**

  - **`-enclosed_only`**

Note:

1. If none of the above three parameters is specified, all the instances presented by the red rectangles will be returned, by default.
2. For querying object with multi-shape (such as `port_shape`) in multiple search areas, if one of its shapes is enclosed/abutted/overlapped with any one of the specified areas, the object will be returned.

get_rect

```
get_rect
[-help]
rect {-ll | -ur | -llx | -lly | -urx | -ury | -size | -dx | -dy | -width | -length | -center | -area}
```

Returns the coordinates of the points of a rectangle. When you need to find the coordinates of a rectangle, in order to either move the rectangle or reshape the rectangle, the command helps you find the coordinates.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_rect` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_rect`
rect {-ll | -ur | -llx | -lly | -urx | -ury | -size | -dx | -dy | -width | -length | -center | -area}	
	Specified rectangle to access values from. • `-area`: Returns the area of the rectangle. • `-center`: Returns the center of the rectangle. • `-length`: Returns the larger of the `-dx` and `-dy` values. • `-ll`: Returns the lower left point of the rectangle. • `-llx`: Returns the lower left x coordinate of the rectangle. • `-lly`: Returns the lower left y coordinate of the rectangle. • `-dx`: Returns the x difference between the larger and smaller x values of the rectangle. • `-dy`: Returns the y difference between the larger and smaller y values of the rectangle. • `-ur`: Returns the upper right point of the rectangle. • `-urx`: Returns the upper right x coordinate of the rectangle. • `-ury`: Returns the upper right y coordinate of the rectangle. • `-size`: Returns the size of the rectangle from lower left to upper right. • `-width`: Returns the smaller of the `-dx` and `-dy` values. For *rect*: *Data_type*: rect, required For all other parameters mentioned above: *Data_type*: bool, optional

Examples

- `-area {8.1 9.2 10.3 11.4} returns 4.84`
- `-center {8.1 9.2 10.3 11.4} returns 9.2 10.3`
- `-length: get_rect -length {8.1 9.2 10.3 11.4}` returns: `2.2`
- `-ll: get_rect -ll {8.1 9.2 10.3 11.4}` returns: `8.1 9.2`
- `-llx: get_rect -llx {8.1 9.2 10.3 11.4}` returns: `8.1`
- `-lly: get_rect -lly {8.1 9.2 10.3 11.4}` returns: `9.2`
- `-dx: get_rect -dx {8.1 9.2 10.3 11.9}` returns: `2.2`
- `-dy: get_rect -dy {8.1 9.2 10.3 11.9}` returns: `2.7`
- `-ur: get_rect -ur {8.1 9.2 10.3 11.4}` returns: `10.3 11.4`
- `-urx: get_rect -urx {8.1 9.2 10.3 11.4}` returns: `10.3`
- `-ury: get_rect -ury {8.1 9.2 10.3 11.4}` returns: `11.4`
- `-size: get_rect -size {8.1 9.2 10.3 11.4}` returns `2.2 2.2`
- `-width: get_rect -width {8.1 9.2 10.3 11.4}` returns: `2.2`

get_transform_shapes

```
get_transform_shapes
[-help]
[-db_units]{-inst instPtr | -hier_inst instPtr | {-cell cellPtr -orient orientEnum -pt {x y}}}
{-local_pt list | -global_pt list}
```

Takes coordinates local to a cell and returns them in context with the global design space. You can specify a specific instance of a cell in the design, or you can specify a library cell, its location in the design, and instruct the software to perform a "what-if" translation of coordinates within that cell.

Parameters

-help	Pints a brief description that includes the type and default information for each `get_transform_shapes` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_transform_shapes`
`-cell` *cellPtr*	Specifies a pointer to a library cell. You must specify the `-pt` and `-orient` parameters with `-cell`. *Data_type*: (base_cell|module|design), optional
`-db_units`	Specifies values in database units, specified in integers. This is an optional parameter. If you use the `-db_units` option, the Boolean value is 1, so the value will be displayed in database units. If you don't specify the `-db_units` option, the Boolean value is 0, the default. *Default*: Specifies values in user units, in microns *Data_type*: bool, optional
`-global_pt` *globalPts*	Specifies the global coordinates to convert into local coordinates. *Data_type*: string, required
`-hier_inst`	Specifies the hierarchical instance of a database object. This option is mandatory. *Data_type*: (hinst), required
`-inst` *instPtr*	Specifies a pointer to a specific instance/bump of a cell in the design. The software derives the coordinates and the orientation for the cell instance from the design. *Data_type*: (inst | bump), required
`-local_pt` *list*	Specifies the local coordinates to convert into global coordinates. *Data_type*: string, required
`-orient` *orientEnum*	Specifies the orientation of the cell specified with `-cell`. You must specify the `-cell` and `-pt` parameters with `-orient`. Valid orientation values are: `r0`, `r90`, `r180`, `r270`, `mx`, `mx90`, `my`, and `my90`. *Data_type*: enum, optional
`-pt` *x y*	Specifies the coordinates for the cell specified with `-cell`. You must specify the `-cell` and `-orient` parameters with `-pt`. *Data_type*: point, optional

Examples

- Assume that a shape exists on *M1* within a NAND2 cell, from (`1 1`) to (`2 2`). If an instance of the NAND2 cell is placed at (`10 10`), with an `r0` (N) orientation, the following command converts the local points (`1 1 2 2`) of the NAND2 cell into their global coordinates:

  ```
  get_transform_shapes -cell [get_db base_cells -if {.base_name == NAND2}] -pt {10 10} -orient r0 -local_pt {1 1 2 2}
  ```

  The software returns the following information:

  ```
  {11 11 12 12}
  ```

- Assume that the NAND2 cell placed at (`10 10`), with an `r0` (N) orientation is named `i1`. The following command converts the local points (`1 1 2 2`) of `i1` into their equivalent global coordinates:

  ```
  get_transform_shapes -inst [get_db insts -if {.name == i1}] -local_pt {1 1 2 2}
  ```

The software returns the following information:

```
{11 11 12 12}
```

report_floating_nets

```
 report_floating_nets
[-help]
[-out_file file_name]
```

Reports the number of nets with zero terms, including the PG nets. This command can also be used to report the number of dangling nets, which could or could not be removed by the `delete_floating_nets` command. The command reports the following information, when used:

- Total number of nets
- Number of dangling nets
- Number of removable dangling nets
- Number of non-removable dangling nets

The removable and non-removable nets are reported based on the usage of the `delete_floating_nets` command. Those dangling nets, which could not be removed by the `delete_floating_nets` command, are reported in the output file due to multiple possible reasons, such as the dangling net:

- Is a physical net.
- Is a PG net.
- Is a bus bit net.
- Is an assign net.
- Has multiple module ports and at least one port is associated with some constraints.
- Has some constraints, such as in an ILM module or some timing constraint.

Note: If a dangling net cannot be deleted due to any reason, only the first reason listed above will be reported in the output file.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_floating_nets` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_floating_nets`
`-out_file file_name`	Reports the list of dangling nets that cannot be deleted by the `delete_floating_nets` command, along with its reasons. *Data_type*: string, required

Examples

- The following command reports the information about the nets listed in the `dangling_net.rpt` file:

```
report_floating_nets -out_file dangling_net.rpt
```

- Following is the output of the above command:

```
############################################################
# Generated by: Cadence Innovus 19.10-p002_1
# OS: Linux x86_64(Host ID sjfsb473)
# Generated on: Sat Aug 18 11:14:18 2018
# Design: design_name
# Command: report_floating_nets -out_file dangling_nets.rpt
############################################################

Total number of nets: 123456
The number of dangling nets: 26
Removable dangling nets: 22
Non-removable dangling nets: 4
Is physical net: 2
Is P/G net: 0
Is bus net: 1
Is assign net: 0
Has module port:0
Has constraints: 1

Reasons for the net not being removed:
net:xxxx is physical net ## net:xxxx here is the DPO name of the net
net:xxxx is physical net
net:xxxx is bus net
net:xxxx has constraints
```

`delete_floating_nets`

report_metal_stack

```
report_metal_stack
[-help]
[-non_preferred_direction]
```

Reports the metal stack configuration and routing track information. For each routing layer, this includes the layer name, preferred routing direction, routing offset (offset of routing track from 0), routing pitch (space between each routing track), min-width DRC rule, min-spacing DRC rule, and the routing default-width (wire width of the default routing rule). Note that for a horizontal direction track, the offset and pitch are in the Y direction (for example, the Y offset from 0, and the Y pitch of horizontal tracks). This command only supports uniform track-patterns with a single pitch value, and will not report non-uniform pitch routing track patterns that can be created with `add_tracks` or `create_tracks`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_metal_stack` parameters. For a detailed description of the command and all its parameters, use: `man report_metal_stack`
`-non_preferred_direction`	By default, the `report_metal_stack` command displays the metal stack and routing information only related to the preferred routing direction. When the `-non_preferred_direction` parameter is used, the information related to the non-preferred routing direction is also displayed. *Data_type*: bool, optional

Examples

- The following command displays the metal stack and routing information:
  ```
  report_metal_stack
  ```

  The following is an example of the output of the above command:

  ```
  ================================================================================
  Layer   Direction   Offset    Pitch      Min_Spacing  Min_Width   Default_Width
  ================================================================================
  M1      horizontal  0.000000  0.040000   0.020000     0.020000     0.020000
  M2      vertical    0.000000  0.057000   0.020000     0.037000     0.037000
  M3      horizontal  0.000000  0.040000   0.020000     0.020000     0.020000
  M4      vertical    0.000000  0.048000   0.020000     0.028000     0.028000
  ```

- The following command adds in the non-preferred routing direction information:
  ```
  report_metal_stack -non_preferred_direction
  ```

  The following is the output of the above command:

  ```
  ============================================================================================
  Layer  Direction     Preferred Offset    Pitch      Min_Spacing  Min_Width  Default_Width
  ============================================================================================
  M1      horizontal   yes       0.000000  0.040000   0.020000     0.020000     0.020000
  M1      vertical     no        0.000000  0.040000   0.000000     0.000000     0.060000
  M2      vertical     yes       0.000000  0.057000   0.020000     0.037000     0.037000
  M2      horizontal   no        0.000000  0.057000   0.000000     0.000000     0.060000
  M3      horizontal   yes       0.000000  0.040000   0.020000     0.020000     0.020000
  M3      vertical     no        0.000000  0.040000   0.000000     0.000000     0.060000
  M4      vertical     yes       0.000000  0.048000   0.020000     0.028000     0.028000
  M4      horizontal   no        0.000000  0.048000   0.000000     0.000000     0.060000
  ```

report_net_wires

```
report_net_wires
[-help]
[-file fileName]
[-net netName]
```

Displays information about the regular net wires. If the `-net` parameter of this command is not specified, the wires of all the nets are displayed. If the `-file` parameter of this command is not specified,, the wire information on the screen (console) and log file are displayed. The information about the net regular wires is categorized as:

- Node Information
- Edge Information

Node Information

It includes XY location (like `Loc=(2.3, 52.11)`), metal layer (like `Layer=M1(2)`), number of edges on the current node (like `Edges=2`), tie special node name (like `Tie Special`), and global route node name (like `Global Route`). If the node has a terminal attached, the node information also includes the term information, like `Term = a/b/c`, `IO Pin = name`, or `PG Term = x/y/z`.

Edge Information

It includes node number (like `Node3 -> Node5`), edge type (like `Type=HV Wire`), and edge status (like `Status=Routed`). The edge status list includes `None`, `Routed`, `Fixed`, `Cover`, `Shield`, `No Shield`, `Global`, `Assigned`. For different edge types, the edge information reports different edge attributes. Following is the list of various edge types and their attributes:

- `HV Wire:`
  `NDR=name` (non-default rule name)
  `Width=3.3` (wire width)
  `Begin Extension=3.3` (wire beginning extension)
  `End Extension=3.3` (wire ending extension)
  `Mask=1` (color/mask value)
- `Via:`
  `Via Cell=name` (via cell name)
  `NDR=name` (non-default rule name)
  `Top Mask=1` (top metal layer's color/mask value)
  `Cut Mask=1` (cut layer's color/mask value)
  `Bottom Mask=1` (bottom metal layer's color/mask value)
- `Patch:`
  `Box=(100.0,200.0,223.6,250.4)` (patch box coordinates)
  `Mask=1` (patch color/mask value)
  `Attr=304` (patch attributes value)
  If it is a non-routing patch, it will also report trim metal information as shown below:
  `Trim Metal Box=(10.0, 10.0, 11.9, 11.9)` (trim metal box coordinates)
  `Mask=1` (trim metal color/mask value)
  `Layer=name` (trim metal layer name)
- `45 Degree:`
  `NDR=name` (non-default rule name)
  `Width=3.3` (wire width)
  `Mask=1` (color/mask value)
- `Zero Length`
- `Term Connect`
- `Virtual:`
  `Zero Length`, `Term Connect`, and `Virtual` have no extra attribute information. Following is an example of a single net:
  Wires for the `net1` net:
  `Node0: Loc=(44.102, 55.203), Layer=PO(2), Edges=1, Global Route`

```
Term = inst1/b
Node1: Loc=(44.102, 66.304), Layer=Po(2), Edges=1
IO Pin = net1
Edge0: (Node0->Node1), Type=HV Wire, Status=Routed, NDR=ndr1, Width=0.056, Begin Extension=0.056, End Extension=0.056, Mask=1
```

Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_net_wires` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_net_wires`
`-file` *`fileName`*	Specifies the name of the file.
`-net` *`netName`*	Specifies the name of the net.

report_preserves

```
report_preserves
[-help]
[-computed]
[-dont_touch | -dont_use]
[-obj_type {design | hinst | module | inst | net | hnet | pin | hpin | base_cell}]
```

By default, this command displays all the preserves that affect optimization set in the library. This includes all the `.dont_touch*`, `.read_only*`, `.is_ilm`, `.dont_use*`, and `.use_cells` attributes that have a non-default value. The command does not show the computed attributes that include inheritance from their parents such as `.dont_touch_effective`, `.dont_use_cells_effective`, `dont_touch_sources`, or `.read_only_effective` to make it easy to see exactly what objects were set in the library (see `-computed` to include them).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_preserves` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_preserves`
`-computed`	Includes computed inheritance attributes such as `.dont_touch_effective`, `.dont_touch_sources`, `.read_only_effective`, and `.dont_use_cells_effective` attributes in the report (unless filtered by `-dont_touch` or `-dont_use`). This causes all objects to inherit a non-default value from a parent or the library to appear in the report. *Data_type*: bool, optional
`-dont_touch`	Displays the report only related to `dont_touch`: `.dont_touch*`, `.read_only*`, and `is_ilm`. *Data_type*: bool, optional
`-dont_use`	Displays the report only related to `dont_use`: `.dont_use_cells*` and `.use_cells*`. *Data_type*: bool, optional
`-obj_type {design | hinst | module | inst | net | hnet | pin | hpin | base_cell}`	Displays the report only on specific object types. *Data_type*: enum, optional

Examples

Example 1

```
set_db hinst:TDSP_CORE_INST .size_only true
```

Queries all hinsts

```
report_preserve -obj_type hinst -dont_touch
```

```

report_rc

```
report_rc
[-help]
out_file
[-inst string]
[-layer string]
[-max_second_rc float]
```

Calculates the first and second RC values. The first RC value is the longest continuous vertical `rx` cut for a cell, where:

- Rx cut is always in the left or right boundaries of the cell, and at times in the internal cell.
- It is the longest vertical bar (number of rows) in which the cell's `rx` cut participate in.
- Multiple-height cells contribute the rows of height.

The second RC value is the largest distance (in microns) from the left or right boundary of the cell to the second `rx` cut in the left and right directions.

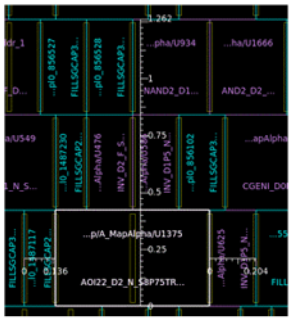
Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_rc` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_rc`
`out_file`	Specifies report filename. *Data_type*: string, required
`-inst` *`string`*	Specifies the distance from inst to report. *Data_type*: string, optional
`-layer` *`string`*	Specifies the layer of obs to calculate. *Data_type*: string, required
`-max_second_rc` *`float`*	Specifies the maximum distance to calculate the second RC. *Default*: `2` *Data_type*: float, optional

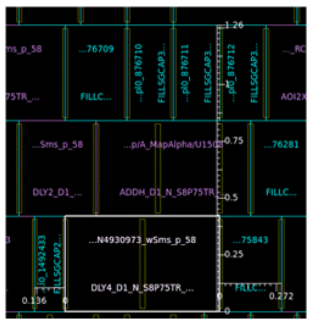
Examples

Refer to the following examples:

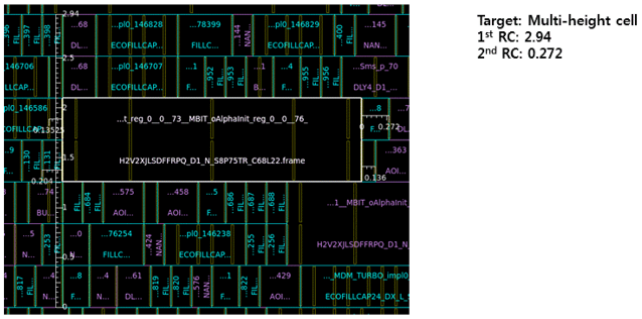
Example 1: STD Cell 1



Example 2: STD Cell 2



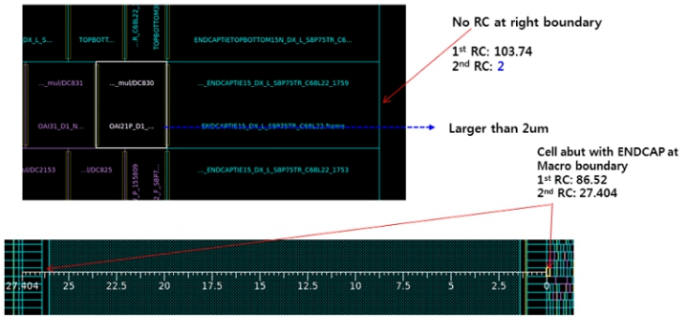
Example 3: Special Cells (Multi-height)



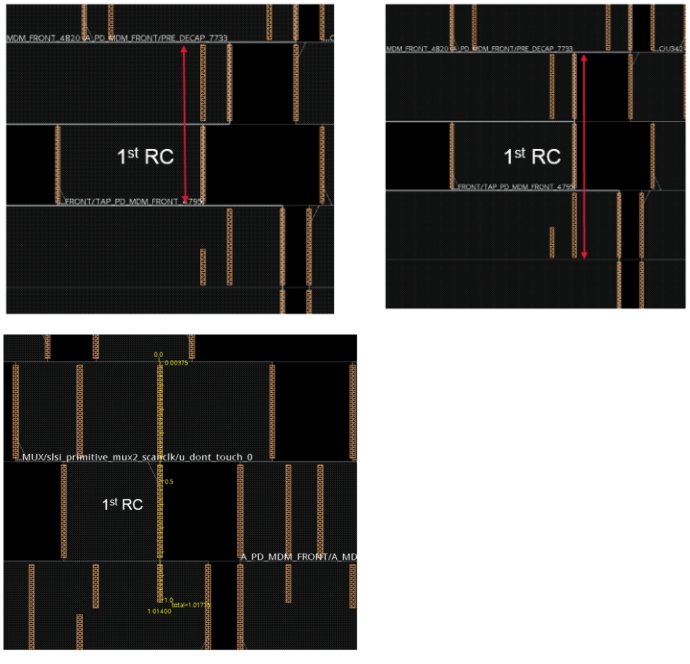
Example 4: Special Cells (ENDCAP)

Note that:

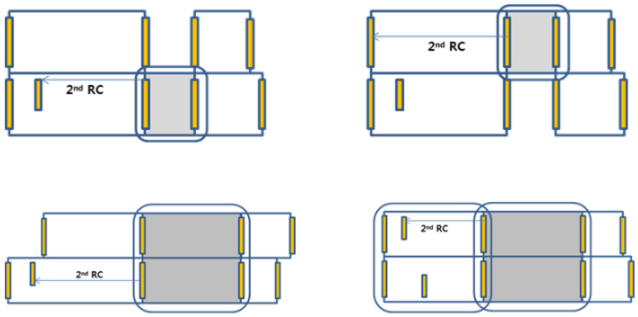
- An ENDCAP cell has a single RC.
- The cell with ENDCAP must have a long second RC.
- The second RC effect is saturated at 2um. It means that the second RC value for the cell is 2 um.



Example 5: First RC Values in Various Scenarios



Example 6: Second RC Values in Various Scenarios



Example 7: Input/Output Format of First and Second RC Generation

```
derive_rxcuts {
    -2nd_rc_saturation_length 2nd RC saturation length
    -output OUTPUT_FILE

}

innovus_shell> derive_rxcuts -2nd_rc_saturation_length  2.0 –output  ./rxcut.info.txt

report_via_def

```
report_via_def
[-help]
[-detail]
[-regular]
[-special]
```

Reports the single and multi-cut via summary for special and/or regular vias. Such a summary could be used for generating statistics regarding the usage of single and multi-cut used vias.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_via_def` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_via_def`
`-detail`	Prints the detailed report related to every via def. *Data_type*: bool, optional
`-regular`	Prints the report related to regular routing vias. *Data_type*: bool, optional
`-special`	Prints the report related to special routing vias. *Data_type*: bool, optional

Examples

Use the following command to display a detailed report related to every via:

```
report_via_def -detail
# Via-def                                Layer(cut)     Single-cut     Total
#--------------------------------------------------------------------------
# VIA1_20_7_20_7_VxaRECT_V                     VIA1       0            29733
# VIA1_20_7_20_7_VxaRECT_N                     VIA1       0            21322
# VIA1_20_7_20_7_VxaRECT_S                     VIA1       0            19468
# VIA1_20_7_7_20_VxaRECT_V                     VIA1       0             1266
# VIA1_0_25_0_25_VxaRECT_N49                   VIA1       0           152109
# VIA1_0_25_0_25_VxaRECT_S49                   VIA1       0           188660
...
#--------------------------------------------------------------------------
# Total                                                              10149027
```

Use the following command to display a report about regular routing vias, including single and multi-cut vias number (ratio):

```
report_via_def -regular
# Layer(cut)              Single-cut               Multi-cut          Total
#--------------------------------------------------------------------------
# VIA1              1872843 ( 74.2%)         649834 ( 25.8%)        2522677
# VIA2              1514819 ( 48.1%)        1632913 ( 51.9%)        3147732
# VIA3               914028 ( 50.4%)         900507 ( 49.6%)        1814535
# VIA4               514637 ( 47.1%)         578552 ( 52.9%)        1093189
# VIA5               203532 ( 40.2%)         302433 ( 59.8%)         505965
# VIA6                69496 ( 28.5%)         174355 ( 71.5%)         243851
```

```
# VIA7                11181 ( 13.9%)          69227 ( 86.1%)          80408
# VIA8                 4634 ( 10.1%)          41441 ( 89.9%)          46075
#-------------------------------------------------------------------------
# Total             5105170 ( 54.0%)        4349262 ( 46.0%)        9454432
```

report_wire_path

```
report_wire_path
[-help]
[-detail]
-end string
[-include_pin]
-start string
[-tcl [-no_output]]
```

Extracts the routing topology report in a point-to-point manner (for example between routing layer, wire length, via, resistor, and capacitance). The report contains the information such as timing path for each via, wire length, and width of path.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `report_wire_path` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_wire_path`
`-detail`	Prints the detailed information related to the path. *Data_type*: bool, optional
`-end string`	Specifies the end terminal name, which can be a `pin`, `port`, `hpin`, and `hport`. *Data_type*: string, required
`-include_pin`	Specifies whether to include pin in the report. *Data_type*: bool, optional
`-no_output`	Specifies whether to print the path when `-tcl` is used. *Data_type*: bool, optional
`-start string`	Specifies the start terminal name, which can be a `pin`, `port`, `hpin`, and `hport`. *Data_type*: string, required
`-tcl`	Specifies whether to return the Tcl dict of the wire path. *Data_type*: bool, optional

safety Category Attributes

The root attributes in the `safety` category are:

- safety_flow_enable
- safety_midas_enable
- safety_ser_cells
- safety_tmr_isolate_clock
- safety_tmr_spacing
- safety_tmr_spacing_x
- safety_tmr_spacing_y

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `tech` category, use the following command:

```
get_db -category safety
```

safety_flow_enable

`safety_flow_enable {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies the master switch to enable the implementation and analysis of the safety-mechanisms defined in the USF file.

safety_midas_enable

`safety_midas_enable {none |` fmeda `|` physical`}`

Default: `none`

Data_type: string, read/write

Enables the Unified Safety Format (USF) technology. The supported values of this attribute are:

- `none`: Does not enable this attribute.
- `fmeda`: Enables the USF command set for the failure mode effect and diagnostic analysis.
  Note: This value is supported only in Genus.
- `physical`: Enables the USF command set for physical implementation of safety mechanisms.
  Note: This value is supported in both Innovus and Genus.

To enable USF in Innovus, you must set `safety_midas_enable` to `physical`.

```
set_db safety_midas_enable physical
```

You will see a message like this:

```
Cadence Midas USF - Physical
Copyright 2022 Cadence Design Systems, Inc. All rights reserved worldwide.
Cadence and the Cadence logo are registered trademarks of Cadence Design Systems Inc.
in the United States and other countries.
Midas USF - Physical Version: 22.03.001
physical
```

ⓘ Once USF Physical is loaded, it is not possible to disable or reload it in the current session.

safety_ser_cells

`safety_ser_cells *string*`

Default: `""`

Data_type: string, read-only

Specifies the list of `base_cells` allowed for those insts, which have a Soft Error Resilience (SER) safety mechanism.

safety_tmr_isolate_clock

`safety_tmr_isolate_clock {none | unique_driver}`

Default: `none`

Data_type: enum, read/write

Specifies the type of clock isolation required for Triple Modular Redundancy (TMR) flops. When set to `unique_driver`, the clock pin of every TMR flop is directly driven by its own unique clock cell with `fanout = 1`.

safety_tmr_spacing

`safety_tmr_spacing *microns*`

Default: `0.0`

Data_type: coord, read/write

Specifies the radial spacing in any direction that should be maintained between the three flops in a TMR group. The value of this attribute is measured in microns.

Note: The `safety_tmr_spacing_x`, `safety_tmr_spacing_y`, and `safety_tmr_spacing` attributes are mutually exclusive.

safety_tmr_spacing_x

`safety_tmr_spacing_x *microns*`

Default: `0.0`

Data_type: coord, read/write

Specifies the horizontal spacing that should be maintained between the three flops in a TMR group. The value of this attribute is measured in microns. Only one value of either `safety_tmr_spacing_x` or `safety_tmr_spacing_y` needs to be met.

Note: The `safety_tmr_spacing_x`, `safety_tmr_spacing_y`, and `safety_tmr_spacing` attributes are mutually exclusive.

safety_tmr_spacing_y

`safety_tmr_spacing_y *microns*`

Default: `0.0`

Data_type: coord, read/write

Specifies the vertical spacing that should be maintained between the three flops in a TMR group. The value of this attribute is measured in microns. Only one value of either `safety_tmr_spacing_x` or `safety_tmr_spacing_y` needs to be met.

Note: The `safety_tmr_spacing_x`, `safety_tmr_spacing_y`, and `safety_tmr_spacing` attributes are mutually exclusive.

tech Category Attributes

The root attributes in the `tech` category are:

- tech_db_units
- tech_finfet_grid_direction
- tech_finfet_grid_offset
- tech_finfet_grid_pitch

- tech_inst_mask_shift_layers
- tech_mfg_grid

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `tech` category, use the following command:

```
get_db -category tech
```

tech_db_units

`tech_db_units int`

Default: `{}`

Data_type: int, read-only

Specifies the database units per micron from LEF UNITS statement or OA techfile, unless `init_min_dbu_per_micron` is larger and overrides the LEF/OA value.

tech_finfet_grid_direction

`tech_finfet_grid_direction enum`

Default: `vertical`

Data_type: enum {vertical horizontal}, read/write

Specifies an enum value indicating the direction of the finfet grid from the LEF FINFET statement or OA.

tech_finfet_grid_offset

`tech_finfet_grid_offset coord`

Default: `{}`

Data_type: coord, read/write

Specifies the finfet grid offset from `0` in microns from the LEF FINFET statement or OA.

tech_finfet_grid_pitch

`tech_finfet_grid_pitch coord`

Default: `{}`

Data_type: coord, read/write

Specifies the finfet grid pitch in microns from the LEF FINFET statement or OA.

tech_inst_mask_shift_layers

`tech_inst_mask_shift_layers layer*`

Default: `{}`

Data_type: layer*, read-only

Specifies the ordered list of layer pointers to the layers that allow instance mask shifting. This is the list of layers that show up in the DEF COMPONENTMASK statement for layers that can have mask values shifted in standard cells.

tech_mfg_grid

`tech_mfg_grid coord`

Default: `{}`

Data_type: coord, read-only

Specifies the manufacturing grid from LEF MANUFACTURINGGRID statement or OA techfile.

Note: This is the default value for each layer, but it can be overridden for specific layers. In some technologies, the `mfg_grid` for higher metal layers is coarser than for the lower layers.

uniquify

```
uniquify
[-help]
{[design | module] | -new_master hinsts} [-exclude modules]
[-verbose]
```

Supports regrouping of master-clone partitions inside the non-unique modules. This command uniquifies or regroups the master/clones (one master module used by two or more `hinst` clones) by creating unique modules for each `hinst` clone, as needed. In all the cases, the new module names are generated by appending the '`_number`' suffix (such as `_1` and `_2`) sequentially to the original module name for creating a unique module name.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `uniquify` parameter. For a detailed description of the command and all its parameters, use the man command: `man uniquify`
`design` `|` *`module`*	Regroups the master/clones within the *`design`* or *`module`* and recursively below it. This assures that all the `hinsts` inside those would have their own unique module, except for the modules specified using the `-exclude` parameter. In case multiple `hinsts` are referenced to the specified `module`, those will remain as clones. *Data_type*: (design|module), required
`-exclude` *`modules`*	Excludes the specified modules from unification or regrouping. Use this parameter if a specific sub-module is a partition, which will be implemented and shared only once. *Data_type*: (module)+, optional
`-new_master` *`hinsts`*	Splits the `hinst` clones of a master module into the clones of a new master. The new master is also regrouped, except for the modules specified using the `-exclude` parameter. It may also happen that one of such `hinst` clones is forced to have a new master (refer to the **Examples** section). In case a `hinst` is not a clone of the same module, an error message is displayed. *Data_type*: (hinst)+, required
`-verbose`	Reports the `hinst` clones (if any), which are regrouped. *Data_type*: bool, optional

Examples

- The following command uniquifies the whole design, where the `h1`, `h2`, and `h3 hinsts` are clones of the `mod1` module, and the `h4` and `h5 hinsts` (clones of the `mod2` module) are inside `mod1`:
```
uniquify top -verbose
#hinst name module name
h1 mod1 (unchanged)
h2 mod1_1
h3 mod1_2
h1/h4 mod2 (unchanged)
h1/h5 mod2_1
h2/h4 mod2_2
h2/h5 mod2_3
h3/h4 mod2_4
h3/h5 mod2_5
```
  Note that the first clone of each module is not modified. So, `h1` still uses `mod1`, and `h1`/`h4` still use `mod2`. However, these are still reported to see the `hinst` clone, which forces a new module for the other `hinst` clones.
- Using the same scenario as in the previous example, the following command uniquifes the design below `mod1`:
```
uniquify mod1 -verbose
#hinst name module name
h1/h4 mod2 (unchanged)
h1/h5 mod2_1
h2/h4 mod2 (unchanged)
h2/h5 mod2_1
h3/h4 mod2 (unchanged)
h3/h5 mod2_1
```
  Note that only the design inside `mod1` is uniquified. So, `h1`, `h2`, and `h3` are still the clones of `mod1`, and there are still master/clones grouping between `h1`, `h2`, and `h3`. For instance, all the `h4`s use `mod2`, and all the `h5`s use `mod2_1`.
- Using the same scenario as in the first example, the following command splits `h1` and `h2` into a new master. This is normally done, if `h1`, `h2`, and `h3` are partitions and need a different implementation than `h3`. It is recommended not to uniquify `mod2`, if it is a lower-level partition, which will be implemented once and shared by all `h1`, `h2`, and `h3`.
```
uniquify -new_master {h1 h2} -exclude mod2 -verbose
#hinst name module name
h1 mod1_1
h2 mod1_1
```
  Note that `h3` is still using `mod1`, and the `mod2 hinsts` inside `mod1` and `mod1_1` (such as `h4` and `h5`) are still the clones of `mod2`. If there is also a `mod3` inside `mod1`, it will also be uniquified, but nothing inside `mod2` is uniquified.
- Using the same scenario as in the first example, the following command splits `h1` and `h4` into a new master. This implicitly forces `h1` to be uniquified from `h2` and `h3`.
```
uniquify -new_master {h1/h4} -verbose
#hinst name module name
h1 mod1_1 (forced by lower level change)
h1/h4 mod2_1
```
  If there is a `mod4` inside `mod2_1`, it will also be uniquified, but it will not be shared with `mod2`.

4

Bus Plan Commands

- create_bus_guide
- delete_bus_guides
- gui_clear_bus_guide_colors
- gui_show_bus_guide_multi_colors
- update_bus_guide

create_bus_guide

```
create_bus_guide
[-help]
[-type {hard| soft}]
-net_group netGrpName
-layer {id | id1:id2}
{[{-center_line {x1 y1 x2 y2} -width value} [-begin_extension value] [-end_extension
value]] | -rect {x1 y1 x2 y2}}
```

Creates bus guides associated with net groups, to guide routing for all the nets of the specified net group. You can create horizontal, vertical, and 45-degree bus guide segments. 45-degree bus guides are required for flip chip routing.

Use this command after defining a net group that will be associated with the new bus guide segment.

After a bus guide is created, you can modify its layer or width later by using the `update_bus_guide` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_bus_guide` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_bus_guide`.
`-begin_extension` *value*	Specifies the value, in microns, by which the bus guide segment is to be extended in the beginning. *Data_type*: float, optional
`-center_line` *x1 y1 x2 y2*	
	Specifies the coordinates of the center line of the bus guide segment. The direction of the guide segment is derived from the `x1 y1 x2 y2` coordinate values. **Note:** Non-orthogonal bus guide segments are not supported. *Data_type*: rect, required
`-end_extension` *value*	Specifies the value, in microns, by which the bus guide segment is to be extended in the end. *Data_type*: float, optional
`-layer {`*id* | *id1*`:`*id2*`}`	Specifies the routing layer constraint honored by the router. ⓘ Routing done on non-preferred routing layers or on layers which are not part of the specified layer constraint can have high cost implications *Data_type*: string, required
`-net_group` *netGrpName*	Specifies the name of the net group that will be associated with the new bus guide segment that you are creating. *Data_type*: string, required
`-rect {`*x1 y1 x2 y2*`}`	Specifies the lower-left and upper-right coordinates of the rectangle formed by the bus guide segment. *Data_type*: rect, required

`-type {hard |soft}`	Specifies the constraint type of bus guide: • `hard` - After running Early Global Route (eGR), NanoRoute (NR), or NanoRoute High Frequency Router (NRHF), the route obeys the path of the bus guide. • `soft` - After running eGR, NR, or NRHF, the bus guide only guides the route path. The tool can route the net out of the bus guide. *Default*: `soft` (If you don't specify the `-type` parameter to define the constraint type, the value of constraint type is taken as `soft`.) *Data_type*: enum, optional
`-width` *value*	Specifies the width, in microns, of the bus guide segment that you are creating. *Data_type*: float, optional

Example

- The following command creates a horizontal bus guide segment whose width is `120` microns, and layer constraint is from METAL4 to METAL8:
  ```
  create_bus_guide -net_group netGroup1 -center_line 4421.8 10749.36 4960.8 10749.36 -width 120 -layer METAL4:METAL8
  ```
- The following command creates a bus guide segment whose lower-left coordinate is at pt {`464 1240`} and upper-right coordinate is at pt {`528 1260`} for the net group `test` and with a layer constraint of Metal1 to Metal4:
  ```
  create_bus_guide -net_group test -layer {1:4} -rect {464 1240 528 1260}
  ```
- The following command creates a 45-degree bus guide segment:
  ```
  create_bus_guide -net_group test3Group -center_line 400 500 450 550 -width 20 -layer {METAL7:METAL8}
  ```

Related Information

delete_bus_guides

```
delete_bus_guides
[-help]
[-area x1 y1 x2 y2]
[-net_groups {netGroup | {list_of_net_groups}}]
[-layers {id | id1:id2}]
[-direction {h | v}]
[-all]
```

Deletes a bus guide.

If you do not specify any option, by default, the command delete all the bus guide segments.

Use this command after creating a bus guide segment.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_bus_guides` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_bus_guides`.
`-all`	Deletes all bus guide segments in the design. *Data_type*: bool, optional
`-area` *x1 y1 x2 y2*	Specifies the coordinates of the area from which the bus guide segments are deleted. *Data_type*: rect, optional
`-direction {h | v}`	Specifies the direction of the bus guide segment to delete. This can be `h` (horizontal) or `v` (vertical). *Data_type*: enum, optional
`-layers {`*id* `|` *id1*`:`*id2*`}`	Specifies the layer or layer range from which bus guide segments are deleted. The command deletes bus guide segments with the exact specified layer information and not a subset of it. For example, for a bus guide segment with layer constraint `2:5` if you specify `-layers 5`, the segment is not deleted. To delete this guide segment you need to specify `-layers 2:5` completely. *Data_type*: string, optional
`-net_groups {`*netGroup*`|` `{`*list_of_net_groups*`}}`	Specifies the name of the net group or list of net groups from which the bus guide segments are deleted. You can also use wildcard (* or ?) for specifying the net group name. *Data_type*: string, optional

Example

The following command deletes all the bus guide segments associated with the net group `abcBus` that has layer constraint from `Metal 3` to `Metal 7`:

```
delete_bus_guides -net_groups abcBus -layers 3:7
```

gui_clear_bus_guide_colors

`gui_clear_bus_guide_colors`

Clears the highlighted bus guide colors.

You can use this command to clear colors after `gui_show_bus_guide_multi_colors` has been used to color the bus guide(s).

Parameters

`-help`	Prints out the command usage. For a detailed description of the command and all of its parameters, use the man command: `man gui_show_bus_guide_multi_colors`

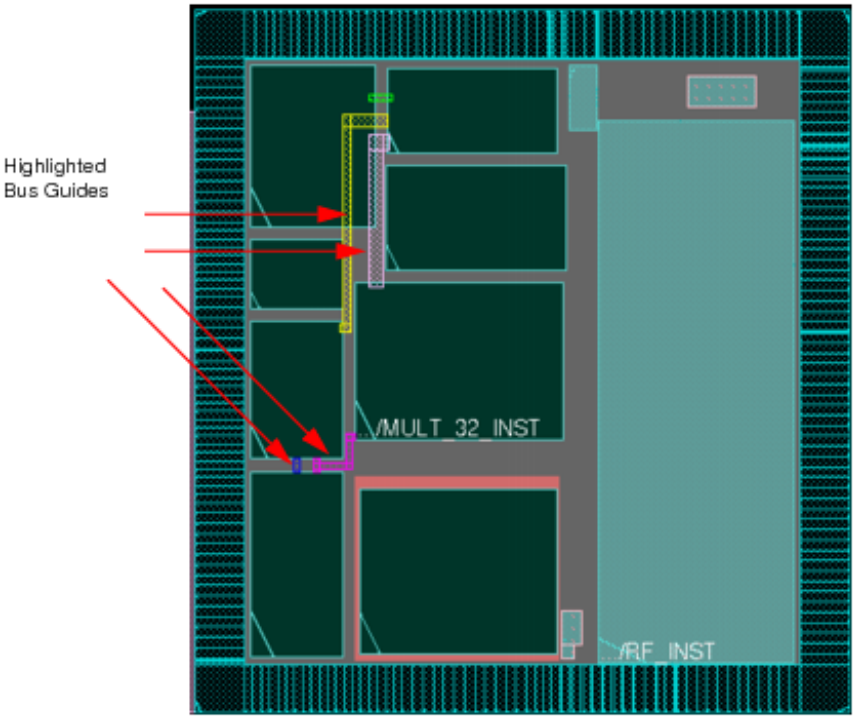
Related Information

- `gui_show_bus_guide_multi_colors`
- Bus Planning chapter in the *User Guide*
  - *Highlighting and Dehighlighting the Bus Guide*
- Edit Menu chapter in the *Menu Reference*
  - *Bus Guide*

gui_show_bus_guide_multi_colors

`gui_show_bus_guide_multi_colors`

Colors all the bus guides. Use this command to make it easy to distinguish between different bus guide objects in the design.



Specify `gui_clear_bus_guide_colors` to clear the bus guide colors.

Parameters

`-help`	Prints out the command usage. For a detailed description of the command and all of its parameters, use the man command: `man gui_clear_bus_guide_colors`

Related Information

- `gui_clear_bus_guide_colors`
- Bus Planning chapter in the *User Guide*
  - *Highlighting and Dehighlighting the Bus Guide*

update_bus_guide

```
update_bus_guide
[-help]
[-avoid_obstacles]
[-horizontal_layers {id | id1:id2}]
[-no_snap]
[-resize_direction {top_right bottom_left}]
[-type {hard | soft}]
[-vertical_layers {id | id1:id2}]
[-width value | -net_group name | {{-route_rule rulename | {-wire_width value -
wire_spacing value}} [-with_shield ]}]
```

Updates the selected bus guide as specified. The bus guide can expand automatically with pre-route or routing blockage.

Use the `update_bus_guide` command when you need to modify the layer or width information of an existing bus guide. Before using the `update_bus_guide` command, select the bus guide with the `select_obj` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `update_bus_guide` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man update_bus_guide`
`-avoid_obstacles`	Specifies whether to avoid pre-routes and blockages (detour). If this option is not specified, the bus guide is expanded with the pre-route and routing blockage. *Data_type*: bool, optional
`-horizontal_layers {id | id1:id2}`	Specifies the horizontal layer *id* or a layer range. Use this parameter to change the horizontal layer of the selected bus guide. *Data_type*: string, optional

`-net_group` *name*	Specifies the net group name. You must specify an existing net group. *Data_type*: (net_group), optional
`-no_snap`	Specifies whether or not to snap the bus guide. *Data_type*: bool, optional
`-resize_direction {top_right bottom_left}`	Specifies the resize direction as follows: • `top_right`: Expands the selected bus guide from the top or right edge. • `bottom_left`: Expands the selected bus guide from the bottom or left edge. If this option is not specified, the bus guide is expanded from the center line. *Data_type*: enum, optional
`-route_rule` *rulename*	Specifies the rule name or default. Use this parameter to change the selected bus guide width as per the wire width or wire spacing defined in the specified LEF rule. If *rulename* is not specified, default LEF rule is used. **Note**: This parameter cannot be used with the `-width`, `-wire_width`, or `wire_spacing` parameters. *Data_type*: string, optional
`-type {hard | soft}`	Specifies the new constraint type of the bus guide: • `hard` - After running Early Global Route (eGR), NanoRoute (NR), or NanoRoute High Frequency Router (NRHF), the route obeys the path of the bus guide. • `soft` - After running eGR, NR, or NRHF, the bus guide only guides the route path. The tool can route the net out of the bus guide. *Data_type*: enum, optional
`-vertical_layers {`*id* `|` *id1:id2*`}`	Specifies the vertical layer *id* or a layer range. Use this parameter to change the vertical layer of the selected bus guide. *Data_type*: string, optional

`-width value`	Specifies bus guide width. Use this parameter to change the selected bus guide width to the specified value. **Note**: This parameter cannot be used with the `-route_rule`, `-wire_width`, or `wire_spacing` parameters. *Data_type*: float, optional
`-wire_spacing value`	Specifies wire spacing. Use this parameter to change the selected bus guide width as per the specified wire spacing value. **Note**: This parameter cannot be used with either the `-route_rule` parameter or the `-width` parameter. *Data_type*: float, optional
`-wire_width value`	Specifies wire width. Use this parameter to change the selected bus guide width as per the specified wire width value. **Note**: This parameter cannot be used with either the `-route_rule` parameter or the `-width` parameter. *Data_type*: float, optional
`-with_shield`	Adds shield wire base on the shield net property defined by the following root attributes in the `edit_wire` category: `edit_wire_outer_shield_spacing`, `edit_wire_outer_shield_width`, and `edit_wire_shield`. When specified with: • `-wire_width` and `-wire_spacing`, the tool considers only the outer shielding nets. • `-route_rule`, the tool considers the shielding nets between wires. *Data_type*: bool, optional

Example

- The following command updates the width of the selected bus guide as per the NDR *doublewidth* defined in LEF. It also changes the horizontal layer of the selected bus guide to 3 and considers the shielding nets between wires.
```
update_bus_guide -route_rule doublewidth -horizontal_layers 3 -with_shield
```

- check_ac_limit_use_rms_delta_t
- check_ac_limit_view

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `check_ac_limit` category, use the following command:

```
get_db -category check_ac_limit
```

check_ac_limit_additional_individual_violation_report

`check_ac_limit_additional_individual_violation_report {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies to generate separate violation reports for each current waveform calculation method (`rms`, `peak`, or `avg`). If this attribute is not specified, a single violation report file is generated using the `check_ac_limit_method {RMS AVG peak}` attribute. This attribute gives you the flexibility of generating either a single collated report or individual reports for each analysis method.

Example:

```
set_db  check_ac_limit_method {rms peak avg} \
check_ac_limit_out_file context1.rpt \
...
check_ac_limit_additional_individual_violation_report true
```

This command will generate 3 different reports, namely `context1.rpt_avg`, `context1.rpt_peak`, and `context1.rpt_rms`. If there are no EM violations for a method, the tool will not generate the corresponding separate report. In this example, if there are violations for `avg` and `rms` but none for `peak`, then it will generate only two reports, `context1.rpt_avg` and `context1.rpt_rms`.

check_ac_limit_avg_recovery

`check_ac_limit_avg_recovery em_recover`

Default: `0.0`

Data_type: double, read/write

Specifies the recovery factor used for calculating I_{avg} current density with recovery. By default, the recovery factor (per layer) is read from the Quantus techfile. If you specify `em_recover`, it overrides the Quantus tech `em_recover` factor for all layers used in I_{avg} limits. The minimum value of this attribute is `-1` and the maximum is `1`.

check_ac_limit_current_file

`check_ac_limit_current_file filename`

Default: `""`

Data_type: string, read/write

Specifies the current of a macro's output pins for EM calculation, in case the macro does not have the respective timing library. When the macro output pin current is set by the current file, the value calculated (if any) from AAE is overwritten.

check_ac_limit_current_scale_factor

`check_ac_limit_current_scale_factor {{avg value} {rms value} {peak value}}`

Default: `""`

Data_type: string, read/write

Scales the signal EM current by the respective factor for avg, rms, or peak current specified by `{avg value} {rms value} {peak value}`.

The value specified for this attribute must be > 0 and <= 10.

check_ac_limit_current_scale_table

`check_ac_limit_current_scale_table` *`current_scale_table_file`*

Default: `""`

Data_type: string, read/write

Specifies the name of the scale table file used for layer-based scaling of the signal EM current. The scale table contains the scale factor for avg, rms, or peak current for each layer.

check_ac_limit_default_freq_for_unconstrained_nets

`check_ac_limit_default_freq_for_unconstrained_nets` *`freq_in_Hz`*

Default: `0.0`

Data_type: double, read/write

Specifies the frequency for EM calculation when a net has no defined frequency or has a defined frequency of `0` Hz in the design.

check_ac_limit_delta_temperature

`check_ac_limit_delta_temperature` *`temp`*

Default: `5.0`

Data_type: double, read/write

Specifies the maximum temperature rise permitted in units of Celsius. This value is normally used in the Quantus tech file for the RMS current limit equation. For example:

```
em_jmax_ac_rms EQU sqrt(12.66 * delta_T * (w - 0.003)^2 * (w - 0.003 + 0.264) / (w - 0.003 + 0.0443))
```

check_ac_limit_delta_temperature_layer_list

`check_ac_limit_delta_temperature_layer_list {{`*`<LEF_layer_name> <delta_T_in_C>`*`}+}`

Default: `""`

Data_type: string, read/write

Specifies the delta temperature for specific LEF layers during signal EM RMS current limit analysis.

check_ac_limit_detailed

`check_ac_limit_detailed`

Default: `false`

Data_type: bool, read/write

Generates a detailed report containing information for all signal nets, including those without violations.

check_ac_limit_effort_level

`check_ac_limit_effort_level {low | medium | high}`

Default: `low`

Data_type: enum {low medium high}, read/write

Specifies the method used for current calculation of nets in the Signal ElectroMigration analysis flow. The two methods are:

- **non-simulation mode** - use the capacitance ratio to distribute the current down the stream from the driver to the receiver.
- **simulation mode** - simulates resistance and capacitance to get the true current on each segment. This mode is more accurate but requires a longer run time.

This attribute has the following three arguments:

- `low`: enables the non-simulation mode for all nets where the current distribution is based on the capacitance ratio.
- `medium`: enables the simulation mode for the nets with physical loops, and the non-simulation mode for the non-loop nets.

- `high`: enables the simulation mode for all nets.

The `medium` and `high` levels require a VTS-AA license.

Note: For the simulation mode with effort level `medium` or `high`:

- If you use `extract_rc`, run `set_db extract_rc_qrc_cmd_type partial extract_rc_qrc_cmd_file` *`qrc.user.cmd`*, where *`qrc.user.cmd`* must include the following CCL commands:
  ```
  extraction_setup -analysis em -cluster_vias_in_em true
  output_db -type spef -subtype "EXTENDED"
  ```

  Refer to the example below:
  ```
  output_db \
   -type spef -busbit_delimiter "[]" -escape_special_character false \
   -hierarchy_delimiter "/" -output_incomplete_nets true \
   -output_unrouted_nets true -pin_delimiter ":" -subtype "EXTENDED" \
   -disable_subnodes false -add_explicit_vias true \
   -include_parasitic_res_width true -include_parasitic_res_width_drawn true
  ```
- If you run standalone Quantus to generate the required SPEF file in the extended format separately, then instead of `extract_rc`, use the following command for signal EM analysis:
  `read_spef -keep_star_node_locations -extended` *`spef_file`*

check_ac_limit_em_cdf_percentage

`check_ac_limit_em_cdf_percentage` *`value`*

Default: `1e-9`

Data_type: bool, read/write

Calculates the Cumulative Distribution Factor (CDF) derating factor based on the EM rules specified in the ICT EM file, given by the `check_ac_limit_ict_em_models` attribute. This attribute is used to calculate the fail rate and reliability of a design. The value of the CDF percentage should be between 0 and 100.

When the CDF related rule exits in the ICT EM file, the software uses the default value `1e-09` for `check_ac_limit_em_cdf_percentage` if it is not specified.

check_ac_limit_em_limit_scale_factor

`check_ac_limit_em_limit_scale_factor {{avg` *`value`*`} {rms` *`value`*`} {peak` *`value`*`}}`

Default: `""`

Data_type: string, read/write

Scales the calculated signal EM limits by the respective factor for avg, rms or peak current limit specified by `{avg` *`value`*`} {rms` *`value`*`} {peak` *`value`*`}`. The software compares the current through the net against the scaled EM limit to report violations in signal EM.

The value specified for this attribute must be > 0 and <= 10.

check_ac_limit_em_limit_scale_table

`check_ac_limit_em_limit_scale_table` *`em_limit_scale_table_file`*

Default: `""`

Data_type: string, read/write

Specifies the name of the scale table file used for layer-based scaling of the signal EM limit. The scale table contains the scale factor for avg, rms, or peak current for each layer.

check_ac_limit_em_res_width

`check_ac_limit_em_res_width {drawn silicon}`

Default: `drawn`

Data_type: enum {drawn silicon}, read/write

Specifies width used to get EM limit.

check_ac_limit_em_temperature

```
check_ac_limit_em_temperature value
```

Default: `0.0`

Data_type: double, read/write

Specifies the temperature expected for the device and is used to look up the temperature scaling factor. By default, no scaling is done. The *value* is a float, in units of degrees Celsius.

check_ac_limit_em_temperature_layer_list

```
check_ac_limit_em_temperature_layer_list {{<LEF_layer_name> <em_temperature_in_C>}+}
```

Default: `""`

Data_type: string, read/write

Sets a different temperature for specific LEF layers during signal EM AVG current limit analysis.

check_ac_limit_em_threshold

```
check_ac_limit_em_threshold value
```

Default: `1.0`

Data_type: double, read/write

Specifies to report violations in signal EM above the threshold value. The value is the ratio of signal current (avg/peak/rms) to the respective EM limit.

check_ac_limit_enable_seb

```
check_ac_limit_enable_seb {true | false}
```

Default: `false`

Data_type: bool, read/write

Specifies to enable the Statistical ElectroMigration Budgeting (SEB) analysis.

check_ac_limit_env_temperature

```
check_ac_limit_env_temperature value
```

Default: `0.0`

Data_type: double, read/write

Specifies the ambient temperature used to calculate S_{DC} for SEB analysis.

check_ac_limit_extraction_tech_file

```
check_ac_limit_extraction_tech_file filename
```

Default: `""`

Data_type: string, read/write

Specifies an extraction technology file for the Signal ElectroMigration analysis flow. If this attribute is not specified, then by default the extraction technology file will be taken from the analysis view (current RC corner).

check_ac_limit_force_hold_view

```
check_ac_limit_force_hold_view
```

Default: `false`

Data_type: bool, read/write

Forces `set_signal_em_analysis_mode` to use the hold view for current calculation even during setup fixing.

check_ac_limit_handle_pin_obs_via

`check_ac_limit_handle_pin_obs_via`

Default: `false`

Data_type: bool, read/write

Specifies to consider the vias defined in the `OBS` (obstructions/blockages) section of LEF in the Signal ElectroMigration flow. By default, the software does not consider via in obstruction.

This attribute does not honor the via obstructions with "`SPACING 0`".

check_ac_limit_ict_em_models

`check_ac_limit_ict_em_models` *`file`*

Default: `""`

Data_type: string, read/write

Specifies the ICT-EM file which only contains the EM rules and excludes the RC extraction data in ICT. The software will use the EM rules in the specified ICT-EM file to calculate EM limits for signal net EM analysis even if there are embedded EM rules in the Quantus tech file.

check_ac_limit_ircx_models

`check_ac_limit_ircx_models {RC.ircx EMIR.ircx}|{RC.ircx}`

Default: `""`

Data_type: string

Specifies an encrypted or unencrypted RC/EM technology (.ircx) file. The foundry-specific IRCX file, which contains the process information for extraction and EM modeling, can be used when the ICT-EM file is not available for electromigration analysis.

You can either specify two IRCX files, one file containing the RC process data (`RC.ircx`) and the other file containing EM rules (`EM.ircx`), or a single IRCX file that includes both the RC and EM sections (`RC.ircx`). A single IRCX file is used for the mature nodes, and separate RC and EM IRCX files are used for the advanced process nodes.

check_ac_limit_lifetime

`check_ac_limit_lifetime` *`value`*

Default: `0.0`

Data_type: double, read/write

Specifies the total hours of operation expected for the device, and is used to look up the lifetime scaling factor. *`value`* is used to find the scaling factor by interpolating from a piece-wise-linear table in the LEF or the Quantus tech file (`em_jmax_ac model` with `jmax_lifetime` table). If there is no scaling factor table, no scaling is done. *`value`* is a float, in units of hours.

check_ac_limit_max_error

`check_ac_limit_max_error` *`value`*

Default: `10000`

Data_type: int, read/write

Controls the number of errors to be included in the signal EM violation report file. If you do not specify this attribute, the top 10000 signal nets with violation will be included in the violation report.

The `check_ac_limit_max_error` attribute can be used to control the size of the violation report file.

check_ac_limit_method

```
check_ac_limit_method {rms peak avg}
```

Default: ""

Data_type: string, read/write

Specifies the current waveform calculation method. You can specify one or more of the following options:

- `avg`: Checks I_{avg} limits and reports any average current limit violations in the design.
- `peak`: Checks I_{peak} limits and reports any peak current limit violations in the design.
- `rms`: Checks I_{rms} limits and reports any RMS current limit violations in the design.

check_ac_limit_min_peak_duty_ratio

```
check_ac_limit_min_peak_duty_ratio duty_ratio
```

Default: `0.0`

Data_type: double, read/write

Sets the minimum duty ratio value for I_{peak} calculation. If the calculated duty ratio of a net is lower than the specified value, the specified value will be used to calculate I_{peak}. The minimum value for *duty_ratio* is `0.0`and the maximum is `1.0`.

check_ac_limit_min_peak_freq

```
check_ac_limit_min_peak_freq freq_in_Hz
```

Default: `0.0`

Data_type: double, read/write

Ignores I_{peak} current limit calculation for signal nets that have an effective frequency below the specified value (in Hertz).

check_ac_limit_net_file

```
check_ac_limit_net_file list_file
```

Default: `""`

Data_type: string, read/write

Specifies the net from file to check the signalEM analysis. The format is one net name per line, with comments using # as the first character. For example:

```
#list of nets to skip
net_a
net_b
net_c
```

check_ac_limit_nets

```
check_ac_limit_nets {netNames}
```

Default: `""`

Data_type: string, read/write

Specifies whether to check named or selected nets. If you name only one net, you do not need the braces around the net name. If you specify more than one net, you must separate the net names with a space.

check_ac_limit_out_file

```
check_ac_limit_out_file filename
```

Default: `""`

Data_type: string, read/write

Specifies the report file for the violation data. The report file includes name of the net, I_{rms}, interpolated `ACCURRENTDENSITY` limit (I_{limit}), layer, width, X and Y location, rise and fall time, effective frequency for the net (F_{eff}), Cnet and Vdd for each net.

check_ac_limit_peak_td_method

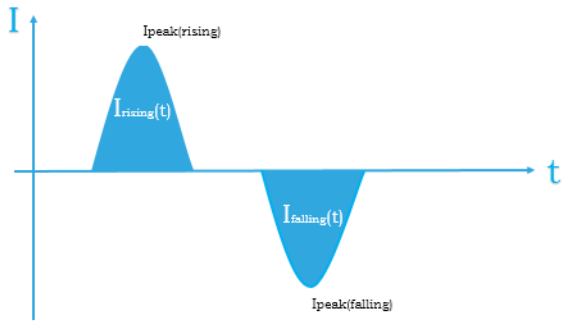
`check_ac_limit_peak_td_method {effective_width_from_integration effective_half_peak_width max_equivalent_dc_peak sum_half_peak_width}`

Default: `effective_width_from_integration`

Data_type: enum {effective_width_from_integration effective_half_peak_width max_equivalent_dc_peak sum_half_peak_width}, read/write

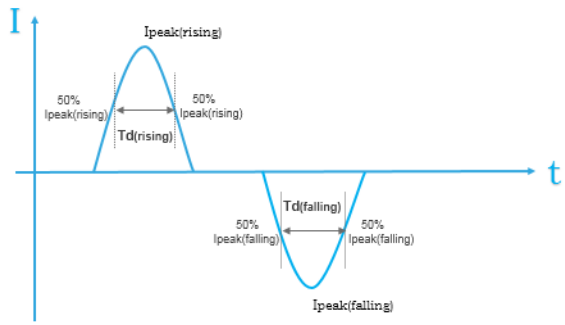
Specifies the Td calculation method for Ipeak check. The legal values are depicted below.

`effective_width_from_integration`



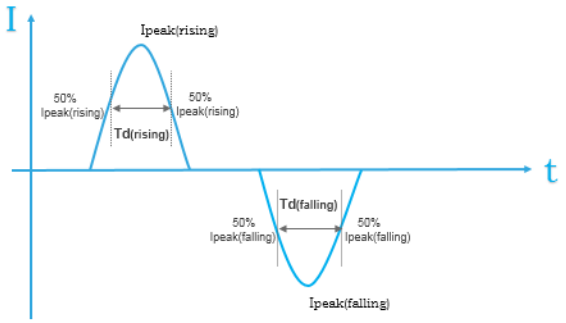
- $\mathrm{Td} = \frac{\int_0^{Tsw} |I(t)|dt}{\mathrm{Ipeak_measured}}$
  - Tsw = Period of one switching cycle (rising + falling)
  - Ipeak_measured = abs.max(Ipeak(rising), Ipeak(ralling))

`effective_half_peak_width`



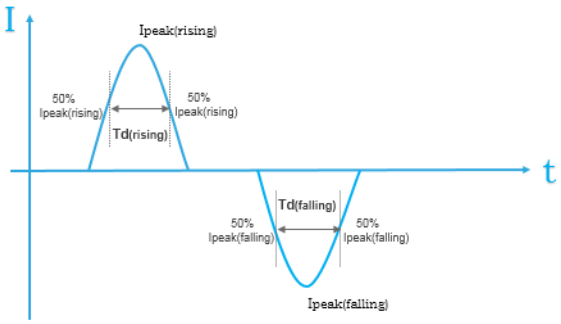
- When Ipeak(rising) >= Ipeak(falling)
  $\mathrm{Td} = \mathrm{Td(rising)} + (\frac{\mathrm{Ipeak(falling)}}{\mathrm{Ipeak(rising)}})^2 * \mathrm{Td(falling)}$
- When Ipeak(rising) < Ipeak(falling)
  $\mathrm{Td} = \mathrm{Td(falling)} + (\frac{\mathrm{Ipeak(rising)}}{\mathrm{Ipeak(falling)}})^2 * \mathrm{Td(rising)}$

max_equivalent_dc_peak



- $R(rising) = Td(rising)/(T/2)$
- $R(falling) = Td(falling)/(T/2)$
- Choose $\max(Ipeak_{(rising)}*sqrt(R_{(rising)}), Ipeak_{(falling)}*sqrt(R_{(falling)}))$ to compare against Ipeak_dc_limit
- $Ipeak_ac_limit = Ipeak_dc_limit/sqrt(R)$
- When $Ipeak_{(rising)}*sqrt(R_{(rising)}) >= Ipeak_{(falling)}*sqrt(R_{(falling)})$
  $Td = 2*Td(rising)$
- When $Ipeak_{(rising)}*sqrt(R_{(rising)}) < Ipeak_{(falling)}*sqrt(R_{(falling)})$
  $Td = 2*Td(falling)$

sum_half_peak_width



- $Td = Td_{(rising)} + Td_{(falling)}$

check_ac_limit_seb_lifetime

`check_ac_limit_seb_lifetime` *value*

Default: `43800` hours (that is, 5 years)

Data_type: double, read/write

Specifies the life time of product in hours.

check_ac_limit_seb_table

`check_ac_limit_seb_table` *table_filename*

Default: `""`

Data_type: string, read/write

Specifies the file name of the Failures in Time (FIT) table. This file is provided by the foundry. The file has the following columns:

- Layer
- MTF
- Sigma

- Activate energy
- Current density exponent

check_ac_limit_seb_temperature

`check_ac_limit_seb_temperature` *`temperature`*

Default: `""`

Data_type: double, read/write

Specifies the temperature used to update the median time to failure (MTF) with respect to the ambient temperature.

- If this temperature is specified, it would be used globally for all the resistors.
- If this temperature is not specified, the `seb_temperature` may take the following possible values depending on the specific circumstances:
  - If detailed delta temperature file is not used for SEB, the `seb_temperature` always takes the same value as that used for EM analysis.
  - If detailed delta temperature file is used for SEB, the `seb_temperature` is calculated by the following equation:
    ```
    seb_temperature  = env_temperature + delta_T
    ```
    Where `delta_T` is the maximum temperature rise, including joule heat and coupling heat from FEOL, in the resistor's bounding box with zero extension.

check_ac_limit_selected

`check_ac_limit_selected` *`filename`*

Default: `false`

Data_type: bool, read/write

Analyzes the net specified by selecting a net in the main GUI window.

check_ac_limit_simulation_net

`check_ac_limit_simulation_net` *`list_of_nets`*

Default: `""`

Data_type: string, read/write

Forces the specified nets to use the simulation mode.

check_ac_limit_simulation_net_file

`check_ac_limit_simulation_net_file` *`filename`*

Default: `""`

Data_type: string, read/write

Forces the nets in the specified file to use the simulation mode.

check_ac_limit_skip_category_mode

`check_ac_limit_skip_category_mode {0 | 1 | 2}`

Default: `1`

Data_type: int, read/write

Specifies to skip nets that belong to categories mapping to the specified mode. This parameter allows you to specify three modes, namely 0, 1 (default), and 2. The following table lists the common categories for all modes, and the categories specific to each mode:

Common Categories	0 Skip Category Mode	1 Skip Category Mode	2 Skip Category Mode
• Non top scope nets • Internal nets on boundary path • P/G nets • Constant nets • User-defined skipped nets • Nets below effective frequency threshold • Physically broken nets • Nets without loading capacitance annotation • Nets with SPEF back-annotation failures during simulation • Nets failed in analysis	• Slave nets by Verilog Assign • Nets (non-constant) without frequency annotation • Nets without physical shape for output pin • Nets without wire shape connection to output pin • Nets with zero pin current	• Equivalent nets by Verilog Assign • Nets without driver • Nets without receiver	• Nets without pins • Equivalent nets by Verilog Assign • Nets without driver • Nets without receiver

For example, if you set `set_signal_em_analysis_mode -skip_category_mode to 1`, the report file lists all categories listed in the *Common Categories* and *1 Skip Category Mode* columns.

Following is a snippet of the report file for mode **1**:

```
Total Nets in Design:              33451
Total Selected Nets in Design:         4
Total Analyzed Nets:                   0
Total Skipped Nets:                    4
  Non top scope nets:                                    0
  Internal nets on boundary path:                        0
  Equivalent nets by Verilog Assign:                     0
  P/G nets:                                              0
  Constant nets:                                         2
  User-defined skipped nets:                             0
  Nets below effective frequency threshold:              0
  Nets without driver:                                   1
  Nets without receiver:                                 1
  Physically broken nets:                                0
  Nets without loading capacitance annotation:           0
  Nets with SPEF back-annotation failures during simulation:  0
  Nets failed in analysis:                               0
```

check_ac_limit_skip_net

`check_ac_limit_skip_net` *`net_name_list`*

Default: `""`

Data_type: string, read/write

Specifies the net to be skipped in the signalEM analysis.

Refer to the example below:

```
{net_a net_b net_c}
```

check_ac_limit_skip_net_file

`check_ac_limit_skip_net_file` *`list_file`*

Default: `""`

Data_type: string, read/write

Specifies the net file to be skipped in the signalEM analysis.

The format is one net name per line, with comments using # as the first char. For example:

```
#list of nets to skip
net_a
net_b
net_c
```

check_ac_limit_toggle

`check_ac_limit_toggle` *`value`*

Default: `1.0`

Data_type: double, read/write

Specifies the switching factor for signal nets. A value of `1.0` means that if a flip-flop is clocked by a 20 Mhz clock, it changes state on 100% of the clock cycles.

Therefore, the signal has 20 million transitions, which is half the number of transitions of the input clock. As a result, the final switching frequency of the signal net is 10 Mhz.

Value Range: `0.0` to `1.0`

check_ac_limit_use_db_freq

```
check_ac_limit_use_db_freq
```

Default: `false`

Data_type: bool, read/write

Uses the database frequency value as the effective frequency per net.

check_ac_limit_use_qrc_tech

```
check_ac_limit_use_qrc_tech
```

Default: `false`

Data_type: bool, read/write

Forces I_{rms} checks to use the Quantus tech file instead of the technology LEF file. If either I_{peak} or I_{avg} is also checked, all checks will use the Quantus tech file, including I_{rms}. This attribute is enabled by default.

Note: The `-method avg` and `-method peak` analysis will only support AC current density rules from Quantus tech file. If either `avg` or `peak` is also specified, then all checks will use the Quantus tech file equations, including RMS.

check_ac_limit_use_rms_delta_t

```
check_ac_limit_use_rms_delta_t {true | false}
```

Default: `false`

Data_type: bool, read/write

When this parameter is set to `true`, the `delta_T` used to calculate `seb_temperature` would be based on the RMS delta T (joule heat only).

If this parameter is set to `false`, the `delta_T` used to calculate `seb_temperature` would be based on the sum of self-heat delta T and RMS delta T.

check_ac_limit_view

```
check_ac_limit_view viewName
```

Default: `null`

Data_type: string, read/write

Specifies the name of the view.

Related Information

Verifying AC Limit section in the Identifying and Viewing Violations chapter of the *Innovus Stylus Common UI User Guide.*

check_ac_limits

```
check_ac_limits
[-help]
```

Checks for the following types of AC current violations on signal nets.

- Root-mean-square (RMS) current limit violations (I_{rms}violations)
- Peak current limit violations (I_{peak}violations)

In addition, `check_ac_limits` can be used for average current limit (I_{avg}) analysis.

AC current limit violations are sometimes also referred as wire self-heat violations. DRC manuals have these current limits to avoid over-heating a signal-nets

wire with too much AC current. To prevent wire self-heating or AC signal electromigration, signal interconnects should be analyzed for their AC current carrying capacity and measured against the AC current limits specified by foundry.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_ac_limits` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_ac_limits`

Related Information

Verifying AC Limit section in the Identifying and Viewing Violations chapter of the *Innovus Stylus Common UI User Guide.*

check_antenna

```
check_antenna
[-help]
[-detailed]
[-error integer]
[-nets {net_names} | -selected]
[-out_file file_name]
[-use {all | signal | power | clock}]
```

Verifies the process antenna effect (PAE) in multi-thread mode with geometry-based check through the advanced NanoRoute antenna checker feature. It also supports advanced antenna rules, such as `LEF58_ANTENNADIFFGATEPWL` and `LEF58_ANTENNAMAXCUMAREA`. This command supports checking antenna rules on the backside metal areas for both PG and signal nets.

Note: Before running this command, ensure that the process antenna or maximum floating area keywords are specified in the LEF file and the signal nets are routed.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_antenna` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_antenna`
`-detailed`	Generates a report containing the PAE value for all layers of all the nets in a design, including those with no violations. If this parameter is not set, the report will include only those layers in the net that have violations. **Note:** To know the point of violation in the report, use the * mark. *Data_type*: bool, optional
`-error integer`	Specifies the maximum number of error messages to report. *Default:* `1000` *Data_type*: int, optional
`-nets {net_names}`	Reports the specified named nets. If you specify one net name, you do not need the braces around the name. *Data_type*: string, optional
`-out_file file_name`	Specifies the name of the output file. The file contains the PAE violation information. *Default:* *design_name*`.antenna.rpt` *Data_type*: string, optional
`-selected`	Reports the specified selected nets. Select nets using the `select_obj` command. If you specify one net name, you do not need the braces around the name. *Data_type*: bool, optional
`-use {all | signal | power | clock}`	Specifies the type of net to be checked. *Data_type*: enum, optional

Example

The following command verifies PAE violations in the routed design and generates a report file called `Test7.antenna.rpt`:

```
check_antenna -report Test7.antenna.rpt
```

check_connectivity

```
check_connectivity
[-help]
[-add_new_open_markers]
[-append]
[-bbox_open_markers]
[-check_pg_ports]
[-check_wire_loops | -check_geometry_loops | -geometry_connect]
[-delete_old_open_markers]
[-die_abstract_file abstractdiefilenames]
[-divide_power_nets]
[-error integer]
[-ignore_dangling_wires]
[-ignore_floating_metal]
[-ignore_opens]
[-ignore_pg_pin cell_name]
[-ignore_soft_pg_connects]
[-ignore_unconnected_pins]
[-ignore_unrouted_nets]
[-ignore_weak_connects]
[-marker_on_highest_layer]
[-nets netNames | -selected]
[-no_fill]
[-out_file filename]
[-preferred_top_layer integer]
[-type {all | special | regular}]
[-use_external_connects]
[-warning value]
```

Detects conditions such as opens, unconnected wires (geometric antennas), unconnected pins, loops, partial routing, and unrouted nets; generates violation markers in the design window; reports violations. Running this command does not have database impact unless you save the design, which also saves the violation markers.

The Verify Connectivity feature now uses `set_multi_cpu_usage` and other multi-CPU commands for multi-threading.

For more information, see the Multiple-CPU Processing Commands chapter in the *Innovus Stylus Common UI Text Command Reference* document.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_connectivity` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_connectivity`
`-add_new_open_markers`	Uses an open violation marker to show unconnected objects. *Data_type*: bool, optional
`-append`	Displays incremental results in the Violation Browser. By default, violation markers are over-written with new results during each `check_connectivity` run. When you specify this parameter, violation markers are appended to the violations of the previous `check_connectivity` run. *Data_type*: bool, optional
`-bbox_open_markers`	Displays violation markers for opens as the bounding box of the island. By default, violation markers for opens are displayed as polygons that include all wires, pins, and vias that connect to the island. *Data_type*: bool, optional
`-check_geometry_loops`	Checks for loop violations of regular nets using a geometrical model. The nets do not have to overlap on the center line. When you specify this parameter, Innovus does not perform any other connectivity checks. Use this parameter if you use a third-party router that does not route using the centerline connection routing technique. In this case, the `-check_wire_loops` parameter might not detect connectivity loop violations. *Data_type*: bool, optional

`-check_pg_ports`	Verifies all PG ports connection. *Data_type*: bool, optional
`-check_wire_loops`	Checks for connectivity loops in regular wires. Detects connectivity loops based on the end points of the center line of a regular wire segment or the center of a via. *Data_type*: bool, optional
`-delete_old_open_markers`	Removes old open violations. *Data_type*: bool, optional
`-die_abstract_file` *`abstractdiefilenames`*	Specifies the TSV abstract die files to be used to check the uBumps between the current die and the adjacent dies. Here, *`abstractdiefilenames`* specifies the names of the abstract die files created using the command `write_die_abstract`. *Data_type*: string, optional
`-divide_power_nets`	Divides power nets into four subareas for connectivity verification. Use this parameter to decrease memory usage in 32-bit machines with limited memory. This parameter might increase or decrease the run time, depending on the design. *Data_type*: bool, optional
`-error` *`integer`*	Specifies the maximum number of errors to report. The command stops when the maximum value is reached. *Default:* `1000` *Data_type*: int, optional
`-geometry_connect`	Checks for connectivity violations of regular wires. Uses a geometrical model instead of the center-line model. In other words, if the wires overlap at any point, they are considered to be connected--they do not have to connect at the center line. Use this parameter if you manually change the routing or use a third-party router that does not route using the centerline connection routing technique. *Data_type*: bool, optional
`-ignore_dangling_wires`	Ignores violations due to unconnected wires (also called geometrical antennas or dangling wires). A wire is called an antenna when the wire end to via center distance is less than ½ of the wire width as shown in the picture below:  In this picture, the blue rectangle is the wire and the yellow squares are the vias. *Data_type*: bool, optional
`-ignore_floating_metal`	Ignores floating metals. A wire is called floating methal, when both ends of the wire are not connected to pin shapes as shown in the picture below. In this picture, the blue rectangle is the wire and the green squares are pin shapes. *Data_type*: bool, optional
`-ignore_opens`	Ignores open violations. A wire is said to be open when one of its ends is connected to a pin shape but the other end is not connected to any pin as shown in the picture below.  In this picture, the blue rectangle is the wire and the green squares are pin shapes. **Note:** This parameter automatically turns on the `-ignore_unconnected_pins` parameter, because open and unconnected pin verification are performed together. A pin shape that is not connected to any wire is called an unconnected pin (`unConnPin`). *Data_type*: bool, optional

`-ignore_pg_pin` *`cell_name`*	Specifies the cell containing the PG pin that can be ignored during connectivity check. *Data_type*: string, optional
`-ignore_soft_pg_connects`	Disables checking of soft Power/Ground connects. By default, `check_connectivity` checks the connectivity on masterslice layers. If `-ignore_soft_pg_connects` option is specified, connectivity on these layers is ignored. *Data_type*: bool, optional
`-ignore_unconnected_pins`	Ignores violations due to pins that are not connected to any other objects. In the picture below, the pin on the right is an unconnected pin (`unConnPin`) as it is not connected to any wire.  **Note:** This parameter is specified automatically when you specify the `-ignore_opens` parameter. *Data_type*: bool, optional
`-ignore_unrouted_nets`	Ignores nets that are not routed. *Data_type*: bool, optional
`-ignore_weak_connects`	Disables checking for routing to more than one port of the weakly connected pin ports. *Data_type*: bool, optional
`-marker_on_highest_layer`	Reports the opening on the highest layer of the pin, which has more one shape. *Data_type*: bool, optional
`-nets` *`netNames`*	Specifies that connectivity should be verified for specified nets only. If you specify more than one net, separate the net names with space and surround the list of net names with braces or quotes. You can use wildcards (`*` and `?`) when you specify net names. **Note:** The `-nets` and `-selected` parameters are mutually exclusive. *Default:* If you do not specify either the `-nets` or the `-selected` parameter, `check_connectivity` verifies all nets. *Data_type*: string, optional
`-no_fill`	Specifies that metal fill also needs to be checked. *Data_type*: bool, optional
`-out_file` *`filename`*	Specifies the report file for connectivity violation data. *Data_type*: string, optional
`-preferred_top_layer` *`integer`*	Specifies the preferred top metal layer. When this parameter is used, check_connectivity does not check the specified top layer and above layers. *Data_type*: int, optional
`-selected`	Specifies that connectivity should be checked for selected nets or the nets connected to the pins of selected instances/macros. **Note:** The `-nets` and `-selected` parameters are mutually exclusive. *Default:* If you do not specify either the `-nets` or the `-selected` parameter, `check_connectivity` verifies all nets in the design. *Data_type*: bool, optional

`-type {all | regular | special}`	Specifies the type of wires to verify. `check_connectivity` is only concerned with the type of the wire and via (special or regular) and not the type of the pin. Irrespective of the `type` specified, all unconnected terminals (special and regular) are always reported unless `-ignore_unconnected_pins` is on. *Default:* `all` **Note:** To check connectivity for whole nets, you do not need to specify a type. **Note:** A pin-open violation is listed under VC DRC type "Problem(s) (ENCVFC-92): Pieces of the net are not connected together". Such a violation means the isolated open island only includes some pins' shapes that come from at least two different ports or pins. Choose one of the following: `all`: Checks all wires, including those that have been previously verified. `regular`: Reports all unconnected pins and open islands that do not include any special wire and via. Does not check a net that has no regular objects (wire, via, pin). `special`: Reports all unconnected pins and open islands that do not include any regular wire and via. Does not report isolated open islands that have any regular wire and via. *Data_type*: enum, optional
`-use_external_connects`	Implies a virtual connection for all bumps and external I/O pins of the same net. Set this parameter to override default behavior of `check_connectivity`, in which bumps and external I/O pins of the same net are not considered to be interconnected. It is useful in flip chip designs, where the power bumps are connected outside the chip. *Data_type*: bool, optional
`-warning` *value*	Specifies the maximum number of warnings to report. *Default:* `50` *Range:* `0` to `1000000` *Data_type*: int, optional

Examples

- The following command verifies connectivity for all nets and generates a maximum of 50 error and 50 warning messages:
  ```
  check_connectivity -type all -error 50 -warning 50
  ```
- The following command reports special unconnected pins and open islands that do not include any regular wire and via
  ```
  check_connectivity -type special -ignore_dangling_wires -error 1000 -warning 50
  ```

check_cut_density

```
check_cut_density
[-area {x1 y1 x2 y2}]
[-detailed]
[-global_density]
[-ignore_cell_obs]
[-layers layer_name_list]
[-oversize value]
[-out_file fileName]
```

Checks the density of specified cut layers or areas of cut layers, or the cut density of the whole chip.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_cut_density` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_cut_density`
`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area to verify. For example, `check_cut_density -area {0 0 100 100}`. *Default:* Entire area *Data_type*: rect, optional
`-detailed`	Generates a detailed cut density report. *Data_type*: bool, optional
`-global_density`	Checks the density across the entire design for the specified cut layers and writes the results to the report file. *Data_type*: bool, optional
`-ignore_cell_obs`	Disables checking of windows that are fully covered by block or pad obstructions. *Data_type*: bool, optional
`-layers layer_name_list`	Specifies the cut layers to verify. Use the following format to specify layer names: {Via12 Via23} For example, `check_cut_density -layers {Via12 Via23}`. *Data_type*: string, optional
`-out_file fileName`	Specifies the report file for the cut density violation information. *Default:* *designName*`.cutdensity.rpt` *Data_type*: string, optional
`-oversize value`	Specifies an offset value for the area to verify. The value is in user units (not in DBU), and can be positive or negative. A positive value adds to the area that is verified. For example, if the design covers the area from `(0,0)` to `(100,100)` and you specify `-oversize 10`, `check_cut_density` checks the area from `(-10,-10)` to `(110,110)`. *Default:* `0` *Data_type*: int, optional

Example

- The following command checks the density across the entire design for the layers `Via12` and `Via23` and generates a detailed report named `density.rpt`.
  ```
  check_cut_density -layers {Via12 Via23} -out_file density.rpt -detailed -global_density
  ```

check_drc

```
check_drc
[-help]
[-area {{lx1 ly1 ux1 uy1} {lx2 ly2 ux2 uy2}...}]
[-check_cuts_in_same_via]
[-check_drc_check_reverse]
[-check_ndr_spacing]
[-check_only {all | regular | special | selected_net | selected | cell  | default}]
[-check_routing_halo]
[-check_short_only]
[-check_trim_length]
[-check_uncolored]
[-enable_post_passive_fill_check]
[-exclude_pg_nets]
[-ignore_trial_route]
[-layer_range {layer1 [layer2]}]
[-limit max_error]
[-out_file file_name]
[-view_window]
```

Checks for DRC violations and creates violation markers in the design database that can be seen on the GUI and browsed with the Violation Browser.

This command uses a new DRC engine that can support all the tech nodes. You can use the `set_db` command to set global parameters for `check_drc`. The parameters you specify with the `set_db` command are then used as default automatically whenever you run `check_drc`. The settings are saved in the design so you need not set them each time you run `check_drc`.

Use `get_db` or `report_obj -categories check_drc -all` to return the current settings for the `check_drc` command. Use `get_db -category check_drc` to list available attributes to set.

Note: The `check_drc` command checks only the placed instances. It skips checking the DRC for unplaced instances.

Note: The `check_drc` command adds the LEF rule in the description section of the *Violation Browser* to provide more information on the rule that is causing the DRC violation.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `check_drc` parameter. For a detailed description of the command and all its parameters, use the man command: `man check_drc`
`-area {{lx1 ly1 ux1 uy1} {lx2 ly2 ux2 uy2}...}`	Specifies the coordinates of one or more area regions to verify. For example, `check_drc -area {0 0 100 100} {100 100 200 200}`. *Data_type*: rect, optional
`-check_cuts_in_same_via`	Checks for any cut-to-cut spacing violation between cuts from the same via cell. *Data_type*: bool, optional
`-check_drc_check_reverse`	Reports the `CONVEXCORNER REVERSE` violation in the flow. *Data_type*: bool, optional
`-check_ndr_spacing`	Checks non-default rule spacing as a hard rule. *Data_type*: enum, optional

`-check_only {all | regular | special | selected_net | selected | cell | default}`	Specifies which types of shapes to be checked: • `all`: Reports violations between all routing shapes (regular and special) and all other shapes (including routing blockages, and cell pin/obs shapes). • `regular`: Only reports violations between regular routing shapes (normally created by nanoroute) and all other shapes. It does not report violations between special routes, routing blockages and cell shapes. This is useful to find violations caused only by nanoroute. • `special`: Only reports violations between special routes, and all other shapes. It does not report violations between regular routes, routing blockages, and cell shapes. This is useful when checking power routing or pre-routed special routes, and isolating these errors from other violations. • `selected_net`: Only reports violations between the selected list of nets. Use this parameter value when the DRC fixes are done on nets and complete/area based DRC check is time consuming or it flags multiple other violations. • `selected`: Reports only the violations on special wire objects/vias of the secondary PG nets with the specified user class. • `cell`: Only reports the cell. • `default`: This value is equivalent to specifying the `regular` and `special` at the same time. *Data_type*: enum, optional
`-check_routing_halo`	Checks for routing halo violations. Routing halos are used to avoid cross-coupling between top-level and inside-the-block routes. As short jogs do not affect cross-coupling much, they can be ignored even if they overlap with the halo region. Normally, it is better to have some short jogs instead of more vias. When the `-check_routing_halo` option is specified, any jog shape with length less than the value set for `set_db -check_drc_max_wrong_way_halo` is ignored for the wrong way check. `check_drc` reports violations only for the jog shapes that have lengths greater than the `set_db -check_drc_max_wrong_way_halo` setting. *Default:* If the `set_db -check_drc_max_wrong_way_halo` option has not been set, `check_drc` uses `4* pitch` as the default value for the routing halo, where `pitch` is the METAL2 routing pitch. *Data_type*: bool, optional
`-check_short_only`	Excludes checking all other DRCs except the short ones. *Data_type*: bool, optional
`-check_trim_length`	Checks the maximum length of the `LEF58_TRIMSHAPE` value for detecting the DRC violations in the trim shape layer. *Data_type*: bool, optional
`-check_uncolored`	Reports violations with no color and invalid mask color for the multi-pattern (MPT) layers. *Data_type*: bool, optional
`-enable_post_passive_fill_check`	Checks if the track is fully filled for the `full_fill` trim layer. *Data_type*: bool, optional
`-exclude_pg_nets`	Excludes the checking of power and ground (P/G) nets. `check_drc -exclude_pg_nets` reports violations caused by routing (special and regular) except for a P/G net. It also reports violations for implant layers. *Data_type*: bool, optional

`-ignore_trial_route`	Ignores trial route when checking drc. *Data_type*: bool, optional
`-layer_range {layer1 [layer2]}`	Checks between the specified range of metal layers, including the cut layers in between. You can use the full layer name, or abbreviations like `metal1` or `1` for the first routing layer, etc. For example, `-layer_range {metal1 metal3}` will check all the layers between `metal1` to `metal3`. If `layer2` is not specified, it only checks DRC on `layer1`. *Data_type*: string, optional
`-limit` *max_error*	Specifies the maximum number of errors to report. *Default:* 1000 *Data_type*: int, optional
`-out_file` *file_name*	Specifies the report file that contains the violations information. *Data_type*: string, optional
`-view_window`	Checks for DRC violations in the current window. *Data_type*: bool, optional

Examples

- Any one of the following commands checks for DRC violations between Metal2 and Metal3 layers:

```
check_drc -layer_range {metal2 metal3}
check_drc -layer_range {metal3 metal2}
```

- The following command checks for special wire related DRC violations, such as spacing violation between power/ground wire to cell blockage:

```
check_drc -check_only special
```

- `write_drc_markers`

check_drc Category Attributes

The root attributes in the `check_drc` category are:

- check_drc_area
- check_drc_check_only
- check_drc_check_reverse
- check_drc_check_routing_halo
- check_drc_check_routing_halo_corner
- check_drc_disable_rules
- check_drc_enable_post_passive_fill
- check_drc_exclude_pg_net
- check_drc_ignore_cell_blockage
- check_drc_ignore_non_rectangle_shapes
- check_drc_ignore_trial_route
- check_drc_inside_via_def
- check_drc_layer_range
- check_drc_limit
- check_drc_max_wrong_way_halo
- check_drc_ndr_spacing
- check_drc_report
- check_drc_short_only
- check_drc_trim_length
- check_drc_uncolored
- check_drc_use_min_spacing_on_block_obs

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `check_drc` category, use the following command:

```
get_db -category check_drc
```

check_drc_area

`check_drc_area {coordinates}`

Default: `{0.0 0.0 0.0 0.0}`

Data_type: rect, read/write

Specifies the coordinates of the area to verify.

Related Commands

`check_drc`

check_drc_check_only

`check_drc_check_only {all | regular | special | selected_net | selected | cell | default}`

Default: `all`

Data_type: enum {all regular special selected_net cell default}, read/write

Specifies which types of shapes are to be checked.

- `all`: This is the default value, and reports violations between all routing shapes (regular and special) and all other shapes (including routing blockages, and cell pin/obs shapes). This release has a limitation that it will not check for violations between cell pin/obs shapes (either inside one cell, or between two cells). You can check for cell overlap with `check_place` which normally finds any cell to cell violations.
- `regular`: Only reports violations between regular routing shapes (normally created by NanoRoute) and all other shapes. It does not report violations between special routes, routing blockages and cell shapes. This is useful to find violations caused only by NanoRoute.
- `special`: Only reports violations between special routes, and all other shapes. It does not report violations between regular routes, routing blockages, and cell shapes. This is useful when checking power routing or pre-routed special routes, and isolating these errors from other violations.
- `selected_net`: Reports only the violations between the selected list of nets. Use this attribute value when the DRC fixes are done on nets and complete/area based DRC check is time consuming or it flags multiple other violations.
- `selected`: Reports only the violations on special wire objects/vias of the secondary PG nets with the specified user class.
- `cell`: Reports only the cell.
- `default`: Reports violations between the default shapes.

Related Commands

`check_drc`

check_drc_check_reverse

`check_drc_check_reverse {true | false}`

Default: `false`

Data_type: bool, read/write

Reports the `CONVEXCORNER REVERSE` violation in the flow.

Related Commands

`check_drc`

check_drc_check_routing_halo

`check_drc_check_routing_halo {true | false}`

Default: `false`

Data_type: bool, read/write

Checks for routing halo violations.

Related Commands

`check_drc`

check_drc_check_routing_halo_corner

`check_drc_check_routing_halo_corner {true | false}`

Default: `false`

Data_type: bool, read/write

Checks for routing halo violations in the corner.

Related Commands

`check_drc`

check_drc_disable_rules

`check_drc_disable_rules` *`rule_name`*

Default: ""

Data_type: enum* {jog2jog_spacing eol_spacing cut_spacing min_cut enclosure color min_step protrusion min_area out_of_die off_manufacturing_grid off_routing_track}, read/write

Disables the specified rule.

Related Commands

`check_drc`

check_drc_enable_post_passive_fill

`check_drc_enable_post_passive_fill {true | false}`

Default: `false`

Data_type: bool, read/write

Checks if the track is fully filled for the `full_fill` trim layer.

Related Commands

`check_drc`

check_drc_exclude_pg_net

`check_drc_exclude_pg_net {true | false}`

Default: `false`

Data_type: bool, read/write

Excludes the checking of power and ground nets.

Related Commands

`check_drc`

check_drc_ignore_cell_blockage

`check_drc_ignore_cell_blockage {true | false}`

Default: `false`

Data_type: bool, read/write

Ignores geometries of cell blockage.

Related Commands

`check_drc`

check_drc_ignore_non_rectangle_shapes

`check_drc_ignore_non_rectangle_shapes {true | false}`

Default: `true`

Data_type: bool, read/write

When set to `true`, this attribute ignores checking DRC markers for the objects with the non-rectangular shapes. When set to `false`, it checks DRC markers for the objects of all shapes.

Related Commands

`check_drc`

check_drc_ignore_trial_route

`check_drc_ignore_trial_route {true | false}`

Default: `false`

Data_type: bool, read/write

Ignores trial route when checking drc.

Related Commands

`check_drc`

check_drc_inside_via_def

`check_drc_inside_via_def {true | false}`

Default: `false`

Data_type: bool, read/write

Checks the cut spacing from the same via.

Related Commands

`check_drc`

check_drc_layer_range

`check_drc_layer_range {layer1 [layer2]}`

Default: `""`

Data_type: string, read/write

Checks between the specified range of metal layers, including the cut layers in between. You can use the full layer name, or abbreviations like metal`1` or `1` for the first routing layer, etc. If *`layer2`* is not specified, it only checks DRC on *`layer1`*. For example, the following command checks all the layers between `metal1` and `metal3`:

```
set_db check_drc_layer_range {metal1 metal3}
```

Related Commands

`check_drc`

check_drc_limit

`check_drc_limit value`

Default: `1000`

Data_type: int, read/write

Specifies the maximum number of errors to report.

Related Commands

`check_drc`

check_drc_max_wrong_way_halo

`check_drc_max_wrong_way_halo` *`halo_length`*

Default: `""`

Data_type: double, read/write

Specifies the length up to which short jog shapes in halo area can be ignored. Routing halos are used to avoid cross-coupling between top-level and inside-the-block routes, and short jogs do not affect cross-coupling much. Normally, it is better to have some short jogs rather than more vias. When this option is specified, any segment with length less than *`halo_length`* is ignored for wrong way check, even if it overlaps with the halo region. `verify_drc` reports violations only for jog shapes with lengths greater than *`halo_engths`*.

Default: If you do not set the `check_drc_max_wrong_way_halo` attribute, `check_drc` uses 4* *`pitch`* as the default value, where *`pitch`* is the METAL2 routing pitch.

Related Commands

`check_drc`

check_drc_ndr_spacing

`check_drc_ndr_spacing {true | false | auto}`

Default: `auto`

Data_type: enum {true false auto}, read/write

Checks non-default rule spacing as a hard rule. Following are the attribute values:

- `true`: Checks all non-default rules.
- `false`: Skips checking any non-default rule.
- `auto`: Checks only the non-default rules with `hard_spacing`.

Related Commands

`check_drc`

check_drc_report

`check_drc_report` *`filename`*

Default: `""`

Data_type: string, read/write

Specifies the report file that contains the violation information.

Related Commands

`check_drc`

check_drc_short_only

`check_drc_short_only {true | false}`

Default: `false`

Data_type: bool, read/write

Excludes checking all other DRCs except the short ones.

Related Commands

`check_drc`

check_drc_trim_length

```
check_drc_trim_length {true | false}
```

Default: `false`

Data_type: bool, read/write

Checks the maximum length of the `LEF58_TRIMSHAPE` value for detecting the DRC violations in the trim shape layer.

Related Commands

`check_drc`

check_drc_uncolored

```
check_drc_uncolored {true | false}
```

Default: `false`

Data_type: bool, read/write

Reports color change violation when the DPT layer shape is 'free color'.

Related Commands

`check_drc`

check_drc_use_min_spacing_on_block_obs

```
check_drc_use_min_spacing_on_block_obs {0 | 1 | auto}
```

Default: `auto`

Data_type: enum, read/write

Checks all the Macro OBS with minSpacing.

Related Commands

`check_drc`

check_endcaps

```
check_endcaps
[-help]
[-area {x1 y1 x2 y2}]
[-core_boundary_only]
[-error integer]
[-ignore_macro SCLA,...]
[-out_file filename]
[-power_domains string]
[-rows string]
[-triple_well]
[-wrong_location]
```

Checks whether pre/post cap cells have been inserted correctly based on `set_db` settings. Use this command after running `add_endcaps` to flag violations such as:

- Inserted end cap cell is of wrong type
- End cap cell is missing

If you use `check_endcaps` with the `-wrong_location` option, it also checks whether the end cap cells are inserted in the right location. Use the `-power_domains` option to check end cap cells inserted for a specific power domain.

Additionally, you can use `check_endcaps -triple_well` to check triple well insertion. Triple well technology is used to isolate p-well from substrate using a deep n-well.

You can view the violation markers generated by `check_endcaps` in Violation Browser.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `check_endcaps` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_endcaps`
`-area {x1 y1 x2 y2}`	Specifies the area in which endcaps are to be verified. *Data_type*: rect, optional
`-core_boundary_only`	Checks endcaps only at the core-boundary and not abutting obstructions. *Data_type*: bool, optional
`-error integer`	Specifies the maximum number of errors to report. *Data_type*: uint, optional
`-out_file filename`	Specifies the file name for the `check_endcaps` report. *Data_type*: string, optional
`-ignore_macro SCLA,...`	Specifies the macro to be ignored. *Data_type*: string, optional
`-power_domains string`	Specifies the power domain to be checked. Use this option to check end cap cells inserted for the specified power domain. *Data_type*: string, optional
`-rows string`	Specifies the row to check. *Data_type*: string, optional
`-triple_well`	Checks triple well insertion. Only checks the cell lists specified in `set_db`. *Data_type*: bool, optional
`-wrong_location`	Checks for cap cells that are not inserted in the right location. If you specify this option, `check_endcaps` marks with a violation marker any cap cell that is not on the beginning/end of the row or not on the boundary of the design/ block design. *Data_type*: bool, optional

Examples

- The following set of commands verifies whether cap cell insertion is as per the `set_db` settings and generates a default report file in the active folder:

```
set_db -add_endcaps_left_edge EC_LE10 -add_endcaps_right_edge EC_RE10
check_endcaps
```

- The following command verifies end cap insertion and generates a report named `endcap.rpt`:

```
set_db -add_endcaps_left_edge EC_LE10 -add_endcaps_right_edge EC_RE10
check_endcaps -out_file endcap.rpt
```

- The following command verifies triple well insertion. It also checks the cap cells that are not inserted in the right location and reports up to `10000` errors:

```
set_db -add_endcaps_left_edge EC_LE10 -add_endcaps_right_edge EC_RE10 -add_endcaps_bottom_edge EC_BE10 \
              -add_endcaps_left_bottom_corner EC_LBC10 -add_endcaps_left_top_corner EC_LTC10 \
              -add_endcaps_right_bottom_corner EC_RBC10 -add_endcaps_right_top_corner EC_RTC10 \
              -topEdge EC_TE10
check_endcaps -triple_well -wrong_location -error 10000
```

check_io_to_bump_connectivity

```
check_io_to_bump_connectivity
[-help]
[-error integer]
[-report string]
[-sub_class string]
[-warning integer]
[-bump_connect_target | -class_bump ]
[-bumps string | -class_bump ]
[-bumps string | -nets string]
```

Verifies multiBump multiPad connectivity. The flip chip flow in Innovus supports multiple pads to multiple bumps connections. Use the `check_io_to_bump_connectivity` command, instead of `check_connectivity` to verify such connections.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `check_io_to_bump_connectivity` parameter. For a detailed description of the command and all its parameters, use the `man` command: man `check_io_to_bump_connectivity`
`-bump_connect_target`	Checks only whether or not the routing matches the connection specified by `bump_connect_target` properties (`io:pin:port`) regardless of the class of the port. *Data_type*: bool, optional
`-bumps string`	Specifies the name of the bumps that are to be checked. *Data_type*: string, optional
`-class_bump`	Checks only whether or not the ports of `CLASS BUMP` are routed to the bumps regardless of the `bump_connect_target` properties. *Data_type*: bool, optional
`-error integer`	Specifies the maximum number of errors to report. *Data_type*: int, optional
`-nets string`	Specifies the names of the nets that are to be checked. *Data_type*: string, optional
`-report string`	Specifies the name of the report file in which `check_io_to_bump_connectivity` violation data is recorded. *Data_type*: string, optional
`-sub_class string`	Specifies the name of the subclasses of which the wires and vias are to be checked. *Data_type*: string, optional
`-warning integer`	Specifies the maximum number of warnings to report. *Data_type*: int, optional

check_isolated_cuts

```
check_isolated_cuts
[-help]
[-area {x1 y1 x2 y2}]
[-error integer]
[-layer {cutLayer_list}]
[-spacing_bbox]
[-report filename]
```

Checks cuts in all or specified cut layers against the spacing rules set by `set_isolated_cut_rule`. If you use the `-area` parameter, checks cuts within the specified area. Reports violations in the log file and in `verify.isoVia.rpt` or the specified report file.

Note: Violations can be viewed in the Violation Browser.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_isolated_cuts` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_isolated_cuts`
`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area to verify. If you do not specify this parameter, the command checks the whole design. For example, `check_isolated_cuts -area {0 0 100 100}`. *Default:* Entire area *Data_type*: rect, optional
`-error integer`	Specifies the maximum number of errors to report. *Default:* `1000` *Data_type*: int, optional
`-layer {cutLayer_List}`	Specifies the cut layers to be checked. If you specify only one layer name, you do not need the braces around the name. For example, `check_isolated_cuts -layer {Via1 Via2}`. *Default:* All cut layers *Data_type*: string, optional
`-report filename`	Specifies the report file for the isolated cut violation information. *Default:* `verify.isoVia.rpt` *Data_type*: string, optional
`-spacing_bbox`	Specifies that the Square metric should be used for checking isolated cuts. By this metric, another cut should exist within a square window from a certain cut. The size of the square window depends on the spacing rules set by `setIsolatedCutRule`. **Note:** If this parameter is not specified, the Euclidean metric is used for checking isolated cuts. *Data_type*: bool, optional

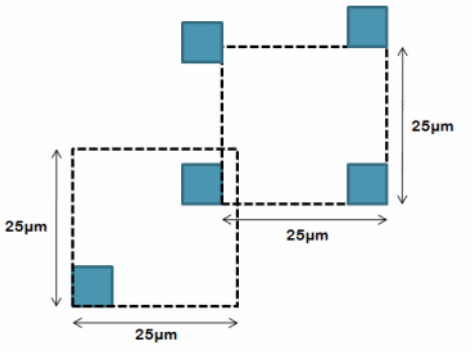
Example

- The following command checks isolated cuts on all layers and generates a report file named `test.isoCut.rpt`:
  ```
  verifyIsolatedCut -report test.isoCut.rpt
  ```
- The following command checks for isolated cuts in the area specified and generates a report named `verify_isoVia.rpt`:
  ```
  check_isolated_cuts -area {0 0 1600 1600}
  ```
- The following set of commands check for isolated cuts on all layers using the Square metric. Any cut that does not have another cut within a 25um x 25um square window is reported:

  [DEV]innovus 45> setIsolatedCutRule -spacing 25

  [DEV]innovus 46> check_isolated_cuts -spacing_bbox

  In the following pattern, no isolated cut violation is reported as each cut has one or more cuts within a `25um x 25um` square window.



In contrast, the following pattern is not okay because no other cut exists within a 25um x 25um square window:

check_litho

```
check_litho
[-help]
-apply {hotspot | ripandreroute | squish_hints}
[-check_function string]
[-check_local]
[-config string]
[-cpu integer]
[-create_guides]
-dir string
[-hints_to_apply string]
[-incremental_check string]
[-layer_map_file string]
[-map_file string]
[-no_compress]
[-oasis]
[-oasis_files string]
[-option_file string]
[-prev_run_dir string]
[-report_file string]
{-read_blockage | -report_only | -routing_layers_only | -sign_off}
[-run_mode string]
[-stream_files string]
[-write_stream_options string]
[-techfile string]
```

Runs LPA on the selected design to flag litho hotspots.

Note: The `check_litho` command is available only if you have the appropriate license and the MVS installation path set up. Refer to the Prerequisites for Running LPA chapter of *Innovus User Guide*.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_litho` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_litho`
`-apply {hotspot | ripandreroute | squish_hints}`	
	Instructs Innovus to perform specific operations based on the results of `check_litho`. The operation performed depends on the value you specify with `-apply`: • `hotspot`: Loads the resulting hotspots into violation browser and prepare for regular litho fixing. • `ripandreroute`: Sets up Innovus to fix hotspots using the router with sized and shifted locations from the hotspot marker. • `squish_hints`: Applies the fill and via replace hints created by `check_litho` automatically if `check_litho` is being run using squish patterns.
`-check_function string`	Specifies the DRC function to be checked.
`-check_local`	Applies fixing with the local DRC.
`-config string`	Specifies the name and path of the LPA custom configuration file. This file, if specified, controls all run options of LPA. It can also specify different instructions for each layer.
`-cpu integer`	Specifies the total number of CPUs available for the LPA run.
`-create_guides`	Generates LPA guidelines.
`-dir string`	Specifies the LPA output directory. This directory contains one subdirectory for each layer. The individual subdirectories for each layer (POLY, 1, etc.) are created when LPA is run with the configuration file for that layer.
`-hints_to_apply string`	Specifies the list of hint number to apply.

`-incremental_check` *string*	Specifies the name and path of the HIF file that you want to use for incremental validation. This HIF file includes the locations that identify the areas affected by each hotspot fix. LPA reads these locations and performs incremental checking only in these areas. This reduces the time for validation.
`-layer_map_file` *string*	Specifies the name of the layer map file.
`-map_file` *string*	Specifies the name and path of the Stream Out Map file created by Innovus to map the GDS stream to the layers in the Innovus database. If the GDS List file and Stream Out Map file are specified, LPA runs on the potential IP blocks defined in these files.
`-no_compress`	Inputs `gds` instead of `gds.gz`.
`-oasis`	Streams out using oasis.
`-oasis_files` *string*	Specifies the `oasis_out` oasis list files.
`-option_file` *string*	Specifies a text file, which can be used to set variables used by the `-apply` operations.
`-prev_run_dir` *string*	Specifies the path to the run directory of a previous Verify Litho run that you want to use for XOR-based incremental validation. When this parameter is specified, the previous run results are compared to the new design and LPA is run only in locations where the layout has changed and where hotspots previously existed, thereby reducing the overall validation run time. This flow is recommended when the design has been changed but no HIF file that identifies the changed areas is available.
`-read_blockage`	Loads the blockage file. **Note**: This parameter cannot be used along with `-sign_off`, `-routing_layers_only`, or `-read_blockage`.
`-report_file` *string*	Specifies the netlist report file.
`-report_only`	Generates the netlist report. **Note**: This parameter cannot be used along with `-sign_off`, `-routing_layers_only`, or `-read_blockage`.
`-routing_layers_only`	Specifies that LPA is to be run in the Routing Layers Only mode. The Routing Layers Only mode is the fast mode of LPA to flag L1 hotspots in a design at the block level during the Implementation phase. In this mode, LPA runs about 100X faster than the Sign-Off mode and helps you identify and fix most hotspots as routing is completed. **Note**: This parameter cannot be used along with `-sign_off`, `-report_only`, or `-read_blockage`.
`-run_mode` *string*	Launches LPA in back/foreground.
`-sign_off`	Specifies that LPA is to be run in the Sign-Off mode. You run LPA in Sign-Off mode for Litho sign-off, as mandated by foundries. Unlike the Routing Layers Only mode, the Sign-Off mode requires you to provide the LPA configuration file containing the Techfile and other settings. You must run LPA Sign-Off mode before handing off the design to the top-level or tape-out. **Note**: This parameter cannot be used along with `-routing_layers_only`, `-report_only`, or `-read_blockage`.
`-stream_files` *string*	Specifies the name and path of the text file containing the list of GDS files for LEF abstracts. By default, LPA runs on the interconnect layers in Sign-Off mode but if the GDS List file and Stream Out Map file are specified, LPA runs on the potential IP blocks defined in these files.
`-techfile` *string*	Specifies the path and name of the qualified LPA Mx technology file that includes process-specific LPA model, hotspot patterns, and hotspot checking options. The LPA model captures the GDSII-to-silicon flow of the targeted process, enabling LPA to predict the variations and hotspots due to lithography, directly from the design database. Hotspot patterns can also be included in the LPA techfile in replacement for the LPA model to support the DRC+ flow, or along the LPA model to enable fast mode. **Note:** The `-techfile` parameter is mandatory if you use the `-routing_layers_only` option to run LPA.
`-write_stream_options` *string*	Enables additional `write_stream` command options.

Examples

Following is an example of the `check_litho` command usage:

```
check_litho -dir lpa -techfile lpa.tcl -layer_map_file lef_map.file -map_file gds_map.file -routing_layers_only -write_stream_options "-outputMacros -merge list_of_GDS_files"
```

check_metal_density

```
check_metal_density
[-help]
[-report filename]
[-detailed]
[-ignore_lef_density]
[-layer layer_name_list]
[-area {x1 y1 x2 y2}]
[-oversize value]
```

Checks the metal density of each routing layer and of macros against values specified by `set_metal_fill`, by LEF file, or against its own internal default values. Reports density information in the log file.

> The `set_metal_fill` command is a user-override command that provides constraints at the run time for each session. These constraints have precedence over the LEF/database values. For example, if you specify `set_metal_fill -iteration_name default`, `check_metal_density` checks against the `default` value.

If neither the LEF file nor `set_metal_fill` specifies the window size or density, `check_metal_density` uses internal default values.

`check_metal_density` now supports multi-threading to improve Metal Fill runtime performance in multi-thread mode. `check_metal_density` supports the new `set_multi_cpu_usage` command use model. For more information, see the following documents:

- Multiple-CPU Processing Commands chapter of the *Innovus Stylus Common UI Text Command Reference*.
- Accelerating the Design Process by Using Multiple-CPU Processing chapter of the *Innovus User Guide*.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_metal_density` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_metal_density`

`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area to verify. For example, `check_metal_density -area {0 0 100 100}`. *Default:* Entire area **Behavior of `check_metal_density -area` with external metal density** When metal fill is added to a block design the external metal density provides a density assumption to `check_metal_density`. The external density is used only for density calculation purposes and no fill shapes are added outside of the design area. When the `-area` parameter is not specified, the external density value is not used. In this case, the `check_metal_density` window is pushed back if it extends outside the design area, as shown in the figure below.  If the `-area` parameter is specified and is larger than the design size then windows extend outside of the block area and use the external density value (see `set_metal_fill` external density value specification) for that area.  If external density is less than the specified preferred density, it is more likely that shapes will be added to the area. If external density is greater than the preferred density it is less likely that shapes will be added (shapes are only added within the design boundary). **Note:** Windows outside the design boundary are ignored. *Data_type*: rect, optional
`-detailed`	Generates a detailed metal density report. *Data_type*: bool, optional
`-ignore_lef_density`	Ignores the MACRO `DENSITY` table in the LEF file and instead uses the default macro density calculation method. **Note:** If you do not specify this parameter, `check_metal_density` uses the LEF MACRO density table for density calculations. *Data_type*: bool, optional
`-layer layer_name_list`	Specifies the LEF or Innovus layers to verify. If you specify only one layer name, you do not need the braces around the name. For example, `check_metal_density -layer {METAL1 METAL2}`. *Data_type*: string, optional
`-oversize value`	Specifies an offset value for the area to verify. The value is in user units (not in DBU), and can be positive or negative. A positive value adds to the area that is verified. For example, if the design covers the area from `(0,0)` to `(100,100)` and you specify `-oversize 10`, `check_metal_density` checks the area from `(-10,-10)` to `(110,110)`. *Default:* `0`. *Data_type*: int, optional
`-report filename`	Specifies the report file for the metal density violation information. *Default:* *designName*`.metaldensity.rpt`. *Data_type*: string, optional

Example

- The following command checks metal density of all layers and generates a report file named `Test7.density.rpt`:
  ```
  check_metal_density -report Test7.density.rpt
  ```
- The following command checks metal density on layer *Metal1* in the area specified and generates a detailed report named `test_chip.density.rpt`:
  ```
  check_metal_density -area {-200 -200 1600.0 1600.0} -layer {Metal1} -reportfile test_chip.density.rpt -detailed
  ```

  In the example above, the layout size is 0 0 1400.0 1400.0. The command considers the density of the area outside of the design as `0`.

check_pg_shorts

```
check_pg_shorts
[-help]
[-area {x1 y1 x2 y2}]
[-net net_name]
[-no_cell_blockages]
[-no_route_blockages]
[-out_file filename]
```

Checks for power and ground shorts between two geometries belonging to different nets. The command performs power and ground short check between the following:

- PG and PG nets
- PG and signal nets
- PG and other special net

This command enables you to check for power and ground shorts in the design before performing any kind of power-grid analysis. You can use this command after restoring the physical design (`read_design -physical_data *.enc` or `read_def filename`).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_pg_shorts` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_pg_shorts`
`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area to verify. For example, `check_pg_shorts -area {0 0 100 100}`. The unit of coordinates is micron. *Data_type*: rect, optional
`-net net_name`	Specifies the name of the power or ground net to be verified. *Data_type*: string, optional
`-no_cell_blockages`	Ignores cell blockages during during power and ground short checking. *Data_type*: bool, optional
`-no_route_blockages`	Ignores routing blockages during during power and ground short checking. *Data_type*: bool, optional
`-out_file filename`	Specifies the name of the report file that contains the violation information. *Data_type*: string, optional

Example

The following command checks for power and ground shorts in the area specified and generates a detailed report named `shorts.rpt`.

```
check_pg_shorts -area {0 0 1600 1600} -out_file shorts.rpt
```

Related Information

- `read_def`
- The Identifying and Viewing Violations chapter in the *Innovus User Guide.*

check_power_vias

```
check_power_vias
[-help]
[-append]
[-area {x1 y1 x2 y2}]
[-check_wire_pin_overlap]
[-check_fill]
[-edge_to_edge]
[-error integer]
[-exclude_region_file check_file]
[-hookup_pitch pitch_value]
[-ignore_objects {drc_fill | io_wire}]
[-layer_range {bottomLayer topLayer}]
[-rail_layers layer_name]
[-stripe_layers layer_list]
[-nets {netNames} | -selected]
[-non_orthogonal_check [-non_orthogonal_distance {x y}]]
[-pitch pitch_value]
[-report file]
[-search_range {x y}]
[-shielding]
[-stacked_via]
[-stripe_rule value]
[-cut_area_ratio value]
[-what_if_report filename]
[-width_range string]
```

This command has a variety of power-rail overlap checks to look for missing power-grid vias. By default, it checks that orthogonal power-routes on adjacent routing layers have a via between them at every intersection. For example, there should be a via at the point where a Metal3 power stripe overlaps a Metal2 power stripe. By default, horizontal routes get checked only for overlaps with vertical routes. If the power shapes are polygon, the polygon is split into rectangles and the rectangles are used to decide the direction. Support for checking stacked vias between non-adjacent routing layers is optional. Violations are highlighted in the layout window, and a text report is generated with the location of the missing vias.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_power_vias` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_power_vias`
`-append`	Specifies that all previous `check_power_vias` settings will be kept. *Data_type*: bool, optional
`-area x1 y1 x2 y2`	Specifies the coordinates of the area to be checked. *Data_type*: rect, optional
`-check_fill`	Specifies that tied-off metal fill should also be checked. Floating fill is still ignored. *Default*: Metal fill will be ignored. *Data_type*: bool, optional
`-check_wire_pin_overlap`	Specifies that wire overlaps of pin shapes should also be checked. By default, only wire overlaps with wires are checked. *Data_type*: bool, optional
`-cut_area_ratio value`	Checks if the cut area in the metal intersection area is sufficient. `viaUtil = Total cut area / Metal intersect area` If the actual ratio is less than specified ratio, `check_power_vias` marks it as violation. By default, the metal intersection area is the metal overlap area. If `setAddStripeMode -via_using_exact_crossover_size` is set to `false`, the partial overlapped metal will be extended to full width intersection area. *Data_type*: float, optional

`-edge_to_edge`	Checks the non-orthogonal distance from edge to edge within a layer. *Data_type*: bool, optional
`-error` *integer*	Specifies the maximum number of errors to report. *Data_type*: int, optional

`-exclude_region_file` *check_file*	Ignores missing VIA checks within the specified `check_file` regions for a cell extension area. The `check_file` format can be a set of the following values:
	• `cell`: Specifies the cell type.
	• `ext_layer_bottom`: Specifies the extension area bottom layer.
	• `ext_layer_top`: Specifies the extension area top layer.
	• `ext_x`: Specifies the extension length in the X direction.
	• `ext_y`: Specifies the extension length in the X direction.
	• `exc_x`: Specifies the exception length in the X direction.
	• `exc_y`: Specifies the exception length in the Y direction.
	Example 1:
	The following set of `check_file` formats ignores missing VIA check within the yellow rectangle (in the output), but checks missing VIA within the blue rectangle:
	`FTV_CELL, B_M0, B_M1, X, Y, X', Y'`
	`INV_D2, M0, M1, X2, Y2, X2', Y2'`
	Following is the output:
	 	Example 2:
	The following set of `check_file` formats ignores missing VIA check within the yellow rectangle (in the output):
	`FTV_CELL, B_M0, B_M1, X, Y`
	`INV_D2, M0, M1, X2, Y2`
	Following is the output:

	`-hookup_pitch` *pitch_value*	Specifies the distance between two vias, which are on the filler instance and are greater than or equal to the given value. *Data_type*: int, optional
`-ignore_objects {drc_fill | io_wire}`	Skips checking the power vias of the specified wire type. *Data_type*: (enum)+, optional

`-layer_range {`*bottomLayer topLayer*`}`	Checks for the missing stacked vias between the bottom and top layers. It also checks for the missing vias between all the adjacent intermediate layers, but does not check for the stacked vias between the intermediate layers. While using this parameter, you can specify full layer names like `METAL1`, or abbreviations like `1`. For example, `check_power_vias -layer_range {2 5}` checks for missing stacked vias between overlapping `metal2` and `metal5`, and also missing vias for overlapping `2/3`, `3/4`, `4/5`.
	This parameter checks the missing adjacent vias if `bottomLayer` is specified, but `topLayer` is not, with considering that `topLayer` is just one layer above. To review the missing stacked via or missing adjacent via DRC marker, use the `gui_show_markers` command for filtering the DRC marker. For example:
	1. To display only the missing stacked via DRC markers, run:
	`gui_show_markers -all -filter {stacked via} -search_description -filter_mode AND`
	2. To display only the missing via DRC markers between the adjacent layers, run:
	`gui_show_markers -all -filter {adjacent via} -search_description -filter_mode AND`
	See `gui_show_markers` for more information on the command usage.
	Data_type: string, optional

`-nets {`*netNames*`}`	Specifies the names of the power nets that will be checked. A single net or a list of nets enclosed in curly braces({}) or quotes (" ") can be specified. Wildcards (* and ?) are supported. For example, when you specify `check_power_vias -nets {v*}`, all PG net names having initial letter as `v` are checked. **Note:** Currently, wildcards are supported for checking PG nets only. *Default*: All power grid nets. *Data_type*: string, optional
`-non_orthogonal_check`	Checks the overlap area for non-orthogonal crossing wires (e.g. wires that are both in the same direction) in adjacent as well as non-adjacent layers. Checks for missing vias between two or more parallel wires. The via center-to-center distance between parallel wires should be less than or equal to the specified spacing If this parameter is not specified, horizontal wires get checked only against vertical wires. **Note**: You can use `-non_orthogonal_distance {x y}` parameter with `-non_orthogonal_check` to find missing vias within a specified window. When the `x` or `y` distance is provided, `check_power_vias` checks if the wire is parallel with another wire. If yes, it checks the via center-center spacing and via center-wire end distance between parallel wires. If the actual distance is greater than the required distance, it marks a violation. *Data_type*: bool, optional

`-non_orthogonal_distance {x y}`	Specifies distances for finding missing via within a specified window for a non-orthogonal check, with `x` and `y` representing the distance in the horizontal and vertical directions, respectively. When the `x` or `y` distance is provided, `check_power_vias` checks if the wire is parallel with another wire. If yes, it checks: • The via center to via center spacing between parallel wires against the value *x (y)* • The via center to wire end distance against the value *x/2 (y/2)* If the actual distance is greater than the required distance in either case, it marks a violation. When the `x` or `y` distance is not provided or set to `0`, the via to via distances are not checked. **Note**: This parameter can only be specified with the `-non_orthogonal_check` parameter. *Data_type*: point, optional
`-pitch pitch_value`	Specifies the distance between two vias, which are not on the filler instance and are greater than or equal to the given value. *Data_type*: int, optional
`-rail_layers layer_name`	Specifies a single power rail layer for missing via (only the via above power rail) check. The check depends on the `-stripe_rule` option. When `-stripe_rule` is specified, the via to via distance should be less than or equal to the specified value. If a distance value is not specified with the `-stripe_rule` option, the check is ignored. See the examples below. The `-rail_layers` option is not controlled by `-layer_range`. You can specify a power rail layer other than that specified with `-layer_range` for checks against the `stripe_rule` and `search_range` rules. *Data_type*: string, optional
`-report file`	Specifies the name of the output file for the report. *Data_type*: string, optional
`-search_range {x y}`	Specifies a rectangle area with `XY`. There should be one valid connection from power rail to power stripe in the specified area. By default, the valid connection would be searched from the uppermost power rail layer to all the power stripe layers. You can use the `-rail_layers` option to specify the power rail layer, and the `-stripe_layers` option to limit the power stripe layers. With the `-rail_layers` and `-stripe_layers` options, only the specified power rail and power stripes layers are used for valid connection check. The x and y values are floats in units of microns. Refer to the **Examples** section for search range examples. *Data_type*: point, optional
`-selected`	Checks for the missing vias between the selected PG wires and other intersecting selected/unselected PG wires. When this parameter is used with the `-check_wire_pin_overlap` parameter, it checks for the missing vias between the intersection of selected PG wires and pins of the selected instances. This parameter eliminates the requirement of running the command on the entire design, and hence improves the run time. *Data_type*: point, optional
`-shielding`	Specifies that shielding wires should also be checked. By default, shielding wires are not checked. *Data_type*: bool, optional
`-stacked_via`	Checks for missing vias between all non-adjacent as well as adjacent layers. *Data_type*: bool, optional
`-stripe_layers layer_list`	Specifies the power stripe layers to be checked for a valid connection path from power rail to power stripe. The check depends on the `-search_range` option. If `-search_range` is specified, at least one valid connection path should be found from the power rail to power stripe in that search range. If a search range is not specified with the `-search_range` option, the check is ignored. You can specify the power rail layer with the `-rail_layers` option. By default, only the uppermost power rail layer is checked. See the examples below. The `-stripe_layers` option is not controlled by `-layer_range`. You can specify power stripe layers other than that specified with `-layer_range` for checks against the `search_range` rule. *Data_type*: string, optional

`-stripe_rule` *value*	Specifies in microns the distance for power via. Only the power via above the power rail is checked. If the via to via center-to-center spacing is greater than the specified value, a violation marker is created. You can specify the power rail layer with `-rail_layers` for checking. By default, only the power via above the uppermost power rail is checked against the rule. Refer to the **Examples** section for stripe rule examples. *Data_type*: float, optional
`-what_if_report` *filename*	
	Writes out `check_power_vias` violations data into a ECO file that can be used directly as input for whatIf rail analysis. When you specify this parameter, the missing via information generated can be used as input for what-if virtual wires. *Data_type*: string, optional
`-width_range` *string*	
	Specifies the metal width to be considered. `check_power_vias` uses the specified width range to filter wires. Only the bottom and top wires that fall in the range are checked. The *`string`* value takes the following format: `-width_range {`*`minWidth`* `maxWidth [layerName …] [`*`minWidth maxWidth [layerName …]`*`] … }` • If *`minWidth`* is 0, all wires with width less than specified *`maxWidth`* will be checked. • If *`maxWidth`* is 0, all wires with width greater than specified *`minWidth`* will be checked. • If *`layerName`* is specified in the string, `widthRange` is enabled only for the specified layer. • If no *`layerName`* is specified in the string, `widthRange` is enabled for all non-specified layers. Refer to the **Examples** section for width range examples. **Note:** Use braces or quotation marks to enclose the string value for `widthRange`. *Data_type*: string, optional

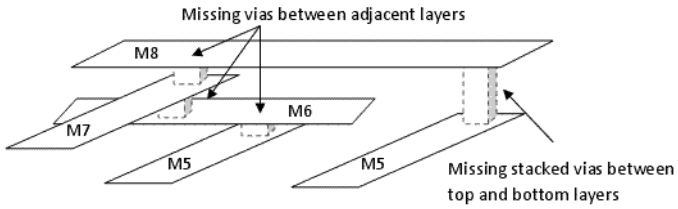
Examples

- The following command specifies that all vias for all powergrid nets will be checked, except for metal fill and shielding wires, and reports it to a file called `power_via.report`:

  ```
  check_power_vias -report power_via.report
  ```

- The following command checks for missing stacked vias between `METAL5` and `METAL8` layer intersections on the VSS net. In addition, it checks for missing vias between `METAL5-METAL6`, `METAL6-METAL7` and `METAL7-METAL8` layer intersections. The violations are reported in the `powerVia.rpt` file and highlighted in GUI.

  ```
  check_power_vias -layerRange {METAL5 METAL8} -nets VSS -report powerVia.rpt
  ```



- The following command checks that the overlapping power routes on adjacent layers have vias that cover at least 70% of the overlap area..

  ```
  check_power_vias -viaUtil 0.7
  ```

- The following command checks that the overlapping power routes have vias that cover at least 70% of the overlap area for layers between `METAL3` and `METAL4`.

  ```
  check_power_vias -viaUtil 0.7 -layer_range {METAL3 METAL4}
  ```

- The following command checks for wires overlaps for all pin shapes included, enclosed, or touched by the specified area:

  ```
  check_power_vias -area {100 100 1000 1000} -check_wire_pin_overlap
  ```

- The following command checks wires with width greater than `0.032` and less than `0.096` for all layers:

  ```
  check_power_vias -width_range {0.032 0.096}
  ```

- The following command checks wires with width in the `0.032` ~ `0.096` range for metal1/metal2 and width `0.038~0.114` for metal3/metal4. For other layers, there is no width control:

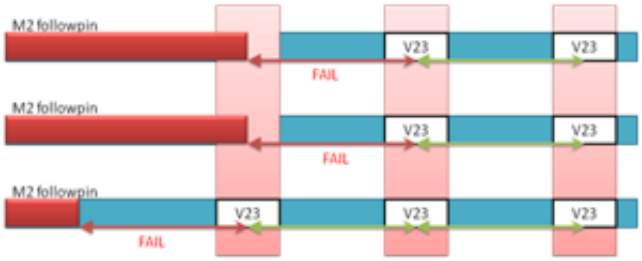
  ```
  check_power_vias -width_range {0.032 0.096 metal1 metal2 0.038 0.114 metal3 metal4}
  ```

- The following command checks wires with width in the `0.032` ~ `0.096` range for metal1/metal2. For other layers, it checks wires with width in the `0.038~0.114` range:

  ```
  check_power_vias -width_range {0.032 0.096 metal1 metal2 0.038 0.114}
  ```

- The following command checks the via between power rail layer metal`2` and metal`3`. If the via's center-to-center distance is more than `17u`, the tool reports a violation and places a marker on the power rail wires.

  check_power_vias -stripe_rule 17 -rail_layers metal2

- The following command checks the valid connection for metal`2` power rail to stripe layer metal`4` and metal`5` with the search rectangle area `10*5`. In the diagram below, there is no violation as the connection is built from metal`2` to metal`4`. If the `V34` vias are removed, then there is a violation as the connection cannot be built from metal`2` to metal`4`.

  check_power_vias -search_range {10 5} -rail_layers metal2 -stripe_layers {metal4 metal5}

check_process_antenna

```
check_process_antenna
[-help]
[-detailed]
[-error value]
[-max_floating_area_different_net]
[-nets {netNames} | -selected]
[-no_io_pin_default]
[-no_max_float_area]
[-out_file filename]
[-pg_net]
```

Verifies process antenna effect (PAE) and maximum floating area violations.

Before running this command, make sure that process antenna or maximum floating area keywords are specified in the LEF file and the signal nets are routed.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_process_antenna` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_process_antenna`
`-detailed`	Generates a report containing the specified information for all nets, including those with no violations. *Data_type*: bool, optional
`-error value`	Specifies the maximum number of error messages to report. *Default:* `1000` *Data_type*: int, optional
`-max_floating_area_different_net`	Verifies the maximum floating area between different nets. *Data_type*: bool, optional
`-nets {netNames} | -selected`	Reports named or selected nets. Select nets by using the select_obj command. If you specify one net name, you do not need the braces around the name. *Data_type*: string, optional
`-no_io_pin_default`	Specifies that the following LEF keywords are not applied to the I/O pins: • `ANTENNAINPUTGATEAREA` • `ANTENNAINOUTDIFFAREA` • `ANTENNAOUTPUTDIFFAREA` *Data_type*: bool, optional
`-no_max_float_area`	Disables check for maximum floating area violations. *Data_type*: bool, optional
`-out_file filename`	Specifies the report file. The file can contain both PAE and maximum floating area violation information. *Default:* `design.antenna.rpt` *Data_type*: string, optional
`-pg_net`	Checks tie-high and tie-low nets for process antenna violations. *Data_type*: bool, optional
`-selected`	Specifies whether to check the selected nets. *Data_type*: bool, optional

Example

The following command verifies PAE violations in the routed design and generates a report file called `Test7.antenna.rpt`:

```
check_process_antenna -out_file Test7.antenna.rpt
```

check_tieoffs

```
check_tieoffs
[-help]
[-no_tieoff_pins_file filename]
[-out_file filename]
[-power_domain string]
```

Checks tie cell connections. `check_tieoffs` honors the tie high/low cell list from `set_db -add_tieoffs_cells` and checks whether or not the tie high/low nets are connected to the tie high/low cells.

Use this command after using `add_tieoffs` to add instances of tie-off cells to the logical hierarchy of the design.

The expected flow is as follows:

1. Specify the tie cell names and other settings with the `add_tieoffs` attributes.
2. Add tie high/low cells with `add_tieoffs`.
3. Run `check_tieoffs` to check whether tie cell connections are correct.

Violations can be viewed in Violation Browser.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `check_tieoffs` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_tieoffs`
`-no_tieoff_pins_file` *`filename`*	Specifies a file containing exception list of instance/pin names. Use this parameter to specify the instance/pins that should not have any tie cell connections. The file should list instance and pin names in the following format: *`instance_name/pin_name`* *Data_type*: string, optional
`-out_file` *`filename`*	Specifies the report file for recording tie cell violations. By default, the report is saved as *`designName`*`.tie.rpt`. *Data_type*: string, optional
`-power_domain` *`string`*	Specifies the power domain name to be checked. *Data_type*: string, optional

Related Information

- `add_tieoffs`
- The Verifying Tie Cells section in the Identifying and Viewing Violations chapter of the *Innovus User Guide*

check_well_antenna

```
check_well_antenna
[-help]
[-need_protect_cells {cell_list}]
[-protect_cells {cell_list}]
[-not_protect_cells {cell_list}]
[-report filename [-detailed]]
```

Checks for any CORE rows that have well-process-antenna violations. Well-process-antenna violations are normally caused by rows with decap cells that do not have any protecting cells in the same row. This command marks with a violation marker any such CORE cell. You can then write a Tcl script to put in a well-antenna cell next to the violation marker.

Parameters

-help	Prints a brief description that includes the type and default information for each check_well_antenna parameter. For a detailed description of the command and all its parameters, use the man command: man check_well_antenna
-detailed	Reports all [CORE | ENDCAP] cells' protect information in a report file. *Data_type*: bool, optional
-need_protect_cells {*cell_list*}	Specifies the cell names that need protection (typically decap cells). This option also indicates that the specified cells do not protect the row they are in. Pattern matching with * is allowed in cell names. *Data_type*: string, optional
-not_protect_cells {*cell_list*}	Specifies the cell names that are to be marked as cells that do not protect rows. By default, the cells with LEF class CORE but without a subclass (e.g. normal BUF and AND2 cells) are assumed to have a well discharge path that protects a row from well-antenna violations. Use -not_protect_cells option to override the default for any of these cells that do not protect a row. Pattern matching with * is allowed in cell names. *Data_type*: string, optional
-protect_cells {*cell_list*}	Specifies the cell names that are to be marked as protection cells. By default, cells with CLASS CORE and a subclass {FEEDTHRU | TIEHIGH | TIELOW | SPACER | ANTENNACELL | WELLTAP} or cells with class ENDCAP (with or without any subclass) do not have a well-discharge path to protect a row. Use the -protect_cells option to override the default for any of these cells that do protect the row. Pattern matching with * is allowed. *Data_type*: string, optional
-report *filename* [-detailed]	Specifies the report file name. By default, the report includes information about only the cells that you specified with the options. If you specify -detailed, check_well_antenna reports every class CORE and ENDCAP cell with its subclass and protection status to the *filename* report. *Data_type*: string, optional

Examples

Normally, the decap cells are the only cells that need protection. However, if the standard-cell library in your design has one of the ENDCAP cells with a well-antenna protection device built-in, and the filler, well-tap, tie-high and tie-low cells are just class CORE rather than with the correct CORE sub-class, you can use the following command:

```
check_well_antenna -need_protect_cells decap* -protect_cells wellAntEndCap -not_protect_cells {filler* welltap* tie*} -report wellant.rpt
```

Related Information

The 'Verifying Well-Process-Antenna Violations' section in the Identifying and Viewing Violations chapter in the *Innovus User Guide.*

check_well_taps

```
check_well_taps
[-help]
[-area x1 y1 x2 y2]
[-avoid_abutment]
[-cells list_of_well_tap_cells]
[-from_edge]
[-max_distance distance]
[-layer layer_name]
[-power_domain powerDomainName]
[-report filename]
[-site_offset number_of_sites]
[-well_cut_cells list_of_well_cut_cells]
[-well_layer string]
```

Generates violation markers for missing well-tap cells and for well-tap cells that do not meet the rule specified for the distance between well-tap cells. Optionally, generates a well-tap violation report.

Honors the `set_well_tap_mode` settings for `-cells`, `-max_distance`, `-well_cut_cell`, `-bottom_tap_cell`, and `-top_tap_cell` options.

Marks violations in the area where well-tap placement violates the rule, covering the shared well of abutting rows. If there is no abutting row, marks the violation where it covers only one-half of a row with a violation.

Reports the actual distance between well-tap cells, as well as the rule distance. If there are no well-tap cells in a row and the row that abuts it, or no well-tap cells between the row end and the edge of a block, the software generates a message.

Does not check row areas that are covered by blocks and their halos, or by placement blockages.

The software places well-tap cells with the `add_well_taps` command. You can delete well-tap cells with the `delete_filler` command.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `check_well_taps` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_well_taps`
`-area x1 y1 x2 y2`	Specifies the area in which well-taps are to be checked. *Data_type*: rect, optional
`-avoid_abutment`	Checks and ensures that there is no abutted tap cell in the vertical and horizontal directions. *Data_type*: bool, optional
`-cells list_of_well_tap_cells`	Specifies the well-tap cells. If not specified, uses cells defined as `CLASS CORE WELLTAP` in the Macro section of the LEF file. *Data_type*: string, optional
`-from_edge`	Checks the rule distance from the right and left edges of the well tap cells, instead of from the center line. Use this parameter when the design has well-tap cells of different widths. If this parameter is not specified, `check_well_taps` checks the rule distance from the center line of the well-tap cells. *Data_type*: bool, optional
`-layer layer_name`	Specifies the layer name to check the rule. *Data_type*: string, optional
`-max_distance distance`	Specifies the maximum distance between two well-tap cells. The spacing between two well-tap cells should be twice the `-max_distance` value when measured from center to center or edge to edge. The distance between tap and row end should be same as the `-max_distance` value. For example, `check_well_taps -max_distance 50`. *Data_type*: float, optional
`-power_domain powerDomainName`	Limits checking to the specified power domain. If you do not use this parameter, *`check_well_taps`* checks the default domain with the designs of N3 or below nodes, and checks the entire design for the other nodes. *Data_type*: string, optional
`-report filename`	Specifies the report name. *Default:* *`topCellName`*`.welltap.rpt` *Data_type*: string, optional
`-site_offset number_of_sites`	Checks the offset value in number of sites that vertical taps need to be aware of. *Minimum*:`1` *Maximum*: `INT_MAX` *Data_type*: int, optional
`-well_cut_cells list_of_well_cut_cells`	Specifies the list of cells with the well cuts. Use this option to flag latch-up violations due to well cut cells. *Data_type*: string, optional
`-well_layer string`	Checks the latchup rule for `pwell` or `nwell`. *Data_type*: string, optional

Examples

The following command displays violations due to well cut cells:

```
check_well_taps -max_distance 30 -well_cut_cells {EP32_VDDI_DSWITCH_50n_NOBUF EP32_VDDI_DSWITCH_50n_BUF} -cells {EP8T32_VDDI_GNDS_CDM EP8T32_VDDI_VDDS_CDM}
```

check_wire_gaps

```
check_wire_gaps
[-help]
[-append]
[-area {x1 y1 x2 y2}]
[-layers layer_names]
[-nets power_nets]
[-out_file filename]
[-wire_to_boundary [-design {v1 v2}] [-core {v1 v2}] [-block {v1 v2}] [-power_domain {v1 v2}]]
[-wire_to_shape [-ring value]]
[-wire_to_wire value]
```

Verifies the continuity of follow pin and stripes. Use this command to identify power strap failures due to broken power wires in the power planning stage. The `check_wire_gaps` command gives you the flexibility to check for breaks in a specific area and for specific layers or power nets.

Additionally, you can use this command to ensure that wires do not stop short of the expected distance from the chip, core, or block boundary.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `check_wire_gaps` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man check_wire_gaps`
`-append`	Specifies that all previous `check_wire_gaps` settings will be kept. *Data_type*: bool, optional
`-area {x1 y1 x2 y2}`	Specifies the area to be checked. *Data_type*:
`-block {v1 v2}`	Specifies the wire-to-block gap distance. Here: • `v1`: Specifies the threshold value or acceptable distance from the block boundary to the wire. • `v2`: Specifies how far to look from the block boundary to find wires that should be considered for the check. Use this check to ensure that vertical straps cover the horizontal straps underneath them near a block edge. For example, if you specify `check_wire_gaps -wire_to_bounday -block {0 0.3}`, any wire that is at a distance less than 0.3 um from the block boundary is reported as a violation. Wires that are at a greater distance than 0.3um are not flagged as violations as such breaks are assumed to be intentional. *Data_type*: point, optional
`-core {v1 v2}`	Specifies the wire-to-core boundary gap distance. Here: • `v1`: Specifies the threshold value or acceptable distance from the core boundary to the wire. • `v2`: Specifies how far to look from the core boundary to find wires that should be considered for the check. For example, if you specify `check_wire_gaps -wire_to_bounday -core {0 0.3}`, any wire that is at a distance less than 0.3 um from the core boundary is reported as a violation. Wires that are at a greater distance than 0.3 um are not flagged as violations as such breaks are assumed to be intentional. *Data_type*: point, optional
`-design {v1 v2}`	Specifies the wire-to-design boundary gap distance. Here: • `v1`: Specifies the threshold value or acceptable distance from the chip boundary to the wire. • `v2`: Specifies how far to look from the chip boundary to find wires that should be considered for the check. For example, if you specify `check_wire_gaps -wire_to_bounday -design {0 0.3}`, any wire that is at a distance less than 0.3 um from the chip boundary is reported as a violation. Wires that are at a greater distance than 0.3 um are not flagged as violations as such breaks are assumed to be intentional. *Data_type*: point, optional
`-layers layer_names`	Specifies the metal layers to be considered. *Data_type*: string, optional

`-nets power_nets`	Specifies the name of the power nets that will be checked. *Data_type*: string, optional
`-out_file filename`	Specifies the report file for `check_wire_gaps` violations data. *Data_type*: string, optional
`-power_domain {v1 v2}`	Specifies the wire-to-power-domain gap distance. Here: • `v1`: Specifies the threshold value or acceptable distance from the power domain to the wire. • `v2`: Specifies how far to look from the power domain to find wires that should be considered for the check. *Data_type*: point, optional
`-ring value`	Specifies the wire-to-ring gap distance. *Data_type*: float, optional
`-wire_to_boundary`	Checks the wire to boundary gap. You must specify one of the following sub-options with `-wire_to_boundary`: • `-block` to check the gap between wire and block boundary. • `-design` to check the gap between wire and chip boundary. • `-core` to check the gap between wire and core boundary. • `-power_domain` to check the gap between wire and power domain. *Data_type*: bool, optional
`-wire_to_shape`	Checks the gap between the wire and some specific shapes. *Data_type*: bool, optional
`-wire_to_wire value`	Specifies the wire-to-wire gap distance. Use this check to ensure that wires do not stop short of another wire of the same net or layer. For instance, you can use this check to ensure that wires connect properly to a power ring. If the wire-to-wire gap in the same net is less than the specified threshold value, `check_wire_gaps` flags it as a violation. If the wire-to-wire is greater than the threshold value, the break is assumed to be intentional.  *Data_type*: float, optional

Example

The following command checks wire-to-wire gap and flags wires in the same net that are closer than 0.2 um:

```
check_wire_gaps -wire_to_wire 0.2
```

Related Information

The Identifying and Viewing Violations chapter in the *Innovus User Guide.*

create_marker

```
create_marker
[-help]
{-bbox {x1 y1 x2 y2} | -poly {x1 y1 x2 y2...}}
[-description description]
[-layer layerName]
[-rule_map]
[-sub_type subtypeName]
[-tool toolName]
[-type typeName]
```

Creates markers for violations in the database and imports DRC markers generated by other software applications. Use this command if you want to import only a specific marker or check a specific marker that has been created by a third party tool.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_marker` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man create_marker`
`-bbox x1 y1 x2 y2`	Specifies the area of the bounding box of the marker. For example, `create_marker -bbox 100 100 100.5 100.5`. *Data_type*: string, optional
`-description description`	Describes the marker. For example, `create_marker -description "the user mark is non default rule spacing check"`. *Default:* `""` *Data_type*: string, optional
`-layer layerName`	Specifies the layer. For example, `create_marker -layer METAL2`. *Data_type*: string, optional
`-poly {x1 y1 x2 y2...}`	Specifies the area of the bounding polygon of the marker. *Data_type*: string, optional
`-rule_map`	Specifies if the marker needs to be created through `rule_map`. *Data_type*: bool, optional
`-sub_type subtypeName`	Specifies the marker subtype. For example, `create_marker -sub_type user_spacing`. *Default:* `Other` *Data_type*: string, optional
`-tool toolName`	Specifies the source software application. For example, `create_marker -tool Innovus`. *Default:* `Other` *Data_type*: string, optional
`-type typeName`	Specifies the marker type. For example, `create_marker -type user_verify`. *Default:* `Other` *Data_type*: string, optional

Example

- The following command generates markers for tool named `Calibre` with type `METAL1` and subtype `S.1`:

  ```
  create_marker -bbox { 1 2 1 2 } -tool Calibre -type METAL1 -sub_type S.1
  ```

  The violation browser displays the marker in the above example as follows:

  ```
  + Calibre
      + METAL1
          + S.1
              ...
  ```

- Suppose the cadence LPA tool has created the following marker on layer `METAL3`:

  ```
  CDNLitho;SPACING; Severity: 3; MARKER_INFO: "CD = 45.39"

  bbox = (468.248, 63.511) (468.310, 63.599)
  ```

  The following command creates a corresponding marker in Innovus design:

  ```
  create_marker -bbox {468.248 63.511 468.310 63.599} -layer metal3 /
              -type CDNLitho -sub_type Spacing
  ```

Related Information

- `delete_markers`
- Identifying and Viewing Violations chapter in the *Innovus User Guide*

delete_drc_markers

```
delete_drc_markers [-help]
```

Clears all design rule checking (DRC) markers in your design.

Note: Do not use the `delete_drc_markers` command before using `ecoRoute` or any other routing command. This is because NanoRoute works only on the existing DRC/violation markers. The routing commands will not necessarily perform DRC checks in the routing halo regions if the violation markers are already cleared.

Parameters

`-help`	Prints a brief description of the `delete_drc_markers` command usage. For a detailed description of the command, use the `man` command: `man delete_drc_markers`

Related Information

- `check_drc`
- Identifying and Viewing Violations chapter in the *Innovus User Guide*

delete_markers

```
delete_markers
[-help]
[-all]
[-area {x1 y1 x2 y2}]
```

Deletes markers from a specified area or the entire design area.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `delete_markers` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man delete_markers`
`-all`	Deletes markers from the entire design area. *Data_type*: bool, optional
`-area {x1 y1 x2 y2}`	Specifies a bounding box for the area from which to delete markers. For example, `delete_markers -area {0 0 100 100}`. *Data_type*: string, optional

[-units]
[-working_dir]
```

Prints parameters for the `signoff_verify_design` command. It also prints `rule_selection_options` for a given process node that can be combined with `all {} | beol {} | feol {}`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_signoff_verify_design_config` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man get_signoff_verify_design_config`
`parameter_names`	Displays information for the specified parameters. You can specify one or more parameters. See `set_signoff_verify_design_config` for descriptions of the parameters you can specify.

Examples

- The following command displays the current setting of the `-stripes` parameter:
  `get_signoff_verify_design_config -stripes`
- The following command displays the current settings for all the `signoff_verify_design` parameters:
  `get_signoff_verify_design_config`

Related Information

- `set_signoff_verify_design_config`

gui_show_markers

```
gui_show_markers
[-help]
[-ac_limit]
[-all]
[-area {x1 y1 x2 y2}]
[-connectivity]
[-density]
[-display_by_layer]
[-geometry]
[-max_error_per_type value]
[-no_false_marker]
[-overlap]
[-process_antenna]
[-search_description]
[-short]
[-filter_query LO_formula | {-filter filterString -filter_mode {AND | OR | NOT}}]
```

Displays a list of violations. The software generates markers for the violations after you use one or more verification commands.

Geometry or Metal Density Violations

Updates geometry and metal density violation markers incrementally during an Innovus session--that is, it displays the markers generated the first time you run the `check_metal_density` command and adds new markers, or deletes markers, on subsequent runs during the same session. If the software finds violations during a subsequent run that were already found previously, the browser display does not change, as there is no incremental update.

The browser can make incremental changes because `check_metal_density` can check a small area of the design and update the database. As a result of this behavior, Innovus saves the information from the first verification run.

Connectivity, Process Antennas, or AC Limit Violations

Overwrites connectivity, process antenna, and AC limit violation markers if the `check_connectivity`, `check_process_antenna`, or `check_ac_limits` commands are run more than once during an Innovus session. These commands are net-based, not area-based, so the browser does not make incremental updates for them. As a result of this behavior, Innovus does not keep the information from the first verification run.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `gui_show_markers` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man gui_show_markers`
`-ac_limit`	Displays AC limit violations. *Data_type*: bool, optional
`-all`	Displays all the violations that are present in the design. *Data_type*: bool, optional
`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area whose violations to display. For example, `gui_show_markers -area {0 0 100 100}`. *Data_type*: string, optional
`-connectivity`	Displays connectivity violations. *Data_type*: bool, optional
`-density`	Displays metal density violations. *Data_type*: bool, optional
`-display_by_layer`	Displays the list of violations by the layer instead of route type. *Data_type*: bool, optional

`-filter filterString`	Specifies a text string in the violation message. Violation Browser searches the message of each violation and displays only the violations whose messages match the search conditions. To specify a list of strings, separate each string with a space. To specify a literal string with space in it, enclose the string in double quotation marks. For example, you can specify strings such as the following: • `METAL5` • `(600, 500)` • `METAL3 (700, 400)` • `"Pin of Net"` *Data_type*: string, optional
`-filter_mode {AND | OR | NOT}`	Specifies the condition for searching multiple strings in the violation browser. You cannot filter complex expressions because the `AND`, `OR`, and `NOT` parameters are mutually exclusive. • The `AND` and `OR` conditions work on single strings or multiple strings. • The `NOT` condition works only on a single string. *Data_type*: string, optional

`-filter_query LO_formula`	Specifies a complex logical expression for filtering violations. This option cannot be used along with `-filter` or `-filter_mode`. You can specify the AND, OR, and NOT conditions in the search expression. Use:
	• `&&` between strings in the expression to specify the AND condition.
	• `||` between strings in the expression to specify the OR condition.
	• ! before a string to specify the NOT condition. Note that ! is an one's complement operator. So for example, `!{object(net1) && layer(m2)}` is not allowed.
	The `-filter_query` parameter supports searches in the object, layer, and description areas. The area can be specified using the `object`, `layer`, and `desc` keywords. For example:
	`object(net1) || layer(m2) && desc(xxx)`
	You can also use the wildcards * and ? in the search expression. For example:
	`!object(clk*) && layer(m?)`
	To specify a literal string with space in it, enclose the string in double quotation marks. For example:
	`!object(clk*) && desc("prl spacing")`
	Data_type: string, optional

`-geometry`	Displays geometry violations. *Data_type*: bool, optional
`-max_error_per_type value`	Specifies a limit for the number of violations parsed for each violation type. For example, if you set `gui_show_markers -max_error_per_type 500`, the Violation Browser parses and displays only 500 markers per error type. Use this parameter if you are loading a large DRC file with millions of violations to prevent the database from becoming slow while loading the file and to limit the number of violations you review in the browser. By default, the Violation Browser displays **all** markers. *Data_type*: int, optional
`-no_false_marker`	Prevents Innovus from displaying false violations. *Data_type*: bool, optional
`-overlap`	Displays overlaps in the design. *Data_type*: bool, optional
`-process_antenna`	Displays process antenna violations. *Data_type*: bool, optional

`-search_description`	Searches for text in the violation message and the violation description. *Data_type*: bool, optional
`-short`	Displays short violations. *Data_type*: bool, optional

Examples

The following command displays all violations whose marker title contains `METAL3`:

```
gui_show_markers -all -filter METAL3
```

The following command displays geometry violations whose marker title contains `METAL3` or `tdsp`:

```
gui_show_markers -geometry -filter {METAL3 tdsp} -filter_mode OR
```

The following command displays geometry violations whose marker title or marker description field contains `Min` and `0.24` and `METAL3`:

```
gui_show_markers -geometry -filter {Min 0.24 METAL3} -filter_mode AND -search_description
```

The following command displays violations occurring on Metal4 or Metal5 layers but excludes short violations:

```
gui_show_markers -filter_query {!Short && (m4 || m5)}
```

[-write_stream_options string]
```

Runs LPA on the selected design to flag Litho hotspots. It helps in creating, extracting, finding, and fixing patterns. This command uses squish and TVL patterns to find locations within a layout. Once a is pattern defined, you can use it for a variety of operations. Patterns can be extended to define via replacement, landing pad extensions, polygon insertions, and routing blockages. Patterns are commonly used to define markers for DRC or Litho hotspots.

Parameters

`-help`	Outputs a brief description that includes the type and default information for the `opt_pattern` parameters. For a detailed description of the command, use the man command: `man opt_pattern`
`-back_out string`	Reverts the fixing on the nets. *Data_type*: string, optional
`-check_function`	Specifies the DRC function. *Data_type*: string, optional
`-check_local`	Applies fixing with the local DRC check. *Data_type*: bool, optional
`-config string`	Specifies the name and path of the LPA custom configuration file. This file, if specified, controls all the run options of LPA. *Data_type*: string, optional

`-create`	Streams out the Innovus design into a GDS file and loads it in `design_review` or `k2_viewer`. ⚠ Specify the stream out map file with `-map_file`. *Data_type*: bool, optional
`-deck string`	Specifies the pattern deck to be used for LPA hotspot detection. ⚠ • The configuration variable, `lpaTechFile`, needs to be specified in the configuration file. • The LPA layer map needs to contain all the layers mentioned in the deck file. *Data_type*: string, optional
`-dir string`	Specifies the LPA output directory. This directory contains individual subdirectories for each layer. *Data_type*: string, optional
`-env_layers string`	Specifies the list of extra layers to be included in `write_stream` GDS/OASIS. ⚠ The layer number and data type of these extra layers need to be included in the LPA layer map. *Data_type*: string, optional
`-exclude string`	Specifies the list of nets that need not be used while fixing hotspots. *Data_type*: string, optional
`-exclude_halo string`	Specifies an extra halo around the marker to check the exclude nets. ⚠ This parameter works with `-exclude`. *Data_type*: string, optional
`-extract_text_pattern`	Produces squish patterns as opposed to TVL patterns, for extraction. *Data_type*: bool, optional
`-find`	Detects and fixes LPA hotspots at the time of run. *Data_type*: bool, optional
`-find_limit string`	Specifies the number of hotspots to be detected. *Data_type*: string, optional
`-fix`	Helps LPA in applying the hints to fix hotspots. *Data_type*: bool, optional
`-fix_limit string`	Specifies the number of hotspots to be fixed. *Data_type*: string, optional
`-guides_only`	Specifies LPA to turn off fixing of hotspots after detection. ⚠ The default behavior of the `-find` parameter is to find and fix hotspots. *Data_type*: bool, optional

`-include string`	Specifies the list of nets to be used while fixing hotspots. *Data_type*: string, optional
`-incremental_check string`	Specifies the name and path of the HIF file to be used for incremental validation. This HIF file includes the locations that identify the areas affected by each hotspot fix. LPA reads these locations and performs incremental checking only in these areas. This reduces the time required for validation. *Data_type*: string, optional
`-input string`	Specifies the path of a GDS. It opens design review with the given file. *Data_type*: string, optional
`-layer_map_file string`	Specifies the path of LPA layer map. ⚠ It can also be specified by including the following string in the configuration file: `setConf layerMapFile` *Data_type*: string, optional
`-layers string`	Specifies the list of layers to run on LPA. ⚠ It can also be specified by including the following string in the configuration file: `setConf layerOrder` *Data_type*: string, optional
`-map_file string`	Specifies the name and path of the Stream Out Map file created by Innovus to map the GDS stream to the layers in the Innovus database. If the GDS List file and Stream Out Map file are specified, LPA runs on the potential IP blocks defined in these files. *Data_type*: string, optional
`-marker_layers string`	Specifies the layers to be extracted in pattern extraction. ⚠ This parameter works along with `-markers`. *Data_type*: string, optional
`-markers string`	Specifies the path to a marker file in the HIF/RDB format for pattern extraction. *Data_type*: string, optional
`-no_compress`	Inputs GDS instead of `gds.gz`. *Data_type*: bool, optional
`-no_violation_browser`	Prevents LPA from loading the detected hotspots to the Innovus Violation Browser. *Data_type*: bool, optional
`-oasis`	Ensures that the stream out process uses OASIS output format. *Data_type*: bool, optional
`-oasis_files`	Specifies the name and path of the text file containing the list of OASIS files for LEF abstracts. *Data_type*: string, optional

`-read`	Loads guideline fixing from the database. *Data_type*: bool, optional
`-selection`	Specifies a list of hotspot type and severity to be extracted in the following format: `[list <type1>:<level1> <type2>:<level2> …]` *Data_type*: string, optional
`-stream_files string`	Specifies the name and path of the text file containing the list of GDS files for LEF abstracts. *Data_type*: string, optional
`-techfile`	Specifies the path of non-default LPA Mx technology file. *Data_type*: string, optional
`-write`	Saves guideline fixing from the database. *Data_type*: bool, optional
`-write_stream_options`	Enables additional `write_stream` command options. *Data_type*: string, optional

Examples

- The following command presents how to use `opt_pattern` to find the hotspots:
  ```
  opt_pattern -find -deck deck.cpaHook.xml -map_file write_stream.map -write_stream_options { -outputMacros } -dir Find_hook -layers "M2"
  ```
- The following command presents how to fix the patterns with the `hinsts` created:
  ```
  opt_pattern -find -deck deck.cpaHook.xml -map_file write_stream.map -write_stream_options { -outputMacros } -dir Find_hook -fix -layers "M2" -fix
  ```
  The following figure depicts an example of a fixed location:
  - The following command applies double via patterns:
  ```
  opt_pattern -find -deck deck.cpaDoubleVia.xml -dir Find_via -map_file write_stream.map -write_stream_options { -outputMacros } -layers "M2"
  ```
- The following command finds the double via patterns and fixes 200 of those:
  ```
  opt_pattern -find -deck deck.cpaDoubleVia.xml -dir Find_via -map_file write_stream.map -write_stream_options { -outputMacros } -layers "M2" -fix -findLimit 200
  ```

read_drc_markers

```
read_drc_markers
[-help]
in_file
[-incremental]
[-orient {r0 | r90 | r180 | r270 | mx | mx90 | my | my90}]
[-origin x y]
```

Loads the specified Design Rule Checking (DRC) violation marker file. Use this command to load DRC markers, which are saved with DB format, into Innovus design. The `read_drc_markers` command is useful in situations when you want to load DRC violation markers without having to load an entire design.

For example, if during an Engineering Change Order (ECO), you find that only 25 of the 300 reported violations are actual violations that need to be corrected immediately, you can:

1. Delete the other 275 violations.
2. Save the 25 actual violations in a marker file using the `write_drc_markers` command.
3. Clear the violations from the design window.
4. Load the marker file containing the saved violation markers using the `read_drc_markers` command.

You can also use the `read_drc_markers` command in situations where, when correcting violations, the ECO editor does not make a change in the way that you wanted. Because the editor removed the marker when it made the change, you cannot find the original violation in the design. You can use the `read_drc_markers` command to load the original marker file, then click on the violation, and zoom to the area in which you were working.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `read_drc_markers` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man read_drc_markers`
in_file	Specifies the name of the marker file to load. *Data_type*: string, required
`-incremental`	Loads the markers stored in the specified file incrementally. This means that the markers already loaded in memory are not removed before loaded from the specified file. *Data_type*: bool, optional
`-orient {r0 | r90 | r180 | r270 | mx | mx90 | my | my90}`	
	Rotates all the DRCs available in the violation marker file with the specified orientation. *Data_type*: enum, optional
`-origin x y`	Specifies the origin coordinate of the DRC available in the violation marker file. *Data_type*: point, optional)

Example

The following command loads markers that were previously saved to the `VG.drc` file using `saveDrc`:

```
read_drc_markers VG.drc
```

Related Information

- The following sections in the Identifying and Viewing Violations chapter of the *Innovus User Guide*:
  - Viewing Violations With the Violation Browser

read_markers

```
read_markers
[-help]
in_file fileName
[-orient {r0 r90 ...}]
[-rule_map_file mapName]
-type {Assura | Calibre | PVS | Hercules | ICV | CDNLitho | CDNCMP | inShapeLitho | CalibreLitho | DRV | ClockTran | CLP | VerifyPower}
[-x_offset value]
[-y_offset value]
```

Loads a violation marker file or a hotspot interface format (HIF) file in one of the following formats and creates markers that Innovus can interpret. Use this command to load third-party markers into Innovus:

- Assura™
- Calibre
- PVS
- Hercules
- ICV
- Cadence or Calibre HIF
- Chemical and Mechanical Polishing (CMP) HIF
- inShapeLitho
- Calibre litho hotspot
- NanoRoute litho
- Transition violation report
- Low power violation reports

After you load the file, you can view the markers in the Violation Browser. By cross-probing between Violation Browser and the design area, you can analyze the violations and take steps to resolve them. The Innovus Auto Query feature displays the rule names for the markers.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `read_markers` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man read_markers`
`in_file` *fileName*	Specifies the marker file to load. Assura files must have a `.err` extension. Calibre files must have a `.db` extension. *Data_type*: string, required
`-orient {`*r0 r90* `...}`	Supports advanced orientation transforms for loading rotated DRC violation markers before loading. This helps in overlaying the *Data_type*: string, optional

`-rule_map_file` *mapName*	Specifies the rule map file for a PVS or Calibre Litho report. The rule map file provides the layer/error type information.
	`read_markers` saves this information to the database. When the markers are created, the layer, error type, and object information
	(width, spacing, enclosure, area, minstep, etc). The rule map file should be a txt file with 3 columns:
	Rule_name Innovus_error_type layer_name
	Below is an example:
	`M1.W_4.5 width metal1`
	`M1.A_0.048 minhole metal1`
	`M1.M_1 minstep metal1`
	Data_type: string, optional

`-type {Assura | Calibre | PVS | Hercules | ICV | CDNLitho | CDNCMP | inShapeLitho | CalibreLitho | DRV | ClockTran | CLP | VerifyPower}`	
	Specifies the file type. The following file types contain violation markers: • Assura - For Assura violations • Calibre - For Calibre violations • PVS - For PVS violations • Hercules - For Hercules violations • ICV - For ICValidator report violations • CDNCMP - For Cadence CMP Predictor (CCP) violations • DRV - For transition violations (reportTranViolation) • ClockTran, CLP, and VerifyPower - For low power violations The following file types contain hotspot markers, which are used to identify areas susceptible to lithography problems: • CDNLitho (LPA as well as NanoRoute litho HIF) • inShapeLitho • CalibreLitho *Data_type*: enum, required
`-x_offset` *value*	Specifies the X offset. When you specify the X and Y offsets, Violation Browser displays the violations at the correct coordinates *Data_type*: float, optional
`-y_offset` *value*	Specifies the Y offset, which Violation Browser takes into account to displays violations at the correct coordinates. *Data_type*: float, optional

Examples

- The following command loads a CDN Litho marker file named `LPA.hif`:
  ```
  read_markers -type CDNLitho -x_offset 0.05 -y_offset 0.05 in_file LPA.hif
  ```
- The following command loads a NanoRoute litho repair file named `NR.hif`:
  ```
  read_markers -type CDNLitho in_file NR.hif
  ```

report_markers

```
report_markers
[-help]
[-all]
[-ac_limit]
[-connectivity]
[-density]
[-geometry]
[-max_error_per_type integer]
[-no_false_marker]
[-overlap]
[-process_antenna]
[-short]
[-area {x1 y1 x2 y2}]
[-report filename]
[-filter filterString]
[-filter_mode {AND | OR | NOT}]
[-search_description]
```

Reports violations flagged by the verification commands. The report file and violation browser list the violations in the same order.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_markers` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man report_markers`
`-ac_limit`	Reports AC limit violations. *Data_type*: bool, optional
`-all`	Reports all violations. *Data_type*: bool, optional
`-area {x1 y1 x2 y2}`	Specifies the coordinates of the area for which to report violations. For example, `report_markers -area {0 0 100 100}`. *Data_type*: string, optional
`-connectivity`	Reports connectivity violations. *Data_type*: bool, optional
`-density`	Reports metal density violations. *Data_type*: bool, optional
`-filter filterString`	Specifies a text string in the violation message (in the bottom portion of the Violation Browser). When you specify a text string, the Violation Browser searches the message of each violation and displays only the violations whose messages match the search conditions. To specify a list of strings, separate each string with a space. To specify a literal string with space in it, enclose the string in double quotation marks. For example, you can specify strings such as the following: • `METAL5` • `(600, 500)` • `METAL3 (700, 400)` • `"Pin of Net"` *Data_type*: string, optional
`-filter_mode {AND | OR | NOT}`	

	Specifies the condition for searching multiple strings in the violation browser. You cannot filter complex expressions because the AND, OR, and NOT parameters are mutually exclusive. • The `AND` and `OR` conditions work on single strings or multiple strings. • The `NOT` condition works only on a single string. *Data_type*: string, optional
`-geometry`	Reports geometry violations. *Data_type*: bool, optional
`-max_error_per_type` *integer*	
	Specifies the error marker number limit for each type of error. Specifies a limit for the number of violations parsed for each violation type. For example, if you set `report_markers -max_error_per_type 500`, the Violation Browser parses and displays only 500 markers per error type in the report. Use this parameter if you are loading a large DRC file with millions of violations to prevent the database from becoming slow while loading the file and to limit the number of violations you review in the browser. By default, the Violation Browser displays **all** markers in the report. *Data_type*: int, optional
`-no_false_marker`	Prohibits Innovus from displaying false violations. *Data_type*: bool, optional
`-overlap`	Reports overlap violations. *Data_type*: bool, optional
`-process_antenna`	Reports process antenna violations. *Data_type*: bool, optional
`-report` *filename*	Specifies the report file for the violation information. *Data_type*: string, optional
`-search_description`	Searches the description field for each marker in addition to the table entries. *Data_type*: bool, optional
`-short`	Reports short violations. *Data_type*: bool, optional

Examples

The following command reports all violations whose marker title contains `METAL3`:

```
report_markers -all -filter METAL3
```

The following command reports geometry violations whose marker title contains `METAL3` or `tdsp`:

```
report_markers -geometry -filter {METAL3 tdsp} -filter_mode OR
```

The following command reports geometry violations whose marker title or marker description field contains `Min` and `0.24` and `METAL3`:

```
report_markers -geometry -filter {Min 0.24 METAL3} -filter_mode AND -search_description
```

set_isolated_cut_rule

```
set_isolated_cut_rule
[-help]
-spacing spacing1
[-corner_spacing spacing2]
[-layers {cutLayer_list}]
```

Specifies spacing rules for isolated cut layers. Use this command before running the `check_isolated_cuts` command to set the spacing rules against which `check_isolated_cut` should check isolated cuts.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_isolated_cut_rule` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man set_isolated_cut_rule`
`-corner_spacing` *spacing2*	Specifies the maximum distance *spacing2* for the corner check. If all corners of the cut being validated have another cut within *spacing2* in the quadrant, the cut being checked is not a violation. **Note:** `-conner_spacing` is ignored if *spacing2* is smaller than `-spacing` *spacing1*. *Data_type*: float, optional
`-layers` `{`*cutLayer_list*`}`	Sets the spacing rule for specified cut layers. If this parameter is not specified, the rule is applied for all cut layers. *Data_type*: string, optional
`-spacing` *spacing1*	Specifies the maximum distance between the cut being validated to its nearest cut. If the actual distance is less than or equal to *spacing1*, `check_isolated_cut` does not report a violation. If the actual distance between the cut being validated and its nearest cut is greater than *spacing1*, `check_isolated_cut` reports a violation. *Data_type*: float, required

Example

- The following command specifies that the maximum distance between the cut being validated and the nearest cut should be `0.5`:

  ```
  set_isolated_cut_rule -spacing 0.5
  ```

- The following set of command specifies that the maximum distance between the cut being validated and the nearest cut should be `0.1`. In addition, the maximum distance for the corner check should be `0.5`. All cuts that violate these spacing rules are marked:

  ```
  set_isolated_cut_rule -spacing 0.1 - corner_spacing 0.5
  check_isolated_cut
  ```

```

Sets the global parameters for the `signoff_verify_design` command. Parameters specified with the `set_signoff_verify_design_config` command are used automatically whenever `signoff_verify_design` is being run. The settings are saved in the design database and will be restored after reloading a database saved earlier.

Use the `get_signoff_verify_design_config` command to return the current values of the `set_signoff_verify_design_config` parameters.

Parameters

`-help`	Prints a brief description of the `set_signoff_verify_design_config` command usage. For a detailed description of the command, use the `man` command: `man set_signoff_verify_design_config`
`-abort_on_layout_error {yes | no}`	Optional keyword to specify whether to continue processing of the design in case of layout error or exit. *Data_type*: enum, optional
`-abort_on_missing_rulecheck {yes | no}`	Optional keyword to specify whether to continue processing of the design in case of missed rule name. *Data_type*: enum, optional
`-area {x1 y1 x2 y2}`	Optional keyword to specify a set of coordinates within which to trim metal fill. *Data_type*: rect, optional
`-attach_instance_name attribute_number`	Optional keyword to specify the instance name to attach. *Data_type*: int, optional
`-attach_net_name attribute_number`	Optional keyword to specify the net name to attach. *Data_type*: int, optional
`-attach_net_prop {{prop_name attr_num} ... }`	Optional keyword to specify the net property to attach. *Data_type*: string, optional
`-auto_merge_base_class string`	Optional keyword to specify the list of cell base classes to auto merge. It must be one or combination of block, core, corner, cover, none, and pad. *Data_type*: string, optional
`-config_file file_name`	Optional keyword to specify the Pegasus configuration file. *Data_type*: string, optional
`-control_file file_name`	Optional keyword to specify PVL control file. *Data_type*: string, optional
`-core_license license_combination`	Optional keyword to set exact combination of licenses to use. *Data_type*: string, optional
`-die_area_as_boundary`	Optional keyword to write the die area as a polygon, that is, a boundary. Otherwise, the write_stream command writes the die area as a rectangle, that is, a box. *Data_type*: bool, optional
`-distributed n`	Optional keyword to run Pegasus in multi-processor mode, n is number of processors. By default, it gets data from Innovus multi CPU usage option. *Data_type*: int, optional
`-distributed_timeout seconds`	Optional keyword to specify how long to wait for the worker processes to start. *Data_type*: int, optional
`-erc_checks`	Optional keyword to enable ERC checks to run (also requires `-connect_all` option). *Data_type*: bool, optional
`-error_limit n`	Optional keyword to limit the number of output errors. *Data_type*: int, optional
`-extra_options string`	Optional keyword to specify to run Pegasus with additional set of parameters defined in the command string. *Data_type*: string, optional
`-format {stream | oasis}`	Optional keyword to specify the format of the flow. *Data_type*: enum, optional

`-ignore_blockage`	Optional keyword to ignore design blockage objects. *Data_type*: bool, optional
`-ignore_fill`	Optional keyword to ignore design fill objects. *Data_type*: bool, optional
`-keep_data key_file`	Keeps debugging data for R&D (requires a key file). *Data_type*: string, optional
`-layer_map_file streamOut_map_file`	Optional keyword to specify `write_stream` layer map file. *Data_type*: string, optional
`-layer_range {top_layer | bottom_layer}`	Optional keyword to specify top layer name and bottom layer name for selected range. *Data_type*: string, optional
`-layers layer_names`	Optional keyword to specify that only rules that use selected layers will be processed. *Data_type*: string, optional
`-layout_path string`	Optional keyword to specify path to layout file to use for the run instead of streaming out. *Data_type*: string, optional
`-lib_name library name`	Optional keyword to specify library name. *Data_type*: string, optional
`-license_distributed_continue`	Optional keyword to specify that if required number of licenses cannot be obtained, continue with fewer CPUs based on the number of licenses obtained. *Data_type*: bool, optional
`-license_stacking {larger_license | same_license}`	Optional keyword to specify license borrowing behavior. *Data_type*: enum, optional
`-license_timeout number_of_seconds`	Optional keyword to specify how long to wait (in seconds) if a license is not immediately available when the run starts. The default is 300 seconds. *Data_type*: int, optional
`-light`	Enables rule selection preset for the light check. *Data_type*: bool, optional
`-merge string`	Optional keyword to specify the list of external stream files. *Data_type*: string, optional
`-merge_path string`	Optional keyword to specify the list of directories with external stream files. *Data_type*: string, optional
`-mode {ALL | FILLONLY | NOFILL | NOINSTANCES}`	Optional keyword to specify the mode. It identifies the layers to write. *Data_type*: enum, optional
`-multi_cpu n`	Optional keyword to specify number of workers. *Data_type*: int, optional
`-multi_thread n`	Optional keyword to specify number of threads per worker. The default is 1. *Data_type*: int, optional
`-net_map_file string`	Optional keyword to specify the path to file containing net name mapping information. *Data_type*: string, optional

`-nets string`	Specifies the list of net names to check in the `SmartVerify` LVS runs. *Data_type*: string, optional
`-no_structure_name`	Optional keyword to merge GDSII file without loading an Innovus database when the `-merge` parameter is also specified. *Data_type*: bool, optional
`-offset {x y}`	Optional keyword to specify, in microns, the location of the design in the GDSII output file. *Data_type*: point, optional
`-output_macros`	Optional keyword to write LEF abstract information such as LEF pin geometries and obstructions for macros. *Data_type*: bool, optional
`-process_node foundary_node`	Optional keyword to specify process node of used rule deck. *Data_type*: string, optional
`-pvs_fill`	Optional keyword to merge the PVS fill data attached to the current database into the output GDSII/OASIS. *Data_type*: bool, optional
`-report_file`	Optional keyword to output cell name changed to the file. *Data_type*: bool, optional
`-rule_file_drc file_name`	Optional keyword to specify rule file for DRC run. *Data_type*: string, optional
`-rule_file_smart_verify_lvs file_name`	Optional keyword to specify rule file for the `smart_verify_lvs` run. *Data_type*: string, optional
`-run_name directory_name`	Optional keyword to specify name of run directory. *Data_type*: string, optional
`-selected_inst`	Runs only the selected instance. *Data_type*: bool, optional
`-skip_auto_load_results`	Optional keyword to specify not to run Pegasus RV after successful run. *Data_type*: bool, optional
`-stripes number`	Optional keyword to specify the number of stripes that divide the design. The default is 1. *Data_type*: int, optional
`-structure_name structure_name`	Optional keyword to specify the superstructure that consists of all geometries that the map file writes out. *Data_type*: string, optional
`-transform_to_inst_master`	Transforms data to the selected instances master coordinate space. *Data_type*: bool, optional
`-ui_data`	Optional keyword to save data required for LVS/`smart_verify_lvs` probing and debugging. *Data_type*: bool, optional
`-uniquify_cell_names`	Optional keyword to create unique cell names if there are name collisions when the software merges files. *Data_type*: bool, optional
`-units {100 | 200 | 400 | 800 | 1000 | 2000 | 4000 | 8000 | 10000 | 20000}`	

	Optional keyword to specify the resolution for values in the GDSII/OASIS file. *Data_type*: enum, optional
`-working_dir` *working_directory*	Optional keyword to specify working directory. *Data_type*: string, optional

Examples

Following are few examples of the set_signoff_verify_design_config command for defining other options required for the run:

- ```
  set_signoff_verify_design_config \
  -output_macros -die_area_as_boundary \
  -rule_file_drc $drcDeck\
  -layer_map_file $gdsOutMap \
  -control_file $drcCtrl \
  -units 2000 \
  -multi_cpu 4 -multi_thread 4
  source merge.txt
  ```
- ```
  set_signoff_verify_design_config \
  -format stream \
  -merge $merge
  ```
- ```
  set_signoff_verify_design_config
  -process_node EXAMPLE_NODE \
  -process_node_data "./RULE/my_custom_template"
  ```

- signoff_verify_design
  ```

set_snap_grid

```
set_snap_grid
[-help]
-layers {layer_list}
[-pitch x y]
```

Creates a global snapping grid for wiring (including metal fill shapes and via cuts). The grid defines the snap pitch, which is finer than the LEF `PITCH` for the specified layer. The grid is a multiple of the manufacturing grid. You can specify pitch value to check/set routing/metal fill segment's corner edges on the snap grid.

When you specify this command, the wires, metal fill shapes, and via cuts are snapped to this grid, and the edges of the shapes (for example, wires and vias) lie on the manufacturing grid.

The snap grid is not saved in the Innovus database. To use the snap grid, you must run this command each time you load a design.

Verify geometry, power planning and routing, metal fill, and wire editing share the grid setting. Before running commands related to these areas, use `set_snap_grid` to define the grid as additional constraints.

For more information, see the commands `add_metal_fill`, `trim_metal_fill`, and `add_via_fill`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_snap_grid` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man set_snap_grid`
`-layers {layer_list}`	Specifies the layers for the snap grid. You can specify metal layers as METAL1, METAL2, and so on, and cut layers as VIA12, VIA23, and so on. *Data_type*: string, optional
`-pitch x y`	Specifies the pitch for the snap grid. The LEF `PITCH` must be a multiple (for example, 2x, 4x, 8x) of the snap grid for the specified layer. For example, if the LEF `PITCH` is 0.2 µ, you can specify a snap grid pitch for both x and y of `0.1` µ. *Data_type*: point, optional

```

Enables configurable signoff checking at every design stage. It integrates Pegasus Signoff and Pegasus SmartVerify™ with Innovus. These checks help you maintain your designs DRC and LVS clean through the design cycle, and help achieve zero DRC and zero shorts out of Innovus. Running signoff checks late in the design involves long iterative runtimes, debug, fixing, and validation cycles. This impacts time to tapeout. This command allows you to run the signoff checks simultaneously without interrupting Innovus.

Parameters

`-help`	Prints a brief description of the `signoff_verify_design` command usage. For a detailed description of the command, use the `man` command: `man signoff_verify_design`
`-abort_on_layout_error {yes | no}`	Optional keyword to specify whether to continue processing of the design in case of layout error or exit. *Data_type*: enum, optional
`-abort_on_missing_rulecheck {yes | no}`	Optional keyword to specify whether to continue processing of the design in case of missed rule name. *Data_type*: enum, optional
`-area {x1 y1 x2 y2}`	Optional keyword to specify a set of coordinates within which to trim metal fill. *Data_type*: rect, optional
`-attach_instance_name attribute_number`	Optional keyword to specify the instance name to attach. *Data_type*: int, optional
`-attach_net_name attribute_number`	Optional keyword to specify the net name to attach. *Data_type*: int, optional
`-attach_net_prop {{prop_name attr_num} ... }`	Optional keyword to specify the net property to attach. *Data_type*: string, optional
`-auto_merge_base_class string`	Optional keyword to specify the list of cell base classes to auto merge. It must be one or combination of block, core, corner, cover, none, and pad. *Data_type*: string, optional
`-background_mode`	Optional keyword to run SVD job in background mode. *Data_type*: bool, optional
`-beol string`	Optional keyword to provide list of rule selection blocks for BEOL checks. *Data_type*: string, optional
`-config_file file_name`	Optional keyword to specify the Pegasus configuration file. *Data_type*: string, optional
`-control_file file_name`	Optional keyword to specify PVL control file. *Data_type*: string, optional
`-core_license license_combination`	Optional keyword to set exact combination of licenses to use. *Data_type*: string, optional
`-die_area_as_boundary`	Optional keyword to write the die area as a polygon, that is, a boundary. Otherwise, the `write_stream` command writes the die area as a rectangle, that is, a box. *Data_type*: bool, optional
`-distributed n`	Optional keyword to run Pegasus in multi-processor mode, n is number of processors. By default, it gets data from Innovus multi CPU usage option. *Data_type*: int, optional
`-distributed_timeout seconds`	Optional keyword to specify how long to wait for the worker processes to start. *Data_type*: int, optional
`-drc`	Required keyword to run DRC check. *Data_type*: bool, required
`-erc_checks`	Optional keyword to enable ERC checks to run (also requires `-connect_all` option). *Data_type*: bool, optional
`-error_limit n`	Optional keyword to limit the number of output errors. *Data_type*: int, optional

`-extra_options` *string*	Optional keyword to specify to run Pegasus with additional set of parameters defined in the command string. *Data_type*: string, optional
`-feol` *string*	Optional keyword to provide list of rule selection blocks for FEOL checks. *Data_type*: string, optional
`-format {stream | oasis}`	Optional keyword to specify the format of the flow. *Data_type*: enum, optional
`-generate_context`	Generates context for an instance. *Data_type*: bool, required
`-ignore_blockage`	Optional keyword to ignore design blockage objects. *Data_type*: bool, optional
`-ignore_fill`	Optional keyword to ignore design fill objects. *Data_type*: bool, optional
`-layer_map_file` *streamOut_map_file*	Optional keyword to specify `write_stream` layer map file. *Data_type*: string, optional
`-layer_range {top_layer | bottom_layer}`	Optional keyword to specify top layer name and bottom layer name for selected range. *Data_type*: string, optional
`-layers` *layer_names*	Optional keyword to specify that only rules that use selected layers will be processed. *Data_type*: string, optional
`-layout_path` *string*	Optional keyword to specify path to layout file to use for the run instead of streaming out. *Data_type*: string, optional
`-lib_name` *library name*	Optional keyword to specify library name. *Data_type*: string, optional
`-license_distributed_continue`	Optional keyword to specify that if required number of licenses cannot be obtained, continue with fewer CPUs based on the number of licenses obtained. *Data_type*: bool, optional
`-license_stacking {larger_license | same_license}`	Optional keyword to specify license borrowing behavior. *Data_type*: enum, optional
`-license_timeout` *number_of_seconds*	Optional keyword to specify how long to wait (in seconds) if a license is not immediately available when the run starts. The default is 300 seconds. *Data_type*: int, optional
`-light`	Enables rule selection preset for the light check. *Data_type*: bool, optional
`-load_results` *path_to_rundir*	Required keyword to run Pegasus RV with data from provided run directory. *Data_type*: string, optional
`-lsf`	Optional keyword to specify to distribute the run to different machines using LSF. *Data_type*: bool, optional
`-merge` *string*	Optional keyword to specify the list of external stream files. *Data_type*: string, optional
`-merge_library`	Generates single merged layout from the list of layouts to merge. *Data_type*: bool, required

`-merge_path` *string*	Optional keyword to specify the list of directories with external stream files. *Data_type*: string, optional
`-mode {ALL | FILLONLY | NOFILL | NOINSTANCES}`	Optional keyword to specify the mode. It identifies the layers to write. *Data_type*: enum, optional
`-multi_cpu` *n*	Optional keyword to specify number of workers. *Data_type*: int, optional
`-multi_thread` *n*	Optional keyword to specify number of threads per worker. The default is 1. *Data_type*: int, optional
`-net_map_file` *string*	Optional keyword to specify the path to file containing net name mapping information. *Data_type*: string, optional
`-nets` *string*	Specifies the list of net names to check in the `SmartVerify` LVS runs. *Data_type*: string, optional
`-no_structure_name`	Optional keyword to merge GDSII file without loading an Innovus database when the `-merge` parameter is also specified. *Data_type*: bool, optional
`-offset {`*x y*`}`	Optional keyword to specify, in microns, the location of the design in the GDSII output file. *Data_type*: point, optional
`-output_macros`	Optional keyword to write LEF abstract information such as LEF pin geometries and obstructions for macros. *Data_type*: bool, optional
`-process_node` *foundary_node*	Optional keyword to specify process node of used rule deck. *Data_type*: string, optional
`-pvs_fill`	Optional keyword to merge the PVS fill data attached to the current database into the output GDSII/OASIS. *Data_type*: bool, optional
`-report_file`	Optional keyword to output cell name changed to the file. *Data_type*: bool, optional
`-rule_file_drc` *file_name*	Optional keyword to specify rule file for DRC run. *Data_type*: string, optional
`-rule_file_smart_verify_lvs` *file_name*	Optional keyword to specify rule file for the `smart_verify_lvs` run. *Data_type*: string, optional
`-run_name` *directory_name*	Optional keyword to specify name of run directory. *Data_type*: string, optional
`-selected_inst`	Runs only the selected instance. *Data_type*: bool, optional
`-skip_auto_load_results`	Optional keyword to specify not to run Pegasus RV after successful run. *Data_type*: bool, optional
`-smartconnect`	Runs `smartconnect` check. *Data_type*: bool, optional
`-smart_verify_drc`	Required option to run `smart_verify_drc` check. *Data_type*: bool, optional
`-smart_verify_lvs`	Required option to run `smart_verify_lvs` check. *Data_type*: bool, optional

`-stripes` *number*	Optional keyword to specify the number of stripes that divide the design. The default is 1. *Data_type*: int, optional
`-structure_name` *structure_name*	Optional keyword to specify the superstructure that consists of all geometries that the map file writes out. *Data_type*: string, optional
`-transform_to_inst_master`	Transforms data to the selected instances master coordinate space. *Data_type*: bool, optional
`-ui_data`	Optional keyword to save data required for LVS/`smart_verify_lvs` probing and debugging. *Data_type*: bool, optional
`-uniquify_cell_names`	Optional keyword to create unique cell names if there are name collisions when the software merges files. *Data_type*: bool, optional
`-units {100 | 200 | 400 | 800 | 1000 | 2000 | 4000 | 8000 | 10000 | 20000}`	
	Optional keyword to specify the resolution for values in the GDSII/OASIS file. *Data_type*: enum, optional
`-working_dir` *working_directory*	Optional keyword to specify working directory. *Data_type*: string, optional

Examples

- The following command prevents auto-loading of results in Results Viewer, after completion of the software run:
  ```
  signoff_verify_design -drc -working_dir DRC_rundir3 -run_name DRCrun -skip_auto_load_results
  ```
  This will not open the Results Viewer with results once the run completes. To load results from the run, use the `-load_results` parameter, as shown in the example usage below:
  ```
  signoff_verify_design -load_results DRC_rundir3/drc/DRCrun
  ```
- The following command runs DRC and cross probes the run results using the Design Review:
  ```
  signoff_verify_design -drc -working_dir DRC_rundir4 -run_name DRCrun
  ```
- The following command runs DRC checks on a specified area:
  ```
  signoff_verify_design -drc -area {30 0 45 15} -working_dir DRC_rundir5 -run_name beolArea
  ```
- The following command runs DRC checks on a specified layers:
  ```
  signoff_verify_design -drc -layer_range {Metal4 Metal5} -working_dir DRC_rundir6 -run_name beolM4M5
  ```
- The following command specifies a single layer to run checks:
  ```
  signoff_verify_design -drc -layers {Metal4 Metal4} -working_dir DRC_rundir7 -run_name beolM4
  ```
- Following is an example of using the `-beol`, `-layer_range`, `-working_dir`, and `-run_name` parameters together:
  ```
  signoff_verify_design -drc -beol {all} -layer_range {Metal2 Metal4} -working_dir workdir_drc -run_name beol_M2M4
  ```
- Following is an example of using the `-beol`, `-area`, `-working_dir`, and `-run_name` parameters together:
  ```
  signoff_verify_design -drc -beol {all} -area {30 0 45 15} -working_dir workdir_drc -run_name beolArea
  ```

- `set_signoff_verify_design_config`

write_drc_markers

```
write_drc_markers
[-help]
out_file
[-force]
[-selected]
```

Saves DRC violation markers in the specified file. The `write_drc_markers` command is useful for situations where you want to save DRC violation markers without having to save the entire design.

For example, if during ECO you find that only 25 of the 500 reported violations are actual violations that need to be corrected immediately, you can:

1. Delete the other 475 violations.
2. Save the 25 violations in a marker file using the `write_drc_markers` command.
3. Clear the violations from the design window.
4. Load the marker file containing the saved violation markers using the `read_drc_markers` command.

Use the `write_drc_markers` command after markers have been flagged by any of the following commands:

- `check_metal_density`
- `check_process_antenna`

Parameters

`-help`	Prints a brief description that includes the type and default information for each `write_drc_markers` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man write_drc_markers`
`out_file`	Saves the DRC violation markers in a file with the specified name. *Data_type*: string, required
`-force`	Creates drc file with a 0 drc count. **Note:** When there is no drc in the design, drc file is not generated (Default). *Data_type*: bool, optional
`-selected`	Saves only the selected DRC violation markers. *Data_type*: bool, optional

Examples

The following command saves markers to the `VG.drc` file:

```
write_drc_markers VG.drc
```

add_clock_tree_exclusion_drivers

```
add_clock_tree_exclusion_drivers
[-help]
[-base_cell list_library_cells]
```

Removes the excluded sinks from the clock trees by adding exclusion drivers above these sinks. Use this command after running the `create_clock_tree_spec` command. Alternatively, you can use the `cts_add_exclusion_drivers` attribute to remove the exclude sinks from the clock tree. It is recommended that you use one of the two, either the command or the attribute, to exclude sinks from the clock trees.

The names of the newly added drivers start with '`AZ_cse`', so that they can be easily identified. This functionality is useful because it allows you to fix hold violations on clock nets. GigaOpt does not fix hold violations on clock nets. For example, if a pin, D, of a flop is a clock sink then the net attached to the D pin is a clock net. Any hold violations will not be fixed by GigaOpt. However, by adding an exclusion buffer above the D pin, the net between the buffer's output pin and the D pin of the flop becomes a non-clock net and any hold violations will be fixed by GigaOpt. Therefore, this new functionality allows previously unfixable hold violations to be fixed.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_clock_tree_exclusion_drivers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_clock_tree_exclusion_drivers`.
`-base_cell`	Specifies a particular buffer or inverter to use as an exclusion driver. If this parameter is not specified or if the attribute, `cts_add_exclusion_drivers`, is used to enable this functionality, then CCOpt will choose small area drivers from the CTS cell lists to use as exclusion drivers. CCOpt will either add pairs of inverters, or single buffers as exclusion drivers. While choosing the cell to use, CCOpt will choose either inverters or buffers depending on the value specified using the `cts_use_inverters` attribute. This attribute specifies whether clock tree synthesis should use inverters or buffers when balancing the clock trees. *Data_type*: string, optional

  - Shared Clock and Data Concerns

add_clock_tree_source_group_roots

```
add_clock_tree_source_group_roots
[-help]
-cell driverCell
[-locations {{x1 y1} {x2 y2}...}]
-name sourceGroupName
-pin rootPin
[-grid {columns rows} [[-adjust_grid_for_aspect_ratio] [-grid_rect {lx ly ux uy}]
[-grid_search_area {width height}]
[-grid_exclusion_rects {{lx1 ly1 ux1 uy1} {lx2 ly2 ux2 uy2}...}]]]
```

This command updates the design and clock tree specification to create a multiple-tree "source group" below the specified driving root pin. A source group is a set of multiple, logically equivalent, clock trees that drive a collection of clock tree sinks. The actual allocation of sinks to specific source group roots is chosen during clock tree synthesis.

This command performs the following tasks:

- Inserts the instances that will become the clock tree roots into the netlist. Their input pins will be driven by the root pin and the fanout originally driven by the root pin will be rewired to the output of a single root instance.
- Defines clock trees at the outputs of each of the newly inserted root instances.
- Defines a clock source group to combine the clock trees.

You can insert a grid of tap buffers and also omit a tap buffer at grid points that are blocked. For this, you can specify grid coordinates, a two-value pair `{x y}`, that place the source group driver at that location.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_clock_tree_source_group_roots` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_clock_tree_source_group_roots`.
`-adjust_grid_for_aspect_ratio`	
When specified, exchanges rows and columns to match the aspect ratio. *Data_type*: bool, optional	
`-cell driverCell`	
	Specifies the driver cell to use for new source group roots (`base_cell`). This is a required parameter. *Data_type*: (base_cell), required
`-grid {columns rows}`	
	Specifies a grid of target locations. By default, the command attempts to create a full grid consisting of columns and rows. However, if a particular grid target point falls within an exclusion rectangle, specified using the `-grid_exclusion_rects` parameter, then that grid point will be skipped. If the `-adjust_grid_for_aspect_ratio` parameter is specified, the columns and rows will be swapped if doing so better matches the aspect ratio of the grid rectangle area. **Note**: The `-grid` and `-locations` parameters can be used together. For example, you can specify a grid, and then use `-locations` to add a few additional taps in specific floor-plan locations. *Data_type*: integer, optional
`-grid_exclusion_rects {{lx1 ly1 ux1 uy1} {lx2 ly2 ux2 uy2}...}`	
	Provides the coordinates of rectangular areas that should not contain source group roots. *Data_type*: (rect)+, optional
`-grid_rect {lx ly ux uy}`	

	Specifies the area that the grid should cover. This parameter provides the overall rectangle intended to be driven by the taps requested by the `-grid` parameter. **Note**: This parameter does not specify the bounding box of the grid taps. Basically the overall `-grid_rect` rectangle is cut up into `m x n`smaller rectangles, and a tap is targeted at the center of each smaller rectangle. to understand more clearly, consider the below example. If you have `-grid {2 2}` and `-grid_rect {0 0 100 100}`, the corresponding target locations will be `{{25 25} {25 75} {75 25} {75 75}}`. This is different than if the `-grid_rect` were the bounding box of tap locations, in which case it would be `{{0 0} {0 100} {100 0} {100 100}})`. *Data_type*: rect, optional
`-grid_search_area {width height}`	
	Specifies the size of the search area around each grid point. *Data_type*: point, optional
`-locations {{x1 y1} {x2 y2}...}`	
	Specifies a list of (`x,y`) locations for the new roots that are to be created. The specified roots are inserted at the nearest legal location. **Note**: This parameter takes a list of points, not rectangles. A specified point will be taken as a tap target location, and the software will search for the nearest legal location. If the `-grid_search_area {width height}` parameter is specified, the search will be limited to the points specified using the `-grid` parameter and not points specified using the `-locations` parameter. If it is not specified, the software will search as far as needed to find a legal location for a tap. If a legal location cannot be found, either within the specified search area, or anywhere in the floorplan, the tap will be added at the target location and not legalized. If all taps can be inserted at legal locations, they will be set to locked for CTS placement status. If one or more taps cannot be legalized, the command will print a warning and all taps will be left in simple placed status. **Note**: The behavior when a tap cannot be legalized, and for whether taps are locked applies to all taps created by this command - from the `-grid` and/or `-locations` parameters. *Data_type*: (point)+, optional
`-name` *prefix*	Specifies the name of the source group to be created for the roots. The name should be unique. The multi-tap roots will be named using this string as a prefix. For example, `sourceGroupName_0`, `sourceGroupName_1`..`sourceGroupName_n`. **Note**: • The skew group name will be `<prefix>_skew_group`. • The clock tree name for a tap will be `<prefix>_<index>`, and `<prefix>_<index>_inst` for the corresponding cell instance. This is a required parameter. *Data_type*: string, required
`-pin` *rootPin*	Specifies the name of the root pin that will drive the multi-tap root inputs. The pin must be an output pin and must drive a net. The entire clock structure, including clock gates, flops, and so on that are to be driven by the multi-tap roots should originally be connected below this pin. If there are multiple drivers on the root net, any one of their output pins may be specified as the `-pin` parameter. *Data_type*: (pin|port), required

assign_clock_tree_source_groups

```
assign_clock_tree_source_groups
[-help]
[-no_merge]
```

When used on designs with clock tree source group definitions, this command assigns clock sinks to the source group roots - multi-tap assignment - and then performs the cloning and rewiring necessary to distribute the sinks among the source group roots.

Note that the source group assignment process normally happens automatically during the early stages of clock tree synthesis. However, on large designs, the full clock tree synthesis step can take some time. The purpose of this command is to provide an easier way to get early feedback about the multi-tap assignment process, visualize the result, adjust source group definitions, and so on.

By default, the command will do initial clock gate merging and then clone as necessary to implement the assignment. However, the merging step can be disabled by specifying the `-no_merge` option. If no source groups are defined, the command will do nothing.

After running the command, you can review the log file messages, or check the result in the database either by using the Tcl commands, `get_db` command, clock tree debugger, and so on.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `assign_clock_tree_source_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man assign_clock_tree_source_groups`.
`-no_merge`	Specifies that clock gates should not be merged. *Data_type*: bool, optional

ccopt_design

```
ccopt_design
[-help]
[-check_cts_config]
[-expanded_views]
[-num_paths number_of_paths]
[-report_dir out_dir]
[-report_prefix file_name_prefix]
[-timing_debug_report]
```

Performs clock concurrent optimization (CCOpt) on the current loaded design in Innovus. CCOpt optimizes both the clock tree and the datapath to meet global timing constraints.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `ccopt_design` parameter. For a detailed description of the command and all of its parameters, use the man command: `man ccopt_design`.
`-check_cts_config`	Checks that all the prerequisites for running clock tree synthesis are fulfilled without actually doing CTS. For example, it checks that the design is loaded, and the options set by that the user are correct. *Data_type*: bool, optional
`-expanded_views`	This parameter is not interpreted in CCOpt but passed directly to `opt_design`. The parameter is same as `opt_design -expanded_views` parameter, which is specified to generate detailed view-specific timing reports at the end of the `opt_design` command run. *Data_type*: bool, optional
`-num_paths` *number_of_paths*	Specifies the number of paths generated in the timing reports. By default, all timing paths are reported. *Data_type*: integer, optional
`-report_dir` *out_dir*	This parameter specifies the directory where the software writes timing reports that are generated after timing optimization. The default directory is `./timingReports` *Data_type*: string, optional
`-report_prefix` *file_name_prefix*	Specifies a prefix for `opt_design` report file names. *Default*: `DesignName_DesignStage` , where `DesignStage` is pre-CTS, post-CTS, or post-Route *Data_type*: string, optional
`-timing_debug_report`	When specified, generates a machine-readable timing debug report after completing CTS. This report is used for debugging timing results using the timing debug feature in Stylus. **Note**: You can specify the number of paths to be reported using the `-num_paths` parameter. *Data_type*: bool, optional

Examples

- The following command runs a complete CCOpt optimization:
  ```
  ccopt_design
  ```

Related Information

ccopt Category Attributes

- ccopt_auto_limit_insertion_delay_factor
- ccopt_merge_clock_gates
- ccopt_merge_clock_logic

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `ccopt` category, use the following command:

```
get_db -category ccopt
```

Note: For attributes that are keyed, ensure that the design is loaded before using the `get_db attribute_name` command.

For more information about the object attributes, see *Stylus Common UI Database Object Information*.

ccopt_auto_limit_insertion_delay_factor

```
ccopt_auto_limit_insertion_delay_factor value
```

Default: `1.5`

Data_type: double, read/write

CCOpt attempts to keep the insertion delays of each clock tree a fixed multiple of the longest insertion delay that would result from a global skew approach. This multiple can be modified by design timing and the presence of other clock trees, but will start at a fixed fraction above the global skew insertion delay. This attribute specifies that fixed fraction.

Valid values: `real`

See also: `auto_limit_insertion_delay_factor_skew_group`

This global attribute does not use additional arguments.

ccopt_merge_clock_gates

```
ccopt_merge_clock_gates {true | false}
```

Default: true

Data_type: bool, read/write

If set to `true`, clock gate merging is enabled. If this is set to `0`, merging of all clock gates is disabled, including clock gates that may have been cloned by CTS.

See also attribute `cts_merge_clock_gates`.

Valid values: true false

ccopt_merge_clock_logic

```
ccopt_merge_clock_logic {true | false}
```

Default: true

Data_type: bool, read/write

If set to true, clock logic merging is enabled. If this is `false`, merging of all clock logics is disabled, including clock logics which may have been cloned by CTS.

See also attribute `cts_merge_clock_logic`.

Valid values: `true false`

check_clock_tree_convergence

```
check_clock_tree_convergence
[-help]
[-path_threshold threshold_value]
```

This command is used to trigger a warning message for sinks that have more than the specified number of convergence paths from the clock sources to the sink. This check is performed at the end of clock tree specification, for complex convergence above sinks that might cause large runtimes in CCOpt as it attempts to balance these trees.

When this command is specified, any sinks that are found to have more than the specified *threshold_value* of paths from the clock sources to the sink are reported in a warning message from the software. For example:

`WARN: (ENCCCOPT-4338):` There are 17 clock paths leading to primaryout. This may cause long CCOpt runtimes. Type '`man ENCCCOPT-4338`' for more detail.

The following detailed information is provided when you type `man ENCCCOPT-4338`:

```
The design contains a lot of converging clock paths leading to some sinks. This may cause long CCOpt runtimes. The sinks with the most paths
leading to them can be found with report_ccopt_clock_tree_convergence. See CCOpt Clock Tree Specification under Clock Tree Synthesis in the
User Guide for more information.
```

Note: The warning is issued if the number of clock paths to any sink is greater than the threshold value of paths specified by the command `check_clock_tree_convergence`.

To view a summary of the convergence above clock sinks and to identify the names of the sinks with the highest number of clock network paths, run the `report_clock_tree_convergence` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `check_clock_tree_convergence` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_clock_tree_convergence`.
`-path_threshold` *threshold_value*	Triggers a warning message for sinks with more than the specified number of paths. *Default*: 100 *Data_type*: int, optional

clock_design

```
clock_design
[-help]
```

Performs clock tree synthesis (CTS) on the design using the CCOpt engine. It does not perform any datapath optimization or useful skew.

Parameters

`-help`	Outputs a brief description about the `clock_design` command.

Related Information

- `create_clock_tree_spec`
- `opt_design`
- The following topics in the *Innovus Stylus Common UI User Guide*
  - Flow and Quick Start for CTS
  - CTS Configuration and Method

clock_opt_design

```
clock_opt_design
[-help]
[-check_cts_config]
[-cts]
[-enable_pre_cts_opt]
[-expanded_views]
[-num_paths number_of_paths]
[-report_dir dirname]
[-report_prefix file_name_prefix]
[-timing_debug_report]
```

The `clock_opt_design` command is used in place of `ccopt_design` when the input DB is place_opt_design V2 (PODV2). It performs clock concurrent optimization (CCOpt) on the current loaded design in Innovus. CCOpt optimizes both the clock tree and the datapath to meet global timing constraints. The only difference between this flow and the `ccopt_design` flow is that `clock_opt_design` has legalization at the beginning to remove overlapping caused by PODV2 optimization.

In this flow, the commands, `place_opt_design` and `clock_opt_design` are used in combination. This means that the `clock_opt_design` command can only be used with the `place_opt_design V2`, which is the `place_opt_design` command that is run after enabling the PODV2 flow.

This flow is enabled by setting the `opt_enable_podv2_clock_opt_flow` attribute to `true`.

```
set_db opt_enable_podv2_clock_opt_flow true

clock_opt_design
```

If you set the above attribute but the DB is not PODV2, the software gives the following message:

```
Cannot run clock_opt_design because current DB is not PODV2 DB
```

By default, this attribute is set to `false`.

The effort level for the PODV2 flow is set using the following `opt` category attribute:

```
set_db opt_podv2_flow_effort {auto | standard | extreme}
```

The following settings are available:

- `auto`: The software follows the `design_flow_effort` attribute setting to perform optimization.
- `standard`: The software performs a fast prects optimization and runtime is less. This option is recommended in the early design stage or in simple designs for PPA estimation.
- `extreme`: The software performs a deep optimization to chase the best PPA. Runtime is high.

By default, this attribute is set to `auto`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `clock_opt_design` parameter. For a detailed description of the command and all of its parameters, use the man command: `man clock_opt_design`.
`-check_cts_config`	Checks that all the prerequisites for running clock tree synthesis are fulfilled without actually doing CTS. For example, it checks that the design is loaded, and the options set by that the user are correct. There are no changes made to the design. *Data_type*: bool, optional
`-cts`	Turns off clock concurrent optimization, and performs only clock tree synthesis (CTS) using the CCOpt engine. It does not perform any datapath optimization or useful skew. *Data_type*: bool, optional
`-enable_pre_cts_opt`	Enables pre-CTS optimization in the extreme flow. *Data_type*: bool, optional
`-expanded_views`	This parameter is not interpreted in CCOpt but passed directly to `optDesign`. The parameter is same as `opt_design -expanded_views` parameter, which is specified to generate detailed view-specific timing reports at the end of the `optDesign` command run. *Data_type*: bool, optional
`-num_paths` *number_of_paths*	Specifies the number of paths generated in the timing reports. By default, all timing paths are reported. *Data_type*: string, optional
`-report_dir` *dirname*	This parameter specifies the directory where the software writes timing reports that are generated after timing optimization. The default directory is `./timingReports` *Data_type*: string, optional
`-report_prefix` *file_name_prefix*	Specifies a prefix for `optDesign` report file names. *Default*: `DesignName_DesignStage` , where `DesignStage` is pre-CTS, post-CTS, or post-Route *Data_type*: string, optional
`-timing_debug_report`	When specified, generates a machine-readable timing debug report after completing CTS. This report is used for debugging timing results using the timing debug feature in Innovus. The number of paths to be reported can be specified using the `-num_paths` parameter. *Data_type*: bool, optional

Examples

- The following command runs a complete CCOpt optimization for the podV2 flow:
  `clock_opt_design`

Related Information

- `create_clock_tree_spec`
- `ccopt_design`
- `opt_design`
- `place_opt_design`
- The following topic in the *Innovus Stylus Common UI User Guide.*
  - Flow and Quick Start for CTS

clock_post_route_repair

```
clock_post_route_repair
[-help]
[-enable_average_id_reduction {true | false}]
[-enable_downsizing_pass {true | false}]
[-enable_drv_repair {true | false}]
[-enable_drv_repair_by_buffering {true | false}]
[-enable_refine_place {true | false}]
[-enable_routing_eco {true | false}]
[-enable_skew_repair {true | false}]
[-enable_skew_repair_by_buffering {true | false}]
```

Repairs clock tree design rule violations (DRVs) and skews that have occurred in the clock tree across a routing step. DRVs and skews can be fixed either by sizing existing clock instances or by adding buffers. Use this command to enable or disable average insertion delay reduction, global cell downsizing pass, refine placement of design, ECO routing, legalizer sharing, and the timing update step.

This command can be run at the following stages:

- After `ccopt_design` – when only the clock is routed
- After `route_design` , but before `opt_design -post_route` – when both clock and datapath are routed.

By default a post `ccopt_design` call to this command will fix DRVs and skew violations by resizing instances. It will also fix persistent DRVs by adding buffers. However, when called post `route_design`, this command is less disruptive by default and will only

perform resizing to fix DRVs. The `clock_post_route_repair` log will report a list of "active optimizations" for clarification of what steps will be executed.

By default, the command will modify the clock to reduce violations and then call `place_detail` and `route_eco` to patch up the modified routes.
Both `place_detail` and `route_eco` parts may be disabled to reduce runtime for user experimentation. But they will need to be called eventually, either with a final call to `clock_post_route_repair` or manually. Without them, timing measurements will be inaccurate.

Note:

- This command is integrated within the `ccopt_design` command and is run after clock routing. It can be identified in the `ccopt_design` log with a search for "PostConditioning....".
- This command is integrated within the `opt_design -post_route` command. It can be identified in the `opt_design` log with a search for "PRO...".
- If this command is called after running `ccopt_design` (when only the clock is routed), it will also call `route_early_global` on the datapath nets.
- The `clock_post_route_repair` command and the clock DRV fixing performed by running `opt_design -post_route` do not work when signoff effort-level for extraction is specified using `extract_rc_effort_level signoff` attribute. The signoff effort-level for extraction should be used only for ECO flows, after post_route optimization.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `clock_post_route_repair` parameter. For a detailed description of the command and all of its parameters, use the man command: `man clock_post_route_repair`.
`-enable_average_id_reduction{true | false}`	Enables or disables average insertion delay reduction. *Data_type*: enum, optional
`-enable_downsizing_pass {true | false}`	Enables or disables a global cell downsizing pass. *Data_type*: enum, optional
`-enable_drv_repair {true | false}`	Enables or disables DRV fixing. *Data_type*: enum, optional
`-enable_drv_repair_by_buffering {true | false}`	Enables or disables DRV fixing by adding buffers. *Data_type*: enum, optional
`-enable_refine_place {true | false}`	Enables or disables refine placement of design. Disabling this may result in instance overlaps. *Data_type*: enum, optional
`-enable_routing_eco {true | false}`	Enables or disables the ECO routing step, which corrects routing for new instance locations. Disabling this will leave inaccurate routing in place and lead to timing inaccuracy. *Data_type*: enum, optional
`-enable_skew_repair {true | false}`	Enables or disables fixing of clock tree skew. **Note the following**: • When `-enable_skew_repair` is set to `false` then whether the `-enable_skew_repair_by_buffering` parameter is specified as `true` or `false`, there is no skew fixing during `clock_post_route_repair`. • When `-enable_skew_repair` is set to `true`, while `-enable_skew_repair_by_buffering` parameter is set to `false`, the software resizes cells to fix skew. • When `-enable_skew_repair` is set to `true`, while `-enable_skew_repair_by_buffering` parameter is set to `true`, the software not only resizes cells but also does buffering to fix skew. *Data_type*: enum, optional
`-enable_skew_repair_by_buffering {true | false}`	Enables or disables fixing of clock tree skew by adding buffers. This will only help with lengthening short paths. *Data_type*: enum, optional

commit_clock_tree_route_attributes

```
commit_clock_tree_route_attributes
[-help]
[-verbose]
```

The command traces the clock tree as defined by the CTS spec and sets net attributes to allow early-global-route to more predictably model clock nets. It sets isClock and isCTSClock on clock tree nets in the database. It applies routing preferences such as: `top_preferred_layer`, `bottom_preferred_layer`, `non_default_rule`, and `shield_net` based on the “route_type” CTS properties.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `commit_clock_tree_route_attributes` parameter. For a detailed description of the command and all of its parameters, use the man command: `man commit_clock_tree_route_attributes`.
`-verbose`	Prints the layer constraint summary for CCOpt nets after attribute application. *Data_type*: bool, optional

Related Commands

- `create_clock_tree_spec`
- `create_clock_tree`

connect_clock_tree_mesh_drivers

```
connect_clock_tree_mesh_drivers
[-help]
[-pin pin_names]
[-source_group source_group_name]
```

Uses the specified set of drivers and merges the nets at their outputs to form a single multi-driven net. To run this command successfully, one of the two options, `-pin` or `-source_group` must be specified.

It is possible that some or all of the driver pin nets are already multi-drive. You might be repeating the same command, or you could be merging additional drivers into an already multi-drive net. Running the command twice does nothing the second time. If the net of any driver pin is *already* multi-drive, the pin list will be interpreted to include all drivers of that net.

The command returns the resulting merged net through a Tcl return value.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `connect_clock_tree_mesh_drivers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man connect_clock_tree_mesh_drivers`.
`-pin pin_names`	Specifies a list of driver output pins whose nets will be merged to form a multi-drive mesh net. *Data_type*: (pin)+, optional
`-source_group source_group_name`	Specifies the source group for the list of driver output pins. Only the root pins of the specified source group will be included in the list of driver output pins. *Data_type*: string, optional

Related Command

- `add_clock_tree_source_group_roots`

convert_lib_clock_tree_latencies

```
convert_lib_clock_tree_latencies
[-help]
[-latency_file_prefix prefix_name]
[-pins pin_list]
[-views view_list]
[-override_existing_latencies | -sum_existing_latencies]
[-sum_existing_latencies | -override_existing_latencies_pins pin_list]
[-override_existing_latencies | -sum_existing_latencies_pins pin_list]
[-sum_existing_latencies | -sum_existing_latencies_pins pin_list]
[-override_existing_latencies | -override_existing_latencies_pins pin_list]
```

Converts the Liberty `max_clock_tree_path` and `min_clock_tree_path` (MCTP) data to per-pin clock latency adjustments.

Note:

- Run the command before running the `create_clock_tree_spec` command so that the the output of `convert_lib_clock_tree_latencies` command impacts the clock tree specification that is created.
- Before running this command, ensure that the analysis type is set as `on-chip variation` (OCV) in the following manner:

  ```
  set_db timing_analysis_type ocv
  ```

By default, the conversion will consider all instance pins with MCTP data in all analysis views. Pins which have any existing network latency, differing from the corresponding clock network latency will be skipped completely for all clocks and for all views – this avoids the conversion process from interfering with any SDC-specified pin latencies. Alternatively, existing latency offsets can be summed or overridden for all or names pins using the appropriately named override and sum option. Additionally, the `-pins` option can be used to consider only a specified list of pins instead of all pins with MCTP data.

By default, the conversion will internally apply the resulting `set_clock_latency` commands to the in memory timing constraints. Alternatively the `-latency_file_prefix` parameter can be specified to have one file per analysis view written containing the `set_clock_latency` commands.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `convert_lib_clock_tree_latencies` parameter. For a detailed description of the command and all of its parameters, use the man command: `man convert_lib_clock_tree_latencies`.
`-latency_file_prefix` *`prefix_name`*	
	When specified, the software, instead of applying changes, writes the commands to one latency file per analysis view. Any pre-existing files are overwritten. For example, `<`*`prefix`*`><`*`analysis_view_name`*`>.sdc` **Note**: The prefix may contain directory name components. New directories should be created, as required. *Data_type*: string, optional
`-override_existing_latencies`	
	When specified, includes all pins with existing latency offsets and overwrites the existing latency offsets. **Note**: • The `-override_existing_latencies` and `-sum_existing_latencies` parameters are mutually exclusive. • The `-override_existing_latencies` and `-sum_existing_latencies_pins` parameters are mutually exclusive. • The `-override_existing_latencies` and `-override_existing_latencies_pins` parameters are mutually exclusive. *Data_type*: bool, optional
`-override_existing_latencies_pins` *`pin_list`*	

	Includes only the specified list of pins with existing latency offsets and overwrites the existing latency offsets. **Note**: • The `-override_existing_latencies_pins` and `-override_existing_latencies` parameters are mutually exclusive. • The `-override_existing_latencies_pins` and `-sum_existing_latencies` parameters are mutually exclusive. • The software issues an error if a pin is specified in both `-override_existing_latencies_pins` and `-sum_existing_latencies_pins` parameters. *Data_type*: (pin)+, optional
`-pins` *`pin_list`*	
	Specifies the clock endpoint pins to consider. By default, the software considers all clock endpoints with the library `max/min_clock_tree_path` attributes. **Note**: The software issues an error if a pin is specified in either the `-sum_existing_latencies_pins` or the `-override_existing_latencies_pins` list, but the pin is not included in the list of pins specified using the `-pins` parameter. *Data_type*: (pin)+, optional
`-sum_existing_latencies`	
	When specified, includes all pins with existing latency offsets and sums the existing latency offset with the library-specified offset. **Note**: • The `-sum_existing_latencies` and `-override_existing_latencies` parameters are mutually exclusive. • The `-sum_existing_latencies` and `-override_existing_latencies_pins` parameters are mutually exclusive. • The `-sum_existing_latencies` and `-sum_existing_latencies_pins` parameters are mutually exclusive. *Data_type*: bool, optional
`-sum_existing_latencies_pins` *`pin_list`*	
	Includes only the specified list of pins with existing latency offsets and sums the existing latency offset with the library-specified offset. **Note**: • The `-sum_existing_latencies_pins` and `-sum_existing_latencies` parameters are mutually exclusive. • The `-sum_existing_latencies_pins` and `-override_existing_latencies` parameters are mutually exclusive. • The software issues an error if a pin is specified to both `-sum_existing_latencies_pins` and `-override_existing_latencies_pins` parameters. *Data_type*: (pin)+, optional
`-views` *`view_list`*	
	Specifies the analysis views to operate on. By default the software operates on all active analysis views. *Data_type*: string, optional

Examples:

Example 1 – Two clocks, existing clock network latency, no pre-existing latency override

```
Circuit

ck1 ---> +------+

         | mux | -----> icg --+--> flop1/CK   (regular flop pin without MCTP data)

ck2 ---> +------+              +--> macro1/CK  (pin with MCTP data, of 0.222R/0.232F at 0.125 transition time)

                              +--> macro2/CK  (pin with MCTP data, of 0.333R/0.343F at 0.125 transition time)

SDC

  create_clock -period 1.0 [get_ports ck1]
```

```

create_clock_tree

```
create_clock_tree
[-help]
[-name clockname]
[-no_skew_group]
-source pin
[-stop_at_sdc_clock_roots]
```

Defines a new clock tree within the design. You can define more than one clock tree and ordering of clock tree definitions is important. CCOpt can only optimize defined clock trees. When you run this command, CCOpt runs an algorithm known as clock tree extraction. Clock tree extraction examines the design starting at the root of a clock tree and decides which pins in the circuit are clock sinks for that tree and its clock gating and logical structure.

The `create_clock_tree` command tells CCOpt that a part of the circuit is a clock tree. CCOpt then synthesizes the clock tree when you run the `ccopt_design` command. CCOpt treats clock trees and datapaths differently for power analysis purposes.

By default, defining a clock tree also creates associated skew groups.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_clock_tree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_clock_tree`.
`-name clockname`	
	Specifies the user-defined identifier for the clock tree. This name should be unique. If this parameter is not specified, the software uses the name of the source pin by default. *Data_type*: string, optional
`-no_skew_group`	
	Specifies that no default skew group will be defined for the sinks in the clock tree. If any skew groups are required, they will need to be defined manually using the `create_skew_group` command. *Data_type*: bool, optional
`-source pin`	
	Specifies the name of the source pin of the clock tree in the design. *Data_type*: (pin|port), required
`-stop_at_sdc_clock_roots`	
	Specifies that clock tree definition should stop searching for parts of the clock tree through the root of SDC clocks. *Data_type*: bool, optional

Example

The following command creates a clock tree named "ck1" by tracking the clock path from the pin "clk":

```
create_clock_tree -name ck1 -source clk
```

create_clock_tree_source_group

```
create_clock_tree_source_group
[-help]
-clock_trees clock_tree_list
-name clock_tree_source_group_name
```

Creates a clock tree source group. These source groups are used when a clock tree has multiple equivalent roots, and you want CTS to automatically swap sinks between roots to reduce insertion delay. It is required for flows where we are connecting one logical clock tree to multiple tap-off points from a top level H-tree or a mesh.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_clock_tree_source_group` parameter. For a detailed description of the command and all of its parameters, use the man command: man `create_clock_tree_source_group`.
`-clock_trees` *clock_tree_list*	Specifies a Tcl list of clock tree names that should be grouped together. CTS will attempt to swap sinks between these clock trees in order to balance the insertion delay under each clock tree's root and may clone clock logic to help this. This parameter is required. **Note:** This Tcl list is the same as that defined previously using the `create_clock_tree` command. *Data_type*: string, required
`-name` *clock_tree_source_group_name*	
	Specifies the user-defined name for the new clock tree source group. The name must be unique. This parameter is required. *Data_type*: string, required

Example

The following command creates a clock tree source group containing three clock trees: clk1, clk2 and clk3:

```
create_clock_tree_source_group -name clk_grp -clock_trees {clk1 clk2 clk3}
```

create_clock_tree_spec

```
create_clock_tree_spec
[-help]
[-keep_all_sdc_clocks]
[-out_file filename]
[-views view_list]
```

Creates a clock tree network with associated skew groups and other clock tree synthesis (CTS) configuration settings such as ignore pins, case analysis, maxTrans, and so on based on a multi-mode timing configuration in the common timing engine (CTE).

When you run this command, one skew group will be created for each SDC clock in each constraint mode. Each such skew group will be able to take a skew target from any delay corner, but will have this target set to “ignore” unless there is an active analysis view that links the constraint mode for the skew group to that delay corner. The output of this command is a sequence of Innovus Tcl commands that can be edited manually.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_clock_tree_spec` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_clock_tree_spec`.
`-keep_all_sdc_clocks`	
	Specifies that all clocks and clock trees should be kept in 1:1 ratio, wherever possible. This means that CCOpt will maintain generated clock names for clock trees, even where these are functionally redundant, for example, clocks defined on buffer outputs. By default, CCOpt will not define these redundant clock trees. *Data_type*: bool, optional
`-out_file filename`	

	Writes this clock tree specification script file in Stylus Common UI format. This is an optional parameter. Providing the filename writes out the specified file. The file is not executed. To execute the file, run the following:
	`create_clock_tree_spec -out_file spec.tcl`
	`source spec.tcl`
	Note: You can execute the file only once. If you run the above again, the software gives an error message:
	`source spec.tcl`
	`Cannot run clock tree spec: clock trees are already defined.`
	The already loaded specification file can be removed by using either of the following commands:
	• `delete_clock_tree_spec`
	• `reset_cts_config`
	Note: If this parameter is not specified, the clock trees are defined by directly running clock tree extraction without the creation of a clock tree extraction script.
	Data_type: string, optional

`-views view_list`	
	Specifies the Tcl list of analysis view names. By default, the software considers all active analysis views. *Data_type*: (analysis_view)+, optional

Example

- The following example shows how running `create_clock_tree_spec` defines clock trees by directly running clock tree extraction instead of creating a clock tree extraction script:

```
get_db clock_trees
create_clock_tree_spec
get_db clock_trees
m_clk m_digit_clk m_dsram_clk m_ram_clk m_rcc_clk m_spi_clk refclk<1> refclk
```

create_flexible_htree

```
create_flexible_htree
[-help]
[-adjust_sink_grid_for_aspect_ratio {true | false}]
-final_cell base_cell
[-image_directory dir_name]
[-hv_balance {true | false}]
[-inverting]
[-layer_density value]
[-max_driver_distance value]
[-max_root_distance value]
[-mode {drv | distance}]
-name flexibleHtreeName
[-omit_symmetry string]
[-partition_boundary_polarity {non_inverting | inverting | ignore}]
[-partition_groups {{partition ...} [max_boundary_net_length] [inverting | non_inverting] [subtree] ...}]
[-power_weight value]
[-sink_grid {columns rows}]
[-sink_grid_box {xmin ymin xmax ymax}]
[-sink_grid_exclusion_regions {{xmin ymin xmax ymax} ...}]
[-sink_instance_prefix prefixName]
[-sink_grid_sink_area {width height}]
[-sink_pins {{pin_name | {xmin ymin xmax ymax}} ...}]
-source  pin | port
[-stop_at_sdc_clock_roots]
-trunk_cell base_cell
```

Creates a design object for a flexible H-tree, under the specified pin. The H-tree is adjusted to consider placement and routing blockages, and any power routing.

You can specify this command in a sequence to create multiple flexible H-trees.

Note: This command does not synthesize flexible H-trees. After creating or defining flexible H-trees using this command, use the `synthesize_flexible_htrees` command to synthesize all the flexible H-trees created using this command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_flexible_htree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_flexible_htree`.
`-adjust_sink_grid_for_aspect_ratio {true | false}`	
	When set to true, adjusts the sink grid for aspect ratio. *Default*: `true` *Data_type*: string, optional
`-final_cell base_cell`	
	Specifies the library cell to use for the H-tree sinks. It must be a buffer or an inverter. *Data_type*: (base_cell), optional
`-image_directory dir_name`	

	Specifies the name of the directory to which the images generated by the H-tree synthesis algorithm are written. The images are PNG files. Color coding of images is provided below: White: Unobstructed edges of the synthesis grid Red: Grid points that are blocked for trunk cell placement in all modules Orange: Grid points that are blocked for final cell placement in all modules Red orange: Grid points that are blocked for trunk and final cell placement in all modules Yellow circle: The grid point of the source Yellow points: Candidate grid points of H-tree sinks Yellow rectangle: The sink area containing target grid point candidates of H-sinks, adjusted to the synthesis grid Brown: If specified, the sink grid box snapped to the synthesis grid Green/blue: The edges of the synthesized H-tree Purple: H-tree repeaters Cyan: Partition boundaries in hierarchical designs *Data_type*: string, optional
`-hv_balance {true | false}`	
	When set to `true`, specifies that the horizontal and vertical metal wires can only be balanced against other wires of the same orientation. When set to `false`, specifies that any wire can be balanced against any other wire. Default: `true` *Data_type*: string, optional
`-inverting`	Specifies whether the tree will invert its input or not. By default, this parameter is not enabled. *Data_type*: bool, optional
`-layer_density` *value*	
	Specifies the layer density used to compute the parasitics for timing estimates of H-tree nets. *Data_type*: float, optional, min=0, max=1
`-max_driver_distance` *value*	
	When specified, the software ignores DRVs and uses the given value as the maximum length of the nets connecting the H-tree drivers. *Data_type*: float, optional
`-max_root_distance` *value*	
	When specified, the software ignores DRVs and uses the given value as the maximum length of the net connecting the root and the first driver of the H-tree. This value can only be specified if the `-max_driver_distance` parameter is also specified. *Data_type*: float, optional
`-mode {drv | distance}`	
	Specifies the driver insertion mode. When set to `drv`, drivers are inserted to avoid DRVs. When set to `distance`, the parameters, `-max_driver_distance` and `-max_root_distance` determine the maximum net lengths allowed. Transitions and delays are not computed in this case. *Default*: `drv` **Note**: When this parameter is set to `distance`, the `-max_driver_distance` and `-max_root_distance` parameters must be specified. *Data_type*: string, optional
`-name` *flexibleHtreeName*	

	Specifies the name of the flexible H-tree to be created. This parameter is required. *Data_type*: string, optional
`-omit_symmetry` *string*	
	Specifies that no symmetry drivers and/or branches should be added to balance the pin load of nets in the flexible H-tree. Symmetry drivers are drivers that are added to balance pin capacitances at branch points. For example, if buffer pairs are inserted at branch points, one of these buffers may not drive any fanout and is inserted to match other buffer pairs at the same level of the flexible H-tree. Omitting symmetry drivers can reduce the power of the H-tree but increase its skew. Drivers that are added to terminate symmetry branches do not count as symmetry drivers and are never omitted. Similarly, symmetry branches are branches that are needed to balance the wire load at branch points. They are added to match other branchpoints at the same level of the flexible H-tree. Symmetry branches are always terminated with drivers, which are not counted as symmetry drivers. Possible values for this parameter are: `false`: Add symmetry branches and drivers `true`: Omit both symmetry drivers and branches `drivers`: Omit symmetry drivers `branches`: Omit symmetry branches `{drivers branches}`: Omit both symmetry drivers and branches `{}`: Add symmetry branches and drivers By default, symmetry branches and buffers are added. *Data_type*: string, optional
`-partition_boundary_polarity {non_inverting | inverting | ignore}`	
	Specifies the polarity of the clock signal with regard to the source of the flexible H-tree when entering partitions. The following values are allowed: • `non_inverting`: When specified, allows only non-inverting polarity at partition entry points. • `inverting`: When specified, allows only inverting polarity at partition entry points. • `ignore`: When specified, allows inverting and non-inverting polarity at partition entry points. *Default*: `non_inverting`
`-partition_groups {{`*partition* `...} [max_boundary_net_length] [inverting | non_inverting] [`*subtree*`] ...}`	

	Specifies the groups in which partitions are clustered in channelless designs. Nested lists imply allowed crossings between groups. Each group has zero or one input port and each partition must only be specified once. Optionally, a maximum pre-route net length from the boundary of a partition group can be specified. The maximum pre-route net length must be specified as the second parameter of a nested partition group. Optionally, the next argument specifies the clock phase when entering the partition group in relation to the root pin of the H-tree. Allowed values are 'inverting' and 'non_inverting'. If no value is specified, the clock phase is unconstrained. The clock phase is unconstrained when crossing the boundaries of partitions within the same group. All specified clock phases must be either inverting or non_inverting. For example, if the following partitions are specified: `{{A} {{C D} 50 non_inverting {{E F}} {{G}}}}` It means the following: • The H-tree starts in partition A and descends into group C/D. • From partition group C/D, the tree descends into groups E/F and G. • Any clustering of sinks inside the C/D and E/F groups is allowed, potentially crossing internal partition boundaries several times. • Partition A has no clock input port and one clock output port • Partition group C/D has one clock input port and two clock output ports • Partition group E/F and G have one clock input port and no clock output port • The maximum net length from the entry point into partition group C/D is 50um (pre-route) • The clock phase is non_inverting when entering parition group C/D. The clock phase is unconstrained when entering other partition groups. Default: `{}` *Data_type*: string, optional
`-power_weight` *value*	
	Specifies the power versus insertion delay trade-off. Valid values are between 0 and 1, specifying the weight that is put on power optimization during the synthesis of flexible H-trees. *Default*: `1` *Data_type*: float, optional, min=0, max=1
`-sink_grid {columns rows}`	
	Specifies the columns and rows of a grid of H-tree sinks. **Note**: This parameter is not supported in master/clone designs. *Data_type*: string, optional
`-sink_grid_box {xmin ymin xmax ymax}`	
	Specifies the area of the box that the grid of H-trees should cover. *Data_type*: string, optional
`-sink_grid_exclusion_regions {{`*xmin ymin xmax ymax*`} ...}`	
	Specifies regions from which sinks of the sink grid are excluded if the regions completely cover the respective sink area. *Data_type*: list, optional
`-sink_grid_sink_area {width height}`	
	Specifies the approximate size of the rectangle describing valid locations for final cells, specified using the `-final_cell` parameter, per H-tree sink in the grid. *Data_type*: string, optional
`-sink_instance_prefix` *prefixName*	
	Specifies the prefix used for instance names of final cells, specified using the `-final_cell` parameter and the sinks specified using the `-sinks` parameter. *Data_type*: string, optional
`-sink_pins {`*pin_name* `|` `{` *xmin ymin xmax ymax* `}}`	

	Specifies approximate rectangular sink regions for the buffer locations at the end of the tree, which are specified using the `-final_cell` parameter or pins. The specified pins must be in the clock tree. Nested lists imply clustering relationships. *Data_type*: list, optional
`-source pin | port`	
	Specifies the pin under which to create the flexible H-tree. This parameter is required. *Data_type*: (pin|port|hpin)+, required
`-stop_at_sdc_clock_roots`	
	Specifies that the clock tree definition should stop searching for parts of the clock tree at the root of SDC clocks.
`-trunk_cell` *base_cell*	Specifies the library cell to use inside the flexible H-tree. It must be either a buffer or an inverter. This parameter is required. *Data_type*: (base_cell), required

Examples

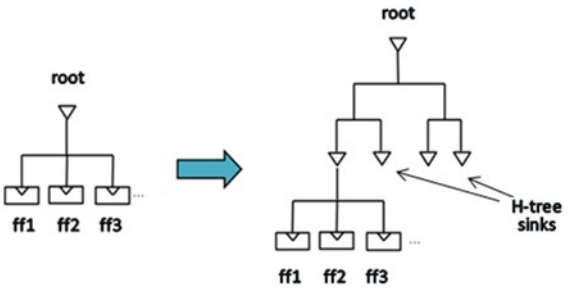
- The following command creates a flexible H-tree for four sinks under the the pin "`root/Y`". The sinks of the H-tree will be of type `BUFX16` and placed approximately inside the specified sink rectangles. Other buffers added to the H-tree will be of type `BUFX8`. No symmetry buffers are added to balance the pin load of nets. The flexible H-tree is then synthesized using the `synthesize_flexible_htrees` command.

```
create_flexible_htree -name tree0 -source root/Y -sink_pins { {200 200 300 300} {200 700 300 800} {700 200 800 300} {700 700 800 800}
} -final_cell BUFX16 -trunk_cell BUFX8 -omit_symmetry drivers
synthesize_flexible_htrees
```

- The following commands create two flexible H-trees under the pins "`rootA/Y`" and "`rootB/Y`". The sinks will be of the type `INVX8` and will be placed in the specified sink grids. Other buffers added to the H-trees will be of type `INVX12`. No symmetry buffers are added to balance the pin load of nets. The flexible H-trees are then synthesized using the `synthesize_flexible_htrees` command.

```
create_flexible_htree -name htreeA -source rootA/Y -sink_grid {2 2} -final_cell INVX8 -trunk_cell INVX12 -omit_symmetry drivers
create_flexible_htree -name htreeB -source rootB/Y -sink_grid {4 4} -final_cell INVX8 -trunk_cell INVX12 -omit_symmetry drivers
synthesize_flexible_htrees
```

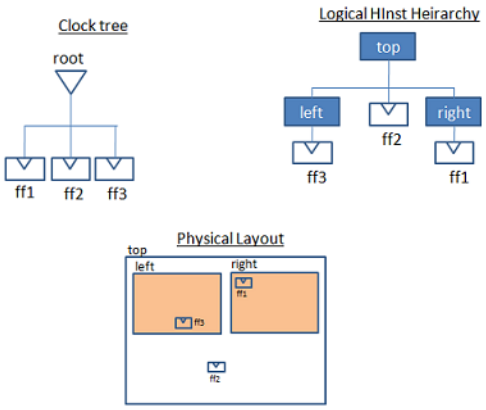
Note: During flexible H-tree synthesis a number of buffers (or inverters) are created. In designs with no fence regions, every instance in the flexible H-tree, including all H-tree sinks, are assigned to the top-level hInst. In this case, the `create_flexible_htree` command moves the original fanout of the root pin of the flexible H-tree to a single H-tree sink as shown in the image below.



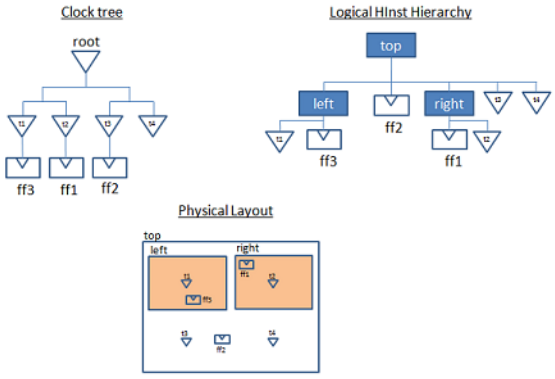
In designs where there are fence regions, the command chooses hInsts for instances in the flexible H-tree considering fence region constraints. The fanout of the root pin of the flexible H-tree is connected to H-tree sinks that best match the hInst to which a fanout instance belongs.

The images below illustrate a clock tree with three clock tree sinks, ff1, ff2, and ff3 and three hInsts, "top", "left", and "right". The hInsts "left" and "right" are fenced. Fenced regions are shown in pale orange. Sink ff1 is in hInst "right", ff2 is in the top-level hInst, and ff3 is in hInst "left". The hInsts "left" and "right" are children of the top-level hInst. After flexible H-tree synthesis there are four H-tree sink instances, t1, t2, t3, and t4 laid out in a square such that t1 is in the fence region for the hInst "left", t2 is in the fence region for the hInst "right", and the other two are in hInst "top". The flops have been connected to H-tree sinks that match their fence constraints. Note that when running `ccopt_design` after creating the flexible H-tree, multi-tap CTS may reconnect ff2 to t4 rather than t3.

Before H-tree Synthesis



After H-tree Synthesis



Using the Sink Grid Parameters

The diagram below illustrates the usage of the sink grid parameters of this command. Note the following:

- The sink grid is specified as {4 4}, which means it will have four columns and four rows
- No H-tree sinks are created for sink areas that are completely covered by placement blockages or exclusions zones
- H-tree sink instances with the name specified in the diagram will be placed inside the unblocked parts of the sink areas
- The sink grid is adjusted by snapping it to the synthesis grid, which means that the specified sink areas are treated only as a guide

create_generated_clock_tree

```
create_generated_clock_tree
[-help]
[-generated_by pins]
[-name clockname]
[-parents parents]
[-search_method method]
-source pin
[-stop_at_sdc_clock_roots]
```

Defines a generated clock tree within the design. Use this command if you want to balance the sinks in the generated tree against those in the parent trees. CCOpt accomplishes this action by pulling up any sinks in the parent trees that contribute directly to the generated clock tree. The insertion delay under such sinks in the parent trees will be set to the insertion delay of the generated clock tree plus the delay between the sink pin and the source of the generated clock tree.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_generated_clock_tree` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_generated_clock_tree`.
`-generated_by pins`	Specifies the sink pins in the parent clock trees for which the delay between the parent and generated clock trees should be considered. If this parameter is not specified, all possible timing paths between sinks in the parent tree and the source of the generated clock tree will be considered. This parameter is mutually exclusive with the `-search_method` parameter. *Data_type*: (pin|port)+, optional
`-name clockname`	Specifies the user-defined identifier for the generated clock tree. This name should be unique. If this parameter is not specified, the software uses the name of the source pin by default. *Data_type*: string, optional
`-parents parents`	Specifies the parent clock trees for the generated clock trees. This parameter should be specified if the parents are ambiguous. *Data_type*: string, optional

`-search_method {same_instance multi_stage}`	Specifies the search methdology to be used when tracing the path to the generator inputs.
	`multi_stage`
	This is the default method, and will select the current behavior of the software. When this method is specified, the software searches backwards through all the delay paths leading into the clock root pin, looking for pre-existing clock sinks. Every such clock sink found is a candidate generator input for the generated clock tree. This includes clock sinks that lie on different instances to the root pin - where multiple stages lie between the clock sink and the root pin. Additional filtering on the candidate generator inputs is applied by the `-parents` parameter to avoid producing cycles in the clock tree structure. Once the set of generator inputs is finalized, the delay path between each finalized generator input and the clock root pin is imported into the CTS clock tree data stuctures. If the generator input lies on a different instance of the clock root pin, ClockGeneratorPathNode objects are created.
	`same_instance`
	This method is similar to the `multi_stage` method, except that the software restricts its search to consider only clock sinks that lie on the same instance as the generated clock tree's root pin. This means that the software does not traverse net arcs looking for generator input clock sinks. Consequently, ClockGeneratorPathNode objects will not be needed to model any generator path.
	Note:
	• This functionally is identical to specifying the `-generated_by` parameter that lists all the clock sinks on the same instance as the clock root pin. However, it avoids the need to explicitly identify those clock sinks.
	• Irrespective of the search method, if no candidate generator clock sink is found, or if there are no valid generator inputs discovered in the set of clock sinks, creation of the generated clock tree fails with an error.
	The software uses `multi_stage` method by default.
	This parameter is mutually exclusive with the `-generated_by` parameter.
	Data_type: enum, optional

`-source pin`	Specifies the name of the source pin of the generated clock tree. This is a required parameter. *Data_type*: (pin|port), required
`-stop_at_sdc_clock_roots`	Specifies that clock tree definition should stop searching for parts of the clock tree through the root of the SDC clocks. *Data_type*: bool, optional

Example

- The following command defines a generated clock tree `clk_div_2`, which is generated from the `gen_clk/CK` clock pin, using the `gen_clk.QN` pin as the source pin:
```
create_generated_clock_tree -name clk_div_2 -source gen_clk/QN -generated_by gen_clk/CK
```

create_route_type

```
create_route_type
[-help]
[-em_route_rule rule_name]
[-em_route_rule_distance float]
[-min_stack_layer layer]
-name string
[-one_side_spacing_range bottomLayerNum:topLayerNum]
[-prefer_multi_cut_via]
[-shield_side one_side | both_side]
[-shield_tap_instance_insertion_effort {none | standard | high}]
[-stack_distance float]
[[-route_rule ndr_name] [-shield_net net_name] [-top_preferred_layer layer] [-bottom_preferred_layer layer] [-preferred_routing_layer_effort
{low | medium | high}]
[-mask mask_number [-layer_mask_range bottomLayerNum:topLayerNum]]
```

Creates a new route type and sets the routing properties for the nets. This command lets you create the **standard route_type** that defines a collection of routing attributes such as non-default rule (NDR), shield net, preferred layers and so on that can then be applied to either all leaf or all trunk nets for a particular clock tree. The type of route_type object created depends on the parameters you specify with this command. A standard route_type object is created if you specify the `-route_rule, -shield_net, top_preferred_layer` or `-preferred_routing_layer` parameters.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_route_type` parameter. For a detailed description of the command and all of its parameters, use the man command: man `create_route_type`.
`-bottom_preferred_layer layer`	Specifies the preferred lowest routing layer. This attribute is a soft limit, which means, NanoRoute might use a layer below the specified layer if necessary to complete routing. A layer name can be any real layer name, for example, from LEF or OpenAccess. Routing layer names can also be abbreviated as 1 for the first routing layer, 2 for the second routing layer and so on. Note, the software will check for real layer names first. So, if 1 matches a real layer name it might not be the first routing layer. If not specified, the router will freely route the net starting on the first routing layer, with no preference for higher layers. *Data_type*: (layer), optional
`-em_route_rule rule_name`	Specifies the EM non-default rule name. *Data_type*: string, optional
`-em_route_rule_distance float`	Specifies the distance from EM NDR rule source to sink. *Data_type*: float, optional
`-layer_mask_range bottomLayerNum:topLayerNum`	Specifies the layer range that the mask constrain should be applied on. For example, 3:4 means that the constrain should be applied on metal3 and metal4. *Data_type*: string, optional
`-mask mask_number`	Specifies the mask constraint number in allowed range (min=0, max=3). *Data_type*: int, optional
`-min_stack_layer layer`	Specifies that the output pins of the net use stacked vias from the pin to the given `layer` and the rest of the connections start from the mentioned `layer`. *Data_type*: (layer), optional
`-name string`	Specifies the name of the route type object. *Data_type*: string, required
`-one_side_spacing_range bottomLayerNum:topLayerNum`	Specifies the layer range that one side spacing constrain should be applied on. By default, NDR spacing is applied to both sides of an NDR net or wire. Use this option to specify the layer range for wires that have only one neighboring wire with minimum spacing, which means only one side needs to follow larger NDR spacing. *Data_type*: string, optional

`-prefer_multi_cut_via`	Specifies whether or not to use the multi-cut vias for connections at the net driver pins. *Data_type*: bool, optional
`-preferred_routing_layer_effort {low | medium | high}`	Specifies whether the preferred routing layer effort will be low, medium, or high. This parameter determines how flexible the NanoRoute router is when setting layer limits for routing specified nets. Use this parameter with the `-top_preferred_routing_layer` and the `-bottom_preferred_routing_layer` parameters. Specify `medium` or `high` routing layer effort level to make NanoRoute less flexible in setting layer limits for routing specified nets. NanoRoute will obey the preferred routing layer range more strictly. Specify `low` to make NanoRoute more flexible in setting layer limits for routing specified nets. *Default*: `high` *Data_type*: enum, optional
`-route_rule` *ndr_name*	Specifies the non-default routing (NDR) rule to associate with this route_type. *Default*: no NDR rule *Data_type*: string, optional
`-shield_net` *net_name*	Specifies a special net to use as a shield for a critical or high-speed net. Typically, shielded nets are routed before routing other nets. You can specify one or two shield nets, however, you cannot control which side is used by the special net that is routed on the same layer as the signal routing. The shield terminates near the pin. If not specified, the net is not shielded. *Data_type*: string, optional
`-shield_side` *one_side* | *both_side*	Specifies whether one or both sides of the shield is used. *Data_type*: enum, optional
`-shield_tap_instance_insertion_effort {none | standard | high}`	Specifies the clock route type for clock shielding of the high and low frequencies through the `high` and `standard` values respectively. The main difference between these values is related to the ground that the tie cell instance/via uses to achieve shield segments of the electrical connection. *Data_type*: enum, optional
`-stack_distance` *float*	Specifies that the cut distance of cuts on adjacent layers in the stacked vias are defined in `-min_stack_layer`. *Data_type*: float, optional
`-top_preferred_layer` *layer*	Specifies the top-preferred layer for the route type. *Data_type*: (layer), optional

Examples

- For example, use the following commands to create the standard route_types that specify the routing attributes we want to assign to particular nets:
```
create_route_type -name RT1 -route_rule NDR1
create_route_type -name RT2 -route_rule NDR2
create_route_type -name RT3 -route_rule NDR3 -top_preferred_layer M4 -bottom_preferred_layer M3
create_route_type -name RT4 -route_rule NDR4 -preferred_routing_layer_effort high -top_preferred_layer M4 -bottom_preferred_layer M3
```
- Use the following command to create the advanced route_type that will map clock tree nets to route_types:
```
create_route_type -name advRT -table { {0 500} {0 10} {RT1 RT2 RT3 RT4} }
```

create_skew_group

```
create_skew_group
[-help]
[-constrains cts | ccopt_initial | ccopt]
[-from_clocks clock_names]
[-from_constraint_modes constraint_mode_names]
[-from_delay_corners delay_corner_names]
-name skew_group_name
[-rank rank]
[-sinks pins | -shared_sinks pins | -exclusive_sinks pins | -auto_sinks | -filtered_auto_sinks pins | -balance_skew_groups skew_groups]
[-sources pins | -balance_skew_groups skew_groups]
[-target_insertion_delay value]
[-target_skew value]
```

Creates a new skew group within the design. CCOpt balances clock trees according to skew group requirements. Balancing between multiple trees can be achieved using the `-sources` parameter. The sinks to be balanced can either be specified explicitly using the `-shared_sinks` or `-exclusive_sinks` parameters or can be automatically inferred by using the `-auto_sinks` parameter.

Every skew group is assigned a rank, accessible through the `cts_exclusive_sinks_rank` attribute:

- **Shared skew groups** always have a `cts_exclusive_sinks_rank` value of zero.
- **Exclusive skew groups** always have a `cts_exclusive_sinks_rank` value greater than zero. When an exclusive skew group is created, CCOpt assigns that exclusive skew group a rank one greater than the highest existing skew group.

For example, consider the following sequence of commands:

1. `create_skew_group -name SG1 -sources top -shared_sinks [get_ccopt_clock_tree_sinks */CK]`
2. `create_skew_group -name SG2 -sources top -exclusive_sinks [get_ccopt_clock_tree_sinks *XYZ*/CK]`
3. `create_skew_group -name SG3 -sources top -exclusive_sinks [get_ccopt_clock_tree_sinks *XYZ_01*/CK]`

After running the first command, a single skew group `SG1` is created. This is a shared skew group, so has an `exclusive_sinks_rank` value of zero. All the "`CK`" pins in the design are members of this skew group. In addition, all the "`CK`" pins are active sinks in skew group `SG1`. This is because `SG1` is the highest ranked skew group so far, even though it has a rank of zero.

The second command defines an exclusive skew group `SG2`. This is given an `exclusive_sinks_rank` value of 1, which is one higher than the current highest rank of 0. Sinks that match the pattern `*XYZ*/CK` are now members of both `SG1` and `SG2`. However, they are only active sinks in `SG2`, which is the highest ranked parent skew group till now. Sinks that don't match this pattern remain active pins in `SG1`.

The third command defines another exclusive skew group, `SG3`. This is given an `exclusive_sinks_rank` value of 2, which is one higher than the current highest rank of 1. Sinks that match the pattern `*XYZ_01*/CK` (which must also be members of `SG2`, since those sinks would also match the pattern `*XYZ*/CK`) are now members of skew groups `SG1`, `SG2`, and `SG3`. However, they are only active sinks in `SG3`, which is the highest ranked parent skew group. Sinks that matched the pattern `*XYZ*/CK` but not `*XYZ_01*/CK` are members of both `SG1` and `SG2` but only active sinks of `SG2`. Sinks that don't match the pattern `*XYZ*/CK` are members of `SG1` and active sinks in `SG1`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `create_skew_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_skew_group`.
`-auto_sinks`	When specified, determines the target sinks for the skew group based on the input pins reachable from the source. *Data_type*: bool, optional
`-balance_skew_groups skew_groups`	
	Specifies that the new skew groups should be created by merging the specified skew groups in order to balance them together as a single skew group. **Note**: The sources of skew groups are specified using the `-sources` parameter. However, if the `-sources` parameter is not specified and you are using the `-balance_skew_groups` parameter, then the sources are the sources of the skew groups that are specified using this parameter. *Data_type*: string, optional
`-constrains cts | ccopt_initial | ccopt`	

	Specifies whether the skew group should constrain `cts, ccopt_initial`, or `ccopt`. If the value includes cts, the created skew group will constrain `cts`, if the value includes `ccopt_initial`, the created skew group will be used to constrain CCOpt's initial solution.If the value includes `ccopt`, the created skew group will constrain CCOpt's final solution. *Data_type*: string, optional
`-exclusive_sinks` *pins*	
	Specifies the input pins in the design that CCOpt should consider as members of the new skew group. This will give the new skew_group an `exclusive_sinks_rank` 1 greater than any other currently defined skew group, effectively removing the pins from all skew_groups that they currently belong to. If both "`shared_sinks`" and "`exclusive_sinks`" are not specified, CCOpt will use the set of sinks reachable from the source if the `auto_sinks` switch is provided, or no sinks otherwise. *Data_type*: string, optional
`-filtered_auto_sinks` *pins*	
	Specifies that the target sinks should be determined automatically from the subset provided. The target sinks for the skew group are determined based on the input pins reachable from the source. However, of these pins, only those are selected that are also present in the list of pins provided as a filter. *Data_type*: string, optional
`-from_clocks` *clock_names*	
	Specifies the names of the clocks for which this skew group was extracted. *Data_type*: string, optional
`-from_constraint_modes` *constraint_mode_names*	
	Specifies the constraint mode for which this skew group was extracted. *Data_type*: string, optional
`-from_delay_corners` *delay_corner_names*	
	Specifies the delay corners associated with the constraint modes for which this skew group was extracted. *Data_type*: (delay_corner)+, optional
`-name` *skew_group_name*	
	Specifies the user-defined name for the new skew group. The name must be unique. *Data_type*: string, required
`-rank` *rank*	Specifies the exclusive_sinks_rank for this skew group. *Data_type*: int, optional
`-shared_sinks` *pins*	
	Specifies the input pins in the design that CCOpt should consider as members of the new skew group but are also shared with other skew groups. These pins are members of both the original skew group and the new skew group. This implies a `exclusive_sinks_rank` of 0. *Data_type*: string, optional
`-sinks` *pins*	Specifies the input pins in the design that CCOpt should consider as members of the new skew group. *Data_type*: string, optional
`-sources` *pins*	Specifies the source pins of the skew group. *Data_type*: string, optional
`-target_insertion_delay` *value*	
	Specifies the target insertion delay to be used for the skew group. CCOpt attempts to keep the latency of all sinks within half the target skew on either side of this delay. For example, `create_skew_group -name b1 -sources b1 -exclusive_sinks {A/CK B/CK G/CK} -target_insertion_delay 0.3ns -target_skew 0.1ns` *Data_type*: string, optional
`-target_skew` *value*	

	Specifies the skew that the clock tree synthesis should aim for. It sets the cts_`target_skew` attribute for the created skew group. If this parameter is not set, the software will use the default value that it gets from `cts_target_skew` attribute. For more information, see the cts Category Attributes chapter. *Data_type*: string, optional

Example

- The following command creates the specified skew group, `clk_disable`, for the specified source and exclusive sinks:

```
create_skew_group -name clk_disable -sources clk -exclusive_sinks {mod/ff1/CK mod/icg/CK}
```

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_cts_library_trace_through_toname value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `cts` category, use the following command:

```
get_db -category cts
```

Note: For attributes that are keyed, ensure that the design is loaded before using the `get_db attribute_name` command.

For more information about the CTS object attributes, see *Stylus Common UI Database Object Information*. The following categories of CTS objects are available:

- clock_tree
- clock_tree_source_group
- flexible_htree
- skew_group

clock_trees

```
clock_trees {list | clock_tree}
```

Default: `{}`

Data_type: string, read/write

Specifies a list of clock trees the pin is contained within. This includes parents of generated clock trees and all relevant parents when clock trees overlap.

Valid values: `list clock_tree`

clock_tree_source_groups

```
clock_tree_source_groups clock_tree_source_group_list
```

Default: `{}`

Data_type: string, read-only

Specifies the list of clock tree source groups to which this clock tree belongs.

Valid values: `clock_tree_source_group_list`

Read-only: This attribute cannot be modified by `set_db`.

cts_add_port_driver_max_distance_from_port

`cts_add_port_driver_max_distance_from_port` *`allowable_distance`*

Default: `auto`

Data_type: string, read/write

This attribute specifies the allowable distance, in `um` if no units suffix is specified, that a port driver is allowed to be placed from the port being buffered. If the driver cannot be added close enough to the port, it will not be added at all. This attribute, if set, overrides any value set using the attribute, `cts_add_port_driver_max_distance_from_port_rows`.

cts_add_port_driver_max_distance_from_port_rows

`cts_add_port_driver_max_distance_from_port_rows` *`allowable_cell_row_height_distance`*

Default: `50`

Data_type: integer, read/write

This attribute specifies the allowable distance, in standard cell row heights, that a port driver is allowed to be placed from the port being buffered. If the driver cannot be added close enough to the port it will not be added at all. The attribute `cts_add_port_driver_max_distance_from_port`, if set, overrides this value.

cts_adjacent_rows_legal

`cts_adjacent_rows_legal {true | false}`

Default: `false`

Data_type: string, read/write

Defines the clock halo in the y direction. If set to true, the y direction clock halo is zero and other clock instances are allowed in adjacent rows. The following attributes can be used to assign y direction clock halos within CTS:

- `cts_cell_halo_y`
- `cts_adjacent_rows_legal`
- `cts_cell_halo_rows`

Only one of these attributes is used to determine the clock halo in the y direction. The following rules determine which:

- If `cts_cell_halo_y` is set to a non-auto value, then this defines the y direction clock halo. The attributes `cts_adjacent_rows_legal` and `cts_cell_halo_rows` have no effect.
- If `cts_cell_halo_y` is set to auto and `cts_adjacent_rows_legal` is set to a non-auto value then `cts_adjacent_rows_legal` defines the clock halo in the y direction. The attribute `cts_cell_halo_rows` has no effect.
- If both `cts_cell_halo_y` and `cts_adjacent_rows_legal` are set to auto then `cts_cell_halo_rows` defines the clock halo in the y direction.

Valid values: `true false`

See also:
. `cts_cell_halo_y`
. `cts_cell_halo_rows`

cts_allow_non_std_clock_gate_inputs

`cts_allow_non_std_clock_gate_inputs {true | false}`

Default: `false`

Data_type: bool, read/write

If this attribute is set, CTS will allow the use of clock gates with non-standard pins. CTS considers the following pin types to be standard: clock pins, enable pins, test enable pins, retention pins, and power gating pins. Before starting clock tree synthesis, CTS will emit a warning, indicating which pin(s) it considers as non-standard.

cts_balance_mode

```
cts_balance_mode {full | cluster | trial}
```

Default: `full`

Data_type: string, read/write

Specifies the CTS mode setting to be used. If the default setting of `full` is not used, it causes CTS to halt before the final completion of the clock tree to facilitate clock tree inspection.

The possible values for this attribute are as follows:

- `full` - default value, a full CTS is performed.
- `cluster` - a cluster-only CTS is performed. The clock tree has no balancing delay applied.
- `trial` - The clock has only virtual (numeric annotation) balancing delays applied.

cts_blackbox_default_driver_base_pin

```
cts_blackbox_default_driver_base_pin pin_name
```

Default: `{}`

Data_type: string

Specifies the base pin that will be used for all timing and capacitance modeling for clock roots with a source pin at a blackbox output.

cts_blackbox_default_load_base_pin

```
cts_blackbox_default_load_base_pin pin_name
```

Default: `{}`

Data_type: string

Specifies the base pin that will be used for all timing and capacitance modeling for clock sinks at blackbox inputs. Any `cts_capacitance_override` attribute will be used in preference to this.

cts_buffer_cells

```
cts_buffer_cells buffer_cell_list
```

Default: `{}`

Data_type: string, read/write

Specifies the buffer cells for CTS. If none are specified CTS will choose buffers from the libraries. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any don't use settings for the cells specified. Different buffer cells may be specified for any combination of clock tree and power domain.

To use different buffers for each net type set the `cts_buffer_cells_top` and `cts_buffer_cells_leaf` attributes.

Some examples are provided below:

To specify buffer cells for all clock trees and all power domains:

```
set_db cts_buffer_cells {bufAX* bufBX*}
```

To specify buffer cells for a particular clock tree and all power domains:

```
set_db clock_tree:<clk> .cts_buffer_cells {bufX20 bufX18}
```

To specify buffer cells for a particular clock tree and power domain:

```
set_db clock_tree:<clk> .cts_buffer_cells -index {power_domain <pd>} {bufX12 bufX8}
```

Valid values: a list of library cell names, or a list of patterns to expand to library cell names

Note: This attribute is applicable to object types, `clock_tree` and `power_domain`.

cts_buffer_cells_leaf

```
cts_buffer_cells_leaf  buffer_cell_list
```

Default: `{}`

Data_type: string, read/write

Specifies the buffer cells available for CTS to use on leaf nets. If none are specified, CTS will use the same buffers as on trunk nets - as specified in the `cts_buffer_cells` attribute. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any don't use settings for the cells specified.

Different leaf buffer cells may be specified for any combination of clock tree and power domain.

Valid values: library cell names, or a list of patterns to expand to library cell names

Note: This attribute is applicable to object types, `clock_tree` and `power_domain`.

cts_buffer_cells_top

`cts_buffer_cells_top` *`buffer_cell_list`*

Default: `{}`

Data_type: string, read/write

Specifies the buffers cells available for CTS to use on top nets. If none are specified, CTS will use the same buffers as on trunk nets - as specified in the `cts_buffer_cells` attribute. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any don't use settings for the specified cells.

Different top buffer cells may be specified for any combination of clock tree and power domain.

Valid values: a list of library cell names, or a list of patterns to expand to library cell names

Note: This attribute is applicable to object types, `clock_tree` and `power_domain`.

cts_cell_density

`cts_cell_density <`*`value`*`>`

Default: 0.75

Valid Values: `0.01 to 1`

Data_type: string, read/write

Specifies the clock halo in the x direction. Any x direction clock halo defined by this attribute is proportional to the cell width. The constant of proportionality is defined by the attribute value. For example:

- If `cts_cell_density = 0.25` then the x direction clock halo equals 3 * cell width.
- If `cts_cell_density = 0.5` then the x direction clock halo equals cell width.
- If `cts_cell_density = 0.75` then the x direction clock halo equals cell width / 3.
- If `cts_cell_density = 1` then the x direction clock halo equals zero.

This attribute can specify the x direction clock halo for all clock trees via:

```
set_db cts_cell_density 0.8
```

This attribute can specify the x direction clock halo per-clock tree via:

```
set_db clock_tree:<clk> .cts_cell_density 0.9
```

The following attributes can be used to assign x direction clock halos within CTS:

- `cts_cell_halo_x`
- `cts_cell_density`
- `cts_cell_halo_sites`

Only one of these attributes is used to determine the clock halo in the x direction. The following rules determine which:

- If `cts_cell_halo_x` is set to a non-auto value, then this defines the x direction clock halo. The attributes `cts_cell_density` and `cts_cell_halo_sites` have no effect.
- If `cts_cell_halo_x` is set to auto and `cts_cell_density` is set to a non-auto value then `cts_cell_density` defines the clock halo in the x direction. The attribute `cts_cell_halo_sites` has no effect.
- If both `cts_cell_halo_x` and `cts_cell_density` are set to auto then `cts_cell_halo_sites` defines the clock halo in the x direction.

cts_cell_halo_mode

```
cts_cell_halo_mode {max | sum}
```

Default: `max`

Data_type: string, read/write

Specifies how clock halos are used to determine the minimum legal separation between a pair of clock instances. There are two possible modes 'max' and 'sum'. When set to 'max' the minimum legal separation is the larger of the two clock halos. When set to 'sum' the minimum legal separation is the sum of the two clock halos.

Valid values: `max sum`

. cts_adjacent_rows_legal
. cts_cell_halo_sites
. cts_cell_halo_rows
. cts_effective_clock_halo_x
. cts_effective_clock_halo_y
. cts_effective_clock_halo_x_source
. cts_effective_clock_halo_y_source

cts_cell_halo_rows

```
cts_cell_halo_rows value
```

Default: `1`

Data_type: int, read/write

Specifies the clock halo in the y direction in rows for all clock cells.

The following attributes can be used to assign y direction clock halos within CCOpt:

- `cts_cell_halo_y`
- `cts_adjacent_rows_legal`
- `cts_cell_halo_rows`

Only one of these attributes is used to determine the clock halo in the y direction. The following rules determine which:

- If cts_cell_halo_y is set to a non-auto value, then this defines the y direction clock halo. The attributes cts_adjacent_rows_legal and cts_cell_halo_rows have no effect.
- If cts_cell_halo_y is set to auto and cts_adjacent_rows_legal is set to a non-auto value then cts_adjacent_rows_legal defines the clock halo in the y direction. The attribute cts_cell_halo_rows has no effect.
- If both cts_cell_halo_y and cts_adjacent_rows_legal are set to auto then cts_cell_halo_rows defines the clock halo in the y direction.

See also:
.cts_cell_halo_y
. cts_adjacent_rows_legal

cts_cell_halo_sites

```
cts_cell_halo_sites value
```

Default: `4`

Data_type: int, read/write

Specifies the clock halo in the x direction in sites for all clock cells.

The following attributes can be used to assign x direction clock halos within CCOpt:

- `cts_cell_halo_x`
- `cts_cell_density`
- `cts_cell_halo_sites`

Only one of these attributes is used to determine the clock halo in the x direction. The following rules determine which:

- If cts_cell_halo_x is set to a non-auto value, then this defines the x direction clock halo. The attributes cts_cell_density and cts_cell_halo_sites have no effect.
- If cts_cell_halo_x is set to auto and cts_cell_density is set to a non-auto value then cts_cell_density defines the clock halo in the x direction. The attribute cts_cell_halo_sites has no effect.
- If both cts_cell_halo_x and cts_cell_density are set to auto then cts_cell_halo_sites defines the clock halo in the x direction.

See also:
. `cts_cell_halo_x`
. `cts_cell_density`

cts_cell_halo_x

`cts_cell_halo_x` *`value`*

Default: `auto`

Data_type: string, read/write

Specifies the clock halo distance in the x direction. The default value of this attribute is auto.
The following attributes can be used to assign x direction clock halos within CTS:

- `cts_cell_halo_x`
- `cts_cell_density`
- `cts_cell_h`alo_sites

Only one of these attributes is used to determine the clock halo in the x direction. The following rules determine which:

- If `cts_cell_halo_x` is set to a non-auto value, then this defines the x direction clock halo. The attributes `cts_cell_density` and `cts_cell_halo_sites` have no effect.
- If `cts_cell_halo_x` is set to auto and cts_cell_density is set to a non-auto value then cts_cell_density defines the clock halo in the x direction. The attribute `cts_cell_halo_sites` has no effect.
- If both `cts_cell_halo_x` and `cts_cell_density` are set to auto then `cts_cell_halo_sites` defines the clock halo in the x direction.

See also:
.`cts_cell_density`
.`cts_cell_halo_sites`

cts_cell_halo_y

`cts_cell_halo_y` *`value`*

Default: `auto`

Data_type: string, read/write

Specifies the clock halo distance in the y direction. The default value of this attribute is auto.
The following attributes can be used to assign y direction clock halos within CTS:

- `cts_cell_halo_y`
- `cts_adjacent_rows_legal`
- `cts_cell_halo_rows`

Only one of these attributes is used to determine the clock halo in the y direction. The following rules determine which:

- If cts_cell_halo_y is set to a non-auto value, then this defines the y direction clock halo. The attributes cts_adjacent_rows_legal and cts_cell_halo_rows have no effect.
- If cts_cell_halo_y is set to auto and cts_adjacent_rows_legal is set to a non-auto value then cts_adjacent_rows_legal defines the clock halo in the y direction. The attribute cts_cell_halo_rows has no effect.
- If both cts_cell_halo_y and cts_adjacent_rows_legal are set to auto then cts_cell_halo_rows defines the clock halo in the y direction.

See also:
. `cts_adjacent_rows_legal`
. `cts_cell_halo_rows`

cts_clock_gating_cells

`cts_clock_gating_cells` *`cell_list`*

Default: `{}`

Data_type: string, read/write

Specifies the clock gates for CTS. If none are specified CTS will choose clock gates from the libraries. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any do not use settings for the cells specified.

A list of lists can be used to specify separate clock gate sub-lists. All CTS transforms will resize clock gates within the clock gate sub-list they are initially part of. If an incoming clock gate is not part of any clock gate sub-list, it will be resized to the first clock gate sub-list.

Different clock gates may be specified for any combination of clock tree and power domain.

Some examples are provided below:

To specify clock gates for all clock trees and all power domains:

```
set_db cts_clock_gating_cells {cgAX* cgBX*}
```

To specify clock gates for a particular clock tree and all power domains:

```
set_db clock_tree:<clk> .cts_clock_gating_cells {cgX20 cgX18}
```

To specify clock gates for a particular clock tree and power domain:

```
set_db clock_tree:<clk> .cts_clock_gating_cells -index {power_domain <pd>} {cgX12 cgX8}
```

To specify separate clock gate sub-lists:

```
set_db .cts_clock_gating_cells {{cgX12A1 cgX8A1} {cgX12A2 cgX8A2}}
```

Valid values: `a list of library cell names, or a list of patterns to expand to library cell names, a list of lists to specify separate clock gate sub-lists`

cts_clock_gate_movement_limit

`cts_clock_gate_movement_limit` *`value`*

Default: `10`

Data_type: string, read/write

Each clock gate is restricted to a Manhattan ball centered on its original location with the CTS flow. The radius of the ball is a multiple of the clock gate height. This attribute controls the default value of that multiple.

cts_clock_source_cells

`cts_clock_source_cells` *`list_of_cells`*

Default: `{}`

Data_type: string, read/write

Specifies the cells available for CTS to size clock sources if the attribute, `cts_size_clock_sources` is set to `true`. If none are specified CTS will choose cells from the libraries. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names.

If set explicitly, CTS will ignore any don't use settings for the specified cells.

Different cells may be specified for clock trees or power domains. Only clock sources that are buffers, inverters, logic, and clock gating cells with a single output can be resized.

Valid values: `a list of library cell names, or a list of patterns to expand to library cell names`

Optional applicable arguments: "`-clock_tree <`*`name`*`>`" and "`-power_domain <`*`name`*`>`".

cts_clock_tree_source_group_clock_trees

`cts_clock_tree_source_group_clock_trees` *`clock_tree_list`*

Default: `{}`

Data_type: string, read/write

A list of the clock trees relevant to this source group.

Valid values: `list clock_trees`

cts_clock_tree_source_input_max_transition_time

`cts_clock_tree_source_input_max_transition_time {double | 0}`

Default: `0`

Data_type: double, read/write

Specifies the slew that will be assumed at the input of the root driver.

Valid values: `double | 0`

cts_cloning_inst_name_suffix

`cts_cloning_inst_name_suffix` *`suffix_name`*

Default: `clone`

Data_type: string

If set, the suffix will be used generally for all insts cloned by CTS, else the suffix will default to "clone".

cts_cloning_inst_name_suffix_source_group_assignment

`cts_cloning_inst_name_suffix_source_group_assignment` *`suffix_name`*

Default: `{}`

Data_type: string, read/write

Specifically controls the suffix used for multi tap cloning. If this is set to a non-empty string, that string will be used as a suffix when naming cloned instances created by multi-tap cloning. Otherwise, the name suffix will be controlled by the `cts_cloning_inst_name_suffix` attribute.

cts_delay_cells

`cts_delay_cells` *`cell_list`*

Default: `{}`

Data_type: string, read/write

Specifies the delay cells available for CTS. If none are specified CTS will not use delay cells. Setting this attribute to the string 'auto' means that CTS will choose delay cells from the libraries to use. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names.

If set explicitly, CTS will ignore any don't use settings for the cells specified. Different delay cells may be specified for any combination of clock tree and power domain, or by omitting those arguments a global setting can be applied.

Some examples are provided below:

To specify delay cells for all clock trees and power domains:

```
set_db cts_delay_cells {delayAX* delayBX*}
```

To specify delay cells for a particular clock tree and all power domains:

```
set_db clock_tree:<clk> .cts_delay_cells {delayX1 delayX2}
```

To specify delay cells for a particular clock tree and power domain:

```
set_db clock_tree:<clk> .cts_delay_cells -index {power_domain <pd>} {delayX2 delayX3}
```

Valid values: `a list of library cell names, or a list of patterns to expand to library cell names, or the string 'auto'`

cts_detailed_cell_warnings

`cts_detailed_cell_warnings {true | false}`

Default: `false`

Data_type: bool, read/write

If set to `true`, CTS outputs detailed cell warning diagnostics when it encounters issues with library cell selection, power domains and/or signal levels.

Valid values: `true, false`

cts_exit_if_no_placeable_area

`cts_exit_if_no_placeable_area {true | false}`

Default: `true`

Data_type: bool, read/write

End CTS during initialization if there is insufficient placeable area.

cts_exit_if_skew_target_over_constrained

`cts_exit_if_skew_target_over_constrained {true | false}`

Default: `true`

Data_type: bool, read/write

End CTS during initialization if the skew target is too low.

Valid values: `true, false`

cts_exit_if_stage_delay_sigma_target_over_constrained

`cts_exit_if_stage_delay_sigma_target_over_constrained {true | false}`

Default: `true`

Data_type: bool, read/write

If set, allows any max stage delay sigma target to be set. If the target is too low, it is likely to lead to runtime problems.

Valid values: `true, false`

cts_fix_clock_sinks

`cts_fix_clock_sinks {true | false | soft}`

Default: `false`

Data_type: string, read/write

If set to `true`, we will DEF lock clock tree sinks after routing in addition to any clock node locking (fixed).

If set to `soft`, we will DEF lock clock tree sinks after routing in addition to any clock node soft_locking (softFixed).

Valid values: `true false soft`

cts_flexible_htree_enable_metrics_reporting

`cts_flexible_htree_enable_metrics_reporting {true | false | post_route}`

Default: `post_route`

Data_type: string, read/write

Controls the reporting of metrics for flexible H-trees. The following values are allowed:

- `true`: Enables all reporting.
- `false`: Disables all reporting.
- `post_route`: Enables only the report at the end of flexible H-Tree synthesis.

Valid values: `true false post_route`

cts_flexible_htree_partition_boundary_polarity

`cts_flexible_htree_partition_boundary_polarity {non_inverting | inverting | ignore}`

Default: `non_inverting`

Data_type: string, read/write

Specifies the polarity of the clock signal with regard to the source of the flexible H-tree when entering partitions. The following values are allowed:

- `non_inverting`: When specified, allows only non-inverting polarity at partition entry points.
- `inverting`: When specified, allows only inverting polarity at partition entry points.
- `ignore`: When specified, allows inverting and non-inverting polarity at partition entry points.

Valid values: `non_inverting inverting ignore`

cts_flexible_htree_placement_legalization_effort

```
cts_flexible_htree_placement_legalization_effort {high | low}
```

Default: `low`

Data_type: string, read/write

The legalization effort for finding placement unblocked points on the synthesis grid for flexible H-trees. High placement legalization effort can avoid having to relax placement constraints when implementing H-trees but may lead to increased runtime.

Valid values: `high low`

cts_force_target_max_transition_time

```
cts_force_target_max_transition_time {true | false}
```

Default: `false`

Data_type: bool, read/write

Specifies that CTS should allow any transition target to be used, even if it is likely to lead to runtime problems. By default, CTS computes a minimum transition target which should not lead to runtime problems, and does not allow any transition target to be set lower than this minimum. This attribute overrides that check, and allows any transition target to be used.

Valid values: `true, false`

cts_ignore_problematic_skew_as_result_of_dont_touch_nets

```
cts_ignore_problematic_skew_as_result_of_dont_touch_nets {true | false}
```

Default: `false`

Data_type: bool, read/write

If set to true, sinks directly connected to nets that are causing unfixable skew problems will be ignored for skew balancing.

Valid values: `true, false`

cts_inst_name_prefix

```
cts_inst_name_prefix prefix_name
```

Default: `CTS`

Data_type: string, read/write

The name prefix of instances/nets created by CTS. The default value is "CTS". The default names of nets are CTS, CTS_1, CTS_2... ...The default names of instances are CTS_*.

Valid values: `string`

cts_inverter_cells

```
cts_inverter_cells inverter_cell_list
```

Default: `{}`

Data_type: string, read/write

Specifies the inverter cells available for CTS. If none are specified CTS will choose inverters from the libraries. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any don't use settings for the cells specified. Different inverter cells may be specified for any combination of clock tree and power domain.

To use different inverters for each net type set the `cts_inverter_cells_top` and `cts_inverter_cells_leaf` attributes.

Some examples are provided below:

To specify inverter cells for all clock trees and all power domains:
```
set_db cts_inverter_cells {invAX* invBX*}
```

To specify inverter cells for a particular clock tree and all power domains:
```
set_db clock_tree:<clk> .cts_inverter_cells {invX20 invX18}
```

To specify inverter cells for a particular clock tree and power domain:
```
set_db clock_tree:<clk> .cts_inverter_cells -index {power_domain <pd>} {invX12 invX8}
```

Valid values: a list of library cell names, or a list of patterns to expand to library cell names

cts_inverter_cells_leaf

`cts_inverter_cells_leaf` *inverter_cell_list*

Default: `{}`

Data_type: string, read/write

Specifies the inverter cells available for CTS to use on leaf nets. If none are specified, CTS will use the same inverters as on trunk nets - as specified in the `cts_inverter_cells` attribute. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any don't use settings for the cells specified.

Different leaf inverter cells may be specified for any combination of clock tree and power domain.

Valid values: a list of library cell names, or a list of patterns to expand to library cell names

Note: This attribute is applicable to object types, `clock_tree` and `power_domain`.

cts_inverter_cells_top

`cts_inverter_cells_top` *cell_list*

Default: `{}`

Data_type: string, read/write

Specifies the inverter cells available for CTS to use on top nets. If none are specified, CTS will use the same inverters as on trunk nets - as specified in the `cts_inverter_cells` attribute. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names.If set explicitly, CTS will ignore any don't use settings for the cells specified.

Different top inverter cells may be specified for any combination of clock tree and power domain.

Valid values: a list of library cell names, or a list of patterns to expand to library cell names

Note: This attribute is applicable to object types, `clock_tree` and `power_domain`.

cts_load_capacitance_cells

`cts_load_capacitance_cells` *list_of_cellnames*

Default: `{}`

Data_type: string, read/write

Specifies the load capacitance cells available for CTS. CTS will use cells from this collection for load capacitance optimizations. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names.

Note: This attribute is applicable to object types, `clock_tree` and `power_domain`.

cts_logic_cells

`cts_logic_cells` *clock_logic_cell_list*

Default: `{}`

Data_type: string, read/write

Specifies the clock logics for CTS. If none are specified CTS will choose clock logics from the libraries. Cell names may be specified as a Tcl list of names, or as a Tcl list of patterns to be expanded to match names. If set explicitly, CTS will ignore any don't use settings for the cells specified. Different logic cells may be specified for any combination of clock tree and power domain.

Some examples are provided below:

To specify logic cells for all clock trees and all power domains:

```
set_db cts_logic_cells {and* mux*}
```

To specify logic cells for a particular clock tree and all power domains:

```
set_db clock_tree:<clk> .cts_logic_cells {andX20 andX18}
```

To specify logic cells for a particular clock tree and power domain:

```
set_db clock_tree:<clk> .cts_logic_cells -index {power_domain <pd>} {andX12 andX8}
```

Valid values: `a list of library cell names, or a list of patterns to expand to library cell names`

cts_manage_power_intent_violations

```
cts_manage_power_intent_violations {true | false}
```

Default: `true`

Data_type: bool, read/write

If this attribute is set, the CTS algorithm will work around power management illegalities in the clock tree, as opposed to failing with an error when it encounters them. This allows the clock tree to be synthesized, but any power
management illegalities will remain in the exported design.

Valid values: `true, false`

cts_max_fanout

```
cts_max_fanout number
```

Default: `100`

Data_type: int, read/write

The maximum fanout at any point in the clock tree.

Valid values: integer ranged between `2` and `1000` inclusive

Note: This attribute is applicable to object type, `base_pin`. For detailed help of the attribute in the tool, type `help <obj_type> <attribute_name>`. For example: `help base_pin cts_max_fanout`

cts_max_instance_height

```
cts_max_instance_height value
```

Default: `3`

Data_type: double, read/write

When selecting cells for use, CTS will filter the selection to remove all buffers, inverters and clock gates taller than this many row heights. This helps quickly eliminate very large cells that are unlikely to be useful.

cts_max_source_to_sink_net_length

```
cts_max_source_to_sink_net_length {auto | double}
```

Default: `auto`

Data_type: string, read/write

The maximum routing length in microns between driving source pin and driven sink pin on each net that clock tree synthesis should observe. This constraint can be applied to either a pin, a clock tree, or a net type. By default (if this attribute is not set) no explicit clock tree net length constraint is enforced. However, other clock tree constraints such as maximum slew (transition) and maximum capacitance will indirectly limit the maximum net length.

Valid values: `auto | double`

cts_max_source_to_sink_net_length_leaf

```
cts_max_source_to_sink_net_length_leaf {auto | double}
```

Default: `auto`

Data_type: string, read/write

The maximum routing length in microns between driving source pin and driven sink pin on each net that clock tree synthesis should observe. This constraint can be applied to either a pin, a clock tree, or a net type. By default (if this attribute is not set) no explicit clock tree net length constraint is enforced. However, other clock tree constraints such as maximum slew (transition) and maximum capacitance will indirectly limit the maximum net length. This attribute only applies to leaf net type.

Valid values: `auto | double`

cts_max_source_to_sink_net_length_top

```
cts_max_source_to_sink_net_length_top {auto | double}
```

Default: `auto`

Data_type: string, read/write

The maximum routing length in microns between driving source pin and driven sink pin on each net that clock tree synthesis should observe. This constraint can be applied to either a pin, a clock tree, or a net type. By default (if this attribute is not set) no explicit clock tree net length constraint is enforced. However, other clock tree constraints such as maximum slew (transition) and maximum capacitance will indirectly limit the maximum net length. This attribute only applies to top net type.

Valid values: `auto | double`

cts_max_source_to_sink_net_length_trunk

```
cts_max_source_to_sink_net_length_trunk {auto | double}
```

Default: `auto`

Data_type: string, read/write

The maximum routing length in microns between driving source pin and driven sink pin on each net that clock tree synthesis should observe. This constraint can be applied to either a pin, a clock tree, or a net type. By default (if this attribute is not set) no explicit clock tree net length constraint is enforced. However, other clock tree constraints such as maximum slew (transition) and maximum capacitance will indirectly limit the maximum net length. This attribute only applies to trunk net type.

Valid values: `auto | double`

cts_merge_clock_gates

```
cts_merge_clock_gates {true | false}
```

Default: `false`

Data_type: bool, read/write

If set to `true`, clock gate merging is enabled. If this is false, merging of all clock gates is disabled, including clock gates which may have been cloned by CTS.

This attribute also impacts the early clock flow.

Note that this attribute only impacts '`ccopt_design -cts`'. See also attribute `cts_merge_clock_logic`.

Valid values: `true, false`

cts_merge_clock_logic

```
cts_merge_clock_logic {true | false}
```

Default: `false`

Data_type: bool, read/write

If set to `true`, clock logic merging is enabled. If this is `false`, merging of all clock logics is disabled, including clock logics which may have been cloned by CTS.

Note that this attribute only impacts '`ccopt_design -cts`'. See also attribute `cts_merge_clock_gates`.

Valid values: `true, false`

cts_mixed_fanout_net_type

```
cts_mixed_fanout_net_type  {leaf | trunk}
```

Default: `leaf`

Data_type: string, read/write

Controls how CTS considers nets that have fanout consisting partially but not entirely of sinks. By default, having any sinks, for example DFFs, will make the net be considered leaf, but when set to trunk, a net has to drive only sinks to be considered as leaf. For example, a net driving a clock gate and a DFF would no longer count as a leaf net.

Valid values: `leaf trunk`

cts_move_clock_gates

```
cts_move_clock_gates {true | false}
```

Default: `true`

Data_type: bool, read/write

If this attribute is set, the CTS algorithm will move clock gates that appear in the clock tree. 'Logic' does not include clock gates, buffers, and inverters in a clock tree, which are always moved unless they are locked, or clock generators that are above the root of the clock tree. Usually, this will affect multiplexers used for selecting one of a number of clocks, or for switching between a test clock and the main clock. Setting this attribute may cause the clock tree to have a lower insertion delay, but might break datapath timing. During optimization, this isn't a problem, because the timing will be automatically recovered during the optimization process.

Note: The cts_move_clock_gates attribute indirectly controls multi-tap CTS because the logic is that if no integrated clock gates (ICGs) can be moved then multi-tap cloning is also disabled. So, it is recommend to not use `cts_move_clock_gates false` for multi-tap CTS.

cts_move_logic

```
cts_move_logic {true | false}
```

Default: `true`

Data_type: bool, read/write

If this attribute is set, the CTS algorithm will move logic that appears in the clock tree. "Logic" does not include clock gates, buffers, and inverters in a clock tree, which are always moved unless they are locked, or clock generators that are above the root of the clock tree. Usually, this will affect multiplexers used for selecting one of a number of clocks, or for switching between a test clock and the main clock. Setting this attribute may cause the clock tree to have a lower insertion delay, but might break datapath timing. During optimization, this isn't a problem, because the timing will be automatically recovered during the optimization process.

Valid values: `true, false`

cts_net_name_prefix

```
cts_net_name_prefix string
```

Default: `CTS`

Data_type: string, read/write

The name prefix of instances/nets created by CTS. The default value is "CTS". The default names of nets are CTS, CTS_1, CTS_2... ...The default names of instances are CTS_*.

Valid values: `string`

cts_override_vias

```
cts_override_vias via_name_list
```

Default: `{}`

Data_type: string, read/write

When specified, this attribute defines the vias to be used in RC extraction from routing estimates. The listed vias will be used in place of those configured on the routing rules for the clock network. The order of the list is irrelevant. The vias may also be overridden for each non-default rule (NDR). In this case, the name of the NDR is given as the first element in the list with subsequent entries being the via names. Multiple NDRs can be specified, for example, `{via1d {NDR1 via2d} {NDR2 via2d}}` will override `via1d` in the default rule, and both `via1d` and `via2d` in `NDR1` and `NDR2`.

Valid values: `list via_call`

cts_pin_insertion_delay_histogram_bin_size

`pin_insertion_delay_histogram_bin_size {auto | time value in library units}`

Default: `auto`

Data_type: string, read/write

This attribute specifies the preferred size of the histogram bins that should be used when reporting the distribution of pin insertion delays. The bin size is specified in time units and must be greater than zero. A value of auto (the default) leaves it to the tool to calculate a bin size.

This attribute affects pin insertion delay histograms that are logged during various flow commands. It also determines the preferred histogram bin size that is used by the `report_pin_insertion_delays` command when an explicit `-bin_size` argument has not been specified.

Valid values: `auto, time value in library units`

cts_post_route_enable

`cts_post_route_enable {true | false}`

Default: `true`

Data_type: bool, read/write

Enable post-conditioning optimization after clock nets are routed.

Valid values: `true false`

cts_post_route_repair_drv

`cts_post_route_repair_drv {true | false}`

Default: `true`

Data_type: bool, read/write

If set to `false`, post-conditioning will skip its DRV fixing step.

Valid values: `true false`

cts_post_route_enable_routing_eco

`cts_post_route_enable_routing_eco {true | false}`

Default: `false`

Data_type: bool, read/write

If set to `false`, post-conditioning will skip its ECO-routing step.

Valid values: `true false`

cts_post_route_repair_skew_by_buffering

`cts_post_route_repair_skew_by_buffering {true | false}`

Default: `false`

Data_type: bool, read/write

If set to `true`, post-conditioning will attempt skew-fixing using rebuffering.

Valid values: `true false`

cts_primary_delay_corner

`cts_primary_delay_corner corner_name`

Default: `{}`

Data_type: string, read/write

This specifies the delay corner in which clock tree balancing applies the slew and insertion delay targets. If more than one timing corner is defined, this must be set before running CTS. By default, this is set to the first defined delay corner.

Valid values: `corner name`, or `empty`

cts_primary_reporting_skew_groups

`cts_primary_reporting_skew_groups` *`list of skew groups`* `| auto | none`

Default: `auto`

Data_type: string, read/write

Specifies the primary skew groups used for reporting. By default, the value is specified as auto that automatically takes the skew group with maximum number of sinks as the primary reporting skew group. For invalid values, the default (auto) will be considered.

Valid values: a `list of existing skew group names, auto` or `none`

cts_primary_reporting_skew_groups_log_min_max_sinks

`cts_primary_reporting_skew_groups_log_min_max_sinks on | off | logv`

Default: `logv`

Data_type: string, read/write

If set to `on`, the sinks with the shortest and longest paths in each primary reporting skew group will be logged. If set to `logv`, they will be logged only to the logv file.

Valid values: `on, off, logv`

cts_repair_congestion

`cts_repair_congestion {true | false}`

Default: `true`

Data_type: bool, read/write

If set, place_fix_congestion is called during CTS. This can reduce congestion and ease later routing issues.

Valid values: `true false`

cts_repair_drv_by_buffering

`cts_repair_drv_by_buffering {true | false}`

Default: `false`

Data_type: bool, read/write

If set to `true`, post-conditioning will fix DRVs by adding buffers.

Valid values: `true false`

cts_report_skew_groups_only_with_targets

`cts_report_skew_groups_only_with_targets {true | false}`

Default: `false`

Data_type: bool, read/write

The skew groups report (run using the `report_skew_groups` command) displays insertion delay, skew, and min/max path information for different combinations of skew group, timing corner, and early/late path. Set the `cts_report_skew_groups_only_with_targets` attribute to `false` (the default) to report on all skew group/timing corner/path combinations regardless of whether a skew target has been set. Set the `cts_report_skew_groups_only_with_targets attribute` to `true` to report only on skew group/timing corner/path combinations where a skew target has been set (either explicitly or using the 'auto' setting).

cts_route_clock_tree_nets

```
cts_route_clock_tree_nets {true | false}
```

Default: `true`

Data_type: bool, read/write

Specifies that detailed routing be performed during the final implementation clock routing phase.

cts_route_type_leaf

```
cts_route_type_leaf {route_type | default}
```

Default: `default`

Data_type: string, read/write

Specifies the route type. Setting this attribute binds an existing user-defined route_type to one or more types of clock tree nets. Binding a route_type to a type of clock tree nets means that all nets of that type (including the nets created by CTS) will be routed according to the specification of that route_type. In the most common usage, the route_type is bound to one of the three types of clock tree nets (top, trunk, or leaf) with the optional -net_type argument. Omitting the -net_type argument causes the route_type to be bound to all three types of clock tree nets. The optional -clock_tree <pattern> argument limits the binding to the clock trees whose name matches <pattern>. Omitting the -clock_tree argument causes the binding to apply to all clock trees.

For a route_type to be used in CTS, it must be bound to at least one net type. If net type is not bound to any route_type, a default route_type will be created for that net type at the start of CTS.

Valid values: names of route_types created with create_route_type

cts_route_type_top

```
cts_route_type_top {route_type | default}
```

Default: `default`

Data_type: string, read/write

Specifies the route type. Setting this attribute binds an existing user-defined route_type to one or more types of clock tree nets. Binding a route_type to a type of clock tree nets means that all nets of that type (including the nets created by CTS) will be routed according to the specification of that route_type. In the most common usage, the route_type is bound to one of the three types of clock tree nets (top, trunk, or leaf) with the optional -net_type argument. Omitting the -net_type argument causes the route_type to be bound to all three types of clock tree nets. The optional `-clock_tree <pattern>` argument limits the binding to the clock trees whose name matches <pattern>. Omitting the -clock_tree argument causes the binding to apply to all clock trees.

For a route_type to be used in CTS, it must be bound to at least one net type. If net type is not bound to any route_type, a default route_type will be created for that net type at the start of CTS.

Valid values: names of route_types created with create_route_type

cts_route_type_trunk

```
cts_route_type_trunk {route_type | default}
```

Default: `default`

Data_type: string, read/write

Specifies the route type. Setting this attribute binds an existing user-defined route_type to one or more types of clock tree nets. Binding a route_type to a type of clock tree nets means that all nets of that type (including the nets created by CTS) will be routed according to the specification of that route_type. In the most common usage, the route_type is bound to one of the three types of clock tree nets (top, trunk, or leaf) with the optional -net_type argument. Omitting the -net_type argument causes the route_type to be bound to all three types of clock tree nets. The optional -clock_tree <pattern> argument limits the binding to the clock trees whose name matches <pattern>. Omitting the -clock_tree argument causes the binding to apply to all clock trees.

For a route_type to be used in CTS, it must be bound to at least one net type. If net type is not bound to any route_type, a default route_type will be created for that net type at the start of CTS.

Valid values: names of route_types created with create_route_type

cts_routing_preferred_layer_effort

```
cts_routing_preferred_layer_effort {standard | high | auto}
```

Default: `standard`

Data_type: string, read/write

Controls preferred layer effort for clock routing. The following settings may be specified:

- `standard` (default) - No change made to current early global route settings.
- `high` - enables a package of early global route settings to increase layer adherence, possibly at the expense of wire length and via count.
- `auto` - maps to `high` effort only if the effective routing effort level for the vast majority of nets of `net_type trunk`, for all clock trees resolves to `high`. Otherwise, the `auto` setting maps to `standard`.

cts_size_clock_gates

```
cts_size_clock_gates {true | false}
```

Default: `true`

Data_type: bool, read/write

When set to true (the default), the CTS algorithm sizes clock gates that appear in the clock tree. 'Logic' does not include clock gates, buffers, and inverters in a clock tree, which are always sized unless they are locked, or clock generators that are above the root of the clock tree. Usually, this affects multiplexers used for selecting one of a number of clocks, or for switching between a test clock and the main clock. Setting this attribute may cause the clock tree to have a lower insertion delay, but might change the cell types of logic gates in the clock tree, which in turn may require them to be moved slightly to find a legal location for the new cell.

cts_size_clock_sources

```
cts_size_clock_sources {true | false}
```

Default: `false`

Data_type: bool, read/write

When set to true, CTS will try to size the clock source. Only clock sources that are buffers, inverters, logic and clock gating cells with a single output will be sized. The cells available for CTS to size clock sources can be set specified using the attribute, `cts_clock_source_cells`.

cts_size_logic

```
cts_size_logic {true | false}
```

Default: `true`

Data_type: bool, read/write

When set to `true` (the default), the CTS algorithm sizes logic that appears in the clock tree. "Logic" does not include clock gates, buffers, and inverters in a clock tree, which are always sized unless they are locked, or clock generators that are above the root of the clock tree. Usually, this affects multiplexers used for selecting one of a number of clocks, or for switching between a test clock and the main clock. Setting this attribute may cause the clock tree to have a lower insertion delay, but might change the cell types of logic gates in the clock tree, which in turn may require them to be moved slightly to find a legal location for the new cell.

Valid values: `true, false`

cts_skew_group_report_columns

```
cts_skew_group_report_columns list_of_columns
```

Default: `{name lib_cell event increment time slew capacitance location distance fanout status}`

Data_type: string, read/write

A Tcl list of columns to include in skew group reports produced by the skew group report. You can use this attribute to specify the columns you would like to include in the skew group report, and the order in which the columns should appear. Most of the legal values are straightforward. However, the set of legal values of the following form deserve further explanation:

```
summaryType_summaryLocation[_event]
```

These values let you report the delay value for other paths that go through the pin.

`summaryType` is one of: max (show the longest delay), min (show the shortest delay), or skew (show the skew, that is the difference between the longest and the shortest delay).

`summaryLocation` is one of: above (show the delay/skew above this pin), below (show the delay/skew below this pin), or through (show the delay/skew for paths through this pin).

`event` is one of: rise (show the delay/skew for the rise event at this pin), fall (show the delay/skew for the fall event at this pin), or both (show the delay/skew for both events at this pin).

Valid values:
`capacitance`
`distance`
`event`
`fanout`
`increment`
`lib_cell`
`location`
`name`
`slew`
`status`
`time`

cts_skew_group_report_histogram_bin_size

```
cts_skew_group_report_histogram_bin_size {auto | string}
```

Default: `auto`

Data_type: string, read/write

When set to a numeric value, that numeric value will be used as the histogram range size (in library units). For example, if the library time units are set to 1 nanosecond, a value of 0.010 for `cts_skew_group_report_histogram_bin_size` will result in histogram ranges of 10 picoseconds.

When set to auto, the size of the histogram ranges are dependent on the skew targets that are set. If a skew target is set for a given half corner and skew group combination, then the histogram range size will be 10% of the skew target for that half corner and skew target combination. If no skew target is set for a half corner and skew group combination but a skew target is set for the primary half corner and skew group combination, then the histogram range size will be 10% of the skew target for the primary half corner and skew group combination.

In the event that no skew targets are set and `cts_skew_group_report_histogram_bin_size` is set to auto, a default value of 10 picoseconds will be used for the histogram range size.

Valid values: `auto | string`

cts_spec_config_base_pin_trace_through_to

```
cts_spec_config_base_pin_trace_through_to base_pin
```

Default: `{}`

Data_type: string, read/write

Clock tree definition will, by default, not continue through certain types of cell arc (for instance, the clock to Q arc in a DFF). This attribute allows you to override the default behavior by specifying the output base_pin to which the
clock tree should propagate, when it arrives at an instance of the given input library pin. The specified output base_pin must be another pin on the same library cell as the given input pin. The configured value is applicable to all instances of the
library cell in the netlist.

The output pin may be specified either by its fully qualified name (i.e. inclusive of the base_cell name), or else simply by its local (cell-relative) name.

Note: if both trace_through_to and library_trace_through_to are applicable at a given netlist instance pin, the trace_through_to value takes precedence.

Valid values: `base_pin`

cts_spec_config_create_clock_tree_source_groups

```
cts_spec_config_create_clock_tree_source_groups {true | false}
```

Default: `false`

Data_type: bool, read/write

Causes `create_clock_tree_spec` to set up a clock tree source group for SDC clocks with multiple source pins. If this attribute is set to active, `create_clock_tree_spec` defines one clock tree for each source pin
and then uses the `create_clock_tree_source_group` command to collect those clock trees together, so that CTS can distribute sinks between the clock trees. If this attribute is set to `inactive` or `true`, the source groups are also created during `create_clock_tree_spec`, but they will be defined as inactive.

Only active source groups will take part in sink allocation.

By default, it is set to `false`, which means that no source groups are extracted from SDC multiple pin clocks.

cts_spec_config_create_generator_skew_groups

```
cts_spec_config_create_generator_skew_group {true | false}
```

Default: `true`

Data_type: bool, read/write

This attribute will cause the `create_clock_tree_spec` command to create skew groups for sequential generators and their adjacent registers. Such skew groups will be specified with the same highest rank so that they can be balanced from the other normal skew groups that share some sinks of them. The adjacent registers of a generator are registers that have a datapath timing path to talk with the generator directly. When this attribute is set to `1`, one skew group will be created per sequential generator instance, master clock and generated clock tree triple. The resulting skew groups will by default be named in the pattern:

```
_clock_gen_<master_clock_name>_<generator_local_name><_optional_number>/<constraint_mode_name>.
```

For example, for a pair of generators, with the same local name "`reg_clkgen`", CTS creates generated clock trees from the same master clock named "`fclk`" in a constraint mode named "`func`" the skew groups emitted into the clock tree specification file would be named:

```
_clock_gen_fclk_reg_clkgen_1/func
_clock_gen_fclk_reg_clkgen_2/func
```

The prefix for the names of such skew groups is controlled by the cts_spec_config_create_generator_skew_group_name_prefix CTS attribute and defaults to "`_clock_gen`" (the start underscore is used to group
such skew groups at the end of any skew group listing ordered by name).

cts_spec_config_create_generator_skew_groups_name_prefix

```
cts_spec_config_create_generator_skew_groups_name_prefix prefix_name
```

Default: `_clock_gen`

Data_type: string, read/write

This attribute controls the skew group name prefix used for skew groups generated to balance generator flops with their adjacent flops. Default is "`_clock_gen`". The default has a start underscore at the beginning to cause listings of skew groups ordered by name to collect such skew groups together at the end of a list.

cts_spec_config_create_reporting_only_skew_groups

```
cts_spec_config_create_reporting_only_skew_groups {true | false}
```

Default: `true`

Data_type: bool, read/write

Controls whether spec creation will synthesize reporting-only skew groups.

A reporting-only skew group is a skew group whose `cts_skew_group_constrains` attribute is set to `none`. Such a skew group imposes no clock balancing constraint and will not be considered by CTS.

The typical example is a generated clock that is synchronous to its master clock. The relationship between the two clocks implies that the sinks of both clocks should be balanced together. To model this, a clock spec created for such a design will have the skew group corresponding to the master clock span the domain of both the master clock and also the generated clock. The skew group of the generated clock is then a subset of the master clock skew group: as such it is a redundant constraint, and may be safely omitted. If it is synthesized, such a skew group will be created as a reporting-only skew group.

When this attribute is set to `false`, reporting-only skew groups are completely omitted from the generated spec. When set to `true`, reporting-only skew groups are included in the generated spec, but are marked with the `cts_skew_group_constrains` attribute set to `none`. Either way, they impose no balancing constraint.

Valid values: `true false`

cts_spec_config_trace_multi_output_cells_with_single_clock_output

```
cts_spec_config_trace_multi_output_cells_with_single_clock_output {true | false | combinational}
```

Default: `combinational`

Data_type: string, read/write

This attribute controls whether and how `create_clock_tree_spec` will extract through cells that have multiple outputs but where only one of those outputs has a clock emanating from it; call these types of instance
multi-output single-clock instances.

If the feature is disabled, spec creation will not trace through multi-output single-clock instances. The resulting clock spec will specify a generated clock tree on

the clock-carrying outputs of every multi-output instace. Clock-carrying inputs that are connected to each clock output by way of timing arcs will be generator inputs to the corresponding generated clock tree. The presence of these generated clock trees may impact CTS operations on the instance such as sizing, moving, and cloning.

If the feature is enabled, the resulting clock spec will include cts_spec_config_trace_through_to settings for multi-output single-clock instances. These settings will allow the instance to be treated as a normal clock instance, most commonly as a clock logic. In this case there will be no need for the generated clock tree on the clock-carrying output. The treatment of instances with multiple clock-carrying outputs is unchanged: on such an instance each clock-carrying output will take a generated clock trees, as before.

The feature may be enabled conditionally, such that it is only applied to multi-output single-clock instance which are combinational. In this case multi-output single-clock instances which are sequential will continue to take a generated clock tree on the clock output.

The possible values for this attribute are as follows:

- `false` - The feature is completely disabled.
- `true` - The feature is enabled for all cell types; both combinational and sequential.
- `combinational` - The feature is enabled for combinational cells, but disabled for sequential cells.

Valid values: `false true combinational`

cts_target_max_capacitance

```
cts_target_max_capacitance {auto | double}
```

Default: `auto`

Data_type: string, read/write

Specifies the target maximum capacitive load to allow during clock tree synthesis. This attribute specifies a maximum (combined pin and wire) capacitance that the clock tree synthesis algorithm will allow any given library pin to drive in a given clock tree when driving a given net_type. It is specified in library units. It currently only constrains the primary delay corner capacitance values - other delay corners can be specified but will not be constrained. This attribute is applied in addition to the `max_capacitance` constraints read from the liberty library data - the tightest (lowest) of the constraint specified by this attribute and the constraint present in the liberty data will be used. It also does not apply at the root pins of clock trees - to constrain those nets the `cts_source_max_capacitance` CTS attribute should be used instead.

Valid values: `auto | double`

cts_target_max_capacitance_leaf

```
cts_target_max_capacitance_leaf {auto | double}
```

Default: `auto`

Data_type: string, read/write

The target maximum capacitive load to allow during clock tree synthesis. This attribute specifies a maximum (combined pin and wire) capacitance that the clock tree synthesis algorithm will allow any given library pin to drive in a given clock tree when driving a given net_type. It is specified in library units. It currently only constrains the primary delay corner capacitance values - other delay corners can be specified but will not be constrained. This attribute is applied in addition to the `max_capacitance` constraints read from the liberty library data - the tightest (lowest) of the constraint specified by this attribute and the constraint present in the liberty data will be used. It also does not apply at the root pins of clock trees - to constrain those nets the `cts_source_max_capacitance` CTS attribute should be used instead. This attribute only applies to the leaf net type.

Valid values: `auto | double`

cts_target_max_capacitance_top

```
cts_target_max_capacitance_top {auto | double}
```

Default: `auto`

Data_type: string, read/write

The target maximum capacitive load to allow during clock tree synthesis. This attribute specifies a maximum (combined pin and wire) capacitance that the clock tree synthesis algorithm will allow any given library pin to drive in a given clock tree when driving a given net_type. It is specified in library units. It currently only constrains the primary delay corner capacitance values - other delay corners can be specified but will not be constrained. This attribute is applied in addition to the `max_capacitance` constraints read from the liberty library data - the tightest (lowest) of the constraint specified by this attribute and the constraint present in the liberty data will be used. It also does not apply at the root pins of clock trees - to constrain those nets the `cts_source_max_capacitance` CTS attribute should be used instead. This attribute only applies to the top net type.

Valid values: `auto | double`

cts_target_max_capacitance_trunk

```
cts_target_max_capacitance_trunk {auto | double}
```

Default: `auto`

Data_type: string, read/write

The target maximum capacitive load to allow during clock tree synthesis. This attribute specifies a maximum (combined pin and wire) capacitance that the clock tree synthesis algorithm will allow any given library pin to drive in a given clock tree when driving a given net_type. It is specified in library units. It currently only constrains the primary delay corner capacitance values - other delay corners can be specified but will not be constrained. This attribute is applied in addition to the `max_capacitance` constraints read from the liberty library data - the tightest (lowest) of the constraint specified by this attribute and the constraint present in the liberty data will be used. It also does not apply at the root pins of clock trees - to constrain those nets the `cts_source_max_capacitance` CTS attribute should be used instead. This attribute only applies to the trunk net type.

Valid values: `auto | double`

cts_target_max_stage_delay_sigma

```
cts_target_max_stage_delay_sigma { double | ignore}
```

Default: `ignore`

Data_type: string, read/write

The max per-stage statistical on-chip variation (SOCV) delay sigma target to use for CTS.

cts_target_max_transition_time

```
cts_target_max_transition_time {default | auto | ignore | double}
```

Default: `default`

Data_type: string, read/write

The target slew used for clock tree synthesis. This attribute specifies a maximum slew time that the clock tree synthesis algorithm will allow in this clock tree, in library units. 'default' means 'auto' in primary half corner and 'ignore' in other half corners. If set to 'auto', CTS picks an appropriate value based on the collection of allowed buffer sizes and library parameters, although this may not give optimal quality of results. If set to 'ignore', CTS does not constrain the corner. The tightest (lowest) of the constraint specified by this attribute and the constraint present in the liberty data (`max_transition`) will be used.

Valid values: `default | auto | ignore | double`

cts_target_max_transition_time_leaf

```
cts_target_max_transition_time_leaf {default | auto | ignore | double}
```

Default: `default`

Data_type: string, read/write

The target slew used for clock tree synthesis. This attribute specifies a maximum slew time that the clock tree synthesis algorithm will allow in this clock tree, in library units. 'default' means 'auto' in primary half corner and 'ignore' in other half corners. If set to 'auto', CTS picks an appropriate value based on the collection of allowed buffer sizes and library parameters, although this may not give optimal quality of results. If set to 'ignore', CTS does not constrain the corner. This attribute only applies to the leaf net type.

Valid values: `default | auto | ignore | double`

cts_target_max_transition_time_top

```
cts_target_max_transition_time_top {default | auto | ignore | double}
```

Default: `default`

Data_type: string, read/write

The target slew used for clock tree synthesis. This attribute specifies a maximum slew time that the clock tree synthesis algorithm will allow in this clock tree, in library units. 'default' means 'auto' in primary half corner and 'ignore' in other half corners. If set to 'auto', CTS picks an appropriate value based on the collection of allowed buffer sizes and library parameters, although this may not give optimal quality of results. If set to 'ignore', CTS does not constrain the corner. This attribute only applies to the top net type.

Valid values: `default | auto | ignore | double`

cts_target_max_transition_time_trunk

`cts_target_max_transition_time_trunk {default | auto | ignore | double}`

Default: `default`

Data_type: string, read/write

The target slew used for clock tree synthesis. This attribute specifies a maximum slew time that the clock tree synthesis algorithm will allow in this clock tree, in library units. 'default' means 'auto' in primary half corner and 'ignore' in other half corners. If set to 'auto', CTS picks an appropriate value based on the collection of allowed buffer sizes and library parameters, although this may not give optimal quality of results. If set to 'ignore', CTS does not constrain the corner. This attribute only applies to the trunk net type.

Valid values: `default | auto | ignore | double`

cts_target_skew

`cts_target_skew { default | auto | ignore | double}`

Default: `default`

Data_type: string, read/write

This specifies the target skew for clock tree balancing. This may be set to a numeric value, or one of '`auto`', '`ignore`' or '`default`'.

If set to '`auto`' this indicates that an appropriate skew target should be computed.

If set to '`ignore`' this indicates that skew should not be balanced for this corner/path combination.

If unspecified then the value of this attribute is '`default`'.

If the value of the attribute is 'default' the target skew for late delays in the primary delay corner is interpreted as 'auto' and as '`ignore`' otherwise.

Valid values: `default | auto | ignore | double`

cts_timing_connectivity_based_skew_groups_balance_master_clocks

`cts_timing_connectivity_based_skew_groups_balance_master_clocks {true | false}`

Default: `false`

Data_type: bool, read/write

This attribute has no effect if `cts_timing_connectivity_based_skew_groups` is set to `'off'`.

With timing connectivity based skew groups enabled, this attribute controls how CTS will address the synchrony of disjoint (i.e. non-overlapping) master (i.e. non-generated) SDC clocks.

When this attribute is set to `false`, all disjoint master clocks are assumed to be mutually asynchronous. The skew groups generated by `create_clock_tree_spec` will not constrain the sinks of two such clocks to be balanced together.

When this attribute is set to `true`, the synchrony of disjoint master clocks is determined by consulting the SDC assertions in accordance with the value of attribute `cts_timing_connectivity_based_skew_groups`.
Additional skew groups will be generated by `create_clock_tree_spec`, such that the sinks of each pair of synchronous disjoint master clocks will be balanced together by CTS.

Valid values `true false`

cts_timing_connectivity_based_skew_groups

`cts_timing_connectivity_based_skew_groups` *`string`*

Default: `off`

Data_type: string, read/write

SDC false path assertions may render a generated SDC clock asynchronous to its master clock. Under such a condition, the sinks of the generated clock need not be balanced against the sinks of the master clock: there are no timing paths between the two clocks that can be affected by inter-clock skew. This balancing 'relaxation' is realized by adjusting the skew groups that are generated for the two clocks.

This attribute specifies which SDC assertions are considered when deciding whether a generated clock is asynchronous to its master. Valid values for this attribute are as follows:

- `off`: In this mode, every generated SDC clock is treated as being synchronous to its master SDC clock.

- `clock_false_path`: In this mode, only clock/clock `set_false_path` and `set_clock_group` assertions are considered.

Valid values: `off clock_false_path`

cts_timing_connectivity_info

`cts_timing_connectivity_info` *`string`*

Default: ""

Data_type: string, read/write

This attribute is populated by clock spec creation when timing connectivity based skew groups are enabled. Configuration of this attribute will be written to the generated spec. It documents the clock/clock balancing relationships that were determined for the production of timing connectivity based skew groups. This attribute is documenting only.

If timing connectivity based skew groups are not enabled, this attribute is not populated by spec creation.

The value of the attribute is a set of nested Tcl dictionaries, four levels in total. The top-level dictionary indicates the information category. Currently there is only one such category: 'clock_relationships'. The
second level is keyed on constrained mode name; the lowest level dictionaries are both keyed on SDC clock name. These keys taken together identify two SDC clocks in a given constraint mode. The leaf value specifies the resolved balancing relationships between the two SDC clocks. It is an enum with the following members:

- direct - The two clocks are determined to belong to the same clock group and must be balanced together.
- indirect - The two clocks do not belong to the same clock group; however by transitive closure they must balance together.

Clocks in a direct or indirect balancing relationship will share one or more skew groups so as to ensure that their sinks are balanced together by CTS. Missing entries should be taken as 'need not balance'; i.e. the pair of SDC clocks have neither a direct nor indirect balancing relationship.

The indirect balancing relationship can be explored in more detail using this same Tcl dictionary to probe out the transitive closure over the direct balancing relationships that link two indirect balance clocks together. For example, if clock A directly balances with clock B only, and clock B directly balances with clock C only; then clock A indirectly balances with clock C.

Below is an example dict value, corresponding to clock groups `{clkA clkB} {clkB clkC}` in constraint mode `cm1`, and clock groups `{clkP clkQ} {clkR clkS}` in constraint mode `cm2`.

```
{clock_relationships \
  {cm1 {clkA {clkB direct clkC indirect} \
       clkB {clkA direct clkC direct} \
       clkC {clkA indirect clkB direct}} \
   cm2 {clkP {clkQ direct} \
       clkQ {clkP direct} \
       clkR {clkS direct} \
       clkS {clkR direct}}}}
```

Notice that although they are in separate clock groups, `clkA` and `clkC` nevertheless indirectly balance. This is due to the fact that `clkB` is present in both clock groups. Note also that we omit information about the relationship between `clkP` and `clkS`: they are 'need not balance'.

cts_top_fanout_threshold

`cts_top_fanout_threshold` *`number_of_sinks`*

Default: `unset`

Data_type: string, read/write

Minimum number of transitive fanout in the clock tree for a net to be routed as a top net. Nets with at least this many sinks in their transitive fanout in the clock tree will have the special routing rules applied to them.

Valid values: `integer`

cts_update_clock_latency

`cts_update_clock_latency {true | false}`

Default: `true`

Data_type: bool, read/write

Determine whether to update IO latencies within `ccopt_design`.

Valid values: `true, false`

cts_use_inverters

`cts_use_inverters {auto | true | false}`

Default: `auto`

Data_type: string, read/write

Specifies whether clock tree synthesis should prefer to use inverters rather than buffers when balancing the clock tree. If set to `true`, CTS will use inverters for the clock tree balancing process. If set to `false`, CTS will use the minimum number of levels of inverters required to maintain logical correctness. If set to `auto` (the default) CTS will use what it considers to be the best combination of buffers and inverters to get optimal quality of results.

Valid values: `auto | true | false`

cts_use_receiver_model_capacitance_for_drv

`cts_use_receiver_model_capacitance_for_drv {auto | true | false}`

Default: `false`

Data_type: bool, read/write

When this attribute is set to `auto`, CTS will use receiver model capacitance for drv if the attribute, `timing_report_use_receiver_model_capacitance` is `true`. When set to `true`, CTS will use receiver model capacitance for drv even if `timing_report_use_receiver_model_capacitance` is `false`. By default, this attribute is set to `false`, which means that CTS will not use receiver model capacitance for drv.

Valid values: `auto true false`

flexible_htrees

`flexible_htrees` *`list of flexible_htree`*

Data_type: flexible_htree*, read-only

Returns the list of flexible h-trees in the design.

Valid values: `list of flexible_htree`

skew_groups

`skew_groups` *`list of skew_groups`*

Data_type: skew_group*, read-only

Returns the list of skew groups in the design.

Valid values: `list of skew_group`

delete_clock_tree_drivers

```
delete_clock_tree_drivers
[-help]
[-force]
```

This command removes buffers and inverter pairs from the clock trees. If used without specifying any parameters, it deletes all repeaters except those that have fixed or dont_touch attributes that are assigned either by the user or by `ccopt_design`. To delete all repeaters, specify the `-force` parameter.

Note: After running the command, there may be remaining inverters in the clock tree that are required to preserve an inversion. The remaining inverters may not be the same as the ones that were originally introduced for inversion, which means that the naming can differ.

Parameter

`-help`	Prints a brief description that includes type and default information for each `delete_clock_tree_drivers` parameter. For a detailed description of the command and its parameter, use the man command: `man delete_clock_tree_drivers`.
`-force`	Deletes all repeaters even if they have fixed or dont_touch attributes. *Data_type*: bool, optional

Related Command

- `ccopt_design`

delete_clock_tree_source_group

```
delete_clock_tree_source_group
[-help]
pattern
[-regexp]
```

This command deletes all clock tree source groups matching the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_clock_tree_source_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_clock_tree_source_group`.
`pattern`	Specifies the patterns for clock tree source groups to delete. This parameter is required. *Data_type*: string, required
`-regexp`	Specifies whether or not to use regular expression matching. *Data_type*: bool, optional

Example

- Use the following command to delete all clock tree source groups starting with `"clk"`:
  ```
  delete_clock_tree_source_group clk*
  ```

Related Information

- `create_clock_tree_spec`
- `create_clock_tree`

- Clock Tree Synthesis chapter in the *Innovus Stylus Common UI User Guide*

delete_clock_tree_spec

```
delete_clock_tree_spec
[-help]
[-preserve_sink_insertion_delays]
```

This command deletes all the skew group definitions and other clock tree synthesis configuration information. However, you can preserve the pin insertion delays on clock tree sinks by specifying the `-preserve_sink_insertion_delays` parameter.

Parameter

`-help`	Outputs a brief description of the `delete_clock_tree_spec` parameter.
`-preserve_sink_insertion_delays`	When specified, preserves pin insertion delays currently configured on clock tree sinks. *Data_type*: bool, optional

Example

- Use the following command to get a list of clock trees:
  ```
  get_db clock_trees
  m_clk m_digit_clk m_dsram_clk m_ram_clk m_rcc_clk m_spi_clk refclk<1> refclk
  ```
- Use the following command to get a list of skew groups:
  ```
  get_db skew_groups
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC m_spi_clk/PM_HL_FUNC
  refclk/PM_HL_FUNC
  ```
- Use the following command to delete all CTS configuration:
  ```
  delete_clock_tree_spec
  ```
- When you check for clock trees and skew groups after deleting the CTS configuration, the software returns nothing.
  ```
  get_db clock_trees
  nothing returned
  get_db skew_groups
  nothing returned
  ```

delete_clock_trees

```
  delete_clock_trees
[-help]
pattern
[-regexp]
```

This command deletes all clock trees matching the specified pattern. It makes no changes to the design.

Note: It is recommended to use the `delete_clock_tree_spec` command to reset the entire CTS configuration. It removes clock tree definition from the in-memory clock tree specification.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_clock_trees` parameter. For a detailed description of the command and all of its parameters, use the man command: man `delete_clock_trees`.
`pattern`	Specifies the patterns for clock trees to delete. This parameter is required. *Data_type*: string, required
`-regexp`	Specifies whether or not to use regular expression matching. *Data_type*: bool, optional

Example

- The following command deletes all clock trees whose names start with "ref":
  ```
  delete_clock_trees ref*
  ```
  The software gives the following message:
  ```
  Un-defining clock tree refclk.
  ```

  - Clock Tree Concepts and Specifications

delete_flexible_htrees

```
delete_flexible_htrees
[-help]
pattern
[-regexp]
```

This command deletes all flexible H-trees matching the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_flexible_htrees`.
`pattern`	Specifies the patterns for flexible H-trees to delete. This parameter is required. *Data_type*: string, required
`-regexp`	Specifies whether or not to use regular expression matching. *Data_type*: bool, optional

Example

The following command deletes all flexible trees whose names start with "`htree`":

```
delete_flexible_htrees htree*
```

delete_skew_groups

```
delete_skew_groups
[-help]
pattern
[-regexp]
```

This command deletes all skew groups matching the specified pattern. It makes no changes to the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_skew_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_skew_groups`.
`pattern`	Specifies the patterns for skew groups to delete. This parameter is required. *Data_type*: string, required
`-regexp`	Specifies whether or not to use regular expression matching. *Data_type*: bool, optional

Examples

- The following command deletes all skew groups associated with the clock, `m_digit_clk`:
  ```
  delete_skew_groups m_digit_clk*
  ```
- The following command deletes all skew groups whose name contains the word "`ram`":
  ```
  delete_skew_groups ram -regexp
  ```

get_ccopt_property_common_ui_map

```
get_ccopt_property_common_ui_map
[-help]
property name
```

This command helps you map all CTS properties, public and private, in Legacy Innovus to the corresponding CTS and CCOpt category attributes in Stylus. The use of wildcards is not supported while specifying the name of the property. For example:

```
get_ccopt_property_common_ui_map ccopt_*
[get_ccopt_property_common_ui_map]: The use of a wildcard is not allowed.
```

If the specified legacy CTS property name does not exist, the software gives the following message:

```
get_ccopt_property_common_ui_map add_multiple
No legacy CCOpt property exists matching 'add_multiple'.
```

If the specified legacy CTS property has multiple associated attributes, the software provides the basic, one-line help information for all these attributes:

```
get_ccopt_property_common_ui_map target_max_trans
Attributes:
cts_target_max_transition_time(clock_tree)
# string, read/write, default=top default trunk default leaf default, indices=delay_corner power_domain
cts_target_max_transition_time_leaf(clock_tree)
# string, read/write, default=default, indices=delay_corner power_domain
cts_target_max_transition_time_top(clock_tree)
# string, read/write, default=default, indices=delay_corner power_domain
cts_target_max_transition_time_trunk(clock_tree)
# string, read/write, default=default, indices=delay_corner power_domain
cts_target_max_transition_time(root)
# string, read/write, default=top default trunk default leaf default, indices=delay_corner power_domain
cts_target_max_transition_time_leaf(root)
# string, read/write, default=default, indices=delay_corner power_domain
cts_target_max_transition_time_top(root)
# string, read/write, default=default, indices=delay_corner power_domain
cts_target_max_transition_time_trunk(root)
# string, read/write, default=default, indices=delay_corner power_domain
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_ccopt_property_common_ui_map` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_ccopt_property_common_ui_map` .
`property name`	Specifies the name of the legacy Innovus CTS property for which the corresponding attribute name is to be retrieved. *Data_type*: string, required

Examples

- The following command retrieves the name of the CTS attribute corresponding to the `add_exclusion_drivers` property:

```
get_ccopt_property_common_ui_map add_exclusion_drivers
Attribute
cts_add_exclusion_drivers(root)
# bool, read/write, default=true, indices={}
```

- The following command retrieves the name of the CCOpt attribute corresponding to the `auto_limit_insertion_delay_factor` property:

```
get_ccopt_property_common_ui_map auto_limit_insertion_delay_factor
Attribute
ccopt_auto_limit_insertion_delay_factor(root)
# double, read/write, default=1.5, indices={}
```

get_skew_group_path

```
get_skew_group_path
[-help]
[-check_type {setup | hold}]
[-delay_corner delay_corner]
[-delay_type {early | late}]
[-show_generator_paths]
-skew_group skew_group_name
[-longest  | -shortest]
[-summarize_stage_depth cell_type_list]
[-virtual_delays_only  | -real_delays_only]
[-wire_delays_only  | -cell_delays_only]
[-sink pin | -below pin]
```

This command returns the path delay information for the specified skew group. By default, this command returns the longest source-to-sink path in the specified skew group, which is the path with the largest delay. Paths are returned as a list of pins. You can use `-shortest` to return the shortest source-to-sink path rather than the longest.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_skew_group_path` parameter. For a detailed description of the command and all of its parameters, use the man command: man `get_skew_group_path`.
`-below pin`	Specifies that CTS will only consider paths below this pin. *Data_type*: (pin|port), required
`-cell_delays_only`	Specifies that CTS will only consider cell delays (ignoring wire delays). By default both cell and wire delays are used to calculate delays. *Data_type*: bool, optional
`-check_type {setup | hold}`	
	Specifies whether the check type for the specified skew group should be setup or hold. If a check type is specified, but the `-delay_type` parameter is not specified, the software behaves in the following manner: • `-check_type -setup` will mean `-delay_type -late` • `-check_type -hold` will mean `-delay_type -early` **Note**: If a check type is not specified, the software will always look at what the views permit, preferring the “setup” view if there is a choice. *Data_type*: enum, optional
`-delay_corner delay_corner`	
	Specifies the delay corner to use when calculating delays. If this parameter is not specified, the software will use the delay corner specified using the CTS attribute, `cts_primary_delay_corner`. However, if no valid delay corner is found, the software will error out. **Note**: For detailed help on the attribute, `cts_primary_delay_corner`, see the cts Category Attributes chapter. *Data_type*: (delay_corner), optional
`-delay_type {early | late}`	
	Specifies whether to use early or late half delays. When `early` is specified, CTS uses only early path timing data to calculate path delay, for the clock edge specified. When `late` is specified, CTS uses only late path timing data to calculate path delay, for the clock edge specified. **Note**: If the delay type is not specified but the check type is specified as “setup”, the software will consider the delay type as “late”. If the check type is “hold”, the software will consider the delay type as “early”. *Data_type*: enum, optional

`-longest`	Specifies that CTS will return the longest path delay within the skew group. This is the default option. *Data_type*: bool, optional
`-real_delays_only`	Specifies that CTS will only consider the real path delays in the design. It will not include the virtual path delays added by trial CTS to resolve skew constraints. *Data_type*: bool, optional
`-shortest`	Specifies that CTS will return the shortest source-to-sink path within the skew group (that is, the path with the smallest source-to-sink delay). By default, this command returns the longest path. *Data_type*: bool, optional
`-show_generator_paths`	Specifies that CTS follows generated clock tree paths when determining the longest source-to-sink path. By default generated clock tree paths are not followed. *Data_type*: bool, optional
`-sink` *pin*	Specifies that CTS will return the longest path to this pin for the specified skew group. *Data_type*: (pin|port), required)
`-skew_group` *skew_group_name*	
	Specifies the name of the skew group for which path information will be returned. This is a required parameter. *Data_type*: string, required
`-summarize_stage_depth` *cell_type_list*	

	Specifies that the command will consider the number of cells of the specified type(s) in the tree, instead of considering delay. Possible values are buffer, inverter,logic, clock_gate, and generator. You can also specify * to include all cell types.
	For example, the following command shows you the path with most buffers and inverters in the skew group, `PM_HL_FUNC`.
	`get_skew_group_path -summarize_stage_depth {buffer inverter} -longest -skew_group m_dsram_clk/PM_HL_FUNC`
	Note: The * setting is not used in combination with any other cell type. For example, the below is not a valid setting.
	`-summarize_stage_depth {* buffer}`
	Data_type: list, optional

`-virtual_delays_only`	Specifies that CTS will return the shortest path delay or longest path delay only considering the virtual path delays (added by trial balancing) in the design. It will not include real path delays added by clustering buffers and existing cells in the design. *Data_type*: bool, optional
`-wire_delays_only`	Specifies that CTS will only consider wire delays (ignoring cell delays). By default both cell and wire delays are used to calculate delays. *Data_type*: bool, optional

Examples

- Use the following command to retrieve the list of skew groups:
  ```
  get_db skew_groups
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC m_spi_clk/PM_HL_FUNC
  refclk/PM_HL_FUNC
  ```
- Use the following command to retrieve the path delay information for the specified skew group:
  ```
  get_skew_group_path -skew_group m_dsram_clk/PM_HL_FUNC
  TEST_CONTROL_INST/g139/ZN 0.000 RAM_256x16_TEST_INST/CPF_LS_160_m_dsram_clk/I 0.000 RAM_256x16_TEST_INST/CPF_LS_160_m_dsram_clk/Z
  16817.000 RAM_256x16_TEST_INST/RAM_256x16_INST/CLK 17463.000
  ```
- Use the following command to retrieve the paths with most buffers and inverters in the skew group, `PM_HL_FUNC`:
  ```
  get_skew_group_path -summarize_stage_depth {buffer inverter} -longest -skew_group m_dsram_clk/PM_HL_FUNC
  TEST_CONTROL_INST/AZ_cid_BUF_m_dsram_clk_G0_L1_1/Z RAM_256x16_TEST_INST/CPF_LS_160_m_dsram_clk/I
  RAM_256x16_TEST_INST/CPF_LS_160_m_dsram_clk/Z CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L3_1/I
  CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L3_1/Z
  CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L4_1/I
  ```

```
CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L4_1/Z
CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L5_1/I
CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L5_1/Z
CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L6_1/I
CORE_INST/CORE_MACH_INST/RC_CG_HIER_INST29/AZ_csf_BUF_m_dsram_clk_G0_L6_1/Z RAM_256x16_TEST_INST/RAM_256x16_INST/CLK
```

get_clock_tree_capacitance

```
get_clock_tree_capacitance
[-help]
-pin pinName
[-delay_corner corner]
[-delay_type {early | late}]
[-edge {rise | fall | both}]
[-load | -wire]
```

This command retrieves the capacitance on the specified pin. When you run the command without specifying the type of capacitance to be retrieved, load or wire, then the command retrieves the total capacitance on a pin, which includes both the wire capacitance of nets connected to the pin, and the load capacitance of pins connected to those nets. Because the capacitance varies depending on the timing data used to calculate delays, this command provides options such as rise, fall, early, and late that let you specify the exact timing criteria to use when calculating capacitances.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_clock_tree_capacitance` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_clock_tree_capacitance`.
`-delay_corner corner`	Specifies the delay corner of the specified pin for which capacitance information is provided. By default, if delay corner is not specified, CCOpt uses the CTS primary corner as configured by the `cts_primary_delay_corner <corner>` attribute. If this is not set, it will use the default setup analysis view as configured by the `set_default_view -setup <view>` command. *Data_type*: (delay_corner), optional
`-delay_type {early | late}]`	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate capacitances, for the clock edge specified. When `late` is specified, CCOPT uses only late path timing data to calculate capacitances, for the clock edge specified. By default, if neither early or late are specified, CCOpt will use late half delays to calculate capacitances. *Data_type*: enum, optional
`-edge {rise | fall | both}`	
	Specifies the edge of the specified pin for which capacitance is to be calculated. When `fall` is specified, CCOpt uses only `falling` clock edge timing data to calculate capacitances. When `rise` is specified, CCOpt uses only `rising` clock edge timing data to calculate capacitances. By default, if neither `rise` or `fall` are specified or if both is specified, CCOpt uses both rising and falling clock edge timing data to calculate capacitances. *Data_type*: enum, optional
`-load | -wire`	When `-load` is specified, the command returns the driven load capacitance value of the specified pin. When `-wire` is specified, the command returns the driven wire capacitance value of the specified pin. The two options are mutually exclusive. *Data_type*: bool, optional
`-pin pinName`	Specifies the pin for which the load capacitance value is to be returned.This is a required parameter. *Data_type*: (pin|port), required

Example

- Use the following command to return the pins for the specified object:

```
get_property [get_pins -of_object RESULTS_CONV_INST/upper770/g54] hierarchical_name
get_pins -of_object RESULTS_CONV_INST/upper770/g54
RESULTS_CONV_INST/upper770/g54/ZN RESULTS_CONV_INST/upper770/g54/I
```

- Use the following command to return the capacitance information for the specified pin:

```
get_clock_tree_capacitance RESULTS_CONV_INST/upper770/g54/ZN
```

  The software returns the following:

```
0.0160777831078
```

- Use the following command to return the wire capacitance information for the specified pin:

```
get_clock_tree_capacitance TEST_CONTROL_INST/g145/ZN -wire
```

  The software returns the following:

```
0.00874637126923
```

get_clock_tree_effective_max_capacitance

```
get_clock_tree_effective_max_capacitance
[-help]
-pin
[-delay_corner corner]
[-delay_type {early | late}]
[-source]
[-value]
```

Returns the value of the frequency-dependent effective maximum capacitance constraint that the software will apply at a given pin in the clock tree. By default, the software returns the following information:

- The actual value of the maximum effective capacitance or constrained maximum capacitance at the specified pin
- The source of the constraint

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_clock_tree_effective_max_capacitance` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_clock_tree_effective_max_capacitance`.
`-delay_corner` *corner*	Specifies the delay corner of the specified pin for which effective maximum capacitance information is provided. By default, if delay corner is not specified, CCOpt uses the CTS primary corner as configured by the `cts_primary_delay_corner` *delay_corner_name* attribute. If this is not set, it will use the default setup analysis view as configured by the command, `set_default_view -setup` *newDefaultSetupView*. *Data_type*: (delay_corner), optional
`-delay_type {early | late}`	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate effective maximum capacitance, for the specified clock edge. When `late` is specified, CCOpt uses only late path timing data to calculate effective maximum capacitance, for the specified clock edge. By default, if neither `early` or `late` are specified, CCOpt will use late half delays to calculate effective maximum capacitance. *Data_type*: enum, optional
`-pin`	Specifies the pin for which the effective maximum capacitance value is to be returned. This is a required parameter. *Data_type*: (pin|port), required
`-source`	Specifies the source of the effective maximum capacitance. It is a boolean type. The reported source may be any of the following: • `library_or_sdc`: Specifies that the most constraining capacitance came from a non-frequency dependent library constraint on a library cell pin or SDC override. This can also apply to clock roots based on the `cts_source_driver` attribute where a clock root can be modeled as a specific type of library cell. • `freq_dep_library`: Specifies that the most constraining capacitance value came from a frequency-dependent library constraint. As per `library_or_sdc`, this can also apply to clock roots via library cell modeling. • `target_max_capacitance`: Specifies that the most constraining capacitance value came from an explicit `cts_target_max_capacitance` attribute value. • `source_max_capacitance`: Specifies that the most constraining capacitance value came from the `cts_source_max_capacitance`attribute. • `computed_source_max_capacitance`: Specifies that the most constraining capacitance value was computed by CCOpt for a clock root based on a library cell and a transition target. *Data_type*: bool, optional
`-value`	Reports the effective maximum capacitance value of the specified pin. *Data_type*: bool, optional

Examples

- Use the following command to return the pins for the specified object, `TEST_CONTROL_INST/g139`:

  ```
  get_pins -of_object TEST_CONTROL_INST/g139
  TEST_CONTROL_INST/g139/A1 TEST_CONTROL_INST/g139/A2 TEST_CONTROL_INST/g139/B TEST_CONTROL_INST/g139/ZN
  ```

- Use the following command to return the source of the effective maximum capacitance value:

  ```
  get_clock_tree_effective_max_capacitance TEST_CONTROL_INST/g139/ZN -source
  ```

  The software returns the following information:

  ```
  library_or_sdc_constraint
  ```

- Use the following command to return the effective maximum capacitance value:

  ```
  get_clock_tree_effective_max_capacitance TEST_CONTROL_INST/g139/ZN -value
  ```

  The software returns the following:

  ```
  0.0853199996948
  ```

get_clock_tree_transition_time

```
get_clock_tree_transition_time
[-help]
[-delay_corner corner]
[-delay_type {early | late}]
[-edge {rise | fall | both}]
-pin pinName
```

This command returns the slew information for the user-specified pin.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_clock_tree_transition_time` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_clock_tree_transition_time`.
`-delay_corner corner`	
	Specifies the delay corner of the specified pin to be queried for slew information. By default, if delay corner is not specified, CCOpt uses the CTS primary corner as configured by the `cts_primary_delay_corner corner` attribute. If this is not set, it will use the default setup analysis view as configured by the `set_default_view -setup view` command. *Data_type*: (delay_corner), optional
`-delay_type {early | late}]`	
	Specifies whether to use early or late half delays. When `early` is specified, CCOpt uses only early path timing data to calculate slew, for the clock edge specified. When `late` is specified, CCOpt uses only late path timing data to calculate slew, for the clock edge specified. By default, if neither early or late are specified, CCOpt will use late half delays to calculate slew information. *Data_type*: enum, optional
`-edge { rise | fall | both }`	
	Specifies the edge of the specified pin for which slew information is to be calculated. When `fall` is specified, CCOpt uses only `falling` clock edge timing data to calculate slew. When `rise` is specified, CCOpt uses only `rising` clock edge timing data to calculate slew. By default, if neither rise or fall are specified, CCOpt uses both rising and falling clock edge timing data to calculate slew. *Data_type*: enum, optional
`-pin pinName`	Specifies the pin for which the slew information is provided. This is a required parameter. *Data_type*: (pin|port), required

Examples

- Use the following command to get a list of clock trees:
  ```
  get_clock_tree_transition_time *
  PLLCLK_INST TEST_CONTROL_INST/CPF_LS_101_clk TEST_CONTROL_INST/g145 TEST_CONTROL_INST/g144 TEST_CONTROL_INST/g136...
  ```

- Use the following command to get the list of pins in the specified clock tree:
  ```
  get_pins TEST_CONTROL_INST/g145/*
  TEST_CONTROL_INST/g145/ZN TEST_CONTROL_INST/g145/A2 TEST_CONTROL_INST/g145/A1
  0x5d5
  ```

- Use the following command to get the slew value for the specified pin in the specified clock tree:
  ```
  get_clock_tree_transition_time TEST_CONTROL_INST/g145/ZN
  ```

  The software returns the following value for the slew for the pin ZN:
  ```
  0.2228
  ```

get_cts_graph_traversal

```
get_cts_graph_traversal
[-help]
[-fanin]
[-fanout]
[-of pin | port | inst*]
[-skew_group skew_group]
[-skip buffers inverters drivers clock_gates logics generators generated_roots all]
[-transitive]
```

This command traverses the clock tree graph, starting at the specified pins, ports, or insances and traversing to their fanin or fanout, returning a list of the resulting pins or port objects. Instance types can be skipped over, and can be restricted to a specified skew group.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_cts_graph_traversal` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_cts_graph_traversal`.
`-fanin`	Traverse graph towards source pins or ports of the specified objects. *Data_type*: bool, optional
`-fanout`	Traverse graph towards load pins or ports of the specified objects. *Data_type*: bool, optional
-of pin | port | inst*	
	Specifies a list of pins, ports, or instances (objects, names, or wildcard-names) to start traversing from. The direction of traversal is controlled by `-fanin` or `-fanout`. *Data_type*: (pin|port|inst)*, optional
`-skew_group` *skew_group_name*	Skew group object or name. If specified, restricts traversal to instances in the skew group. *Data_type*: string, optional
`-skip` *buffers inverters drivers clock_gates logics generators generated_roots all*	
	Specifies the types of nodes that should be skipped past to their fanin/fanout during the traversal. You can specify one or more of the following: • buffers • inverters • drivers (equivalent to buffers and inverters) • clock_gates • logics • generators • generated_roots • all (equivalent to listing all the above, and also equivalent to `-transitive`) *Data_type*: list, optional
`-transitive`	Skip all types and get sinks (if `-fanout`) or clock roots (if `-fanin`). This is equivalent to the `-skip all` option. *Data_type*: bool, optional

Examples

- ```
  set simple_fanout [get_cts_graph_traversal -fanout -of CTS_ccd_BUF_clock_G0_L1_1]
  set simple_fanout [get_cts_graph_traversal -fanout -of [get_db insts CTS_ccd_BUF_clock_G0_L1_1]]
  set fanin_with_skip [get_cts_graph_traversal -fanin -skip {buffers generators logics} -of [get_db pins CTS_*/A]]
  foreach pin_or_port_name [get_db $fanin_with_skip .name] {
  puts "Got $pin_or_port_name"
  }
  ```
  ```

get_lib_clock_tree_path_delay

```
get_lib_clock_tree_path_delay
[-help]
-base_pin base_pin_name
[-delay_type {max | min}]
[-edge {rise | fall}]
[-mode analysis_mode_name]
[-power_domain power_domain]
-transition transition_time
-view view_name
```

This command retrieves information about the Liberty `max_clock_tree_path` and `min_clock_tree_path` delay attributes for a library pin. You can then use Tcl to apply the command options, as required. The value returned by the `get_lib_clock_tree_path_delay` command is in the default system units, such that the user can pass to the `set_clock_latency` command directly. The same units are used for the `-transition` value.

If the library pin does not have a corresponding `min/max_clock_tree_path` delay attribute, the command returns a value of `0`. If other errors are encountered, the command fails.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_lib_clock_tree_path_delay` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_lib_clock_tree_path_delay`.
`-base_pin base_pin_name`	
	Specifies the name of the base pin for which the `min/max_clock_tree_path` attribute value is to be retrieved. This is a required parameter. *Data_type*: (base_pin), required
`-delay_type {max | min}`	
	Specifies whether to use `max` or `min` delays. You can specify either `max` or `min` to retrieve the `max_clock_tree_path` and `min_clock_tree_path` delay values, respectively. *Default*: `max` *Data_type*: enum, optional
`-edge {rise | fall}`	
	Specifies whether the delay should be retrieved for the rising edge or the falling edge of the signal. *Default*: `rise` *Data_type*: enum, optional
`-mode analysis_mode_name`	Specifies the Liberty timing library mode value to be used while retrieving the delay attributes for the library pin. If no mode definition is available, the default look-up table (LUT) is used. The detailed use model is provided below. **User-Specified Item**: **Software Behavior** • mode + delay_type: Use the specified mode and the specified delay_type LUT • mode: Use the specified mode and the first max LUT • delay_type: Use the first specified delay type LUT • No mode and no delay type: Use the first max LUT For more information about setting modes, see `set_mode`. *Data_type*: string, optional
`-power_domain power_domain`	
	Specifies the name of the power domain. This parameter is only required to be specified when the same base cell has different models between different power domains. *Data_type*: (power_domain), optional

`-transition transition_time`	
	Specifies the input transition time. This is a required parameter. *Data_type*: float, required, min=0, max=99
`-view view_name`	
	Specifies the analysis view name. This is a required parameter. *Data_type*: (analysis_view), required

Examples:

- Use the following command to retrieve the value of `max_clock_tree_path` delay at the rising edge of the specified pin:
  ```
  get_lib_clock_tree_path_delay -base_pin macro_lib_cell/CLK -view setup_func_m40 -transition 0.1
  ```
- Use the following command to retrieve the value of `min_clock_tree_path` delay at the falling edge of the specified pin:
  ```
  get_lib_clock_tree_path_delay -base_pin macro_lib_cell/CLK -view setup_func_m40 -delay_type min -edge fall -transition 0.1
  ```
- Use the following command to retrieve the value of `max_clock_tree_path` delay when `macro_lib_cell` is specified only in the `setup_func_m40c` view of `PD_TOP` power domain:
  ```
  get_lib_clock_tree_path_delay -base_pin macro_lib_cell/CLK -view setup_func_m40 -power_domain PD_TOP -transition 0.1
  ```

- The following section in Clock Tree Synthesis chapter of *Innovus Stylus Common UI User Guide*
  - Converting Library Path Delays to Clock Latencies

get_skew_group_delay

```
get_skew_group_delay
[-help]
[-check_type {setup | hold}]
[-delay_corner delay_corner]
[-delay_type {early | late}]
[-edge {rise | fall}]
[-exclude_pin_insertion_delays]
-skew_group skew_group_name
[-skew | -longest | -shortest ]
[-path_length distance_metric | -summarize_stage_depth cell_type_list]
[-all_active_sinks | -to pin | -from pin | -through pin ]
[-virtual_delays_only | -real_delays_only ]
[-wire_delays_only | -cell_delays_only ]
[-delay_corner delay_corner ]
```

By default, this command returns the longest source-to-sink delay for the specified skew group. Alternatively, you can use `-shortest` to return the shortest source-to-sink delay, or `-skew` to return the difference between the shortest and longest source-to-sink delay.

Optional arguments let you restrict the set of pins considered. For example, use `-to` to return the longest delay to the specified sink pin, use `-delay_type` and `-delay_corner` to specify how delays are calculated, and use `-wire_delays_only` to specify which delays are considered.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_skew_group_delay` parameter. For all of its parameters, use the man command: `man get_skew_group_delay`.
`-all_active_sinks`	Specifies that the result should be a tcl dict of pairs of sink and delay, describing delays for all the active sinks of the `latency_a sink_b latency_b ... sink_n latency_n}`.
`-cell_delays_only`	Specifies that CTS only considers cell delays when calculating delays and ignores wire delays. *Data_type*: bool, optional
`-check_type {setup | hold}`	
	Specifies whether to use setup or hold timing as the check type to use for the specified skew group. If a check type is specified, but the `-delay_type` parameter is not specified, the software behaves in the following ma • `-check_type -setup` will mean `-delay_type -late` • `-check_type -hold` will mean `-delay_type -early` **Note**: If a check type is not specified, the software will always look at what the views permit, preferring the “setup” vie *Data_type*: enum, optional
`-delay_corner delay_corner`	
	Specifies the delay corner to use when calculating delays. If this parameter is not specified, the software will use the delay corner specified using the CTS attribute, `cts_primar` corner is found, the software will error out. **Note**: For information about the attribute, `cts_primary_delay_corner`, see the cts Category Attributes chapter. *Data_type*: (delay_corner), optional
`-delay_type {early | late}`	
	Specifies whether to use early or late half delays. When `early` is specified, CTS uses only early path timing data to calculate delay, for the clock edge specified. When timing data to calculate delay, for the clock edge specified. **Note**: If the delay type is not specified but the check type is specified as “setup”, the software will consider the delay t software will consider the delay type as “early”. *Data_type*: enum, optional

`-edge {rise | fall}`	Specifies the edge of the specified pin for which delay information is to be calculated. When `fall` is specified, CTS uses only `falling` clock edge timing data to calculate delay. When `rise` is specified, C data to calculate delay. *Data_type*: enum, optional
`-exclude_pin_insertion_delays`	Specifies that the delay should exclude pin insertion delays.
`-from` *pin*	Specifies the pin to query delays from. This means that only paths from the given pin to a sink of the skew group will (pin|port), optional
`-longest`	Specifies that CTS will return the delay of the longest source-to-sink path within the skew group. This is the default o *Data_type*: bool, optional

`-path_length {half_perim pin_to_pin_steiner routed}`	Specifies that CTS will report by the distance from the root measured using the specified distance metric. You can ch metrics:
	• `half_perim`: The sum of the Manhattan distances between terminals on the path. This is not blockage-aware and
	• `pin_to_pin_steiner`: The sum of lengths calculated using a pin-to-pin steiner route. This is blockage-aware and i
	• `routed`: The sum of pin-to-pin paths calculated on the full steiner for each net. This is blockage-aware but is not su
	The routed metric is best post-CTS as it measures the actual clock path. The other metrics are good for pre-CTS alth CTS. For pre-CTS, the `half_perim` metric is fast to calculate while the other metrics are slow.
	Example:
	`get_skew_group_delay -skew_group skew_group:clk/default_constraint_mode -longest -path_length half_per`
	`get_skew_group_delay -skew_group skew_group:clk/default_constraint_mode -longest -path_length half_per 930.0045`
	Note:
	• You can only specify one metric at a time.
	• You have to specify a skew group and that the length reported will be from the skew group sources to the skew gr clock tree. The calculated length will take account of any cells on the clock path, which may increase the path len The -longest, -shortest, and -skew options work the same. This means that the software looks at all skew group si longest/shortest distance. This sink will not always be the same with the three metrics.
	• This parameter is mutually exclusive with the `-summarize_stage_depth` parameter.
	Data_type: enum, optional

`-real_delays_only`	Specifies that CTS only considers real delays in the design. It will not include the virtual delays added by trial CTS to *Data_type*: bool, optional
`-shortest`	Specifies that CTS will return the delay of the shortest source-to-sink path within the skew group. *Data_type*: bool, optional
`-skew`	Specifies that CTS will return the difference between the shortest and longest source-to-sink delays within the skew *Data_type*: bool, optional
`-skew_group` *skew_group_name*	
	Specifies the name of the skew group for which the delay information will be returned. This is a required parameter. *Data_type*: string, required
`-summarize_stage_depth` *cell_type_list*	

	Specifies that the command will consider the number of cells of the specified type(s) in the tree, instead of considerin inverter, logic, clock_gate, and generator. You can also specify `*` to include all cell types.
	For example, the following command tells you the number of buffers and inverters along the specified path type in the
	`get_skew_group_delay -summarize_stage_depth {buffer inverter} -skew_group m_dsram_clk/PM_HL_FUNC`
	Note: The `*` setting is not used in combination with any other cell type. For example, the below is not a valid setting.
	`-summarize_stage_depth {* buffer}`
	Note: This parameter is mutually exclusive with the `-path_length` parameter.
	Data_type: list, optional

`-through pin`	Specifies the pin to query delays through. This means that only paths from a source of the given skew group, through group, will be considered. *Data_type*: (pin|port), optional
`-to pin`	Specifies the pin to query delays to. This means that only paths from a source of the given skew group to this pin will *Data_type*: (pin|port), optional
`-virtual_delays_only`	Specifies that CTS will return the skew, shortest path delay, or longest path delay only considering the virtual delays will not include real delays added by clustering buffers and existing cells in the design. *Data_type*: bool, optional
`-wire_delays_only`	Specifies that CTS will return the skew, shortest path delay, or longest path delay only considering the wire delays in *Data_type*: bool, optional

Examples

- Use the following attribute to list all active skew groups in all clocks:
  ```
  get_db skew_groups
  m_clk/PM_HL_FUNC m_digit_clk/PM_HL_FUNC m_dsram_clk/PM_HL_FUNC m_ram_clk/PM_HL_FUNC m_rcc_clk/PM_HL_FUNC m_spi_clk/PM_HL_FUNC
  refclk/PM_HL_FUNC
  ```
- Use the following attribute to list the sinks in the specified skew group:
  ```
  cts_sinks -skew_group m_clk/PM_HL_FUNC
  TDSP_DS_CS_INST/g395/A1 ROM_512x16_0_INST/CLK SPI_INST/present_state_reg[0]/CP SPI_INST/dflag_reg/CP S..
  ```
- Use the following command to get the longest source to sink delay for the specified sink:
  ```
  get_skew_group_delay -skew_group m_clk/PM_HL_FUNC -to SPI_INST/dflag_reg/CP
  ```
- Use the following command to get the number of buffers and inverters along the specified path type in the skew group, `PM_HL_FUNC`:
  ```
  get_skew_group_delay -summarize_stage_depth {buffer inverter} -skew_group  m_dsram_clk/PM_HL_FUNC
  ```
  The software returns the following value:
  ```
  4
  ```

gui_ctd_close

```
gui_ctd_close
[-help]
[-all | -id WindowIDName]
```

Closes open CTD windows. When no parameter is specified, the command closes the current active CTD window.

Parameters

`-help`	Outputs a brief description that includes type and default information for each gui_ctd_close parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_ctd_close`.
`-all`	Closes all open CTD windows. *Data_type*: bool, optional
`-id` *WindowIDName*	Closes the CTD window with the specified window ID. **Note**: The parameters, `-all` and `-id` are mutually exclusive. *Data_type*: string, optional

Examples

- The following command closes all CTD windows in the current session:
  ```
  gui_ctd_close -all
  ```
- The following command closes the CTD window with the ID, `user_id2`:
  ```
  gui_ctd_close -id user_id2
  ```

Related Information

- Clock Menu chapter of the *Innovus Stylus Common UI Menu Reference*.

gui_ctd_get_title

```
gui_ctd_get_title
[-help]
[-all | -id WindowIDName]
```

Retrieves the titles of the CTD windows. If no parameters are specified, the command retrieves the title of the current active CTD window.

Note: Before using this command, ensure that a CTD window is open. You can open a CTD window using the `gui_open_ctd` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_get_title` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_ctd_get_title`.
`-all`	Retrieves the IDs of all CTD windows. *Data_type*: bool, optional
`-id` *WindowIDName*	Retrieves the title of the CTD window with the specified ID. **Note**: The parameters, `-all` and `-id` are mutually exclusive. *Data_type*: string, optional

Examples

- The following command retrieves the titles of all CTD windows in the current session:

  ```
  gui_ctd_get_title -all
  ```

  {user_id1 : Clock Tree Debugger : title1} {user_id2 : Clock Tree Debugger : title2} {user_id3 : Clock Tree Debugger : title3}
- The following command retrieves the title of the CTD window with the ID, `user_id2`:

  ```
  gui_ctd_get_title -id user_id2
  ```

  ```
  user_id2 : Clock Tree Debugger : title2
  ```

  where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and `title2` is the mapping title for this window.

gui_ctd_get_window_id

```
gui_ctd_get_window_id
[-help]
[-all]
[-detail]
```

Retrieves the IDs of the CTD windows. If no parameters are specified, the command retrieves the window ID of the current active CTD window. For example, if you create a window with the ID, `user_id`, and then run this command without specifying any parameters, the software displays the following information:

```
gui_ctd_open -title my_title -id user_id
gui_ctd_get_window_id
user_id
```

Note: Before using this command, ensure that a CTD window is open. You can open a CTD window using the `gui_ctd_open` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_get_window_id` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_ctd_get_window_id`.
`-all`	Retrieves the IDs of all CTD windows. *Data_type*: bool, optional
`-detail`	Retrieves the IDs of CTD windows, with a mapping to their titles. *Data_type*: bool, optional

Examples

- The following command retrieves the ID of all CTD windows in the current session:

  ```
  gui_ctd_get_window_id -all

  user_id1 user_id2 user_id3
  ```

- The following command retrieves the IDs of CTD windows, with a mapping of their titles:

  ```
  gui_ctd_get_window_id -detail

  user_id2 : Clock Tree Debugger : title2
  ```

  where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and `title2` is the mapping title for this window.

- `gui_ctd_set_title`
- `gui_ctd_highlight`
- Clock Menu chapter of the *Innovus Stylus Common UI Menu Reference*.

gui_ctd_highlight

```
gui_ctd_highlight
[-help]
[-color color_name]
[-from clock_root]
[-index color_index]
[-out_file file_name]
[-to sink | -through instance_name]
```

Highlights the clock tree path from the clock root to the pin or from one pin to the other if the two pins are on the same path using the specified color or color index. The highlighted clock tree path can be viewed in the Clock Tree Viewer of the CCOpt Clock Tree Debugger (CTD). You can also use the Highlight Clock Path option in the context menu of the CTD to highlight the complete clock tree path of a selected pin to the clock root.

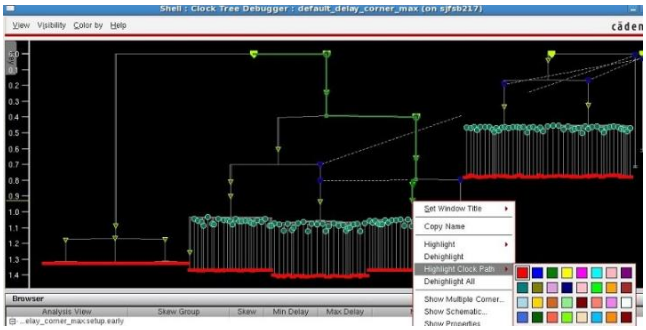
Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_highlight` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_ctd_highlight`.
`-color color_name`	Specifies the color to be used for highlighting the clock tree path that is being traced. *Default*: red *Data_type*: string, optional
`-from clock_root`	Specifies the instance name as the starting point of the highlight. If this parameter is not specified, the starting point of the highlight is the clock root of the specified sink. *Data_type*: string, optional
`-index color_index`	Specifies the range of colors that can be used to highlight the clock tree path. Minimum is 1 and maximum is 32. The range corresponds to the colors in the color picker provided in the *Highlight Clock Path* option in the context menu of the Clock Tree Viewer. The number 1 means red, 2 means blue, and so on. An example is shown in the image below. *Default:* 1 or red. *Data_type*: int, optional, min=1, max=32

`-out_file file_name`	Specifies the name of the file in which the physical information for each instance and net in the clock path being highlighted will be dumped.
	The following information is saved in the file:
	`Name Cell Status Location Wire Length`
	`CLK_ROOT PAD Fixed (20,40)`
	`net_1 don't_touch 12.5`
	`Buf_1 BUFX1 placed (100,180)`
	`net_2 35`
	`Buf_2 BUFX2 placed (200, 120)`
	Name is the instance name or the net name
	Cell is the instance cell type. This information is only for instances
	Status is the place status for an instance and constrain status for a net. For dont_touch nets, the status is '`dont_touch`', otherwise this column is left blank
	Location is the physical location of the instance or the coordinate of that instance
	Wire Length is only for nets
	Data_type: string, optional

`-through instance_name`	Specifies the instance or pin through which the path should be traced. *Data_type*: string, optional
`-to sink`	Specifies the end point of the highlighted path. *Data_type*: string, optional

The image below shows the clock tree path highlighted in green, which corresponds to the color index 3. It also shows the color picker with the range of colors included in the color index.

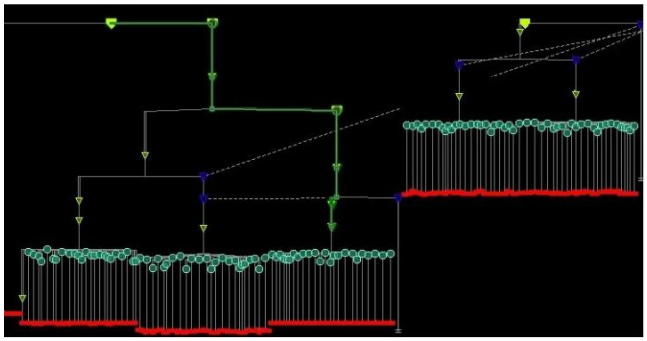


Example

The following command highlights the clock tree path for the specified pin, `ff1`, from the clock root in green color:

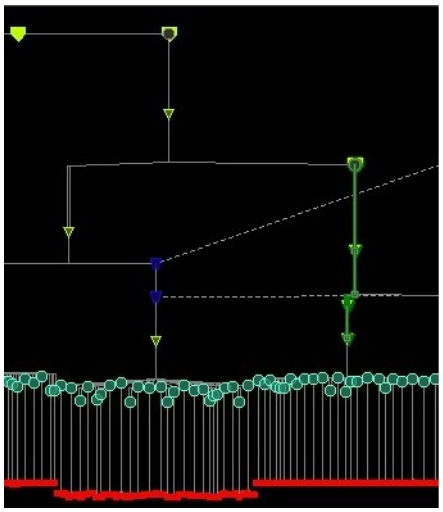
- `gui_ctd_highlight -to ff1 -index 3`

  The CTD shows the following:

- The following command highlights the path between two sinks that are on the same path, in green color:

  ```
  gui_ctd_highlight -to ff1  -from u1  -index 3
  ```

Related Information

- `gui_ctd_open`
- `gui_ctd_close`
- `gui_ctd_get_window_id`
- `gui_ctd_get_title`
- `gui_ctd_set_title`
- The following section in Clock Menu chapter of the *Innovus Stylus Common UI Menu Reference*
  - Context Menu of the Clock Tree Debugger

gui_ctd_open

```
gui_ctd_open
[-help]
[-id window_id_name]
[-include_reporting_only_skew_groups]
[-title ctd_window_id]
[-unit_delay]
```

Opens a Clock Tree Debugger (CTD) window with the user-defined window ID and title.

When run without specifying the ID and title, the command opens a CTD window with a system default window title. By default, the window title is the name of the current analysis corner, which shows in the CTD window. For example, "Clock Tree Debugger - func_rcbest".

By default, all CTD windows have their unique window ID. The mechanism of the default window ID is `ctdMain_0, ctdMain_1, ctdMain_2, ctdMain_3`....and so on. So, by default, the window ID of a new opened Clock Tree Debugger window is `ctdMain_0`.

The information in the title comprises the following:

```
Session title: Window type: Window title
```

where,

Window type is always “Clock Tree Debugger”.

If the user-specified session title is “`my_test.tcl`”, and the default primary analysis corner is “`primary_corner`”, then with `gui_ctd_open`, the total set of the window title line will be:

```
my_test.tcl : Clock Tree Debugger : primary_corner
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_open` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_ctd_open`.
`-id window_id_name`	Opens a Clock Tree Debugger window with a user-specified window ID. By default, the window IDs will be `ctdMain_0`, or `ctdMain_1`, and so on. *Data_type*: string, optional
`-include_reporting_only_skew_groups`	When this parameter is specified, the GUI includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `cts_skew_group_constrains` attribute is set to `none`. Such a skew group imposes no clock balancing constraint and is not considered by CTS. By default, this setting if off, which means the reporting-only skew groups are omitted from the CTD. **Note**: Once the CTD is started, you cannot add or remove the reporting-only skew groups from those that are displayed. Start a new CTD window specifying the skew group filtering. *Data_type*: bool, optional
`-title ctd_window_id`	Specifies the user-defined title for the CTD window. Open a Clock Tree Debugger window with a user specified title. For example, if you specify `my_title` as the window title, when session title is `my_test.tcl` and the primary analysis corner is `primary_corner`, then the total set of the window title line will be: `my_test.tcl : Clock Tree Debugger : my_title` **Note**: The window’s ID if not specified using the `-id` parameter, will be system default ID. To view the default window ID, use the `gui_ctd_get_window_id` command. *Data_type*: string, optional

`-unit_delay`	Opens the CTD window in unit delay mode. The unit delay lets you view the depth of clock tree objects easily. This is useful when you have large designs with deep gate-level trees. When debugging clock trees, you can use this view to check how the clock trees are balanced by looking at the depth of the clock trees. Although, the unit delay mode can also be enabled using the *Unit delay* submenu in the *Visibility* menu of the CTD but this is only valid after running clock tree synthesis, and you still need to invoke timing calculation and extraction, which are time consuming. You can use this parameter to open the CTD in unit delay mode even if the design is not placed or without performing CTS. When the CTD is opened in this mode, the following options in CTD menus are disabled: *Visibility* menu: • Timing windows • Delays • Unit delay *Color by* menu and the *Control* panel: • Transition time • Total net cap • Max cap violation • Skew • Setup slack • Hold slack • Timing windows This is shown in below image.  *Data_type*: bool, optional

Examples

- The following command creates a CTD window ID with the default name, `ctdMain_0`:

  ```
  gui_ctd_open
  ```

  When you use the `gui_ctd_get_window_id` command to list the window ID, you get the above window ID:

  ```
  gui_ctd_get_window_id
  ctdMain_0
  ```

- The following command creates a CTD window ID with the user-specified name, `my_test`:

  ```
  gui_ctd_open -id my_test
  ```

  Now, when you use the `gui_ctd_get_window_id` command to list all window IDs, you get the above window IDs in the list:

```
gui_ctd_get_window_id -all
ctdMain_0 my_test
```

If you use the `gui_ctd_open` command with an existing window ID, it will pop up the corresponding CTD windows instead of creating a new one. This command will open the existing window, `my_test`.

```
gui_ctd_open -id my_test
```

- The following command creates a CTD window ID, `my_test` and CTD window title of `myTest.tcl`:

```
gui_ctd_open -id my_test -title myTest.tcl
```

When you use the `-detail` parameter of the `get_ctd_win_id` command, the following information is returned:

```
gui_ctd_get_window_id -detail
my_test "Clock Tree Debugger:myTest.tcl: func_rcbest"
```

where, `my_test` is the specified window ID, window type is Clock Tree Debugger, window title is `myTest.tcl`, and `func_rcbest` is the name of the current analysis corner.

gui_ctd_write_histogram

```
gui_ctd_write_histogram
[-help]
[-csv]
-file fileName
[-id windowID]
```

Saves the CTD histogram to a file. By default, the file type is PNG. You can also specify that the file be saved in the CSV format.

Before using this command to save the histogram view, first open and configure the histogram in the GUI, including skew group and delay corners.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_write_histogram` parameter. For a detailed description of the command and all of its parameters, use the man command: man `gui_ctd_write_histogram`.
`-csv`	Saves the histogram in CSV format. This parameter is optional. By default, the histogram is saved as a PNG file.
`-file` *fileName*	Specifies the name of the file where you want to save the histogram. This parameter is required.
`-id` *windowIDName*	Specifies the ID of the active CTD window. The default value is the ID of the current active window.

Example

The following command saves the histogram in the `histogram1.csv` file.

```
gui_ctd_write_histogram -file histogram1 -csv
```

gui_ctd_write_view

```
gui_ctd_write_view
[-help]
-file fileName
[-id windowID]
[-legend_on]
[-type {PNG | GIF}]
```

Saves the current snapshot of the clock tree viewer into a file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_write_view` parameter. For a detailed description of the command and all of its parameters, use the man command: man `gui_ctd_write_view`.
`-file` *`fileName`*	Specifies the name of the file where you want to dump the display image. This parameter is required.
`-id` *`windowIDName`*	Specifies the window ID whose display is to be saved. The default value is the returned value of command `gui_ctd_get_window_id`.
`-legend_on`	Saves the whole window including the panels that are open.
`-type {PNG | GIF}`	Specifies whether the format of the image should be GIF or PNG. The default format is PNG.

Example

The following command saves the view snapshot in the `snapshot1.png` file.

```
gui_ctd_write_view -file snapshot1 -type PNG
```

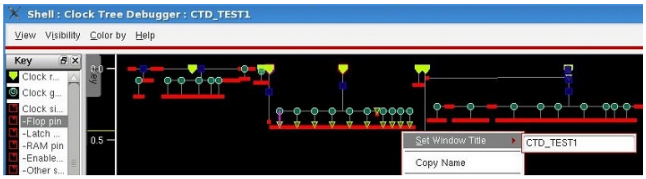
gui_ctd_set_title

```
gui_ctd_set_title
[-help]
title
[-id window_id_name]
```

Specifies the title of the CTD window. By default, this command is used to set the title of the current active CTD window either if a unique ID has not been specified for this window or if you want to change the existing window ID.

You can also set the window title from the context menu of the Clock Tree Viewer in the CTD. Click Set Window Title, type the title for the CTD session, and press enter. The new title appears in the top bar of the CTD. This is shown in below image.



Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_ctd_set_title` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_ctd_set_title`.
`-id` *`window_id_name`*	
	Specifies the ID of the window whose title is to be set. If there are several CTD windows open in the current session, with window IDs, `user_id1, user_id3, user_id3`, and so on, with corresponding window titles, `title1, title2, title3`, and so on, then the following command will only change the `title1` of window with ID, `user_id1`, to `my_new_title`. `gui_ctd_set_title my_new_title -id user_id1` *Data_type*: string, optional
`title`	Specifies the new window title to be given to the specified window. This parameter is required. *Data_type*: string, required

Examples

- The following command sets the window title of the current CTD window, `my_title`, to `my_new_title`:

  ```
  gui_ctd_set_title my_new_title
  ```

  The active CTD window title will be changed from:

  ```
  my_test.tcl : Clock Tree Debugger : my_title
  ```

  to:

  ```
  my_test.tcl : Clock Tree Debugger : my_new_title
  ```

- The following command retrieves the window IDs of CTD windows, with a mapping of their window titles:

  ```
  gui_ctd_get_window_id -detail
  ```

  ```
  user_id2 : Clock Tree Debugger : title2
  ```

where, `user_id2` is the window ID, Clock Tree Debugger is the window type, and title2 is the mapping title for this window.

gui_ctd_zoom

```
gui_ctd_zoom
[-help]
[-id string]
[-in | -out | -selected]
[-vertical_range {ymin ymax}]
```

Zooms into or out of the CTD window.

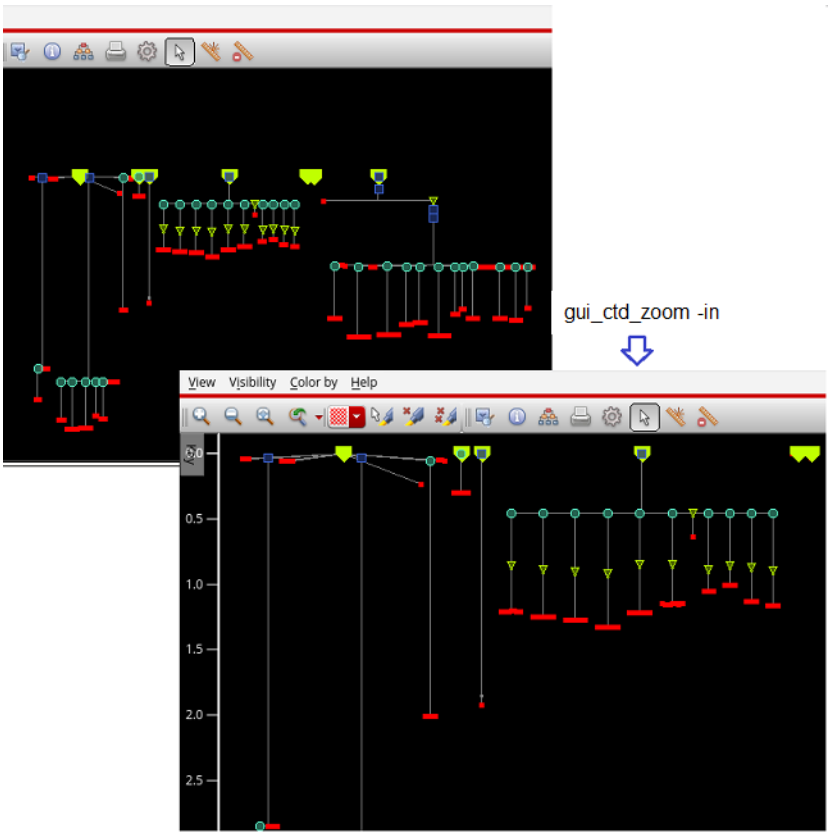
Parameters

`-help`	Prints a brief description of the `gui_ctd_zoom` command. For a detailed description of the command, use the `man` command: `man gui_ctd_zoom`.
`-id string`	Specifies the window ID of the CTD window in which to zoom in or zoom out. *Data_type*: string, optional
`-in`	Zoom into the CTD window. *Data_type*: bool, optional
`-out`	Zoom out of the CTD window. *Data_type*: bool, optional
`-selected`	Zoom to enclose all selected objects. *Data_type*: bool, optional
`-vertical_range {ymin ymax}`	Zoom to a specific vertical latency range. If CTD is in timing-based mode, the window will zoom to the clock tree parts where latency is between *ymin* and *ymax*, and the unit is the same as global timing unit. If CTD is in unit delay mode, the window will zoom to the clock tree parts where stage depth is between *ymin* and *ymax*. For example, if CTD is in timing-based mode, then the command, `gui_ctd_zoom -vertical_range {0 1.5}` will zoom to the clock tree parts where latency is between 0 and 1.5, the unit is the same as `get_time_unit`. If CTD is in unit delay mode, then the command, `gui_ctd_zoom -vertical_range {0 1.5}` will zoom to the clock tree parts where stage depth is between 0 and 1.5. **Note**: The window only zooms in vertical.

Examples

Use the following command to zoom in to the CTD:

```
gui_ctd_zoom -in
```



Select an instance and use the following command to zoom into the selected instance:

```
gui_ctd_zoom -selected
```

merge_clock_tree_instances

```
merge_clock_tree_instances
[-help]
[-only_above_flops]
[-only_clock_gates]
[-only_clock_logics]
```

When specified without any parameters, the command merges both clock gates and clock logic. You can specify the parameters, `-only_clock_gates` or `-only_clock_logic` to merge only clock gates or clock logics, respectively. The command ignores the settings of the `cts_merge_clock_logic and cts_merge_clock_gates` attributes.

The log will show the names of instances that will be merged by saying, “Merging clock gates...”, or "Merging clock logics", or ”Merging clock gates and clock logics". The summary tables in the log will list the number of instances that are merged. This is shown in the "Examples" section below.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `merge_clock_tree_instances` parameter. For a detailed description of the command and all of its parameters, use the man command: `man merge_clock_tree_instances`.
`-only_above_flops`	
	Specifies that CCOpt should merge clock gates that only drive flops and not the ones that drive RAMs, latches, black boxes, or any other clock tree sink that is not a flop. *Data_type*: bool, optional
`-only_clock_gates`	
	Specifies that only clock gates should be merged and not clock logics. *Data_type*: bool, optional
`-only_clock_logics`	
	Specifies that only clock logics should be merged and not clock gates. *Data_type*: bool, optional

Examples

- When you run the following command, the summary table that is generated is shown below:
  `merge_clock_tree_instances -only_clock_gates`

  Summary of the merge of duplicate siblings

```
------------------------------------------------------------
Description                          Number of occurrences
------------------------------------------------------------
Total clock gates                              2
Globally unique enables                        1
Potentially mergeable clock gates              1
Actually merged clock gates                    0
------------------------------------------------------------

------------------------------------------------------
Description                       Number of occurrences
------------------------------------------------------
Total clock logics                         2
Actually merged clock logics               0
------------------------------------------------------

------------------------------------------------------------
Cannot merge reason                  Number of occurrences
------------------------------------------------------------
UniqueUnderParent                              1
ClockLogicMergingDisabledOnTree                2
------------------------------------------------------------
```

  In the above example, the first table is for clock gates – there are two in this design. No clock gates were merged.
  The second table is for clock logics – there are two in this design. No clock gates were merged.
  The third table provides the reasons as to why the instances could not be merged. Logic merging has been disabled because of the `-only_clock_gates` parameter. If the logics cannot be merged, then the clock gates are not siblings and cannot be merged.

- When you run the following command, the summary table that is generated is shown below.
  `merge_clock_tree_instances`

```
Summary of the merge of duplicate siblings
------------------------------------------------------
Description                     Number of occurrences
------------------------------------------------------
Total clock gates                        2
Globally unique enables                  1
Potentially mergeable clock gates        1
Actually merged clock gates              1
------------------------------------------------------

--------------------------------------------------
Description                    Number of occurrences
--------------------------------------------------
Total clock logics                      2
Actually merged clock logics            1
--------------------------------------------------

---------------------------------------------
Cannot merge reason     Number of occurrences
---------------------------------------------
UniqueUnderParent                1
---------------------------------------------
```

  In the above example, the clock logics got merged - one logic got merged with its sibling logic. This means that the clock gates became siblings and were merged.

Related Information

- The following attributes:
  - `cts_clock_gating_opt_only_above_flops`
  - `cts_cannot_merge_reasons`

For more information about the above attributes, see the cts Category Attributes chapter.

place_detail_clock_tree

```
place_detail_clock_tree
[-help]
```

Performs clock placement refinement with cell halos. Use this command at the end of CTS to ensure that all clock cells are placed legally and obey cell halo and density constraints. You can use `report_clock_tree_halo_violations` to report any clock halo constraint violations. Then run `place_detail_clock_tree` to fix any reported violations. You can re-run the `report_clock_tree_halo_violations` command to verify that these instances have been fixed.

Parameter

`-help`	Outputs a brief description for the `place_detail_clock_tree` command parameter. For a detailed description of the command, use the man command: `man place_detail_clock_tree`.

Example

The following set of commands show that halo violations are reported with `report_clock_tree_halo_violations` command, then the `place_detail_clock_tree` command performs clock placement refinement with cell halos and then `report_clock_tree_halo_violations` is re-run to verify that the instances have been fixed:

```
report_clock_tree_halo_violations

  - Cell Halos

read_cts_config

```
read_cts_config
[-help]
input_path
```

Reads the CTS configuration from the specified directory.

Note: The CTS configuration will not be read when `read_db -mmmc_file` option is set. In this case, the software issues the following warning:

```
**WARN: (IMPIMEX-4016): The saved CCOpt configuration will not be restored, as the -mmmc_file option has been set. To restore the CCOpt configuration try restoring the design again without using the -mmmc_file option.
```

Parameter

`-help`	Outputs a brief description of the `read_cts_config` parameter.
input_path	Specifies the directory path from which to read the CTS configuration. *Data_type*: string, required

Example

- The following command reads the CTS configuration from the specified path:
  ```
  read_cts_config ../ccopt_tutorial/work
  ```

Related Commands

- `check_cts_config`
- `reset_cts_config`
- `write_cts_config`

report_cts_cell_name_info

```
report_cts_cell_name_info
[-help]
```

Returns the list of cell name codes. All new cell instances created by CTS have an identifying code in their name to let you determine why that cell was created. This command lists all available codes and their meanings.

Parameters

`-help`	Outputs a brief description for the `report_cts_cell_name_info` parameter. For a detailed description of the command, use the man command: `man report_cts_cell_name_info`.

Example

- The following command returns a list of all available codes and their meanings:

```
report_cts_cell_name_info

Creators:
CTSG Unnamed - this should not be used any more.
cuk Cts: Unknown creator, will not appear in the netlist.
ccl_a Cts: Created during clustering by the agglom clustering algorithm.
cbi Cts: Created by the swapping buffers and inverters for power.
cex Cts: Existing cells in the clock tree which cannot be removed.
coi Cts: Cells created as a result of cancelling out inversions
lbl Cts: Created by the clustering process to meet the slew target
ccl Cts: Created by the clustering process to meet the slew target
ccd Cts: Created by clustering for balancing the tree - these cells are not necessary to meet the slew target.
cci Cts: Created by the clustering process to fix inversion.
csf Cts: Created by the CTS slew fixing step in cases where clustering did not meet the slew target.
cms Cts: Created during the process of physically moving clock gates to improve their enable timing.
cid Cts: Created by CTS on the outputs of weak driving cells to reduce insertion delay.
cdb Cts: Created by CTS to balance the delays in the clock tree.
cdbw Cts: Created by CTS to balance the delays in the clock tree.
cwb Cts: Created by CTS to balance the wire delays in the clock tree.
cfo Cts: Created by CTS to reduce fanout skew.
csk Cts: Created by the CTS skew fixing step to finely balance the clock tree.
cmf Cts: Created by CTS to buffer long nets.
cbc Cts: Created by the clock tree conditioning step to clone off sub trees that cannot optimized by gated synthesis, such as those
parts above RAMs, black boxes, and lockup latches.
css Cts: Created by the early cloning of simple sink allocations.
cdc Cts: A clock driver created by adding driver cell process for attribute cts_add_driver_cell.
cpd Cts: A clock driver created below an input port or above an output port specified by attribute cts_add_port_driver.
ccg Cts: A clock gate created by one of the gated synthesis algorithms.
cse Cts: A clock driver created above exclude pins to remove them from the clock tree.
cfh Cts: A clock driver created as part of a flexible H-tree.
cat Cts: Created by the add_clock_tree_source_group_roots command
cpc_drv Cts: A clock driver created by post conditioning.
cpc_sk Cts: A clock driver created by post conditioning.
PRO Post-route optimization.
PRO_drv Post-route optimization.
PRO_sk Post-route optimization.
sfc Cloned by slew fixing.
ccc Cts: Created by the clone_clock_cells command.
grb Cts: A clock driver created by global route buffering.
sgb Cts: A clock driver created by source group balancing.
idc Cloned to reduce insertion delay
vgb Cts: A clock driver created by VG buffering.
USK skewClock
cff Cts: A clock driver created by fanout fixing.
```

report_ccopt_worst_chain

```
report_ccopt_worst_chain
[-help]
[-check_type {setup | hold}]
[-out_file filename]
[-through pin | -through_file filename]
[-view viewname]
```

This command displays information about the worst chain, which is the chain that contains the path with the worst negative slack or WNS in the design. CCOpt is able to move slack between paths, so the fundamental timing constraint is not from one flop to the next, but chains of flop–to–flop paths. At each flop, timing can be shifted before or after the flop in order to make the physical optimization problem easier.

The command reports a chain as a series of nodes linked together by timing paths. Additionally, it contains information to let you determine how well the chain has been optimized. This report contains the following information:

- The timing chain containing the worst flop-to-flop path, which is identified in the report output by the string, "*WNS*"
- Timing path and constraint information to show why that WNS cannot be improved

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_worst_chain` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_ccopt_worst_chain`.
`-check_type setup | hold`	
	Specifies whether setup views or hold views are used for the report. *Default*: By default, only the worst chain for setup views is reported. *Data_type*: enum, optional
`-out_file filename`	Specifies that a copy of the contents of the report will be saved to the specified file name. *Data_type*: string, optional
`-through pin`	Specifies the path through which the worst chain is being reported. When this parameter is specified, the chain containing the given pin or port is reported. The timing path which contains the `-through` pin is labelled with "*SEL*". When this parameter is not specified, the chain with the WNS timing path is reported. The WNS timing path in the chain is labelled "*WNS*". *Data_type*: (pin|port), optional
`-through_file filename`	
Creates a worst chain report for each pin or port in the specified file. **Note**: The parameters, `-through` and `-through_file` are mutually exclusive. *Data_type*: string, optional	
`-view viewname`	Specifies the view for which the worst chain is being reported. *Data_type*: (analysis_view), optional

Example

Following is an example of the report output:

```
report_ccopt_worst_chain
```

report_clock_tree_convergence

```
report_clock_tree_convergence
[-help]
[-out_file file_name]
```

This command is used to report a summary of the convergence above clock sinks and to identify the names of sinks with the highest number of clock path networks. If there are sinks with many paths leading to them, there can be a considerable impact on runtime. Reducing the complexity of the logic, or excluding sinks that need not have timing constraints from the clock trees can help improve runtime. An example of the report is shown below.

```
Convergence above clock sinks
=============================
-------------------------------------------------------------------
Number of paths to sink PIOs DFFs  Other sinks Total
-------------------------------------------------------------------
1                       1    10118 0           10119
8                       54   2134  183         2371
16                      13   311   18          342
32                      2    0     0           2
700                     3    164   5           172
1400                    5    0     0           5
-------------------------------------------------------------------
Sinks with most paths leading to them
=====================================
---------------------------------
Sink             Number of paths
---------------------------------
Owest/nout[0]    1400
Owest/nout[1]    1400
Owest/nout[2]    1400
Owest/nout[3]    1400
Owest/nout[4]    1400
---------------------------------
---------------------------------
```

In the above sample report, 5 primary IOs have 1400 paths leading to them from the clock sources.The report also shows a table with the names of sinks with most paths leading to them. In the "Sinks with most paths leading to them" section of the report, the five sinks, `Owest/nout[n]`, have 1400 paths leading to them. These sinks are likely to be problematic and need to be checked.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_ccopt_clock_tree_convergence` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_clock_tree_convergence`.
`-out_file` *`file_name`*	Specifies the file name in which the report will be saved. *Data_type*: string, optional

report_clock_tree_halo_violations

```
report_clock_tree_halo_violations
[-help]
[-add_markers | -clear_markers]
[-out_file file_name]
[-max_violation_count number]
[-summary]
```

This command is used to report clock instances with clock halo violations.

By default, when the command is specified without any arguments, it will check for halo violations for clock halos defined using all of the following cts category attribute pairs:

- `cts_cell_halo_x` / `cts_cell_halo_y`
- `cts_cell_density` / `cts_adjacent_rows_legal`
- `cts_cell_halo_sites` / `cts_cell_halo_rows`

The report can be viewed as a text file and in the Violation Browser within the Stylus GUI.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_clock_tree_halo_violations` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_clock_tree_halo_violations`.
`-add_markers`	Adds any detected clock halo violations to the Violation Browser. *Data_type*: bool, optional
`-clear_markers`	Removes any markers added to the Violation Browser by the `report_clock_tree_halo_violations` command. *Data_type*: bool, optional
`-max_violation_count` *number*	Specifies the number of violations to report for each clock. *Data_type*: int, optional
`-out_file` *file_name*	Specifies the name of the file in which the contents of the report will be saved. *Data_type*: string, optional
`-summary`	Prints a report providing information about the instances with cell halos and the instances with cell halo violations or "Failed instances". This report contains a summary table titled, "Clock Cell Halo Rule Check in Summary". *Data_type*: bool, optional

Example

The following command prints the summary of the cell halo violation report:

```
report_clock_tree_halo_violations -summary
```

The software prints the following report:

```
Clock Cell Halo rule Check in Summary
=====================================

-----------------------------------------------------------
Clock       Instances with cell_halo Failed Instances
-----------------------------------------------------------
funcclk1           4                   3
funcclk2           4                   3
funcclk3           4                   2
-----------------------------------------------------------
total number of violating instances: 8
```

Use the following command to view the detailed "Clock Cell Halo Rule Violations" table.

```
report_ccopt_cell_halo_violations
```

The software prints the following report:

```
Clock Cell Halo Rule Violations
===============================

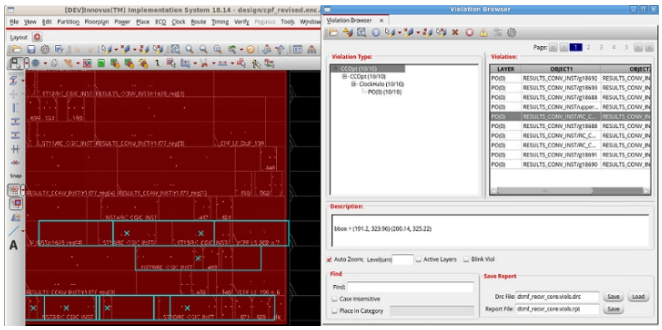
-------------------------------------------------------------------------------------------------------------------------------------------------------------
No. Cell      Instance                          In clock   Power domain  Cell Halo (x, y)   Violating instance                                  From clock    Intrusion (x, y)
-------------------------------------------------------------------------------------------------------------------------------------------------------------
 1  INVD1BWP  RESULTS_CONV_INST/g18692          m_rcc_clk  TD8PCore      (3, 0)             RESULTS_CONV_INST/RC_CG_HIER_INST8/RC_CGIC_INST  m_rcc_clk     (2.94, 1.26)
 2  INVD1BWP  RESULTS_CONV_INST/g18693          m_rcc_clk  TD8PCore      (3, 0)             RESULTS_CONV_INST/RC_CG_HIER_INST9/RC_CGIC_INST  m_rcc_clk     (2.94, 1.26)
 3  INVD1BWP  RESULTS_CONV_INST/g18688          m_rcc_clk  TD8PCore      (3, 0)             RESULTS_CONV_INST/RC_CG_HIER_INST8/RC_CGIC_INST  m_rcc_clk     (2.58, 1.26)
```

Note: The "Power Domain" column helps to understand where the halo value comes from in the case where the halo has been set per power domain.

Use the following set of commands to view the clock halo violations in the Violation Browser

- Create cell halo violations using the following attribute:
  `set_db cts_cell_halo_x 3`
- Use the following command to add the detected clock halo violations to the Violation Browser and display them in the GUI:
  `report_clock_tree_halo_violations -add_markers`

  You will see the following:



- Use the following command to clear the clock halo violations in the Violation Browser and delete markers in the GUI:
  `report_clock_tree_halo_violations -clear_markers`

  You will see the following:

report_clock_tree_structure

```
report_clock_tree_structure
[-help]
[-check_type {setup | hold}]
[-clock_trees {list_of_clock_trees}]
[-delay_corner corner]
[-delay_type {early | late}]
[-expand_below_logic]
[-expand_generated_clock_trees {independently | inline | independently_and_inline}]
[-include_reporting_only_skew_groups]
[-out_file filename]
[-show_sinks]
[-update_timing]
```

Reports the structure of the clock network as a text report. When the command is run without specfying the `-update_timing` parameter, the report format is as follows:

- The summary information is added below the name of the clock tree
- The slew, capacitance, and co-ordinate information is not included
- The input and output pin information is merged in a single line

For details, see the examples below.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_clock_tree_structure` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_clock_tree_structure`.
`-check_type {setup | hold}`	
	Specifies whether setup or hold views are used for the report. By default, setup view is used for the report. *Data_type*: enum, optional
`-clock_trees {list_of_clock_trees}`	
	Restricts the report to the specified clock trees. *Data_type*: list, optional
`-delay_corner`	Reports in the specified delay corner. By default, the software will use the primary-half delay corner that is set using the CCOpt attribute, `cts_primary_delay_corner`. *Data_type*: (delay_corner), optional
`-delay_type {early | late}`	
	Reports in the specified delay type, early or late. When late is specified, only the late half of the delay corners are reported. When early is specified, only the early half of the delay corners are reported. By default, late half of the delay corners are reported. *Data_type*: enum, optional
`-expand_below_logic`	

	When this parameter is specified, the subtree below each multi-input logic will be printed in its entirety every time it is encountered. When this parameter is not specified, then by default, the clock tree below a multi-input clock logic is reported only once, which is at the first place it is encountered in the report. Subsequent visitations of the subtree will simply note the presence of an omitted subtree, for example, "...71 `fanout omitted`". **Note**: For clock networks with ladders of reconverging clock logic, this can produce large volumes of output. *Data_type*: bool, optional
`-expand_generated_clock_trees {independently | inline | independently_and_inline}`	
	Specifies how generated clock trees should be displayed. The following options are available: `independently`: display generated clock trees at the top level. This is the default display. `inline` : display generated clock trees as fanout of their generator inputs `independently_and_inline`: display generated clock trees both at the top level and as fanout of their generator inputs *Data_type*: enum, optional
`-include_reporting_only_skew_groups`	When specified, the report additionally includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `cts_skew_group_constrains` attribute is set to `none`. Such a skew group imposes no clock balancing constraint and is not considered by CTS. By default, the reporting-only skew groups are not included in the report. *Data_type*: bool, optional
`-out_file` *filename*	Saves a copy of the report in the specified file. *Default*: `{}` *Data_type*: string, optional
`-show_sinks`	Includes all clock network sinks in the report. This parameter controls whether the clock network sinks, which are the non-generator flops/latches, are included in the report or not. By default, these are not included in the interest of minimizing the report output. Instead, a count of the number of sinks is displayed,for example. `"... 209 sinks omitted"`. When this parameter is specified, per-skew group latencies for each sink are included. **Note**: The report identifies macros in the clock tree. This means that if your clock sink is a macro, the report will show “macro sink” instead of just “sink”. *Data_type*: bool, optional
`-update_timing`	When specified, the report includes detailed timing information including pin slew, capacitance, and location along with the clock tree structure. *Data_type*: bool, optional

Examples

- Use the following command to report the structure of the clock network for the specified clock trees, `m_clk` and `m_digit_clk`:

```
report_clock_tree_structure -clock_trees {m_clk m_digit_clk}
```

A part of the report is shown below.

```
Clock tree m_clk:
Total FF: 115
Max Level: 5
  (L1) TEST_CONTROL_INST/g137/ZN (ND2D1BWP)
  \_  (L1) port TEST_CONTROL_INST/m_clk
       \_ ... (21 sinks omitted)
       \_  (L2) DMA_INST/CPF_LS_158_m_clk/I -> Z (LVLHLD2BWP)
        |   \_ ... (8 sinks omitted)
        |   \_  (L3) DMA_INST/RC_CG_HIER_INST0/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
        |       \_ ... (8 sinks omitted)
        \_  (L2) RESULTS_CONV_INST/CPF_LS_159_m_clk/I -> Z (LVLHLD2BWP)
```

```
        |   \_ ... (15 sinks omitted)
        |   \_  (L3) RESULTS_CONV_INST/RC_CG_HIER_INST1/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
        |   |   \_ ... (9 sinks omitted)
        |   \_  (L3) RESULTS_CONV_INST/RC_CG_HIER_INST2/RC_CGIC_INST/CP -> Q (CKLNQD1BWP)
        |   |   \_ ... (16 sinks omitted)
```

.....

```
Clock tree m_digit_clk:
 Total FF: 9
  Max Level: 3
    (L1) TEST_CONTROL_INST/g141/ZN (IOA21D1BWP)
    \_  (L1) port TEST_CONTROL_INST/m_digit_clk
         \_ ... (9 sinks omitted)
```

- Use the following command to report the structure of the clock network inlcuding the timing information for the specified clock tree, `m_clk`:

```
report_clock_tree_structure -clock_trees {m_clk} -update_timing
```

```
Clock tree m_clk:
TEST_CONTROL_INST/g137/ZN root output at (273.210,301.000), lib_cell ND2D1BWP, level 1, slew 9.719ns, wire_cap 0.096pF, load_cap 0.452pF
\_ port TEST_CONTROL_INST/m_clk port output, preserved by {sdc_constraint}, level 1, slew 0.000ns, wire_cap 0.000pF, load_cap 0.000pF
   \_ ... (21 sinks omitted)
   \_ DMA_INST/CPF_LS_158_m_clk/I logic input at (169.210,300.720), lib_cell LVLHLD2BWP, level 2, slew 9.720ns
   | DMA_INST/CPF_LS_158_m_clk/Z logic output at (169.770,300.860), lib_cell LVLHLD2BWP, level 2, slew 0.431ns, wire_cap 0.008pF,
     load_cap 0.006pF
   | \_ ... (8 sinks omitted)
   | \_ DMA_INST/RC_CG_HIER_INST0/RC_CGIC_INST/CP cgate input at (115.450,305.760), lib_cell CKLNQD1BWP, level 3, slew 0.431ns
   |    DMA_INST/RC_CG_HIER_INST0/RC_CGIC_INST/Q cgate output at (116.290,305.900), lib_cell CKLNQD1BWP, level 3, slew 0.298ns,
        wire_cap 0.004pF, load_cap 0.005pF
   |    \_ ... (8 sinks omitted)
   \_ RESULTS_CONV_INST/CPF_LS_159_m_clk/I logic input at (199.170,320.880), lib_cell LVLHLD2BWP, level 2, slew 9.720ns
   | RESULTS_CONV_INST/CPF_LS_159_m_clk/Z logic output at (199.730,321.020), lib_cell LVLHLD2BWP, level 2, slew 0.714ns,
     wire_cap 0.021pF, load_cap 0.015pF
```

- Use the following command to report the structure of the clock network with generated clock trees expanded inline for the specified clock trees, `m_clk` and `m_digit_clk`:

```
report_clock_tree_structure -clock_trees {m_clk m_digit_clk} -expand_generated_clock_trees inline
```

```
Clock tree m_clk:
Total FF: 115

[-use_previous_timing]
[-early_only | -late_only]
```

This command reports a summary of all defined clock trees. In particular, this report provides a summary of numbers of clock gates at different depths in each clock tree. Use the `report_clock_trees` command to monitor the amount of clock gating used in the design and the buffering used in the clock tree. You can run this command any time after defining or extracting clock trees.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_clock_trees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_clock_trees`.
`-clock_trees {list_of_clock_trees}`	
	Specifies that the report will be restricted to the specified clock trees. *Data_type*: list, optional
`-delay_corners {list_of_delay_corners}`	
	Specifies that the report will be restricted to the specified delay corners. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive. *Data_type*: (delay_corner)+, optional
`-early_only`	Specifies that only the early half of the delay corners will be reported. *Data_type*: bool, optional
`-histograms`	Specifies that histograms of key information will be displayed. *Data_type*: bool, optional
`-late_only`	Specifies that only the late half of the delay corners will be reported. *Data_type*: bool, optional
`-list_special_pins`	Specifies that the report will list individual pins that are stop, ignore, min, or other special type of pins. *Data_type*: bool, optional
`-num_capacitance_violating_pins number_of_pins`	
	Specifies the maximum number of capacitance violating pins reported in the "Max capacitance violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations. *Data_type*: int, optional
`-num_fanout_violating_nets number_of_nets`	

	Specifies the maximum number of violating fanout nets reported in the "Max fanout violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations. *Data_type*: int, optional
`-num_length_violating_nets` *number_of_nets*	
	Specifies the maximum number of `max_source_to_sink_net_length` violating nets reported in the "Max length violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations. *Data_type*: int, optional
`-num_resistance_violating_nets` *number_of_nets*	
	Specifies the maximum number of `max_source_to_sink_net_resistance` violating nets reported in the "Max resistance violation summary across all clock trees" table of the report. By default, the software reports the top 10 violations. *Data_type*: int, optional
`-num_transition_time_violating_pins` *number_of_pins*	
	Specifies the maximum number of worst slew violating pins that are reported in the "Slew violation summary across all clock trees" table. By default, the software reports the top 10 violations. *Data_type*: int, optional
`-out_file` *file_name*	Specifies that a copy of the contents of the report will be saved to the specified file name. *Data_type*: string, optional
`-skip_timing_update`	Specifies that the timing engine should not be updated. The timing engine is used to calculate the timing data that is displayed in the report. By default, when you generate the report, the timing data is recalculated. This increases the time taken to generate the report. Specify this parameter to skip calculation of timing data. You can also specify the `-use_previous_timing` option to reuse the existing timing data for the report. *Data_type*: bool, optional
`-summary`	Specifies that just the summary table should be displayed in the report. *Data_type*: bool, optional
`-tcl_list`	Specifies that the report will be created as Tcl data instead of a text report. *Data_type*: bool, optional
`-use_previous_timing`	Specifies that the timing engine should not be invalidated. The timing engine is used to calculate the timing data that is displayed in the report. By default, this is invalidated when you generate the report, so all the timing data is recalculated. This increases the time taken to generate the report. Use this option to reuse the existing timing data for the report. *Data_type*: bool, optional
`-views {`*list_of_views*`}`	Restricts the report to the delay corners associated with the specified views. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive. *Data_type*: (analysis_view)+, optional

Examples

Example1: **Clock Timing Summary table**

```

-----------------------------------------------------------------------------------------------------------------------
Target sources:
target_max_capacitance_property - the target was set in the target_max_capacitance property
library_or_sdc_constraint - the non-frequency-dependent target was set in a library file or by an SDC constraint
frequency_dependent_library_or_sdc_constraint - the frequency-dependent target was set in a library file or by an SDC constraint
computed_from_slew_target - the target was calculated based on the slew target at a clock root
clock_root_forced - the target was forced to be zero at a clock root

Found a total of 0 clock tree nets with max resistance violations.
Found a total of 0 clock tree nets with max length violations.
Found a total of 0 clock tree nets with max fanout violations.
Found a total of 279 clock tree pins with a slew violation.
```

Example4: Count of violations table

```
Count of violations across all clock trees:
===========================================

-------------------------------------------------------------------------------
```

```
Clock Tree  #Max capacitance #Max resistance #Max length #Max fanout #Slew
Name        violations        violations     violations  violations  violations
--------------------------------------------------------------------------------
m_clk        1               0              0           0           30
m_digit_clk  0               0              0           0           0
m_dsram_clk  1               0              0           0           2
m_ram_clk    1               0              0           0           2
m_rcc_clk    0               0              0           0           69
m_spi_clk    0               0              0           0           0
refclk       0               0              0           0           0
refclk<1>    1               0              0           0           176
--------------------------------------------------------------------------------
Total        4               0              0           0           279
--------------------------------------------------------------------------------

Note the above table per clock tree is based on CCOpt clock tree view. The violations are counted across half corners.

Found a total of 4 clock tree pins with max capacitance violations.
Found a total of 4 max capacitance violations.
Total violation amount 0.838pF.
```

Example5: Clock Sink Summary Report

```
Clock Sink Summary:

report_cts_cell_filtering_reasons

```
report_cts_cell_filtering_reasons
[-help]
[-cell_type buffer | inverter | logic | delay | clock_gate]
[-clock_trees {list_of_clock_trees}]
[-out_file file_name]
[-power_domain power_domain_name]
[-tcl_list]
```

Reports the reasons for filtering the specified cell types. The report can be saved as a file by specifying the `-out_file` parameter of the command or it can be viewed as a Tcl list by specifying the `-tcl_list` parameter. The output of the command is also included in the log.

In the report, "all" is used for the Clock tree names where the reason is common to all clock_trees. Some of the reasons for filtering that are reported and their brief descriptions are provided below:

- `Unbalanced rise/fall delays` : The difference between rise and fall delays for the cell is bigger than 20%; or any of rise or fall timing arcs is missing in the library.
- `Too tall`: The cell height is bigger than the maximum cell height specified using the `cts_max_instance_height` attribute.
- `Wrong power context` : The cell does not match the power context requirements. For example, do not have same power context on all pins.
- `Not available in all views` : The cell is not available in all analysis views because the library does not contain all the specified views (corner cases) in the design for that specific cell. To avoid this filtering, check the libraries and the MMMC configuration to see why the cell is not available in some views.
- `Always on but not in cpf`: The cell is marked as always on but does not match the CPF description. You can avoid this filtering by checking/updating the CPF.
- `Weak max cap cell`: The cell is unable to drive enough capacitance at certain clock frequencies.
- `Library trimming`: The cell was removed automatically because it is an inefficient cell. The cell was removed as an inefficient cell to reduce the library size and save runtime. To avoid removing such cells, disable library trimming.
- `Can't use due to library mismatch`: Check the library data for the cell - both timing and physical data for the cell are needed. There is a mismatch between LEF and liberty libraries because the cell is missing in one of them.
- `Invalid for balancing`: The cell is filtered out because it does not match several predefined properties for balancing, such as: 1) cell delay is too small; 2)cell has an invalid (rise/fall) timing arc.
- `No test enable signal`: The clock gate cell is filtered out because it does not have a test enable input.
- `Has test enable signal`: The clock gate cell is filtered out because it has a test enable input.

  Note: The above two cell filtering reasons are context dependent. The software filters all clock gates, reporting the clock gates with test enables as one set and the clock gates without test enables as another set. A clock gate either has a test enable or it does not have one, so all clock gates are listed in one of the two sets. However, if you need a clock gate with no test enable signal, but there are no such clock gates, you can use a clock gate that has a test enable signal. But the other way around is not possible, which means if you need a clock gate with test enable signal but there is no such clock gate, you cannot use one that does not have a test enable signal.
- `Has observable output`: Clock gates without observability outputs are preferred, if they are available. Normally any cells with observability outputs will be filtered out. But if all the available cells have observability outputs they will not be filtered.
- `Edge sensitive`: The clock gate cell is filtered out because it is not positive edge sensitive.
- `Cannot be legalized`: The cell is filtered because it cannot physically be legalized in the power domain.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_cts_cell_filtering_reasons` parameter. For a detailed description of the command and all of its parameters, use the man command: man `report_cts_cell_filtering_reasons`.
`-cell_type buffer | inverter | logic | delay | clock_gate`	
	Restrict the report the specified library cell type. *Data_type*: enum, optional
`-clock_trees {`*`list_of_clock_trees`*`}`	
	Restricts the report to the specified clock trees. *Data_type*: string, optional
`-out_file` *`file_name`*	Specifies that a copy of the contents of the report will be saved to the specified file name. *Data_type*: string, optional
`-power_domain` *`power_domain_name`*	Restricts the report to the specified power domain. *Data_type*: (power_domain), optional
`-tcl_list`	Returns the report as Tcl formatted data, and formats the `-file` as tcl, if specified. *Data_type*: bool, optional

Examples

- Use the following command to filter reasons for clock gate cell types:

```
report_cts_cell_filtering_reasons -cell_type clock_gate

Filtering reasons for cell type: clock gate cell
================================================

-------------------------------------------------------------------------------------------------
Clock trees  Power domain   Reason                  Library cells
-------------------------------------------------------------------------------------------------
{ clk4 }     auto-default   No test enable signal  { TLATNCAX12 TLATNCAX16 TLATNCAX2 TLATNCAX20
                                                      TLATNCAX3 TLATNCAX4 TLATNCAX6
                                                      TLATNCAX8 }
{ clk4 }     auto-default   Has test enable signal { TLATNTSCAX12 TLATNTSCAX16 TLATNTSCAX2
                                                      TLATNTSCAX20 TLATNTSCAX3 TLATNTSCAX4
                                                      TLATNTSCAX6 TLATNTSCAX8 }
-------------------------------------------------------------------------------------------------
```

- Use the following command to filter reasons for buffer cell types:

```
report_cts_cell_filtering_reasons -cell_type buffer

Example output format:

Filtering reasons for cell type: buffer
=======================================

-------------------------------------------------------------------------------
Clock trees   Power domain   Reason             Library cells
-------------------------------------------------------------------------------
all           AO             Library trimming  { BUFFD12BWP BUFFD2BWP BUFFD3BWP
                                                   BUFFD4BWP BUFFD6BWP BUFFD8BWP
                                                   PTBUFFD2BWP }
all           PLL            Unbalanced        { BUFFD12BWP BUFFD2BWP BUFFD3BWP
                             rise/fall delays    BUFFD4BWP BUFFD6BWP BUFFD8BWP
                                                 PTBUFFD2BWP }

  - Reporting

report_pin_insertion_delays

```
  report_pin_insertion_delays
[-help]
[-bin_size string]
[-check_type {setup | hold}]
[-clock_trees {string1 string2 ...}]
[-delay_corner delay_corner_name]
[-delay_type {early | late}]
[-out_file file_name]
[-skew_groups {string1 string2 ...} | -include_reporting_only_skew_groups]
[-sources {string1 string2 ...}]
```

Reports pin insertion delays at clock tree sinks. By default, the report visits all the clock tree sinks, and checks for pin insertion_delay at each sink. Statistics about the distribution of pin insertion_delay values are generated and reported. The intention of the report is to give a quick overview of the distribution and nature of the pin insertion delays found, which can be used to identify the problem areas such as excessively large skews, surprisingly numerous skews, or large numbers of small skews, and so on.

The `-clock_trees` and `-skew_groups` parameters are used to restrict the scope of the report as a subset of the clock tree sinks, which means that when the `-clock_trees` parameter is specified, only those sinks that are under the listed clock trees are selected, and when the `-skew_groups` parameter is specified, only those sinks that are under the listed skew groups are selected. By default, the report analyzes the pin insertion delays that are found under the CCOpt primary half corner. The `-delay_corner`, `-check_type`, and `-delay_type` parameters permit the selection of another half corner to report against.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_pin_insertion_delays` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_pin_insertion_delays`.
`-bin_size string`	Specifies a bin (bucket) size for the report histograms. By default the software uses the histogram bin size specified using the cts category attribute, `cts_pin_insertion_delay_histogram_bin_size`. Use this parameter to override this default bin size value. *Data_type*: string, optional
`-check_type {setup | hold}`	
	Specifies the check type for the specified skew group to be reported. You can specify either `setup` or `hold`. If a check type is specified, but the `-delay_type` parameter is not specified, the software behaves in the following manner: • `-check_type -setup` will mean `-delay_type -late` • `-check_type -hold` will mean `-delay_type -early` **Note** : If a check type is not specified, the software will always look at what the views permit, preferring the “setup” view if there is a choice. *Data_type*: enum, optional
`-clock_trees {string1 string2 ...}`	
	Restricts the report to the specified clock trees. This means that only those sinks that are under the specified clock trees are selected for reporting. *Default*: all defined clock trees *Data_type*: list, optional
`-delay_corner delay_corner_name`	
	Reports in the specified delay corner. By default, the software will use the primary-half delay corner that is set using the CCOpt attribute, `cts_primary_delay_corner` . *Data_type*: (delay_corner), optional
`-delay_type {early | late}`	

	Reports in the specified delay type, early or late. When late is specified, only the late half of the delay corners are reported. When early is specified, only the early half of the delay corners are reported. *Default:* `late` *Data_type*: enum, optional
`-include_reporting_only_skew_groups`	When specified, the report additionally includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `cts_skew_group_constrains` attribute is set to `none`. Such a skew group imposes no clock balancing constraint and will not be considered by CTS. By default, the reporting-only skew groups are not included in the report. If a reporting-only skew group is explicitly specified using the `-skew_groups` parameter, then that skew group is always included in the report output. **Note**: The `-include_reporting_only_skew_groups` and `-skew_groups` parameters are mutually exclusive. If both these parameters are specified together, the software errors out. *Data_type*: bool, optional
`-out_file` *file_name*	Specifies that a copy of the contents of the report be saved to the specified file name. *Data_type*: string, optional
`-skew_groups {string1 string2 ...}`	
	Restricts the report to the specified skew groups. This means that only those sinks that are under the specified skew groups are selected for reporting. **Note**: The `-include_reporting_only_skew_groups` and `-skew_groups` parameters are mutually exclusive. If both these parameters are specified together, the software errors out. *Default*: all defined skew groups *Data_type*: list, optional

`-sources {string1 string2 ...}`	Restricts the report to skew group sink pins that have a pin insertion delay value from one of the listed sources.
	This `-sources` list of categories takes wildcard values that are expanded to matching categories.
	For example:
	`report_pin_insertion_delays -sources u*`
	This is equivalent to:
	`report_pin_insertion_delays -sources {useful_skew user}`
	Data_type: list, optional

Example

The following command reports the pin insertion delays at all clock tree sinks.

```
report_pin_insertion_delays
```

Note: The CCOpt pin insertion delays are +ve valued if they produce an advance, and -ve valued if they produce a delay. This can be viewed in the report output shown below.

```
Positive (advancing) pin insertion delays

report_skew_groups

```
report_skew_groups
[-help]
[-delay_corners {list_of_delay_corners} | -views {list_of_views}]
[-exclude_pin_insertion_delay]
[-exclude_source_latency]
[-out_file file_name]
[-from sources]
[-histograms]
[-num_paths number_of_paths]
[-skew_groups list_of_skew_groups | -include_reporting_only_skew_groups]
[-summarize_stage_depth cell_type_list]
[-skip_timing_update]
[-summary]
[-through list_of_pins]
[-tcl_list]
[-to list_of_sinks]
[-use_previous_timing]
[-early_only | -late_only ]
```

This command displays information about skew and insertion delay in skew groups. By default, the `report_skew_groups` command displays two summary tables at the beginning of the report. The first table lists the insertion delays and skews (along with target values) for each skew group in each timing corner. The second table lists the start and end points of the min and max paths in the skew group. The remainder of the report contains detailed min and max path information for each skew group, in each timing corner.

You can customize the columns included in the skew group report by setting the attribute, `cts_skew_group_report_columns`.

You can customize the size of the histogram ranges by setting the attribute, `cts_skew_group_report_histogram_bin_size`.

Note: For more information about these attributes, see the cts Category Attributes chapter.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_skew_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: man `report_skew_groups`.
`-delay_corners list_of_delay_corners`	
	Specifies that the report will be restricted to the specified delay corners. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive. *Data_type*: (delay_corner)+, optional
`-early_only`	Specifies that only the early half of the delay corners will be reported. *Data_type*: bool, optional
`-exclude_pin_insertion_delay`	
	Specifies that pin insertion delay should be excluded from the report. *Data_type*: bool, optional
`-exclude_source_latency`	Specifies that source latency of the clocks should be excluded from the report. *Data_type*: bool, optional
`-from sources`	Specifies the list of sources of the skew group to consider for the report. If specified, only paths beginning at one of the sources specified will be reported. *Data_type*: string, optional
`-histograms`	Specifies that histograms of key information will be displayed. *Data_type*: bool, optional

`-include_reporting_only_skew_groups`	When specified, the report additionally includes the reporting-only skew groups. A reporting-only skew group is a skew group whose `cts_skew_group_constrains` attribute is set to `none`. Such a skew group imposes no clock balancing constraint and will not be considered by CTS. By default, the reporting-only skew groups are not included in the report. If a reporting-only skew group is explicitly specified using the `-skew_groups` parameter, then that skew group is always included in the report output. **Note**: The `-include_reporting_only_skew_groups` and `-skew_groups` parameters are mutually exclusive. If both these parameters are specified together, the software errors out. *Data_type*: bool, optional
`-late_only`	Specifies that only the late half of the delay corners will be reported. *Data_type*: bool, optional
`-num_paths` *number_of_paths*	Specifies the number of paths to report on for each timing corner. *Default*: 1 *Data_type*: int, optional
`-out_file` *file_name*	Specifies that a copy of the contents of the report will be saved to the specified file name. *Data_type*: string, optional
`-skew_groups` *list_of_skew_groups*	
	Restricts the report to the specified skew groups. By default, all defined skew groups are displayed. *Data_type*: string, optional
`-skip_timing_update`	Specifies that the timing engine should not be updated. The timing engine is used to calculate the timing data that is displayed in the report. By default, when you generate the report, all the timing data is recalculated. This increases the time taken to generate the report. Use this option to skip calculating the timing data. You can also use the `-use_previous_timing` parameter to reuse the existing timing data for the report. *Data_type*: bool, optional
`-summarize_stage_depth` *cell_type_list*	

	Specifies that the command will consider the number of cells of the specified type(s) in the tree, instead of considering delay while reporting. Possible values are buffer, inverter,logic, clock_gate, and generator. You can also specify * to include all cell types.
	The following command shows a report of the skew groups with counts of the buffers and inverters, instead of the delay.
	`report_skew_groups -summarize_stage_depth {buffer inverter}`
	Note: The * setting is not used in combination with any other cell type. For example, the below is not a valid setting.
	`-summarize_stage_depth {* buffer}`
	Data_type: list, optional

`-summary`	Specifies that just the summary table should be displayed in the report. *Data_type*: bool, optional
`-tcl_list`	Specifies that the report will be created as Tcl data instead of a text report. *Data_type*: bool, optional
`-through` *list_of_pins*	Provides a list of pin objects representing points that all # paths reported must pass through. The paths must pass through one of the pins specified. *Data_type*: string, optional
`-to` *list_of_sinks*	Provides a list of pin objects representing all the sinks of skew groups to consider for the report. If specified, only paths terminating at one of the sinks specified will be reported. *Data_type*: string, optional

`-use_previous_timing`	Specifies that the timing engine should not be invalidated. The timing engine is used to calculate the timing data that is displayed in the report. By default, this is invalidated when you generate the report, so all the timing data is recalculated. This increases the time taken to generate the report. Use this option to reuse the existing timing data for the report. *Data_type*: bool, optional
`-views {`*`list_of_views`*`}`	Restricts the report to the delay corners associated with the specified views. **Note**: The `-delay_corners` and `-views` parameters are mutually exclusive. *Data_type*: (analysis_view)+, optional

Examples

Use the following command to display the skew group information as a summary table in the report:

Example1: Use the following command to display the skew group information as a summary table in the report:

```
report_skew_groups -summary

-    min RESULTS_CONV_INST/go_reg/CP
-    max RESULTS_CONV_INST/r941_reg[15]/CP
                                     m_spi_clk/PM_HL_FUNC    0.301     -         0.303     -
```

Note:

- The “Timing Corner” column specifies the delay corner, timing check type (setup or hold) and derate type (early or late) reporting conditions for the skew group. All *early corners are reported using early clock derates and all *late corners are reported using late clock derates. A skew group row with no timing column specification is using the timing corner specified above it.
- The "Skew Target Type" column shows either "explicit", “auto computed” or “ignored”. Only the timing corner(s) with "explicit" or "auto computed" are actually considered during clock tree construction, and only these corners will have a numeric skew target in the “Target Skew” column. Generally, only timing corners with late derates for a delay corner are activated for clock tree construction.
- The "Skew window occupancy" column is defined as the percentage of sinks in the skew group that fall within the user-defined skew target. It is computed by finding a min and max latency window in which the largest proportion of sinks fall. The intent of this column is to indicate, when the skew target is not met, some measure of how badly it has not been met by showing the largest proportion of sinks that occupy the desired skew target.

Example2: Use the following command to shows a report of the skew groups with counts of the buffers and inverters, instead of the delay:

```
report_skew_groups -summarize_stage_depth {buffer inverter} -skew_groups m_dsram_clk/PM_HL_FUNC

Timing for timing corner AV_HL_FUNC_MIN_RC1_dc:hold.late, max clock_path:
=========================================================================

 PathID : 8
```

```
Path type : skew group m_dsram_clk/PM_HL_FUNC (path 1 of 1)
Start : TEST_INST/g139/ZN
End : RAM_TEST_INST/RAM_INST/CLK
Counted cell types : buffer inverter
Count : 0

reset_cts_config

```
reset_cts_config
[-help]
[-preserve_sink_insertion_delays]
```

Resets the CTS configuration. This command wipes out all CTS-specific data in Innovus. However, you can preserve the pin insertion delays on clock tree sinks by specifying the `-preserve_sink_insertion_delays` parameter.

Parameter

`-help`	Outputs a brief description of the `reset_cts_config` parameter.
`-preserve_sink_insertion_delays`	When specified, preserves pin insertion delays currently configured on clock tree sinks. *Data_type*: bool, optional

Example

- The following command resets the CTS configuration:
  ```
  reset_cts_config
  ```

Related Commands

- `check_cts_config`
- `read_cts_config`
- `write_cts_config`
- `create_clock_tree_spec`
- `delete_clock_tree_spec`
- `delete_clock_trees`
- `delete_skew_groups`

reset_clock_tree_routing_state

```
reset_clock_tree_routing_state
[-help]
[-excluded {netname1 netname2.....}]
[-no_delete_routes]
[-reset_preroutes]
```

Resets the status of the clock nets to "routed". The default behavior of the software is to then delete these nets, but you can specify the `-no_delete_routes` parameter to stop these nets from being deleted. The purpose of this command is to reset the routing state post NanoRoute, so that it can be rerun later using the `route_clock_tree_nets` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_clock_tree_routing_state` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_clock_tree_routing_state`.
`-excluded {netname1 netname2.....}`	Specifies the list of nets whose routing state is not to be reset. *Data_type*: (net)+, optional
`-no_delete_routes`	
	Specifies that the nets whose status is set to routed should not be deleted. *Data_type*: bool, optional
`-reset_preroutes`	
	When specified, resets the status of pre routes. By default, the pre-routes will be skipped. *Data_type*: bool, optional

Example

- The following command resets the routing state of clock nets without deleting them and excluding the specified net:

  ```
  reset_clock_tree_routing_state -no_delete_routes -excluded {clock1111}
  ```

Related Command

- `route_clock_tree_nets`

route_flexible_htrees

```
route_flexible_htrees
[-help]
[nets net+]
```

Routes CCOpt flexible h-tree nets as a separate step after running the synthesize_flexible_htrees command. The following use models are supported:

1. Routing during H-tree syntheses:
    a. `create_flexible_htree`
    b. `synthesize_flexible_htrees`
2. Routing after H-tree synthesis (block level)
    a. `create_flexible_htree`
    b. `synthesize_flexible_htrees -use_estimated_routes`
    c. `route_flexible_htrees`

Note: When using this command, the software expects the input routes of nets in the flexible H-tree to be fully connected, as it is the case for routes generated by `synthesize_flexible_htrees -use_estimated_routes`. If this expectation is not met, then unexpected results such as open nets may occur and you should check for connectivity-related warnings in the log file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `route_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man route_flexible_htrees`.
`-nets net+`	
	Specifies a list of flexible h-tree nets to route. The specified nets must all have been created by the `synthesize_flexible_htrees` command. By default, the software automatically determines all the flexible h-tree nets that need to be routed.

Related Commands

- `create_flexible_htree`
- `synthesize_flexible_htrees`

Related Attributes

You can also set the following attributes on the flexible H-tree design objects by using the `set_db attribute_name value` command:

- `cts_flexible_htree_placement_legalization_effort`
- `flexible_htrees`

For detailed information, see the cts Category Attributes chapter in the *Innovus Stylus Common UI User Guide*. You can also use the following command:

```
get_db attribute_name
```

route_clock_tree_nets

```
route_clock_tree_nets
[-help]
[-mesh]
```

Performs routing of clock tree nets using the CTS route guides. Use this command after running `ccopt_design`.

CTS uses internal clock routes during the early stages of CTS. It then generates route guides that are passed to NanoRoute for final clock tree routing. This is done by default for full CTS runs. If, for some reason, you have disabled final clock tree routing in CTS, then this command can be used to complete the clock tree routing based on the CTS route guides. When the `-mesh` parameter is specified, the command only routes the mesh nets.

Note: Before running this command, ensure that the CTS data structures are in place.

Parameters

`-help`	Outputs a brief description for `route_clock_tree_nets` parameter.
`-mesh`	Specifies that only mesh nets should be routed. *Data_type*: bool, optional

Related Commands

- `ccopt_design`
- `reset_clock_tree_routing_state`

synthesize_flexible_htrees

```
synthesize_flexible_htrees
[-help]
[-block_master_clone]
[-dry_run]
[-partition_nets_dir dirname]
[-spec_file filename]
[-use_estimated_routes | -trial_mode {true | false | placement_only | routing_only}]
```

This command is used to synthesize all flexible H-trees that have been created but not previously synthesized, in one go. The flexible H-trees are created using the `create_flexible_htree` command. The `synthesize_flexible_htrees` command helps reduce the runtime by synthesizing all flexible H-trees in one go as compared to if the flexible H-trees were synthesized one at a time. This is because when you use this command, nanoRoute is called only once to route all flexible H-trees at the same time.

Note: You must run the `synthesize_flexible_htrees` command to synthesize any flexible H-trees previously created using the `create_flexible_htree` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `synthesize_flexible_htrees` parameter. For a detailed description of the command and all of its parameters, use the man command: `man synthesize_flexible_htrees`.
`-block_master_clone`	When specified, blocks master/clone partitions for H-tree instances and nets. If this parameter is not specified, and the master/clone partitions do not contain H-tree sink pins, then the software will error out with the following error: `**ERROR: (IMPCCOPT-1506): Flexible H-tree 'htree' uses a sink grid, which is not supported on master/clone designs unless master/clone partitions are blocked during flexible H-tree synthesis. If applicable, master/clone partitions can be blocked using synthesize_ccopt_flexible_htrees -block_master_clone.` *Data_type*: bool, optional
`-dry_run`	Runs the synthesis algorithm but do not insert the H-tree into the database. *Data_type*: bool, optional
`-partition_nets_dir` *dirname*	Specifies the name of the directory to which route guides and the files specifying the names of synthesized H-tree nets per partition/top module will be written. This parameter is used in master clone designs where H-tree routing needs to be done at the partition-level because of a lack of partition-awareness when running NanoRoute at the top level. For non-master clone designs, even if the design contains partitions, this data is generated only for the top module. *Data_type*: string, optional
`-spec_file` *fileName*	Specifies the name of the clock tree specification script file. When the file name is specified, the clock tree specification file is not amended to reflect the new state of the clock tree. Instead, the amendments, which are in the form of Tcl commands, are written to the file specified using this parameter. *Data_type*: string, optional
`-trial_mode {true | false | placement_only | routing_only}`	When set, enables trial routing and placement mode for flexible H-tree synthesis. The following settings are available: `true`: Run routing and detailed placement in trial mode. `false`: Run neither routing nor detailed placement in trial mode. THis si the default setting. `placement_only`: Only run detailed placement in trial mode. `routing_only` : Only run routing in trial mode. **Note**: The `-trial_mode` and `-use_estimated_routes` parameters are mutually exclusive. The `-trial_mode true` setting and `-use_estimated_routes` share the same behavior except that when `-trial_mode true` is specified, the software will skip full routing and treat estimated routes as fully-routed wires. When `-trial_mode` is set to `true`, `get_db flexible_htrees .nets.skip_routing` would be `true` When `-use_estimated_routes` is specified, `get_db flexible_htrees .nets.skip_routing` would be `false` *Default*: `false`
`-use_estimated_routes`	Specifies that NanoRoute should not be called. So, the routing estimates are left in the netlist. *Data_type*: bool, optional

Example

- The following set of commands are used to a flexible H-tree of the type, `INVX9` and will be placed in the specified sink grid. Other buffers added to the H-tree will be of type `INVX13`. The flexible H-tree is then synthesized using the `synthesize_flexible_htrees` command.

```
create_flexible_htree -name htreeC -sink_grid {6 6} -final_cell INVX9 -trunk_cell INVX13
synthesize_flexible_htrees
```

update_clock_tree_source_latency

```
update_clock_tree_source_latency
[-help]
-clock_tree_source_groups source_group_list
```

Stores clock arrival and transition times at the clock tree source group roots in preparation for multi-tap CTS.

This command may be helpful for configuring arrival times for clock structures in which a mesh drives the source group roots. With other structures such as H-tree, which have a single driver per net, the source group roots are usually defined as generated clock trees and CTS will automatically propagate the clock arrival times from the clock source, through the drive structure, up to the inputs of the source group roots. Flexible H-tree synthesis takes care of all this automatically. However for mesh applications, the CTS clock specification, clock trees defined by the `create_clock_tree` and `create_generated_clock_tree` commands, cannot include nets with multiple drivers, so CTS cannot automatically propagate arrival times through the clock mesh. For these structures, the source group is typically defined as a collection of non-generated clock trees, and the arrival times are explicitly annotated at their roots before the start of CTS.

Note: The `update_clock_tree_source_latency` command queries the timing graph to get arrival times and transitions. If timing is not already available, the command will first perform a timing graph update, which may take some time. The command assumes that for a particular source group there is a single common clock phase present at all roots. If there is no common clock phase at all roots, or if there are multiple common clocks phases, the command will issue an error message and quit. Also, if a specified source group includes any generated clock trees, the command will issue an error message and quit.

Parameters

`-help`	Outputs a brief description of the `update_clock_tree_source_latency` command. For a detailed description of the command, use the man command: `man update_clock_tree_source_latency`.
`-clock_tree_source_groups source_group_list`	
	The list of clock tree source groups for whose clock roots the latencies will be stored. This parameter is required to be specified. *Data_type*: list, required

Example

The following command updates the latencies for a single source group, `four_taps`. In this case, timing is already available and no timing graph update is required.

```
update_clock_tree_source_latency -clock_tree_source_groups four_taps

Updating clock tree source latencies for source group 'four_taps'.

Found common clock 'clock' at all source group roots.

Set source timing for 4 roots (latency rising = [0.105ns, 0.116ns], falling = [1.130ns, 1.140ns]; transition = 0.004ns)
```

Related Information

- `create_clock_tree`
- `create_generated_clock_tree`

update_clock_tree_spec_annotations

```
update_clock_tree_spec_annotations
[-help]
[-out_file file_name]
```

Updates all ideal nets, transition and delay annotations to match active timing constraints and removes all prior annotations from the clock tree specification. When this command is specified, all prior annotations are removed from the clock tree specification and the `set_annotated_transition` and `set_annotated_delay` values are mapped to the `cts_annotated_*` attribute settings. The updated settings can be written to a file using the `-out_file` option or they can be applied immediately.

The following object attributes are provided to model the data captured by `set_ideal_network`, `set_annotated_delay`, `set_annotated_transition`, `set_ideal_latency` and `set_ideal_transition`:

- `cts_ideal_net`: If this attribute is set, the clock tree timing engine will consider the specified net as ideal.
  Default: `false`
- `cts_annotated_delay(pin)`: Overrides any clock tree timing engine computed cell arc or net arc delays to this pin, in a similar manner to SDC set_annotated_delay.
  Default: `{}`
- `cts_annotated_delay(port)`: Overrides any clock tree timing engine computed cell arc or net arc delays to this pin, in a similar manner to SDC set_annotated_delay.
  Default: `{}`
  Note:
  - **For cell arcs**: The format is dict where the keys are pins and the values are a rise fall delay pair. For example:
    `"<from pin 1> {<from rise delay 1> <from fall delay 1>} <from pin 2> {<from rise delay 1> <from fall delay 2>}"`
  - **For net arcs**: The format is dict where the keys are pins and the values are the delay. For example:
    `"<from pin 1> <delay 1> <from pin 2> <delay 2>}"`

  For convenience, set the cts_annotated_delay* attribute using a single value that will apply to all available delays from pins and rise/fall from edges. For example, "0.100".
- `cts_annotated_transition(pin)`: Overrides any clock tree timing engine computed transition at this pin, in a similar manner to SDC set_annotated_transition.
  Default: `auto`
- `cts_annotated_transition(port)`: Overrides any clock tree timing engine computed transition at this pin, in a similar manner to SDC set_annotated_transition.
  Default: `auto`

Note: For details about the above attributes, see *Stylus Common UI Database Object Information* manual.

Parameters

`-help`	Outputs a brief description of the `update_clock_tree_spec_annotations` command. For a detailed description of the command, use the man command: `man update_clock_tree_spec_annotations`.
`-out_file file_name`	Writes commands to the specified file instead of applying the changes in memory.

Example

Use the set of commands listed below to define a transition annotation at `pin b1/I`, delay annotation at `net_b1`, update the annotations from CTE to clock tree timing engine (CTTE), and verify that the annotation is corrected applied at clock tree timing engine (CTTE).

```
set_interactive_constraint_modes [all_constraint_modes]

set_propagated_clock [all_clocks]

create_ccopt_clock_tree -name clk -source clk -no_skew_group
create_skew_group -name clk/default_constraint_mode -sources clk -auto_sinks
```

Annotate transition at b1/I pin using the below command:

```
set_annotated_transition 1.234 [get_pins {b1/I}]
```

Annotate delay at net_b1 net using the below command:

```
set_annotated_delay 2.345 -net -from [get_pins {b1/Z}] -to [get_pins {b2_2/I}]
```

Update the annotations from CTE to CTTE using the below command:

```
update_clock_tree_spec_annotations
```

The log shows the following information:

```
<CMD> update_clock_tree_spec_annotations

update_skew_group

```
update_skew_group
[-help]
[-make_exclusive]
-skew_group skew_group_name
[-add_sinks pins | -remove_sinks pins]
[-add_ignore_pins pins | -remove_ignore_pins pins]
```

This command is used internally to add or remove sinks in existing skew groups produced automatically by the `create_skew_group` command, but you can also use it to modify existing skew_group objects. Sinks and ignore pins can be added or removed using the appropriate switches.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `update_skew_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_skew_group`.
`-add_ignore_pins pins`	Specifies the ignore pins to be added to the skew group. *Data_type*: string, optional
`-add_sinks pins`	Specifies the sink pins to be added to the skew group. *Data_type*: string, optional
`-make_exclusive`	When specified, sets the exclusive sink rank of the specified skew group, using the `-skew_group` parameter, to be the highest one. *Data_type*: bool, optional
`-remove_ignore_pins pins`	Specifies the ignore pins to be removed from the skew group. *Data_type*: string, optional
`-remove_sinks pins`	Specifies the sink pins to be removed from the skew group. *Data_type*: string, optional
`-skew_group skew_group_name`	Specifies the user-defined identifier for the skew group to be modified. *Data_type*: string, required

Example

- The following command specifies the sink pins to be added to the specified skew group:
  ```
  update_skew_group -skew_group clkA -add_sinks f1/ck
  ```

Related Information

write_cts_config

```
write_cts_config
[-help]
out_dir
```

Writes the CTS configuration to the specified directory.

Note: The content of the files generated using this command is proprietary. The files may not be in any particular format, or even human-readable, and are subject to change. The only supported use of the output of `write_cts_config` command is as input to the `read_cts_config` command.

Parameter

`-help`	Outputs a brief description of the `write_cts_config` parameter.
out_dir	Specifies the directory path to which the CTS configuration will be written. *Data_type*: string, required

Example

- The following command writes the CTS configuration to the specified directory:
  ```
  write_cts_config ../ccopt_tutorial/work
  ```

Related Commands

- `check_cts_config`
- `reset_cts_config`
- `read_cts_config`

Conformal Commands

- run_clp

run_clp

```
run_clp
[-cpf fileName]
[-cmd cmdFile]
[-extra_libraries lib …]
[-extra_verilog fileName …]
[-setup_only]
[-use_eeq_cell_with_liberty_info]
```

Generates the following files, then runs the Conformal® Low Power Verification tool, or generates a template script to run the Conformal® Low Power Verification tool the ConformalÃ, ® Low Power Verification tool.

- Netlist (`clp_input/feclp.v`)
- CPF/1801 file (`feclp.cpf or feclp.upf`)
- dofile (`clp_input/feclp.tcl`)

Parameters

`-extra_libraries` *lib …*	Specifies a list of extra libraries (`-liberty`). *Data_type*: string, optional
`-extra_verilog` *fileName …*	Specifies a list of extra Verilog files (`-verilog`). *Data_type*: string, optional
`-cpf` *fileName*	Specifies the CPF file to use as input to the verification tool. *Default:* `feclp.cpf`, generated by the Innovus software. *Data_type*: string, optional
`-cmd` *cmdFile*	Specifies the Tcl file to use as input to the verification tool. *Default*: feclp.tcl, generated by the Innovus software. *Data_type*: string, optional
`-setup_only`	Generates input files, but does not run the verification tool. *Data_type*: bool, optional
`-use_eeq_cell_with_liberty_info`	Uses an EEQ cell with timing library definition as the master cell of a leaf instance. *Data_type*: bool, optional

Example

The following command will write out template CLP script, clp_input/feclp.tcl:

```
> run_clp -setup
```

8

Database Access and Handling Commands and Attributes

- define_attribute
- delete_buffer
- delete_obj
- get_db
- get_db Category Attributes
- is_attribute
- reset_db
- set_db
- sort_db
- write_preserves

define_attribute

```
define_attribute
[-help]
attribute_name
-obj_type object_type
[-obsolete]
{-alias existing_attribute | {-category category [-data_type {bool | int | double | area | coord | string | enum | point | rect | line |
delay | resistance | capacitance | voltage | in_dir | out_dir | in_file | out_file  | object | object*} [-enum_values values]]
[-check_function check_function]
[-compute_function compute_function]
[-default default]
[-help_string description]
[-hidden]
[-set_function set_function]
[-skip_in_db]}}
```

Creates a new, user-defined attribute with the specified characteristics. The attribute created is a first-class db object whose name is `object_type/attribute_name`. Use `delete_obj` to undo `define_attribute`.

The attribute value can be reset whether or not the default value is specified. If a default value is specified, `reset_db` will use it. If no default value is specified, `reset_db` resets the default value to one of the following:

- `no_value` for simple numeric types such as `int`, `double`, `delay`, `capacitance`, `coord`, `area`, `resistance`, and `voltage`
- `false` for Boolean types
- "" (empty string) for all other types, including `string`, `in_file`, `out_file`, `in_dir`, `out_dir`, `point`, `rect`, and `line`

Note that the new user-defined attribute created by `define_attribute`, and the attribute value can be recorded in the def file using the `write_def` command only after resetting the value using the `set_db` command, The default user-defined attribute and its value cannot be recorded in the def file using the `write_def` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `define_attribute` parameter. For a detailed description of the command and all its parameters, use the man command: `man define_attribute`

`-alias existing_attribute`	Makes *attribute_name* a hidden alias for *existing_attribute*, which must have been defined. This parameter is used along with the `-obj_type` parameter. It could also be used with the `-obsolete` parameter to generate an obsolete warning. *Data_type*: string, optional
attribute_name	Specifies the name of the attribute to be defined. Note that the name of the underlying db object that is created is `object_type/attribute_name`. *Data_type*: string, required
`-category category`	Specifies the category of the attribute. Categories group attributes that perform similar functions, whereas `object_type` specifies on which type of object the attribute is valid. You can specify any category name, both new and existing category names are allowed. *Data_type*: string, required
`-check_function check_function`	Specifies a previously defined Tcl procedure's name to ensure that the newly defined attribute is valid. The Tcl procedure should be of the form `proc {object value} { <body returns 0 or 1> }`. *Data_type*: string, optional
`-compute_function compute_function`	Specifies a previously defined Tcl procedure's name to get the newly defined attribute's value later (with the `get_db` command). The Tcl procedure must be of the form `proc {object} { <body returns value of type data_type> }`. When you use this option, the attribute becomes a read-only attribute because its value is always computed. *Data_type*: string, optional
`-data_type {bool | int | double | area | coord | string | enum | point | rect | line | delay | resistance | capacitance | voltage | in_dir | out_dir | in_file | out_file | object | object*}`	
	Defines the data type of the attribute. Possible data types are: bool, int, point, string, etc., as described in the Types and Definitions chapter in the *Stylus Common UI DB Object Information* manual. The `object` and `object*` data types correspond to `obj` and `obj*` in the *Stylus Common UI DB Object Information* manual. Only those objects that have a DPO with a unique name (like `inst:top/i1`) are supported. Objects without a DPO name (like `wire:0x222222222`) are not supported. *Data_type*: enum, required
`-default default`	Specifies a default value for the attribute. In case this parameter is not specified while creating an attribute, the default value will be: • `no_value` for simple numeric types such as `int`, `double`, `delay`, `capacitance`, and `coord` • `false` for Boolean types • "" (empty string) for all other types, including `enum`, `string`, `in_file`, `out_file`, `in_dir`, `out_dir`, `point`, `rect`, `polygon`, `line`, and `obj_type` *Data_type*: string, optional
`-enum_values values`	Specifies a list of all the possible values of the enumerated type. For example, `-enum_values {a b c}`. *Data_type*: string, optional
`-help_string description`	Specifies the help text for the attribute. *Data_type*: string, optional
`-hidden`	Specifies whether the defined attribute is a hidden attribute. *Data_type*: bool, optional
`-obj_type object_type`	Specifies the object type of the attribute. All valid object types can be found by running the following command through the command prompt: `get_db obj_types -if {.accept_user_defined_attributes}` The attribute is assigned to the specified type. *Data_type*: string, required
`-obsolete`	Specifies if the defined attribute is obsolete, and gives a warning if used. *Data_type*: bool, optional

`-set_function` *set_function*	Specifies a previously defined Tcl procedure's name. This option allows you to override user-defined values provided it conforms to the parameters in the Tcl procedure you created. The Tcl procedure should be of the form `proc {object new_value current_value} { <body returns value of type data_type> }`. Returns new value to be assigned to the attribute. *Data_type*: string, optional
`-skip_in_db`	Prevents the `write_db` command to write out the defined attribute in the db being written. *Data_type*: bool, optional

Examples

- The following command creates a Tcl procedure, `check_fxn`, and then creates an attribute named test_check. The `-check_function` parameter is specified so that the test_check attribute can be tested for validity when it is specified later:

  ```
  proc check_fxn {obj val} { if { $val > 0 } { return 0}; r eturn 1 }
  define_attribute test_check1 -obj_type inst -data_type int -category test -help_string "test_check_function" -check_function  check_fxn
  ```

  Based on the check_function parameter, the checking criteria attribute value can be set only to a negative value. As a result the following command sets the attribute value to -1:

  ```
  set_db insts .test_check1 -1
  ```

  but the following command displays an error and keeps the previous value.

  ```
  set_db insts .test_check1 2
  ```

- The following command creates a Tcl procedure, `set_fxn`, and then creates an attribute named `test_set`. The `-set_function` parameter is specified so that you can change the value of the `test_set` attribute (provided it is valid):

  ```
  proc set_fxn {obj new_val cur_val} { if {$new_val > $cur_val} { return $new_val }; r eturn $cur_val }
  define_attribute test_set -obj_type root -data_type int -category test -help_string "test set function" -set_function set_fxn -default 0
  ```

  Now, the following command sets the attribute value to 1 because the default value is 0

  ```
  set_db test_set 1
  ```

  The following command changes the attribute value to 4 as the new value is greater than the current value

  ```
  set_db test_set 4
  ```

  But with the following command the value is not changed as the new value is less than the current value (4)

  ```
  set_db test_set 2
  ```

- The following command uses the `compute_function` to set attribute values. Note that the attribute becomes read-only if `compute_function` is applied.

  ```
  proc comp_func {obj} { return 5 }
  define_attribute test_compute -obj_type root -data_type int -category test -help_string "test set function" -compute_function comp_func
  get_db test_compute 5
  ```

  Now, the following command will issue an error as attribute value cannot be changed.

  ```
  set_db test_compute 3
  ```

- The following command creates an alias to a pre-existing attribute:

  ```
  define_attribute attr1 -alias old_hidden_attr2 -obj_type root
  ```

  Note that the old_hidden_attr2 attribute must be pre-defined, else the above command will return an error message. Note that in general define_attribute creates an attribute db object–but when invoked with the -alias switch it doesn't.

- The following commands check to see if the attribute exists and if not creates the attribute, then deletes the attribute:

  ```
  if { ! [ is_attribute myAttribute -obj_type inst ] } { define_attribute myAttribute -obj_type inst -data_type bool -category
  myAttributes }
  delete_obj [ get_db attributes inst/myAttribute ]
  ```

- The following commands define new attribute of the `design obj_type`, and then record the attribute and its current value, which is reset by the user through the `set_db` command:

  ```
  define_attribute test_1 -data_type string -obj_type design -category write_def -help_string {DEF property} -default_value {abc} -quiet
  set_db designs .test_1 aabbcc
  write_def new.def

  #new.def content#
  ```

```
PROPERTYDEFINITIONS
DESIGN test_1 STRING "aabbcc" ;
```

delete_buffer

```
delete_buffer
[-help]
-buffer buffer_name
```

Deletes the specified buffer for a list of instances.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `delete_buffer` parameter. For a detailed description of the command and all its parameters, use the man command: `man delete_buffer`
`-buffer buffer_name`	Specifies the list of buffers to be deleted. *Data_type*: (inst)+, required

Examples

Following are few examples of the command usage for removing the specified buffers:

```
delete_buffer -buffer b1
delete_buffer -buffer u1/b1
delete_buffer -buffer {u1/b1, u2/b1} # u1 and u2 are master-clone hierarchical instances
delete_buffer -buffer {u1/b1 u2/b2 b3}
```

delete_obj

```
delete_obj any_object+
[-help]
```

Deletes one or more existing objects from the database. The command can delete `netlist` objects and physical data like `routing` and `floorplan` objects, but not the `clock` or `timing` objects (such as `clock_tree`, and `rc_corner`).

The following `obj_types` can be deleted through this command: `attribute`, `bump`, `bus_guide`, `flow`, `flow_step`, `group`, `gui_text`, `gui_line`, `gui_rect`, `gui_polygon`, `hinst`, `hnet`, `hpin`, `hport`, `inst`, `marker`, `module`, `net`, `net_group`, `patch_wire`, `pin_guide`, `pin_group`, `pin_blockage`, `place_blockage`, `port`, `port_shape`, `resize_blockage`, `route_blockage`, `route_type`, `row`, `sdp`, `special_wire`, `special_via`, `text`, `via`, `virtual_wire`, `what_if_via`, `what_if_wire`, and `wire`.

Parameters

`-help`	Provides a brief description of the command that includes the type and default information for parameters. For a detailed description of the comm `man delete_obj`
`any_object+`	Specifies the object or the list of objects to be deleted. *Data_type*: (special_wire|special_via|place_blockage|route_blockage|pin_blockage|resize_blockage|text|gui_text|gui_line|gui_rect|gui_polygc flow|flow_step|wire|via|patch_wire|virtual_wire|port_shape|attribute|route_type|what_if_wire|what_if_via|hinst|hpin|hport|port|module|inst|net|hr

Examples

- The following command deletes all the `place_blockages`:
  ```
  delete_obj [get_db place_blockages]
  ```
- The following command deletes the specified `place_blockage` object:
  ```
  delete_obj place_blockage:0x2b77dfbf0048
  ```
- The following command deletes all the special routes from the VDD net:
  ```
  set my_net [get_db pg_nets VDD]
  delete_obj [get_db $my_net .special_wires]
  delete_obj [get_db $my_net .special_vias]
  ```
- The following command deletes a group of SDPs:
  ```
  delete_obj sdp:DTMF_CHIP/wCardInstGrp_1
  ```

Related Information

- For information on querying the database objects, see the `get_db` command.

get_db

```
get_db
[-help]
{[start [chain] [pattern1 [pattern2 ..] [[-if expression] | [-expr expression]] [-dbu] [-foreach tcl_body] [-index {object | obj_type1
name1 [object | obj_type2 name2 …]}] [-invert] [-regexp] [-match_hier] [-unique] [-computed]}
[-category category]
[-depth {[min] max}]
[-skip_fail]
```

Returns objects and attributes in the database with different types of filtering. The `get_db` commands takes a dual-ported object, dual-ported object list or a collection as input, then uses a period (.) to traverse to other related objects or to access attributes. You can use additional periods to traverse the data base schema.

Note: A Dual-Ported Object (DPO) is a Tcl_Obj in the C++ programming interface. The pointer is kept as a C++ pointer inside Tcl unless Tcl forces it to be evaluated as a string. In normal usage it never gets converted to a string which is more efficient, but if you do a "puts $var" or return the value to the shell, it will be converted to its "dual" string form.

- The string form is normally a useful name preceded by the `obj_type`, so a `base_cell` object string form might look like `base_cell:and2`.
- A netlist name will have the current design name included, so an instance named `i1/i2` in design top, would look like `inst:top/i1/i2`.
- An object with no name like a wire, will just show the pointer hex-value like `wire:0x22222`.

The `get_db` command accepts collections as an input but it only returns objects in dual-ported object list form.

For descriptions on all objects and attributes, see Common UI Database Object Information.

The root object has the current design data under the `current_design` attribute, while technology and library data are normally directly accessible as root attributes (e.g. layers and base_cells). The `root` object is the default starting point if there is no input list or collection given.

You can query a root attribute in any of the following ways:

- `get_db / .layers`
  where, '/' is the notation for the root object
- `get_db layers`
  This implicitly starts at the root. In this usage, no "." is used before the "layers" attribute name.

For example, you can use the following command to get all the driver-pins of all nets in `current_design`:

```
>get_db current_design .nets.drivers
```

Note: The `current_design` is implicitly created by the `init_design` or the `read_db` commands.

Frequently used current_design attributes like insts or hinsts (hierarchical insts) have root attribute aliases (or shortcuts). These attributes can be accessed by just typing the root attribute alias name.

For example, the following commands gets all instances of the current design with names that start with `i1/i2*`:

- `get_db current_design .insts i1/i2*`
- `get_db insts i1/i2*`

Where, `insts` is a root attribute alias for `current_design .insts`

Some of the more commonly used aliases from the `current_design` attributes include: `nets`, `pins`, `insts`, `hnets`, `hpins`, and `hinsts`.

The `get_db` command supports auto-complete when you press the <`Tab`> key. It will give a list of all matching attributes starting with the letters entered so far, or it will complete the name if it is unique.

For example:

```
>get_db insts .par<Tab>

parent partition

>get_db insts -if {.par<Tab>

parent partition
```

If you press the `<Shift+Tab>` keys together, the matching attributes are displayed along with their help string, like this:

```
>get_db insts .par<Shift+Tab>

parent # The parent of the inst, which is either a hinst for an instance within hierarchy or the design object for an instance at
the toplevel.
partition # If this inst is a physical black_box, this partition will carry the pin constraints and related data for the blackbox.
Otherwise it is empty.
```

There are two database definition objects: `obj_type` and `attribute`. If you want to query all the details for an attribute definition on an `obj_type`, rather than an attribute value, use the following command:

```
get_db attribute:<obj_type>/<attribute_name> .*
```

You can use `get_db` to query user-defined properties from LEF. Following is the mapping between the LEF `objectType` and database object:

```
LAYER -> layer
LIBRARY -> design
MACRO -> base_cell
NONDEFAULTRULE -> route_rule
PIN -> base_pin
VIA -> via_def
VIARULE -> via_def_rule
```

Note: If `PROPERTYDEFINITION` is defined for `LIBRARY`, the `PROPERTY` will be mapped as a design attribute with a `tech_lef_property_*` prefix.

Copying and pasting pointers in an active session may cause the tool to crash. To prevent this situation, do not:

- Copy pointers from the output of the `get_db` command and paste to another command as input.
- Copy a pointer from one session to another.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_db` parameter.

`-category` *category*	Specifies a category of root attributes to return. This is intended to return all the root attributes associated with one application c used for anything but root attributes. The return value is list of root attribute names.
	Example:
	The following command can be used to see all the root attributes associated with the category place:
	`get_db -category place`
	The output is as follows:
	`place_design_floorplan_mode place_design_refine_place place_detail_allow_border_pin_abut ...`
	You can view the complete list of categories with the get_db categories command as follows:
	`innovus 1> get_db categories`
	`active_logic_view add_endcaps add_fillers add_rings ...`
	Data_type: string, optional

chain	Specifies the *chain* in the form `[.attribute_name1 [.attribute_name2]...]`. A chain always starts with a `"."`.
	The specified attribute names are valid for each level of the traversal in the *chain*.
	Example:
	The following command returns the names of pins of `$my_insts`
	`get_db $my_insts .pins.name`
	If the chain has a * or ? in the attribute name, it will be expanded to all matching attribute names, and the display will show the a values are returned to Tcl. Values that may require significant time to compute (like timing data that requires the timing-graph) v
	For example:
	`get_db $my_insts .b*`
	`Object: inst:top/i1`
	`base_cell: base_cell:BUFX2`
	`bbox: {34.32 10.08 38.94 15.12}`
	`Object: inst:top/i2`
	`...`
	Data_type: string, optional

`-computed`	Forces `get_db` to output the values of attributes that may require significant time to compute (like timing data that requires the ti usage when using a pattern match with * or ? for an attribute name. If only a single attribute name is given, then the value is alw
	Example:
	`>get_db $my_pins .slack_max*`
	`Object: pin:top/inst$odd/Y`
	`slack_max: NC`
	`slack_max_edge: NC`
	`...`
	`>get_db $my_pins .slack_max* -computed #if timing-graph not available yet, it will be computed`
	`Object: pin:top/inst$odd/Y`
	`slack_max: 550.12`
	`slack_max_edge: rise`
	`...`
	`>get_db $my_pins .slack_max #single attribute names always return value and force computation if needed`
	`550.12 ...`
	Data_type: bool, optional

`-dbu`	Indicates that attribute values (coord, pt, rect, polygon, area, ...) should be returned as an int in database units.
	Default: If not given, the value returned is a double in microns (or microns**2).
	Examples:
	• In the following command the return type is a double in microns.
	`get_db $my_inst .location`
	`{1.0 1.0}`
	• In the following command the return type is an int in database units.
	`get_db -dbu $my_inst .location`
	`{1000 1000}`
	Data_type: bool, optional

`-depth {[min] max}`	Specifies the hierarchy depth range. It expands each `design` or `hinst` object in the input list into a list of `design` or `hinst` objects specified. `0` here signifies the level of the starting object. The `-depth` expansion happens first, and the resulting expanded list is then processed as the input list of objects by `get_db`. For example: `get_db hinst:top/h1 -depth {0 1}` Returns `hinst:top/h1`, and the first level of hinsts below it. *Data_type*: string, optional

`-expr` *expression*	Returns the object if the *expression* is true. The *expression* argument is a strict Tcl expression that can be passed as is to the with any attribute or chain value for each object as they are visited, and `$obj(.)` returns the object itself. For example,
	`get_db insts -expr {$obj(.base_cell.name) eq "AND2"}  #all insts that are AND2`
	Normally the `-if` *expression* parameter is faster for simple expressions, but it is limited to a few operators, and simple `$var` sul char escaping, or complex `$var` substitution, you must use `-expr`.
	This parameter can be used with a *chain* and `pattern` like this:
	`get_db $my_insts .pins i1/* -expr {$obj(.base_name) eq "A"}`
	Here, the `i1/*` pattern is checked first for pin names that match `i1/*`, then the pin `.base_name` is checked if it is equals "`A`".
	`-expr` cannot be used at the same time with `-if`.
	Data_type: string, optional

`-foreach` *`tcl_body`*	Specifies a list of Tcl commands to process for each object. This parameter avoids the overhead of creating long lists of objects `$obj(.)` is the object itself. The Tcl commands break and continue also work as expected in a `foreach` loop (break stops the tra Unlike inside `-if`, the `tcl_body` is strict Tcl. The *`.attribute`* names are not substituted, you must use `$obj()` to access the attrib each `object` that matches the *`pattern`*, `-if`, or `-expr` expression. The following command prints the names of every inst that starts with "abc" and is an AND2 gate: `get_db insts abc* -if {.base_cell.name == AND2} -foreach {puts $obj(.name)}` It returns the total number of `insts` that are printed. *Data_type*: string, optional

`-if` *`expression`*	Specifies a boolean expression, with extensions to make pattern matching simpler.
	• == and != do not require a quoted string, and they support pattern matching with * and ?.
	• Other operators like >, <, <=, >=, &&, ||, and the unary negate operator ! are supported.
	• Parentheses "( )" can be used to group complex expressions.
	
	Note: Unlike the <pattern> argument, inside the -if expression, you cannot use a string pattern to implicitly match the .name attr will not match anything because .base_cell will become something like `base_cell:AND2`.
	
	`>get_db insts -if {.base_cell == buf*} #matches nothing`
	
	use either of these instead:
	
	>get_db insts -if {.base_cell.name == buf*} #match the .name attribute
	
	>get_db insts -if {.base_cell == base_cell:buf*} #match the DPO name directly
	
	Note: If you use an attribute that is an object list (like .pins), every object in the list is tested in an "implicit OR", so if any of them
	
	Handling of indexed attributes inside of the `-if` statement:
	• The `-index` option is kept outside of the `-if` statement
	• The `-index` option MUST be valid for ALL attributes inside the `-if` statement otherwise an error occurs
	
	Examples:
	• The following command finds all instances with `base_cell` names that matches "`buf*`".
	`get_db insts -if {.base_cell.name == buf*}`
	• The following command returns all insts that have one or more pins that match `CLK*`. Only one copy of the matching inst obje
	`get_db insts -if {.pins.base_name == CLK*}`
	• The following command gets all pins where `delay_max_rise` is greater than 5 or `slew_max_fall` is smaller than 8. This is a v abbreviation of `analysis_view`).
	`get_db pins -if {.delay_max_rise > 5 || .slew_max_fall < 8 } -index {view v1}`
	
	Note: The `-if` parameter does not support the usage of embedded Tcl command as operands. Use the `-expr` for this requirem
	
	Data_type: string, optional

`-index {object | obj_type1 name1 [object | obj_type2 name2 …]}`	Some attributes represent an array of values. For example, a `pin .slack_max_rise` attribute has a different value for each `anal` attribute is used (for example, the maximum, or minimum of all values in the array). For `slack_max_rise` with no `-index` value, th
	If you want to return a specific value, you must include the index value. The index values are object pointers, or a pair of `obj_ty` abbreviation for `analysis_view`.
	For example:
	`get_db $my_pins .slack_max_rise -index "view func_wc_cworst"`
	Will return the worst case `.slack_max_rise` for the `analysis_view func_wc_cworst` across all clocks. This attribute also accepts
	`get_db $my_pins .slack_max_rise -index "view func_wc_cworst clock clk1"`
	To get the value for that specific `analysis_view` and `clock`.
	In the special case of a clock and `analysis_view` as shown above, a clock object is sufficient for both, because a clock object is
	`set my_clk_obj [get_db clocks -if {.view_name == func_wc_worst && .base_name == clk1}]`
	`get_db $my_pins .slack_max_rise -index $my_clk_obj`
	The `-index` parameter also accepts a pattern of attribute name to be matched. While specifying an attribute pattern string with `-` support `-index` will return the values specified by the index. For example:
	`get_db net:dtmf_recvr_core/scan_out2 .* -index {view func-wc_cworst}`
	Will return all the attributes and values for the `net` object. Any attribute that supports a view index will return the value for that vi
	Data_type: tcl_obj, optional

`-invert`	Negates the *`pattern`*, `-if` *`expression`*, `and -expr` *`expression`* filters to return the objects/attributes that do not match instead *Data_type*: bool, optional
`-match_hier`	Specifies that the `*` in the *`pattern`* and *`expression`* expands to the next hierarchical divider character `/` instead of a complete str Example: The following command matches i1, i2, but not i1/i2. `get_db insts i* -match_hier` *Data_type*: bool, optional

pattern1 [pattern2 ..]	Specifies string pattern(s), where:
	* matches 0 or more of any characters
	? matches exactly one character
	More complex patterns require `-regexp` or `-if` expression.
	Refer to the following examples:
	• The following command finds all instance names starting with A:
	`get_db insts .name A*`
	`A0 A1/A2 …`
	• The pattern matching can also work directly on a dual-ported object. In that case, it will match the '.name' attribute of the obj have a `.name` attribute defined. For example, the following command finds all instance objects (not names) with a name star
	`get_db insts A*`
	`inst:top/A0 inst:top/A1/A2 …`
	• The pattern matching can also work to match multiple lists of the name patterns. Refer to the following example:
	`get_db {*/BC* *TC*}`
	`CG/BC1 CG/BC2 TC1 TC2 TC3 TC4`
	`0x19f`
	Note: For the special case where a pattern string starts with '.' you need to use an extra '.' (an empty attribute name) so that '.text' is treated as a pattern and not as an attribute name.
	• The following command finds all nets whose names equal to `.odd_name`
	`get_db nets . .odd_name`
	• The following command finds all instance names starting with A or B:
	`get_db insts A* B*`
	Data_type: string, optional

`-regexp`	Specifies that *pattern* use *regexp* syntax instead of the simple * and ? style. It does not change the `-if` pattern matching. ⚠ This parameter matches the specified pattern with the whole reference string. See the example below to understand the usage of the `-regexp` parameter: `get_db insts -regexp {u_warmreset_cntr/reset_cntr_reg_(\d+)_}` *Data_type*: bool, optional
`-skip_fail`	Skips displaying the fail error, when the object does not have the specified attribute. *Data_type*: bool, optional

start	The starting objects or root attributes. Can be an object list, collection, root (/), or root attribute.
	Example:
	• The following command returns the root attribute `insts` that is an object list of all `insts` in `current_design`.
	`>get_db insts`
	• The following command starts from a dual-ported object list or collection of objects in the Tcl variable `$my_list`, and returns
	`>get_db $my_list`
	• The following command returns a root attribute that is a simple value.
	`>get_db timing_cap_unit`
	• If the name has a * or ?, it will be expanded to all matching root attribute names, and the display will show the attribute name example,
	`>get_db timing*`
	`Object: root:/`
	`timing_allow_input_delay_on_clock_source: false`
	`timing_analysis_aocv: false`
	`...`
	Data_type: tcl_obj, required

`-unique`	Removes duplicate entries from the return list. If the specified attribute is a list, this parameter returns a unique set of lists., and *Data_type*: bool, optional

Built-In Sub-attributes

The types `rect`, `line`, `point`, and `polygon` have built-in sub-attributes. For a full list of all built-in sub-attributes, see Common UI Database Object Information.

Example:

The `rect` type has built-in sub-attributes like:

area	Area of rect
dx	Delta x
dy	Delta y
ll	Lower-left point
ur	Upper-right point
width	Shorter of dx and dy
length	Longer of dx and dy
perimeter	Length of the rect perimeter

A `point` has sub-attributes like:

x	X coordinate
y	Y coordinate

Like other attributes you can chain them together.

For example, an inst object has a .bbox (bounding box) that is type “rect”. Here are some operations allowed on the .bbox attribute of an inst.

```
get_db $my_inst .bbox

{1.0 2.0 3.0 4.0}

get_db $my_inst .bbox.ll

{1.0 2.0}

get_db $my_inst .bbox.area

4.0

get_db $my_inst .bbox.ll.x

1.0

set box [get_db $my_inst .bbox]

{1.0 2.0 3.0 4.0}

get_db $box .ll

{1.0 2.0}
```

Examples

- The following command finds insts with names starting with PTN* that have at least one pin capacitance > 0.1. The pattern is checked first, and those that pass will be tested with the `-if` expression. Inside the `-if` expression, there are many `.pins` for one inst, so each pin is tested. If any of the pins have a capacitance > 0.1, the single inst will be matched.
  ```
  get_db insts PTN2* -if {.pins.capacitance_max_rise  > 0.1}
  ```
- The following command returns insts that are not physical-only cells whose name matches `i1/i2*`.
  ```
  get_db insts i1/i2* -if {!.is_physical}
  ```
- The two commands below generate the same list of pins from `$my_insts` that have a base_name `clk`. The first uses a * pattern to match all pins, while the second has no pattern and defaults to all pins, so both cases check the `-if` expression for all pins of `$my_insts`.
  ```
  get_db $my_insts .pins * -if {.base_name == clk}
  ```

```
get_db $my_insts .pins  -if {.base_name == clk}
```

- The following command finds `buf1` cell instances connected to nets named `clk` and changes their placement status to `fixed`.
  Note: The examples below is inefficient and used to illustrate different methods of traversal done in different styles. A more efficient method would be to start from the nets and looking at their pin connections directly.
  Example 1:

```
set cell_name buf1
set net_name clk
foreach inst_obj [get_db insts] {
      set cell_obj [get_db $inst_obj .base_cell]
      if { [get_db $cell_obj .name] == $cell_name } {
               foreach pin_obj [get_db $inst_obj .pins] {
                     if { [get_db $pin_obj .net.name] == $net_name } {
                         set_db $inst_obj .place_status fixed
                     }
               }
       }
}
```

  Example 2: Same output using full traversal style with intermediate variables. The second `-if` returns true if any of the .pins.net.name match `$net_name` (implicit OR).

```
set buf1_list [get_db insts -if {.base_cell.name == $cell_name}]
set buf1_clk1_list [get_db $buf1_list -if {.pins.net.name == $net_name}]
set_db $buf1_clk1_list .place_status fixed
```

  Example 3: Same output using full traversal style (fully chained)

```
set_db [get_db insts -if {.base_cell.name == $cell_name && .pins.net.name == $net_name}] .place_status fixed
```

  Example 4: Or use the `-foreach` method so no list is returned, but the number of buffers processed is returned.

```
get_db insts -if {.base_cell.name == $cell_name && .pins.net.name == $net_name} -foreach {set_db $obj(.) .place_status fixed}
```

- The following command finds all the insts named `i1/i2` that end with `_buf`:

```
get_db insts i1/i2/*_buf
```

  Or your could start inside the `hinst` named `i1/i2`:

```
get_db [get_db hinsts i1/i2] .insts *_buf
```

  Or use the hinst dual-ported object name directly. Note that netlist dual-ported object names have the design name included, so if `top` is the design name you could do this:

```
get_db hinst:top/i1/i2 .insts *_buf
```

- The following command gets `arrival_max_rise` for the `analysis_view setup_test` for all pins. Here the abbreviation "view" is allowed for analysis_view.

```
get_db pins .arrival_max_rise -index "view setup_test"
```

- The following command finds insts that have a cell_port named CK and that pin is connected to a net named clk*:

```
get_db insts -if {.lib_cells.lib_pins.name == */CK && .pins.net.name == clk*}
```

- The following command uses -foreach to find the first inst named u1/* with .place_status "fixed" and then break. It uses strict Tcl inside the -foreach.

```
get_db insts u1/* -foreach { if {[string match fixed $obj(.place_status)]} { puts $obj(.name) ; break } }
```

- The following `get_db` command uses `-foreach` to count the number of each base_cell used in the netlist inside the cell_count Tcl array. You can then use `array get cell_count` to see a list of all the `base_cell` names and how many times they are used in the netlist.

```
get_db insts .base_cell -foreach {incr cell_count($obj(.name))}
```

- The following `get_db` command displays all the details of the `flow_template_type` attribute of the `root obj_type`:

```
get_db attribute:root/flow_template_type .*
Object: attribute:root/flow_template_type
base_name: flow_template_type
category: flow
check_function: {}
compute_function: {}
data_type: string
default_value: {}
help: {Type of template being run.}
indices:
is_computed: false
is_obsolete: false
```

```
is_settable: true
is_user_defined: true
name: root/flow_template_type
obj_type: obj_type:root
set_function: {}
skip_in_db: false
```

- The following example depicts the use of the `-if` parameter to find all HVT insts:
  ```
  get_db insts -if {.base_cell.name == *_HVT}
  ```
- The following command returns all hinsts 1 or 2 levels inside the design:
  ```
  get_db design:top -depth {1 2}
  hinst:top/h1 hinst:top/h1/h2
  ```
- The following command finds all `local_insts` of each `hinst` at depth 2 that have `.dont_touch == true`:
  ```
  get_db design:top .local_insts -depth {2 2} -if { .dont_touch == true }
  inst:top/h1/h2/i1 inst:top/h1/h2/i2
  ```
- All the following commands return inst with `.name i1/i2`:
  ```
  set a i1/i2
  get_db insts i1/i2
  get_db insts -expr {$obj(.name) eq $a}
  get_db insts -expr {[get_db $obj(.) .name] eq "i1/i2"}
  ```
- The following command returns all nets with more than 5 loads:
  ```
  get_db nets -expr { [llength $obj(.loads)] > 5 }
  ```
- The following command returns all insts with `base_cell.name AND2`:
  ```
  get_db insts -expr {$obj(.base_cell.name) eq "AND2"}
  ```
- The following example presents the use of LEF with the `define_attribute` syntax:
  ```
  PROPERTYDEFINITIONS
  VIARULE myViaRule STRING ;
  END PROPERTYDEFINITIONS

  VIARULE via4Array
  LAYER metal4 ;
  ...
  LAYER metal5 ;
  ...
  PROPERTY myViaRule Test ;
  END via4Array
  ```

  `define_attribute` will be defined as:
  ```
  define_attribute myViaRule -category lef_property -data_type string -default Test -obj_type via_def_rule -skip_in_db -help_string {This was created by a LEF PROPERTYDEFINITION statement with the name "myViaRule". Any change to the value is only valid during the current session. The next read_db will recreate these attribute names and values from the LEF file only.}
  ```

  The following command will query the property:
  ```
  get_db via_def_rule:via4Array .myViaRule
  Test
  ```

Related Topics

- For details on LEF property definitions, see the 'Property Definitions' section on the LEF Syntax chapter in the *LEF/DEF Language Reference*.
- For information on how to set DB attributes, see the `set_db` command.
- For information on how to reset attribute values, see the `reset_db` command.
- For a list of objects attributes that can be queried for information or changed, see Common UI Database Object Information.

get_db Category Attributes

The root attributes in the `get_db` category are:

- get_db_display_limit

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `get_db` category, use the following command:

```
get_db -category get_db
```

get_db_display_limit

`get_db_display_limit {integer}`

Default: `10`

Data_type: int, read/write

Controls the length of lists and number of objects displayed on the screen using queries that contain wildcards.

Note: This variable does not change the return value of `get_db` command.

Example

The following example sets the number of objects and length of the lists to 1 and then calls `get_db` to display instance attributes. `get_db` command outputs one instance object and every attribute list is truncated to one element.

```
set_db get_db_display_limit 1
get_db insts .*
```

```
Object: inst:TOP/I0
arcs:                   NC
area:                   0.7056
base_cell:              base_cell:BUFFD0BWP
bbox:                   {0.0 0.0 0.0 0.0}
.....
pg_base_pins:           base_pin:BUFFD0BWP/VDD ... (total length 2) #truncated as length of the list is set to 1
pg_pin_nets:            net:TOP/VDD ... (total length 2) #truncated as length of the list is set to 1
pins:                   pin:I0/Z ... (total length 2) #truncated as length of the list is set to 1
...
route_halo_top_layer:   {}
test_reset_inst:        1
```

Note: Number of objects exceeds limit. Use `set_db get_db_display_limit <value>` to control the number of objects evaluated by `get_db <object>.*` query.

is_attribute

```
is_attribute
[-help]
attribute_name
-obj_type obj_type
```

The `is_attribute` returns `true` if attribute `attribute_name` is defined for objects of type `obj_type`, `false` otherwise.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `is_attribute` parameter. For a detailed description of the command and all its parameters, use the man command: `man is_attribute`
`attribute_name`	Specifies the name of the attribute to be checked. *Data_type*: string, required
`-obj_type` *`obj_type`*	Specifies the object type of the attribute to be checked. *Data_type*: string, required

Examples

- The following `is_attribute` command returns `true` because the attribute `test_delete` is defined for `inst` type objects:

```
define_attribute test_delete -obj_type inst -data_type int -category test -help_string "test delete function" -default 1
is_attribute -obj_type inst test_delete
1
```

- The following commands first delete the attribute `test_delete` if it exists, then checks to see if the attribute exists (which it doesn't) and the 2nd `is_attribute` returns `false`:

```
if { [ is_attribute test_delete -obj_type inst ] } { delete_obj attribute:inst/test_delete }
is_attribute test_delete -obj_type inst
0
```

- How to create user-defined attributes: define_attribute

reset_db

```
reset_db
[-help]
{ root_attribute_name | start [chain] | -category category_name }
[-quiet]
[-verbose]
```

Resets attribute value to a pre-defined default value. It returns a single value when resetting a single attribute, a list of values when resetting same attribute on different object instances, or a human readable table for multiple attributes. It also returns the values and number of attributes that were reset. The output is returned in the following format:

```
Attribute_name value
```

For example:

```
Place_xxx true
Add_filler  true
```

Note: The `-category` parameter of the `reset_db` command can be used to reset root attributes only. Both user-defined and system root attributes can be reset using the `-category` option.

Note: The attribute value can be reset if the attributes `default_value` is specified.

When the `-category` parameter is used, the command resets the values of both the hidden and unmapped attributes. In such a case, the command does not return the count of the reset attributes. The output in such cases will be like the following:

```
Some hidden attributes were also reset.
```

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `reset_db` parameter. For a detailed description of the command and all its parameters, use the man command: `man reset_db`
`root_attribute_name`	Resets the named root attribute. Wild-cards work. Attribute db-objects do not work. Attribute db-object names do not work. A tcl-list of root attribute names does not work.
`start`	Can be any object list (or collection) or *shorthand*. For example nets, insts... Attributes found by following *chain* off of this object list are reset. *Data_type*: tcl_obj, optional
`chain`	Specifies the attribute *chain* in the form *`.attribute_name1[.attribute_name2]...`* *Data_type*: string, optional

`-category` *`category_name`*	Specifies the root attribute category to be reset based. For example, the following command resets all the root attributes (including hidden and unmapped ones) to the default value in the `ccopt` category:
	`reset_db -category ccopt`
	One can find all the categories by:
	`get_db categories`
	`category_name` must be a single category name, no list of names, no wild-cards.
	Note: This applies only to the root level attributes and is ignored for the lower levels.
	Data_type: string, optional

`-quiet`	By default `set_db` is quiet. If the `set_db_verbose` root attribute is set to true, then the name of each object that is modified is echoed to the terminal (see the `-verbose` parameter's description for an example). However, `-quiet` forces `set_db` to be quiet even if `set_db_verbose` is true. *Data_type*: bool, optional

`-verbose`	Turns on verbose output that echoes the name of each object that is modified. This can be useful debug tool to ensure that the correct objects were affected. For example:
	`reset_db -verbose [get_db hinsts D*] .dont_touch`
	`Setting attribute of hinst 'DATA_BUS_MACH_INST': 'dont_touch' = false`
	`Setting attribute of hinst 'DECODE_INST': 'dont_touch' = false`
	`2 false`
	Note: The `set_db_verbose` root attribute can also be set to true, to force verbose output for all `set_db` and `reset_db` usage without requiring `-verbose`.
	Data_type: bool, optional

Examples

- The following resets the value of a user-defined instance attribute:

```
define_attribute test_reset_inst -obj_type inst -data_type int -category reset -help_string "test reset function" -default 1
1
set_db insts .test_reset_inst 10
5 true       #Five instances in the design
reset_db insts .test_reset_inst
5 1            #All 5 attributes are reset to default values
```

- The following command resets the root attributes using the `-category` parameter:

```
define_attribute test_reset1 -obj_type root -data_type int -category reset -help_string "test reset function" -default 1
define_attribute test_reset2 -obj_type root -data_type int -category reset -help_string "test reset function" -default 1
define_attribute test_reset3 -obj_type root -data_type int -category reset -help_string "test reset function" -default 1
set_db test_reset1 10
10
set_db test_reset2 10
10
set_db test_reset3 10
10
```

  On specifying:

```
reset_db -category reset
```

  The attributes are reset to their default values and a human readable table with new values is displayed.

```
test_reset1 1
test_reset2 1
test_reset3 1
```

- The following command resets all root attributes: `reset_db *`
- The following command resets the *place_status* attribute of all non-physical insts with `place_status` *fixed*: `reset_db [ get_db insts -if { ( .place_status == "fixed" ) && ! .is_physical } ] .place_status`

Related Topics

set_db

```
set_db
[-help]
start
[chain]
value
[-dbu]
[-index {index_type1 name1 [index_type2 name2 …]}]
[-quiet]
[-verbose]
```

Changes the specified attribute value for a database object. The `set_db` command takes a dual-ported object, dual-ported object list, or a collection as input, and then uses a period (.) to traverse to other related objects or to access attributes. You can use additional periods to traverse the data base schema.

Note: A Dual-Ported Object (DPO) is a `Tcl_Obj` in the C++ programming interface. The pointer is kept as a C++ pointer inside Tcl unless Tcl forces it to be evaluated as a string. In normal usage it never gets converted to a string which is more efficient, but if you do a `puts $var` or return the value to the shell, it will be converted to its dual string form.

- The string form is normally a useful name preceded by the `obj_type`, so a `base_cell` object string form might look like `base_cell:and2`.
- A `netlist` name will have the current design name included, so an instance named `i1/i2` in design top, would look like `inst:top/i1/i2`.
- An object with no name like a wire, will just show the pointer hex-value like `wire:0x22222`.

The `set_db` command does not create or delete objects.

For information on what object attributes are settable, see the Common UI Database Object Information document. It contains a description of all database objects and attributes.

The root object has the current design data under the `current_design` attribute, while technology and library data are normally directly accessible as root attributes (For example, layers and libraries). The root object is the default starting point if there is no input list or collection given.

You can set any root attribute in any of the following ways:

- `set_db / .flow_mail_to name`
  where, '/' is the notation for the root object , or,
- `set_db flow_mail_to name`
  This implicitly starts at the root.

For example, you can use the following command to change the design text font:
`set_db current_design .texts.font_number  4`

Note: The `current_design` is implicitly created by the `init_design` or the `read_db` commands.

Frequently used `current_design` attributes like `insts` or `hinsts` (hierarchical insts) have root attribute aliases (or shortcuts). These attributes can be accessed by just typing the root attribute alias name.
For example, the following two commands set all insts .place_status to fixed.

```
set_db current_design .insts.place_status fixed
set_db insts .place_status fixed
```

Some of the more commonly used aliases from the current_design attributes include: insts, hinsts, nets, hnets, ports, hpins, pins.

The `set_db` command supports auto-complete when you press the <`Tab`> key. It will give a list of all matching attributes starting with the letters entered so far, or it will complete the name if it is unique.

For example:
`set_db plan_design_use<Tab>`
returns `plan_design_use_guide_boundary plan_design_use_sdp_group`

This command does not support the usage of embedded Tcl command as operands. Use the `-expr` parameter of the `get_db` command for this requirement. For information on how to access DB objects, see the `get_db` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_db` parameter.
start	The starting objects or attributes. Can be an object list, collection, root (/), or root attribute. *Data_type*: tcl_obj, required
chain	Specifies a *chain* in the form `[.attribute1[.attribute2]...]`. The attribute names must be valid for each level of the traversal in the *chain*, where the first name is valid for the start object. For example, `set_db $my_pins .inst.place_status fixed` where `.inst` is an attribute of an pin object and `.place_status` is an attribute of an inst object. *Data_type*: string, optional
value	Specifies new value for the specified object attribute elements. The value type depends on which object attribute type is being modified. *Data_type*: string, required
`-dbu`	Indicates that attribute values (coord, pt, rect, polygon, area, ...) should be in database units. *Default*: The default is microns (or microns**2). *Data_type*: bool, optional
`-index {`*index_type1 name1* `[`*index_type2 name2* `…]}`	
	Some attributes represent an array of values. For example, a pins .slack_max_rise attribute has a different value for each analysis_view. With no index, all the values defined for that attribute are modified by the `set_db` command. If you want to change a specific value, you must include the index value. The index values are pairs of obj_type names (for example, analysis_view, clock, skew_group) followed by the name. The word "view" is accepted as an abbreviation for "analysis_view". For example, some ccopt attributes can take both a view and clock index like this: `-index "view func_wc_cworst clock clk1"` *Data_type*: tcl_obj, optional
`-quiet`	By default `set_db` is quiet. If the `set_db_verbose` root attribute is set to true, then the name of each object that is modified is echoed to the terminal (see the `-verbose` parameter's description for an example). `-quiet` forces `set_db` to be quiet even if `set_db_verbose` is true. This is intended for internal scripts that want to be certain that the verbose output is off. *Data_type*: bool, optional

`-verbose`	Turns on verbose output that echoes the name of each object that is modified. This can be useful during interactive debugging to ensure that the correct objects were affected. For example:
	`set_db -verbose [get_db hinsts D*] .dont_touch false`
	`Setting attribute of hinst 'DATA_BUS_MACH_INST': 'dont_touch' = false`
	`Setting attribute of hinst 'DECODE_INST': 'dont_touch' = false`
	`2 false`
	Note: The `set_db_verbose` root attribute can also be set to true, to force verbose output for all `set_db` and `reset_db` usage without requiring `-verbose`.
	Data_type: bool, optional

Examples

- The following command sets a value of root attribute.
  ```
  set_db place_global_solver_effort high
  ```
- The following commands define an instance attribute and change its value to 0.
  ```
  define_attribute myattr -default 1 -obj_type inst -data_type int -help_string "my attribute" -category my_cat
  set_db insts .myattr 0
  ```
- The following command sets an instance attribute value to 5 only if its current value is 0.
  ```
  set_db [get_db insts -if {.myattr == 0}] .myattr 5
  ```

Related Topics

- For information on how to query DB attributes, see the `get_db` command.

sort_db

```
sort_db
[-help]
obj_list
[attribute_list]
[-descending]
[-dictionary]
```

Returns a sorted DPO (dual-ported object) list based on the contents of one or more attributes. It is based on `lsort` using get_db to access various attributes.

This command sorts objects only based on the attributes that have a "simple" data type of string, float, integer, or object. If it is an object, it is implicitly sorted by the `.name` field and treated as a string. Numeric values are sorted numerically, and string values are sorted using the ASCII values like `lsort`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `sort_db` parameter. For a detailed description of the command and all its parameters, use the man command: `man sort_db`

`obj_list`	A DPO list to be sorted. If the first element of the specified list is not a DPO, then it is treated as a root attribute name and passed directly to `get_db` to return a DPO list. So, the following two commands have identical results:
	`sort_db insts`
	`sort_db [get_db insts]`
	Data_type: tcl_obj, required

`attribute_list`	Sorts the DPO list by the specified attribute values. The first attribute in the *`attribute_list`* has the highest sort precedence. Each attribute can be a chain identical to what `get_db` supports. A leading "." is optional, so all the following commands presenting the use of `attribute_list` specify legal arguments for an inst list:
	`sort_db insts name`
	`sort_db insts .name`
	`sort_db insts {location.x location.y}`
	`sort_db insts {.location.x .location.y}`
	Data_type: string, optional

`-descending`	Sorts the list of objects by the descending order. *Data_type*: bool, optional
`-dictionary`	Sorts string attribute values by the dictionary order (the same as `lsort -dictionary`). The casing of characters is ignored except as a tie-breaker. If two strings contain embedded numbers, the numbers are compared as integers, not characters. For example, `bigBoy` is sorted between `bigbang` and `bigboy`, and `x10y` is sorted between `x9y` and `x11y`. *Data_type*: bool, optional

Examples

- The following command sorts all the insts by name:
  `sort_db insts`
- The following command sorts the pins based on their slack. The pins with the same slack are further sorted by the x-location:
  `sort_db [get_db pins] {.slack .location.x}`

write_preserves

```
write_preserves
[-help]
[-dont_touch]
[-dont_use]
[-obj_types {design hinst module inst net hnet pin hpin base_cell}]
[-out_file string]
```

Writes preserve constraints in a consumable TCL file so that the exported file can sourced.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `write_preserves` parameter. For a detailed description of the command and all its parameters, use the man command: `man write_preserves`
`-dont_touch`	Writes the preserve constraints only for the non-default attributes related to the `dont_touch` object. *Data_type*: bool, optional
`-dont_use`	Writes the preserve constraints only for the non-default attributes related to the `dont_use` object. *Data_type*: bool, optional
`-obj_types {design hinst module inst net hnet pin hpin base_cell}`	
	Writes the preserve constraints only for the specific object types. *Data_type*: (enum)+, optional
`-out_file string`	Displays the TCL file name. *Data_type*: string, optional

Delay Calculation Commands and Attributes

- add_decap_cell_candidates
- add_decaps
- delaycal Category Attributes
- delete_decaps
- delete_exclude_net_attribute
- report_decap_cell_candidates
- report_decaps
- report_delay_calculation
- reset_decap_cell_candidates
- write_exclude_nets
- write_set_load

add_decap_cell_candidates

```
add_decap_cell_candidates
[-help]
{ cell_name capacitance [ cell_name capacitance ... ] | -in_file fileName }
```

Defines the cells that can be used by the `add_decaps` command to insert decoupling capacitance.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_decap_cell_candidates` parameter. For a detailed description of the command and all of its parameters, use the man command: man `add_decap_cell_candidates`.
`cell_name capacitance [ cell_name capacitance ... ]`	Specifies the base cell name(s) and capacitance value(s) in femtofarads (fF) for the cell candidate(s).
`-in_file` *`fileName`*	Defines the cells and capacitance values contained in the specified file as decoupling capacitance cell candidates. File format is: one or more lines of `cell_name capacitance`

Example

The following commands define two decoupling capacitance cell candidates: `DECAP1` has a capacitance value of 10fF, and `DECAP8` has a capacitance value of 5fF.

```
add_decap_cell_candidates DECAP1 10
add_decap_cell_candidates DECAP8 5
```

In addition, the following commands do the same thing:

```
add_decap_cell_candidates DECAP1 10 DECAP8 5
add_decap_cell_candidates "DECAP1 10 DECAP8 5"
add_decap_cell_candidates {DECAP1 10 DECAP8 5}
add_decap_cell_candidates [ list DECAP1 10 DECAP8 5 ]
```

Related Topics

- `report_decap_cell_candidates`
- `reset_decap_cell_candidates`

add_decaps

```
add_decaps
[-help]
-total_cap total_cap_in_fF
[-cells cellName ]
[-place_status]
[-area llx lly urx ury |  -exclude_areas {{ llx lly urx ury } ...}]
[-effort [low | high]]
[-prefix prefixName ]
[-ignore_drc]
[-log logName]
[-max_iteration number]
[-in_file fileName]
[-pg_net netName]
```

Adds decoupling capacitance instances to the design. The software chooses from decoupling capacitance cell candidates and adds instances until their combined total capacitance value equals the user-specified value.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_decaps` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_decaps`.
`-place_status`	Added decap instances are marked as `place_status fixed` (otherwise: `place_status placed`)
`-area llx lly urx ury`	Defines an area within the design in which to add the decoupling capacitance. *Default:* Entire design area
`-cells cellName …`	The base cell names to be used for decoupling capacitance insertion. The cells must first be defined using the `add_decaps_cell_candidates` command. *Default:* All cells defined with previous `add_decap_cell_candidates` commands

`-effort [low | high]`	Specifies the approach to use when inserting decoupling capacitance. **low:** Uses a homogeneous approach to add the decoupling capacitance. That is, the software treats all areas the same when adding decoupling capacitance cells. **high:** Analyzes the peak current of the instances and tries to add more cells to the areas with high peak current density. *Default:* `low`
`-exclude_areas { llx lly urx ury } …`	Defines a blockage area within which decoupling capacitance cannot be inserted. You can specify one or more blockage areas. **Note:** The parameters `-exclude_areas` and `-area` are mutually exclusive. When both parameters are specified on the command line, the tool throws an error.
`-ignore_drc`	Disables correction of DRC errors.
`-in_file fileName`	Performs decoupling capacitance insertion using the information in the specified log file (created from a previous `add_decaps` session). This file contains information for adding decoupling capacitance cells and for deleting existing decoupling capacitance cells.

`-log` *logName*	Outputs a log file with the specified name that contains information on where the decoupling capacitance cells were added. It can also contain information on where cells were deleted due to DRC violations.
	The log file can be used for tracking the location of decoupling capacitance and for debugging purposes. It can also be used to insert decoupling capacitance cells in a different session.
	The log file is output in the following format:
	`ADD` *cellName locationX locationY* `[` *orientation* `] [` *instanceName* `]`
	`DEL` *instanceName*
	It contains the cell name and the location where an instance of it was placed. It can also contain the orientation of the instance, and a name for the instance, if that name has not been used already.
	For example, the following line shows that a new instance of `CELL_8` with the name `Instance100` was added at the location 100 200, with an orientation of R0:
	`ADD CELL_8 100 200 R0 Instance100`

`-max_iteration` *number*	Specifies the maximum number of iterations of DRC fixing. *Default*: 10
`-prefix` *prefixName*	Defines the prefix to use for the decoupling capacitance cells. *Default:* `DECAP`
`-pg_net` *netName*	Adds decap cells on the specified power rail. *Default:* Add decap cells irrespective of power nets.
`-total_cap` *total_cap_in_fF*	Specifies the total decoupling capacitance to add to the design, in femtofarads (fF).

Command Order

Use this command after defining decoupling capacitance cell candidates with the `add_decap_cell_candidates` command.

Examples

- The following commands add 1000 fF of capacitance to the design using `DECAP1` and `DECAP8` cells, in that order:

```
add_decaps -total_cap 1000 -cells DECAP1 DECAP8
add_decaps -total_cap 1000 -cells "DECAP1 DECAP8"
add_decaps -total_cap 1000 -cells {DECAP1 DECAP8}
add_decaps -total_cap 1000 -cells [ list DECAP1 DECAP8 ]
```

- The following command adds 6367.341 fF of capacitance to the specified area within the design, and marks the placement status of all instances as fixed:

```
add_decaps -total_cap 6367.341 -area 600 600 900 900 -place_status
```

delaycal Category Attributes

The root attributes in the "delaycal" category are:

- delaycal_accuracy_level
- delaycal_advanced_pin_cap_mode
- delaycal_advanced_node_pin_cap_settings
- delaycal_combine_mmmc
- delaycal_degrade_slew_on_early_nets
- delaycal_default_net_delay
- delaycal_default_net_load
- delaycal_enable_high_fanout
- delaycal_enable_quiet_receivers_for_hold
- delaycal_enable_si
- delaycal_enable_wire_load_model
- delaycal_equivalent_waveform_model
- delaycal_equivalent_waveform_type
- delaycal_equivalent_waveform_model_for_timing_check
- delaycal_honor_slew_propagate_constraint
- delaycal_ignore_net_load
- delaycal_input_transition_delay
- delaycal_irdrop_data_type
- delaycal_early_irdrop_data_type
- delaycal_late_irdrop_data_type
- delaycal_library_interpolation_mode
- delaycal_irdrop_window_based
- delaycal_report_out_bound
- delaycal_signoff_alignment_settings

- delaycal_slew_out_bound_limit_high
- delaycal_slew_out_bound_limit_low
- delaycal_skip_slew_merge_from_disabled_path
- delaycal_socv_accuracy_mode
- delaycal_socv_lvf_mode
- delaycal_socv_machine_learning_level
- delaycal_socv_use_lvf_tables
- delaycal_support_output_pin_cap
- delaycal_support_wire_load_model
- delaycal_timing_create_clock_use_ideal_slew
- delaycal_use_default_delay_limit

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `power` category, use the following command:

```
get_db -category delaycal
```

For delay calculation reports, use the following command:

- `report_delay_calculation`

delaycal_accuracy_level

`delaycal_accuracy_level` *level*

Default: 0, *Min*: 0, *Max*: 4

Sets the accuracy level for delay calculations.

You can use this attribute to enable new enhancements for different process nodes, without using the `design_process_node` parameter.

delaycal_advanced_pin_cap_mode

```
delaycal_advanced_pin_cap_mode {0 | 1 | 2}
```

Default: 0

Simulates the current stage and receiver stages together, such that the back miller effect is modeled dynamically.

When set to 1, the receivers are no longer modeled as simple non-linear current source models. This results in increasing the delay calculation accuracy significantly as the modeling back miller effect improves.

When set to 0, the receiver current sources are computed using ECSM/CCS capacitance tables with the estimated input slew.

delaycal_advanced_node_pin_cap_settings

```
delaycal_advanced_node_pin_cap_settings {true | false}
```

Default: `false`

Enables advanced node pin cap settings.

delaycal_combine_mmmc

```
delaycal_combine_mmmc {none | early_late | early_late_corner}
```

Default: `early_late_corner`

Specifes the vdc mode to be used.

Specifies whether delay calculation runs are to be combined for delay calculation simulations. This attribute provides user control for improving the runtime of AAE for all analysis types by combining runs for early and late simulations into a single simulation. The views with common delay corners may also be combined into a single delay calculation simulation for added runtime improvement.
When none is specified, the software does not combine any delay calculation runs. Individual delay calculation simulations are performed for early and late for example, which will result in significant CPU performance degradation due to the increased number of simulation runs performed.
When `early_late` is specified, the software combines early and late simulations of a single corner into one delay calculation simulation and will improve CPU performance by avoiding unnecessary delay calculation simulations.
When early_late_corner is specified, the software combines early / late simulations of a single corner, like with the `early_late` setting,

but also combines views with common delay corners into one single delay calculation simulation. For example, the software will combine views having different `set_case_analysis` statements in one single simulation. This can result in significant improvement in CPU performance by avoiding unnecessary delay calculation simulations.

delaycal_degrade_slew_on_early_nets

```
delaycal_degrade_slew_on_early_nets {true | false}
```

Default: `true`

Controls whether slews in early path delay calculation are degraded as they pass across the interconnect from driver to receiver. You can specify a value of `false` to turn off interconnect slew degradation for early paths and have the driver slews copied to the receivers. Early path delay calculation affects all Hold paths in best-case/worst-case analysis mode, capture clock paths in on-chip variation Setup analysis, and clock launch and data paths in on-chip variation Hold analysis.

delaycal_default_net_delay

```
delaycal_default_net_delay delay_value
```

Type: `String`
Default: 1000ps

Sets the default net delay for delay calculation. The software uses this default value for nets that exceed 1,000 terminals. Delay calculation is performed for nets with fewer than 1,000 terminals.

delaycal_default_net_load

```
delaycal_default_net_load load_value
```

Type: `String`

Default: 0.5pF

Sets the default net load for delay calculation. You can use this attribute to specify the default net load value that is used for nets that exceed 1,000 terminals.

delaycal_enable_high_fanout

```
delaycal_enable_high_fanout {true | false}
```

Default: `false`

When this attribute is set to `true`, the default net delay will be annotated on high fanout nets. A net will be treated as a high fanout net when the fanout is more than the limit specified using the `delaycal_use_default_delay_limit` attribute. The default value of this attribute is 1000 fanouts. The default net delay is also specified using this attribute. The default net delay is 1ns. The cell delay will use the lumped capacitance that is specified using the `delaycal_default_net_load` attribute for table lookup. The default net load is 0.5pF. The driver slew will use the default value of 0ps , which can be changed by using the `delaycal_input_transition_delay` attributes and there will be no slew degradation along the interconnect.

delaycal_enable_quiet_receivers_for_hold

```
delaycal_enable_quiet_receivers_for_hold {true | false}
```

Default: `false`

Forces some receivers to be static (“quiet”).

When set to `true`, the software assumes that the receivers are not switching - to compute the worst-case delays for early analysis. This yields more conservative early delays.

When set to `false`, the software assumes that the receivers may switch.

delaycal_enable_si

```
delaycal_enable_si {true | false}
```

Default: `false`

Enables SIAware delay calculation that also includes cross-talk induced delays.

Note: SIAware delay calculation requires the design to be in Multi-Mode, Multi-Corner (MMMC) Mode and the analysis type to be set to on-chip variations.

delaycal_enable_wire_load_model

```
delaycal_enable_wire_load_model {0 | 1}
```

Type: `Integer`

Default: 0

Enables support of Liberty wire-load models and related SDC commands.

delaycal_equivalent_waveform_model

```
delaycal_equivalent_waveform_model {none | no_propagation | propagation}
```

Default: `none`

Specifies the equivalent waveform model to be used.

delaycal_equivalent_waveform_type

```
delaycal_equivalent_waveform_type {moments | simulation}
```

Default: `moments`

Specifies the equivalent waveform model (EWM) to be used:

The options are described below:

- `moments`: Enables moment-based equivalent waveform model.
- `simulation`: Enables simulation-based equivalent waveform model. The simulation-based EWM is required for predicting delay in noisy waveforms.

It is recommended to use simulation-based EWM as it is more accurate than moment-based EWM.

delaycal_equivalent_waveform_model_for_timing_check

```
delaycal_equivalent_waveform_model_for_timing_check {true | false}
```

Default: `false`

Models the waveform distortion effect for timing check value look ups at both the data and clock pins.

The model uses simulations to convert the distorted waveforms into equivalent waveforms (pre-driver waveforms in the libraries) by matching the pin CCB output waveforms. This feature requires the CCSN library.

delaycal_honor_slew_propagate_constraint

```
delaycal_honor_slew_propagate_constraint {true | false}
```

Default: `true`

Determines whether to propagate the slew from the disabled timing arcs to the output pin.

When this attribute is set to `false`, the slew from the disabled timing arc affects the delay of the next stage. Setting this attribute to false results in more accurate slew computation for the disabled timing arcs but can take longer run time.

When set to `true`, the timing constraints defined using commands such as `set_disable_timing` and `set_case_analysis` impact the slew propagation, and the slew from the disabled timing arcs is not propagated.

delaycal_ignore_net_load

```
delaycal_ignore_net_load {true | false}
```

Default: `false`

Ignores the net load for delay calculation.

When set to `true`, this attribute removes the default system requirement for having RC parasitics available for delay calculation.

This attribute is used to get initial design timing when the design is not in a proper state to generate extracted results and an external SPEF source of parasitics is not available. The results obtained by enabling this attribute are equivalent to those obtained using a zero-cap, zero-resistance wire-load model for estimating delays.

delaycal_input_transition_delay

```
delaycal_input_transition_delay " "
```

Type: String

Default: 4ps

Sets the default input transition delays and the ideal clock transition time for delay calculation.

The default transition will be used in those cases where the transition is not defined (using `set_input_transition`, `set_annotated_transition`, or any driving cell). For all the ports/pins that do not have any driving cell in fanin (or `set_input_transition`/`set_annotated_transition` settings) will also use this default slew value.

It is mandatory to specify time units for this command. Valid time units are ps, ns, etc.
In addition, the default input transition value is applied to those pins to which the slew was not propagated. For example:

- Tiehi or tielo pins
- Macro output pins, which do not have a related input pin

A macro output pin, which has a related input pin will most likely have slew propagation from the related input pin to the output pin.

- Macro output pins for which all the timing arcs are disabled
- Input ports without a user-specified transition value

delaycal_irdrop_data_type

```
delaycal_irdrop_data_type {best_average | worst | best | average | worst_average}
```

Default: `worst`

Allows you to set early/late IR drop EIV values for different EIV voltages.

delaycal_early_irdrop_data_type

```
delaycal_early_irdrop_data_type {best_average | worst | best | average | worst_average}
```

Default: `worst`

Allows you to set early IR drop EIV values for different EIV voltages.

delaycal_late_irdrop_data_type

```
delaycal_late_irdrop_data_type {best_average | worst | best | average | worst_average}
```

Default: `worst`

Allows you to set late IR drop EIV values for different EIV voltages.

delaycal_library_interpolation_mode

```
delaycal_library_interpolation_mode {linear | non_linear}
```

Default: `linear`

Controls library scaling mode - `linear` or `non_linear` - for the interpolation flow.

delaycal_irdrop_window_based

```
delaycal_irdrop_window_based {none | late | early | both}
```

Default: `both`

Searches window-based EIV values from the EIV database.

delaycal_report_out_bound

```
delaycal_report_out_bound {true | false}
```

Default: `false`

Generates a report that contains a list of index values (input transition) in the delay tables that are beyond the index range. The index values detected by this attribute can cause inaccurate delay values to be calculated. The report generated by this attribute can be used for debugging.

When this attribute is set to `true`, the extrapolation information will be dumped into the following two files:

- <design-name>.dc.outbound.slew.early.<view-name>.txt
- <design-name>.dc.outbound.slew.late.<view-name>.txt

The software writes a warning message in the log files noting that there are input transition values that are out of the index range of the timing table. The warning message also provides the file name for viewing the detail report.

delaycal_signoff_alignment_settings

```
delaycal_signoff_alignment_settings {true | false}
```

Default: `false`

Enables signoff alignment settings.

delaycal_slew_out_bound_limit_high

```
delaycal_slew_out_bound_limit_high double
```

Default: 3.40282e+38

Limits the maximum slew used in the analysis to the specified value times max characterized slew in a library.

delaycal_slew_out_bound_limit_low

`delaycal_slew_out_bound_limit_low` *`double`*

Default: 0.5

Limits the minimum slew used in the analysis to the specified value times min characterized slew in a library.

delaycal_skip_slew_merge_from_disabled_path

`delaycal_skip_slew_merge_from_disabled_path {true | false}`

Default: `false`

Avoids merging slews from unconstrained, segmented paths and black-box output pin.

When set to `true`, the software does not allow merging transitions from disabled paths.

delaycal_socv_accuracy_mode

`delaycal_socv_accuracy_mode {low | high}`

Default: `low`

Allows the ability to control levels of accuracy.

This attribute specifies level-based accuracy effort for delays and slews. You can use one of the following options:

- `low`: Ignores correlation between slews and delays.
- `high`: Considers skewness of non-gaussian distribution into account for computing quantiles. The skewness is local to one stage only.

delaycal_socv_lvf_mode

`delaycal_socv_lvf_mode` *`string`*

Default: `moments`

Controls SOCV LVF analysis modes. You can specify - `moments`, `early_late`, or `average` - options.

delaycal_socv_machine_learning_level

```
delaycal_socv_machine_learning_level {0 | 1}
```

Default: 0

Enables the SOCV machine learning mode.

For accurate SOCV analysis, the software creates several statistical models, which are not available with standard LVF library, such as correlation between cells delay and output slew, conversion of moments from late/early sigma tables, and effects of waveform distortion on sigma and mean shift. When this attribute is set to 1, the software enables several machine learning algorithms to generate such models internally.

delaycal_socv_use_lvf_tables

```
delaycal_socv_use_lvf_tables string
```

Default: `all`

Controls which type of variations – `all`, `delay`, `slew`, or `constraint` - are considered during analysis.

delaycal_support_output_pin_cap

```
delaycal_support_output_pin_cap {true | false}
```

Default: `true`

Includes the output pin capacitance when calculating delay values. When set to 0, the software excludes only the pin capacitance of the driver for which you are calculating the delay.

delaycal_support_wire_load_model

```
delaycal_support_wire_load_model {0 | 1}
```

Type: Integer

Default: 0

Enables support of Liberty wire-load models and related SDC commands.

delaycal_timing_create_clock_use_ideal_slew

```
delaycal_timing_create_clock_use_ideal_slew {true | false}
```

Default: `false`

Enables the use of ideal slew at the inputs of the clock driver cells.

When set to `true`, the software detects created clocks, and uses zero input slew. Other slew values, including those set using `set_annotated_transition` command, will be ignored.

When set to `false`, the software honors `set_annotated_transition` command settings.

delaycal_use_default_delay_limit

```
delaycal_use_default_delay_limit value
```

Type: Integer

Default: 1000

Sets the pin number threshold for nets for delay calculation. Nets that have more than the specified number of pins are excluded from delay calculation, and use the default delay values instead. The net default delay values are:

- Net delay: 1 ns
- Transition time: 0 ps
- Net load: 0.5 pF

Note: In post route stage, default delay calculation does not honor this attribute. Slews and delays are computed based on actual parasitics.
To change the default delay values, set the following attributes:

- `delaycal_default_net_delay`
- `delaycal_default_net_load`
- `delaycal_input_transition_delay`

delete_decaps

```
delete_decaps
[-help]
```

Deletes all decoupling capacitance cells. You can use this command to delete decoupling

capacitance cells that you added using the `add_decaps` command.

Parameters

`-help`	Outputs a brief description of the `delete_decaps` command. For a detailed description of the command, use the man command: `man delete_decaps`.

Examples

The following command deletes all of the decoupling capacitance cells in a design:

```
delete_decaps
```

Related Topics

- Placing the Design chapter in the *Innovus System User Guide*
  - Adding Decoupling Capacitance
- `add_decaps`
- `report_decaps`

delete_exclude_net_attribute

```
delete_exclude_net_attribute [-help]
```

Clears excluded net settings - any nets that were previously excluded from delay calculation are included. You do not have to rebuild the timing graph to include the previously-excluded nets.

Parameter

`-help`	Outputs a brief description of the `delete_exclude_net_attribute` command. For a detailed description of the command, use the man command: `man delete_exclude_net_attribute`.

Examples

The following command clears excluded nets such that previously excluded nets are now included again in delay calculation:

```
delete_exclude_net_attribute
```

Related Information

- `write_exclude_nets`

report_decap_cell_candidates

```
report_decap_cell_candidates
[-help]
[-out_file outputFileName]
```

Reports the available cells for decoupling capacitance insertion. You use this command to report decoupling capacitance candidates previously specified using the add_decap_cell_candidates command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_decap_cell_candidates` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_decap_cell_candidates`.
`-out_file` *filename*	Outputs a list of the available cells for decoupling capacitance insertion to the specified file. This file can then be used by the `add_decap_cell_candidates` command to define cell candidates in a different session, or after cell candidates have been deleted.

Example

Following is a sample report generated by using the `report_decap_cell_candidates` command:

```
############################################################
# Generated by:
# OS:          Linux x86_64
# Generated on: Tue Jan 25
# Design:      dtmf_chip
# Command:      report_decap_cell_candidates
############################################################
#The available decoupling capacitance cells:
#--------------------------
#Cell Name    Cap (fF)
#--------------------------
```

```
DECAP1 10
DECAP8 5
#-------------------------
```

Related Topics

- Placing the Design chapter in the *Innovus System User Guide*
  - Adding Decoupling Capacitance
- `add_decap_cell_candidates`
- `reset_decap_cell_candidates`

report_decaps

```
report_decaps
[-help]
-area llx lly urx ury
```

Reports placed decoupling capacitance cells in the specified area.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_decaps` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_decaps`.
`-area` *`llx`* *`lly`* *`urx`* *`ury`*	Defines the area for which to report placed decoupling capacitance cells. *lly* Specifies the area's lower left y coordinate. *urx* Specifies the area's upper right x coordinate. *ury* Specifies the area's upper right y coordinate.

Example

The following command reports placed decoupling capacitance cells in the specified area:

```
report_decaps -area 250 250 1000 1000
```

Related Topics

- Placing the Design chapter in the *Innovus System User Guide*
  - Adding Decoupling Capacitance
- `add_decaps`
- `delete_decaps`

report_delay_calculation

```
report_delay_calculation
[-help]
[-active_arcs]
-from port_or_pin_name
[-max]
[-min]
[-out_file string]
[-si]
[-show_all_attackers]
[-thresholds]
-to port_or_pin_name
[-view viewname]
[-voltage]
[-waveform]
```

Reports the delay calculation information for a cell or net timing arc. You can use this command to report delay calculation details for the specified timing arc. The delay calculation report may be useful for debugging timing or for verifying timing data.

You can run the `report_timing` command before running `report_delay_calculation` to have the correct timing window and aggressor slew.

Note: The `report_delay_calculation` command does not support AOCV derating.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_delay_calculation` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_delay_calculation`.
`-active_arcs`	Disables reporting of all the non-active parallel delay arcs and reports only the valid check arcs.

`-from` *port_or_pin_name*	Specifies the name of the From port or pin. If the From port or pin is output of a cell and To port or pin is input of a cell, delay is calculated for the net and the delay type in the report is 'net delay.' If the From port or pin is input of a cell and To port or pin is output of a cell, delay is calculated for the cell and the delay type in the report is 'cell delay.'
`-max`	Indicates that the delay calculation report is for the worst-case operating conditions in min-max mode. If neither `min` nor `max` arguments are specified, then the default mode is set to `max`.
`-min`	Indicates that the delay calculation report is for the best-case operating conditions in min-max mode. If neither `min` nor `max` arguments are specified, then the default mode is set to `max`.
`-out_file` *string*	Specifies the name of the output file in which to save the delay calculation report.
`-si`	Reports signal integrity (SI) related information.
`-show_all_attackers`	Includes all the attackers in the report.
`-thresholds`	Displays the rise delay, rise slew, fall delay, fall slew, and slew delay threshold values for the From and To pins.
`-to` *port_or_pin_name*	Specifies the name of the To port or pin. If the From port or pin is output of a cell and To port or pin is input of a cell, delay is calculated for the net and the delay type in the report is 'net delay.' If the From port or pin is input of a cell and To port or pin is output of a cell, delay is calculated for the cell and the delay type in the report is 'cell delay.'
`-view` *viewname*	Specifies the view name for which to print the delay calculation report when using the multi-mode multi-corner (MMMC) mode.
`-voltage`	Displays the voltage of the cell or net timing arc.
`-waveform`	Reports the waveforms of the pins.

Example

- The following command shows the cell delay calculation report for the From pin I1/A and To pin I1/Y:

```
report_delay_calculation -from I1/A -to I1/Y
From pin : I1/A
To Pin : I1/Y
Cell : S2INVV1D1
Library : test
Arc sense : negative unate
Delay type : cell delay

reset_decap_cell_candidates

```
reset_decap_cell_candidates
[-help]
```

Clears all available cells for decoupling capacitance insertion. You can use this command to clear previously defined decoupling cell candidates specified using the add_decap_cell_candidates command.

Parameter

`-help`	Outputs a brief description of the `reset_decap_cell_candidates` command. For a detailed description of the command, use the man command: man `reset_decap_cell_candidates`.

Example:

The following command clears all available decoupling cell candidates:

```
reset_decap_cell_candidates
```

Related Information

add_decap_cell_candidates

report_decap_cell_candidates

write_exclude_nets

```
write_exclude_nets
[-help]
out_file
```

Writes out the excluded nets to an output file. Nets that exceed the default value of 1,000 pins are excluded from delay calculation, and default delay values are used. .

You can use `delaycal_excluded_net_file` attribute to use the file containing nets to be excluded during delay calculation. The list of excluded nets can be redirected to an output file.

Parameters

`-help`	Prints out the command usage
`out_file`	Specifies the name of the excluded net file.

Related Information

- `delete_exclude_net_attribute`

write_set_load

```
write_set_load
[-help]
out_file
[-direct]
[-exclude_zero_cap]
[-include_pin_cap]
[-view string]
[-wire_load]
```

Writes the specified capacitance on the specified ports or nets of the top cell to an output file.

Parameters

`-help`	Prints out the command usage.
out_file	Specifies the output file name.
`-direct`	Refers to the ports directly.
`-exclude_zero_cap`	Excludes the net that has zero net capacitance.
`-include_pin_cap`	Includes the pin capacitance.
`-view` *string*	Specifies the view name for the output file.
`-wire_load`	Marks the `set_load -wire_load` option for a port. This interprets the specified capacitance as the external wire capacitance of the port.

assign_bumps

```
assign_bumps
[-help]
[{-area {x1 y1 x2 y2} | -selected }]
[-constraint_file file_name]
[-exclude_regions {x1 y1 x2 y2} ...]
[-multi_bumps_to_multi_pads]
[{[[-pg_nets net_list] | [-exclude_pg_nets net_list]][-pg_insts instance_list]} [-pg_only]]
```

Assigns the bumps closest to the I/O cells, using euclidean distance, and adds bump connection target property onto bump. These bumps can be signal bumps specified in the Verilog netlist or power/ground (PG) bumps specified in the command line. From the 14.1 release, `assign_bumps` adds bump connect target to bumps by default during bump assignment.

This command is for area I/O flip chip designs. Bumps must be created or loaded from the I/O assignment file.

Use this command after the design is placed.

Note: The `assign_bumps` command does not affect any existing assignment. Hence, it will not reassign any existing power/ground assignments.

Support for CLASS BUMP Property

The `assign_bumps` command supports the `CLASS BUMP` of `PORT` in `LEF`. Using the `LEF` 5.7 syntax, you can add a new property in the `PORT` of the hard macro `LEF` called `CLASS BUMP`. With this property, `route_flip_chip` is able to route from these ports to the assigned bump.

The `assign_bumps` command supports I/O pads or hard macros that have pins with multiple geometries. For the following hard macro definition in LEF, `assign_bumps` assigns three bumps for `block1`, including two bumps for pin `signal1` and one for pin `powerpin`.

:

```
    MACRO block1
        PIN signal1
            PORT
                CLASS BUMP ;
                LAYER … ;
                RECT … ;
            END
            PORT
                CLASS BUMP ;
                LAYER … ;
                RECT … ;
            END
        END signal1
        PIN powerpin
            PORT
                CLASS BUMP ;
                LAYER … ;
                RECT … ;
            END
        END powerpin
```

```
END block1
```

`route_flip_chip` also supports routing for this kind of assignment. In the above example, routing happens from the two signal bump to the two port geometries and one power bump to the powerpin geometry with `CLASS BUMP` property.

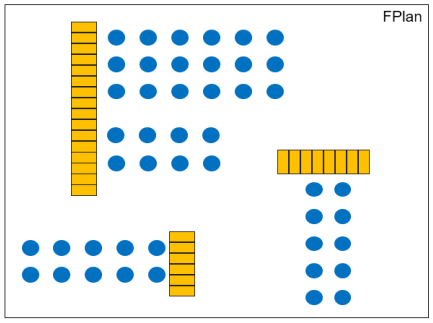
The behavior of `CLASS BUMP` is summarized as below:

- If the `CLASS BUMP` property is not defined in any cell, `assign_bumps` assigns one bump to each IO pin and `route_flip_chip` works normally.
- If any pin port in `CLASS PAD AREAIO` or `CLASS BLOCK` cells contains the `CLASS BUMP` property, `assign_bumps` uses the property for assignment.
- Each pin port with the `CLASS BUMP` property will have a bump assigned. This means a pin can have multiple bumps assigned to it if it has more than one port defined as CLASS `BUMP`. `route_flip_chip` honors this property and routes the port and its assigned bump. A port with `CLASS BUMP` attribute with multiple geometries is considered as one object for assignment and routing.

Parameters

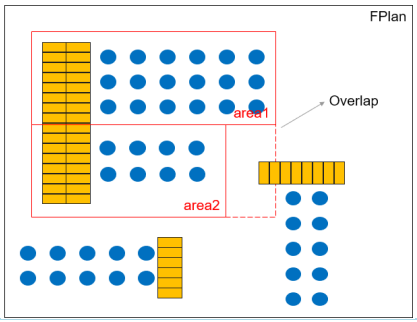
`-help`	Outputs a brief description that includes type and default information for each `assign_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man assign_bumps`

`-area {x1 y1 x2 y2}`	Assigns objects in the area specified by the *x1* , *y1* , *x2* , and *y2* coordinates.
	• If the specified area includes only bumps, `assign_bumps` assigns the selected bumps to IO cells based on the total shortest distance.
	• If the specified area includes only IO cells, `assign_bumps` assigns the selected IO cells to bumps based on the total shortest distance.
	• If the specified area includes both IO cells and bumps, then `assign_bumps` assigns the selected IO cells to the selected bumps. If the number of bumps are not enough, `assign_bumps` issues a warning.
	Note: The selected objects must be same as the ones selected by the command `gui_window_select`.
	For designs with double pad rows, the following conditions must be kept in mind while defining area with `assign_bumps -area`:
	• All IO pads inside the area should be regular and should be placed in either two rows or two columns. If the pads are irregular, the tool will turn off double pad row assignment automatically and use the traditional optimization algorithm, based on minimal global length.
	• Define areas in such a way that there is only one double pad row in one area.
	• If two areas overlap, it means there are now two double pad rows in one area. The results of bump assignment in such situations might not be the most optimal. To get the most optimal results, split one of the areas into two to avoid overlap as shown below:
	 	Now, you can assign bumps using the following commands:
	`assign_bumps -area area1`
	`assign_bumps -area area2`
	`assign_bumps -area area3`
	`assign_bumps -area area4`
	Note that for assigning bumps in a design with single pad rows, you can use `assign_bumps` without the `-area` option.



In the following example, the double pad area should be split to avoid overlaps as shown below. The rest of the bumps can be assigned without using the `-area` option:

```
assign_bumps -area area1
assign_bumps -area area2
assign_bumps
```



`-constraint_file` *file_name*	Specifies the path to the file containing bump assignment constraints. At present, the following types of bump assignment constraints are supported: • `SHARE_FIND_PORT` constraint to filter unnecessary ports • `ASSIGN_ANALOG_PG_NETS` constraint to specify which signal nets are analog PG nets • `SHARE_IGNORE_*` and `ASSIGN_IGNORE_*` constraints to exclude instances, macros, pins, or nets for assignment. • `ASSIGN_PAD2BUMP_RATIO` constraint to specify the pad to bump ratio per net, macro, or instance. For more information on specifying bump assignment constraints, refer to the "Using Bump Assignment Constraints" section of the Flip Chip Methodologies chapter of the *User Guide.* *Data_type*: string, optional
`-exclude_pg_nets` *net_list*	Specifies the names of the power/ground nets that must be excluded from bump assignment. Wild cards are supported in net names. The net names should be enclosed in double quotation marks (" ") or braces {}. *Data_type*: (net)*, optional
`-exclude_regions {`*x1 y1 x2 y2 ...*`}`	Excludes bumps in the area specified by the box coordinates. You can specify multiple regions, which may be disjoint. *Data_type*: rect, optional
`-multi_bumps_to_multi_pads`	Specifies that multiple pads need to be assigned to multiple bumps. This parameter is useful when you need to assign multiple pads on one net to multiple bumps based on shortest distance. *Data_type*: bool, optional
`-pg_insts` *instance_list*	Specifies the names of power/ground instances to which the power bumps are assigned. The instance names should be enclosed in double quotation marks (" ") or braces {}. *Data_type*: (inst)+, optional

`-pg_nets net_list`	Specifies the names of the power/ground nets to which the bumps are assigned. The net names should be enclosed in double quotation marks (" ") or braces {}. By default, bumps are assigned to all pads whose ports are connected to power/ground nets. *Data_type*: (net)+, optional
`-pg_only`	Assigns only power/ground nets to bumps. When this option is specified, signals are not assigned to bumps. **Note:** Option `-pg_insts` or `-pg_nets| -exclude_pg_nets` is required for option `-pg_only`. *Data_type*: bool, optional
`-selected`	Assigns selected bumps to the closest I/O instances or selected I/O instances to the closest bumps. • If only bumps are selected, `assign_bumps` assigns the selected bumps to IO cells based on the total shortest distance. • If only IO cells are selected, `assign_bumps` assigns the selected IO cells to bumps based on the total shortest distance. • If both IO cells and bumps are selected, `assign_bumps` assigns the selected IO cells to the selected bumps. If there are not enough bumps, `assign_bumps` issues a warning. **Note:** The `-selected` parameter works with other options of `assign_bumps`, except `-area` and `-exclude_regions`. *Data_type*: bool, optional

Examples

- The following command assigns bumps to the power and ground nets, `VDD` and `VSS`, within the area specified by the coordinates `600.0`, `960.0`, `2600.0`, and `4100.0`.
  ```
  assign_bumps -pg_nets {VDD VSS} -area {600.0 960.0 2600.0 4100.0}
  ```
- The following command assigns multi-PG pads to bumps:
  ```
  assign_bumps -pg_only -pg_nets {VDD VSS}
  ```

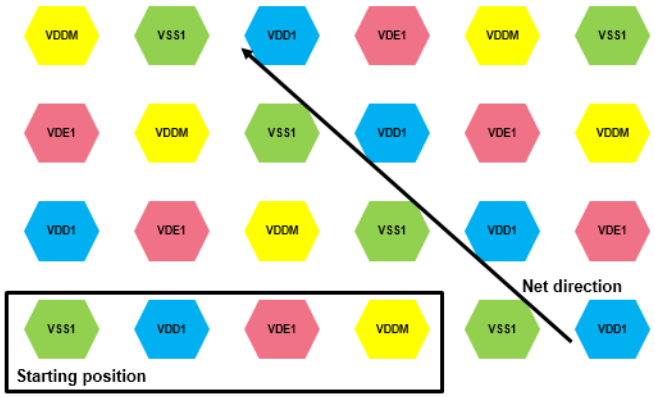
assign_pg_bumps

```
assign_pg_bumps
[-help]
[-connect_type {ioring | corering | stripe | iopin}]
-nets {nameList}
[-selected | -floating | -bumps {bump_name_list}]
[-vertical | -horizontal | -checker_board [-square {width height}]]
```

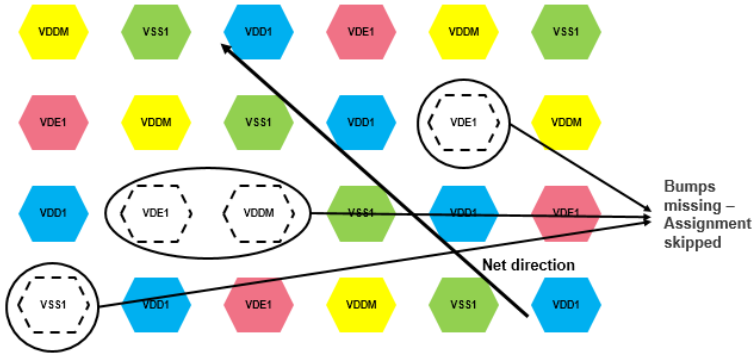
Assigns power and ground bumps to connect flip chip I/O pins and adds property value onto bumps. Use this command after bumps are created. It overwrites existing assignments for selected bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `assign_pg_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man assign_pg_bumps`
`-bumps {bump_name_list}`	Specifies the names of the bumps to be assigned. The names must be enclosed in braces. Wildcards are supported in bump names. **Note**: This parameter cannot be used with `-selected` and `-floating`. *Data_type*: (bump)+, required
`-checker_board`	Specifies that the checkerboard style of bump assignment will be used if multiple nets are defined using the `-nets` parameter:  The `-checker_board` parameter is typically used for a regular (rectangular) bump array. To apply this pattern for an irregular (rectilinear) bump array, first form a regular array by creating virtual bumps in the areas where there are no bumps. Next, assign the bumps using the checkerboard pattern and then remove the virtual bumps. **Notes** • The checkerboard style can be used with more than two nets, as shown below: `assign_pg_bumps -nets {VSS1 VDD1 VDE1 VDDM} -checker_board -selected`



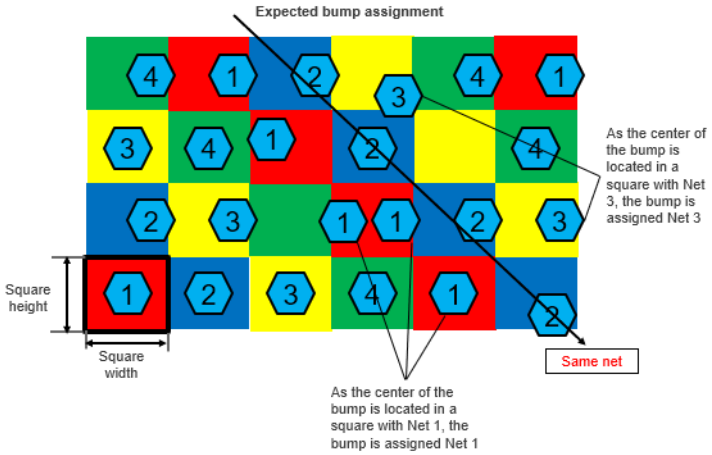
The `-checker_board` option for multiple nets can be used in a regular bump matrix with the same bump cell for all bumps and the same X/Y pitch between bumps. If bumps are missing in the pattern, the tool skips assignment to maintain the diagonal, staggered net direction.



- The checkerboard style can support irregular bump assignment when used with the `-square` parameter. For details, see the description of the `-square` parameter.

`-connect_type {ioring | corering | stripe | iopin}`	
	Specifies the bump connect type when assigning power/ground bumps. Connection type can be I/O Ring, Core Ring, Stripe, or I/O Pin. *Data_type*: enum, optional
`-floating`	Assigns to all floating bumps. *Data_type*: bool, required

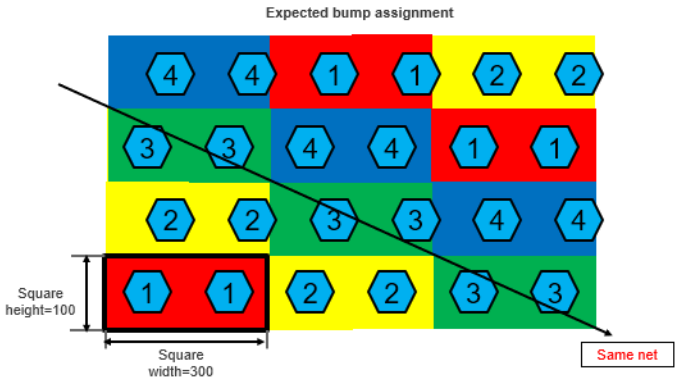
`-horizontal`	Specifies that the horizontal style of bump assignment will be used if multiple nets are defined using the `-nets` parameter:  *Data_type*: bool, required
`-nets {nameList}`	Specifies the net names. Net names must be enclosed in braces. *Data_type*: (net)+, required
`-selected`	Assigns to selected bumps. *Data_type*: bool, required
`-square {width height}`	Specifies the width and height of a square in the checkerboard style of bump assignment. Use this parameter if you want to apply the checkerboard style of bump assignment for an irregular bump matrix. When you specify the `-square` parameter, the tool creates a virtual checkerboard made of squares of the specified dimensions and then assigns the squares with the specified nets. The square to which a bump belongs is determined based on the location of its center. The tool then assigns the corresponding net to the bump. For example, the following command creates a virtual checkerboard with squares of width 150 and height 100, assigns the squares with the Nets 1, 2, 3, and 4, and assigns the nets to bumps based on the square on which their center is located: `assign_pg_bumps -nets {1 2 3 4} -checker_board -selected -square {150 100}` **Case A**  As shown in Case B below, the assignment is dependent on the location of the center of the bumps. **Case B**



The assignment also changes if you change the dimensions specified for the checkerboard squares. For example, the following command creates a virtual checkerboard with squares of width 300 and height 100.

```
assign_pg_bumps -nets {1 2 3 4} -checker_board -selected -square {300 100}
```

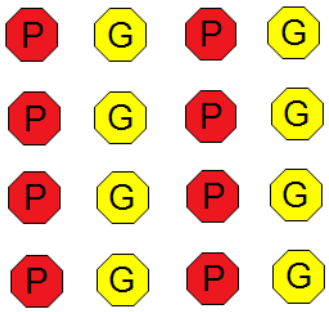
Case C



Note that although the bump locations are same in both Cases A and C, the assignments in Case C are different from Case A

`-vertical`

Specifies that the vertical style of bump assignment will be used if multiple nets are defined using the `-nets` parameter:



Data_type: bool, required

Example

- The following command assigns selected bump to power net `VDD`:

  ```
  assign_pg_bumps -nets VDD -selected
  ```

- The following command assigns only the specified bumps to the power net `VDD`:

  ```
  assign_pg_bumps -nets VDD -bumps {Bump_1 Bump_2 Bump_3}
  ```

- The following command assigns floating bumps to the specified nets in the horizontal style:
  ```
  assign_pg_bumps -horizontal -floating -nets {VSS1 VDD1 VDE1}
  ```
- The following command assigns selected power/ground bumps in the checkerboard style to the VDD and VSS nets:
  ```
  assign_pg_bumps -selected -nets {VDD VSS} -checker_board
  ```
- The following command assigns all the floating bumps in checkerboard pattern to the VDD and VSS nets:
  ```
  assign_pg_bumps -floating -nets {VDD VSS} -checker_board
  ```

Related Information

assign_signal_to_bump

```
assign_signal_to_bump
[-help]
{ {{-net net_name | {-top_pin port [-bump_pin bump_pin_name]}} {-bumps bump_name_list | -selected}} }
```

Assigns selected or specified bumps to the specified net or pin. The command supports signal, power, as well as ground nets. Feedthrough bumps with multiple pins are also supported.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `assign_signal_to_bump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man assign_signal_to_bump`
`-bump_pin bump_pin_name`	Specifies the name of the bump pin that has to be assigned to the specified top pin. Use this option for feedthrough bumps, which have multiple pins. This parameter can be used only with the `-top_pin` parameter. *Data_type*: string, optional
`-bumps bump_name_list`	Specifies the bumps to be assigned to the net specified with `-net`. Use braces to enclose the bump names. *Data_type*: string, optional
`-net net_name`	Specifies the signal or PG net to which bumps are to be assigned. *Data_type*: (net), optional
`-selected`	Assigns the selected bump to the specified nets. *Data_type*: bool, optional
`-top_pin port`	Specifies the name of the top-level pin to which bumps are to be assigned. After assignment, the pin name of the bump is the top-level pin name and the net name of the bump is the net name of the specified pin. This parameter cannot be used with the `-net` parameter. *Data_type*: string, optional

Examples

- The following command assigns `bump_1` and `bump_2` to the signal net `sig[1]`:
  ```
  assign_signal_to_bump -net sig[1] -bumps {bump_1 bump_2}
  ```
- The following command assigns `bump_1` to the power net `VDD`:
  ```
  assign_signal_to_bump -net VDD -bumps bump_1
  ```
- The following command assigns the selected bumps to the ground net `VSS`:
  ```
  assign_signal_to_bump -net VSS -selected
  ```
- The following command assigns the `PIN_1` pin of the `bump1` feedthrough bump to the top-level pin, `CLK_IN`:
  ```
  assign_signal_to_bump -bumps bump1 -top_pin CLK_IN [-bump_pin PIN_1]
  ```

check_bond_pad_spacing

```
check_bond_pad_spacing [-help]
```

Checks for bond pad spacing violations after using the `space_bond_pads` command. You can use this command at any time after using the `space_bond_pads` command.

Parameters

`-help`	Prints a brief description of the `check_bond_pad_spacing` command. For a detailed description of the command, use the `man` command: `man check_bond_pad_spacing`

Related Commands

- `get_bond_pad`
- `place_bond_pad`
- `place_bond_pad_by_stagger`
- `reset_fixed_bond_pad`
- `set_bond_pads_to_fixed`
- `space_bond_pads`

check_bumps

```
check_bumps
[-help]
[-bump_to_pin_overlap inst+]
[-delete_markers]
[-out_file fileName]
[-select_violation_bumps]
[-selected | -region {x1 y1 x2 y2}]
[-relative_type {embedded_bump inst_pin_port} [[-relative_obj {inst_pin_port_list}] [-relative_assignment ] [-relative_offset x y]]]
[ [[-relative_type {embedded_bump inst_pin_port}] [-bump_to_pin_pitch {pitch_value {[bump_name] [inst_pin_name [pin_x pin_y]]}}]]
  | -nets net+ ]
[-bump_to_edge_pitch pitch_value [-edge_offset {offset [corner_offset]}]]
[ [[-bump_pitch {pitch_value [bump_name]}]
   [-bump_to_pin_pitch {pitch_value {[bump_name] [inst_pin_name [pin_x pin_y]]}}]]
  | -bump_max_pitch max_pitch_value | -bump_to_edge_pitch pitch_value]
[-on_bump_grid [-on_bump_grid_tolerance bump_grid_name value]]
```

Checks the legality of the bump assignment and creates a report, which is either displayed in the console window or written to a file. Use this command for bump overlap and pitch checking. The `check_bumps` command can be used after bumps are assigned with the `assign_bumps` command or defined in the I/O file with the signal name but without the `-fixed` constraint.

Bump-to-Bump Overlap Checking

`check_bumps` checks bump overlaps, including overlap of dummy bumps, by default. If a bump overlaps with others, `check_bumps` places violation markers on the center of the overlapped bumps and reports the total number of overlapped bumps.

The violation markers for bump overlap can be browsed in Violation Browser.

⚠ `check_bumps`:

- Checks overlaps between regular bumps by checking for pin overlaps on bumps.
- Checks overlaps between dummy bumps by checking for OBS overlap.
- Checks overlaps between dummy bumps and regular bumps by checking for OBS and bump pin overlap.

Bump-to-Pin Overlap Checking

If `-bump_to_pin_overlap` is used, `check_bumps` checks for overlaps between bump shapes, including dummy bumps, and pins of the specified block. If the bump shape and the block pins are at the same location but on different layers, the tool does not consider them to be overlapping. However, if the bump shapes and the block pins are at the same location and on the same layer, they are reported as overlapping, as shown below:

Bump Pitch Checking

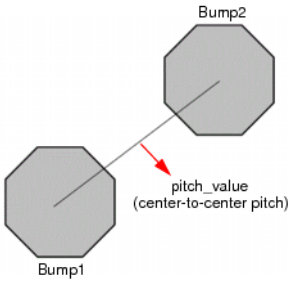
`check_bumps` provides a bump pitch checking feature to record bumps that violate the bump pitch. The bump pitch checking feature has multiple options:

- `-bump_pitch` for checking the center-to-center pitch between bumps. The bumps that have a smaller center-to-center distance than the specified *`pitch_value`* are marked as spacing violations.
- `-bump_max_pitch` for checking whether the center-to-center pitch between neighboring bumps violates the maximum spacing constraint.
- `-bump_to_edge_pitch` for checking the pitch from the bump center to the guard or die edge.
- `-bump_to_pin_pitch` for checking the pitch between bump and pins of hard macros. The bumps and instance pin pairs that have a smaller bump_center-to-pin_center or bump_center-to-specified_pin_geometry_location distance than the *`pitch_value`* are marked as spacing violations.

In all these cases, bumps that violate the pitch request are marked as spacing violations and can be checked using the Violation Browser.

Bump-to-Bump Pitch Checking

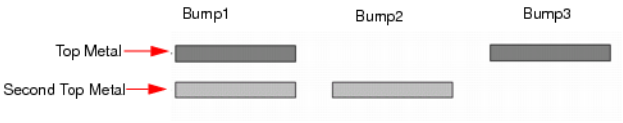
For bump to bump pitch checking, the center-to-center bump pitch is needed. The center of a bump is calculated using the bump cell geometry at the topmost RDL layer.



Note: Only bump cell with single geometry at one RDL layer is supported. For multiple-layer bump cell, the topmost layer in the bump cell is the topmost RDL layer. If no geometry is defined at that layer, the geometry on the second topmost layer is used and a warning is issued:

No geometry at XX layer found; the geometry at XXX layer is used for bump center calculation.

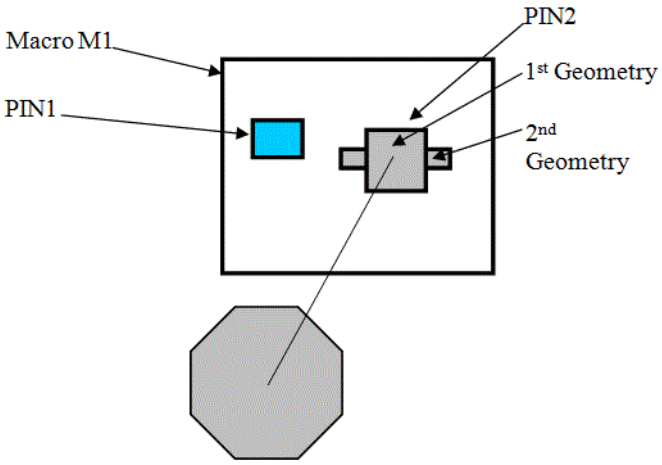
If the check is between a multiple-layer bump and a single-layer bump, the center is calculated using the geometries on the topmost layer in each cell. For example, in the following diagram, center-to-center pitch between `Bump1` and `Bump2` is calculated using the geometries on the top metal in `Bump1` and the second top metal layer in `Bump2`.



If there is no common layer in two bumps, there is no center-to-center pitch to be checked. For example, there is no violation to be reported for `Bump2` and `Bump3` in the above diagram.

Bump-to-Pin Pitch Checking

In some designs with IP macros, bumps have already been embedded inside the macro and are considered as macro pins. In this case, `check_bumps` checks pitch between the bump center and the pin center. Bump center is defined in the same way as in the bump-to-bump case. Pin center calculation for pitch checking can vary as follows:

- Pin has multiple geometries on common layer
  `check_bumps` selects all geometries of the pin if its layer is equal to bump's layer. For example, if bump only has topmost geometry, `check_bumps` selects all the geometries on the topmost layer for pin. If the bump has both topmost and second layer geometry, `check_bumps` selects the geometries for both layers. If no valid geometry of pin is found, `check_bumps` skips the pin pitch checking for that pin.
  In the example below, the tool checks one by one the pitch for each geometry of `PIN2` on `Bump1`'s layer to see if there is a violation. That is, `check_bumps` calculates the distance from the center of 1st geometry of `PIN2` to the center of `Bump1`. Then, it calculates distance from the center of 2nd geometry of `PIN2` to center of `Bump1`. For each check, `check_bumps` reports a violation if the distance is less than `100`.
  ```
  check_bumps -bump_to_pin_pitch {100 {Bump1 M1/PIN2}}
  ```
  


- Pin has multiple geometries and a particular geometry location is specified
  In case of multiple geometries, `check_bumps` allows you to specify a location `[pin_xpin_y]`. If this location overlaps with a geometry, the pitch to this geometry is checked. `check_bumps` calculates the distance from the center of this geometry to the bump center.

Note: `check_bumps` does not support pin-to-pin pitch checking because such violations can only be fixed at LEF level which is beyond the flipchip tool capability. So in the following command:

```
check_bumps -bump_to_pin_pitch {100 {Bump1 M1/PIN1 M1/PIN2}}
```

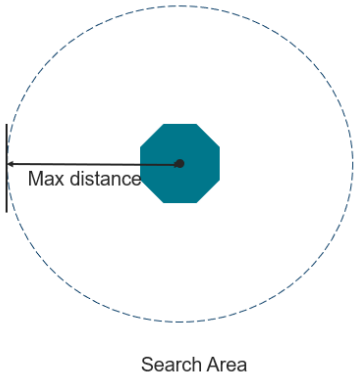
`check_bumps` checks `Bump1` and `M1/PIN1`; and `Bump1` and `M1/PIN2`; but not `M1/PIN1` and `M1/PIN2`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `check_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_bumps`

`-bump_max_pitch max_pitch_value`

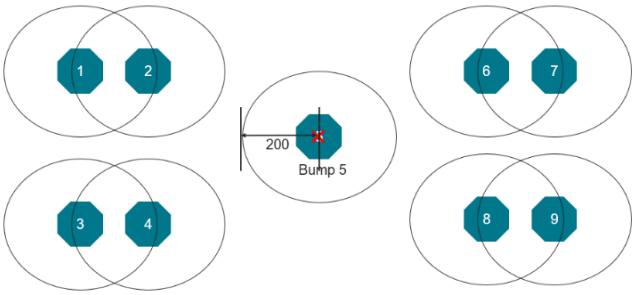
Checks the center-to-center pitch between neighboring bumps in microns. For any bump, the search area is defined by a circle wi of `max_pitch_value` and the bump center as its center.



If another bump is detected within a bump's search area, the bump is DRC free. If no other bump is detected in a bump's search a bump is marked with a maximum spacing violation and a warning message is displayed.

In the example below, only Bump 5 violates the maximum spacing constraint and is flagged with a maximum spacing violation:

```
check_bumps -bump_max_pitch 200
```



The `-bump_max_pitch` parameter works on:

- all bumps in the design by default.
- selected bumps if `-selected` is specified.
- bumps in a specific area if `-region` is specified.
- same-net bumps if `-nets` is specified.

Note: The `-bump_max_pitch` parameter cannot be specified along with the `-bump_pitch` or the `-bump_to_edge_pitch` parameter.

Data_type: float, optional

`-bump_pitch {pitch_value [bump_name]}`

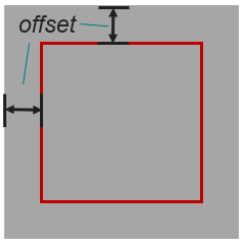
	Checks the center-to-center pitch between bumps. Here: • *pitch_value* represents the center-to-center pitch value in microns. • *bump_name* is the name of the bump. You can check pitch between two or more bumps. Wildcards can be used to specify bump If more than two bumps are specified, bump pitch is checked for all possible pairings. In the following example, check_bumps ch center-to-center pitch between B1 and B2; B1 and B3; B2 and B3: check_bumps -bump_pitch {100 {B1 B2 B3}} Any illegal pitch is logged as "Bump pitch between B1 and B2 XX < 100." Specifying bump names is optional. If bump names are specified, -bump_pitch works on the specified bumps. If bump names a specified, -bump_pitch works on: ◦ selected bumps if -selected is specified. ◦ bumps in a specific area if -region is specified. ◦ all bumps in the design, if neither -selected nor -region is specified. **Note:** You can specify pitch checking multiple times in this option. *Data_type*: string, optional
-bump_to_edge_pitch *pitch_value*	
	Checks whether the pitch from the bump center to the guard or die edge is within the specified pitch value. If the detected pitch is l the specified value, a warning is displayed and the bump is flagged with a spacing violation. *pitch_value* is specified in microns. By default, if -bump_to_edge_pitch is specified, the tool checks the pitch from the bump center to the die edge. You can additional edge_offset with this parameter to define a guard shape. If -edge_offset is specified, the tool checks the distance from the bump the guard edge defined by -edge_offset. If the bump center is outside the guard edge, the center-to-guard pitch will be a negative number, which is not allowed. The tool is warning in such cases. Check the **Examples** section to see how the bump_to_edge_pitch parameter can be used. The -bump_to_edge_pitch parameter works on: • all bumps in the design by default. • selected bumps if -selected is specified. • bumps in a specific area if -area is specified. • bumps with specific nets if -nets is specified. **Note**: The -bump_to_edge_pitch parameter cannot be specified along with the -bumpPitch or the -bumpMaxPitch parameter. *Data_type*: float, optional
-bump_to_pin_overlap *inst+*	
	Checks if the bump overlaps with the pins of the specified block. If the bump shape and the block pins are at the same location bu different layers, the tool does not consider them to be overlapping. However, if the bump shapes and the block pins are at the sam and on the same layer, they are reported as overlapping. The -bump_to_pin_overlap parameter works on: • all bumps, by default. • selected bumps, if -selected is specified. • bumps in the specified area, if -region is specified. • bumps with the specified nets, if -net is specified. *inst+* should be of type block. Overwise, the tool reports an error. *Data_type*: (inst)+, optional
-bump_to_pin_pitch {*pitch_value* {[*bump_name*][*inst_pin_name* [*pin_x pin_y*]]}}	

	Checks the center-to-center pitch between bumps and pins of hard macros. Here: • *pitch_value* represents the center-to-center pitch value in microns. • *bump_name* is the name of the bump. • *inst_pin_name* is the name of the instance pin. • *pin_x* and *pin_y* specify the pin geometry. **Note:** You can specify pitch checking multiple times in this option. Wildcards can be used in bump and pin names. *Data_type*: string, optional
-delete_markers	Resets violation markers. *Data_type*: bool, optional
-edge_offset {*offset* [*corner_offset*]}	

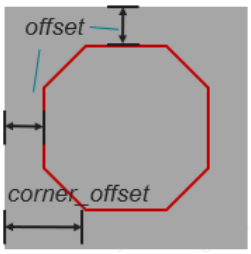
Defines the guard shape if it is different from the die boundary. The `-edge_offset` parameter can be used only if the `-bump_to_edg` parameter is specified.

You can specify either one or two values with the `-edge_offset` parameter:

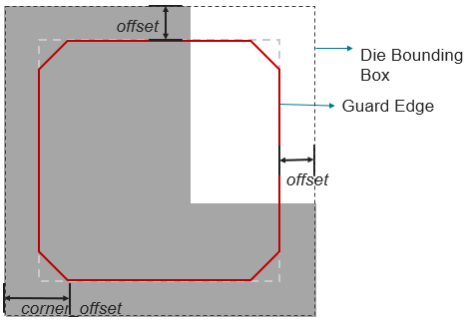
- If only one value (*`offset`*) is specified, the guard edge shape is a rectangle with the die boundary to guard edge distance being the specified `offset` value.



- If two values (*`offset`* and *`corner_offset`*) are specified, the guard edge shape is an octagon with 45-degree exterior angles. H guard edge to the die boundary distance is the specified *`offset`* value and the distance from the die boundary to the lower-left guard edge is the specified *`corner_offset`* value.



In a rectilinear design, you can use the bounding box of the die as a reference for specifying the offset for the guard edge.



Data_type: string, optional

`-nets net+`	Checks constraints for the bumps with the specified nets. If `-bump_max_pitch` is specified along with `-nets`, the tool checks for the maximum pitch constraint only between bumps belonging same net. For instance, in the example given below, if you specify the command `check_bumps -bump_max_pitch 300 -nets {VDD` tool checks: • Checks the `VDD Pitch1` between bump1 and bump3, `VDD Pitch2` between bump3 and bump4, and `VDD pitch3` between bump bump6 • Checks the `VSS Pitch` between bump2 and bump5.  If `-bump_max_pitch` is not specified, the tool performs default checks for the bumps with the specified nets. **Note**: The `-nets` parameter cannot be used along with the `-bump_max_pitch` or `-relative_type` parameter. *Data_type*: (net)+, optional
`-on_bump_grid`	Checks if the bumps are on bump grids. This option cannot be used with any of the other parameters, except `-on_bump_grid_tole` and `-out_file`. The command errors out in the following cases: • If there is no bump grid in the DB - In this case, use the `create_bump_grid` command to create a bump grid. • If there are multiple bump grids on a single layer The command reports an error but keeps checking in the following case: • If there are multiple bump grids in different layers for one bump Warnings are reported in the following cases: • If there is no bump grid on the bump's layer • If a bump is off bump grid; the bump is also marked with a DRC marker. *Data_type*: bool, optional
`-on_bump_grid_tolerance bump_grid_name value`	
	Specifies the tolerance value to be used when checking if bumps are on the specified bump grid. If this parameter is specified, the checks the Euclidean distance between the bump center and the specified grid and reports a violation only if the distance is more specified tolerance value. ⚠ • The `-on_bump_grid_tolerance` option can be specified only when `-on_bump_grid` is specified. • The value specified with `-on_bump_grid_tolerance` should be smaller than half of the bump grid. If not, the tool returns an *Data_type*: string, optional
`-out_file fileName`	Specifies the report filename. If no filename is specified, the report is printed to the console window. *Data_type*: string, optional
`-region {x1 y1 x2 y2}`	Checks constraints for the bumps in the specific area. The unit is microns. The bumps selected by `-region` should be the same a selected by the command `gui_select`. If `-region` is used with `-bump_pitch`, `check_bumps` checks the bump pitch only for the bumps in the specific area. If `-region` is spec without `-bump_pitch`, `check_bumps` performs the default checks for the bumps in the specific area. **Note:** This parameter cannot be used with with `-bump_to_pin_pitch` or `-selected`. *Data_type*: rect, optional

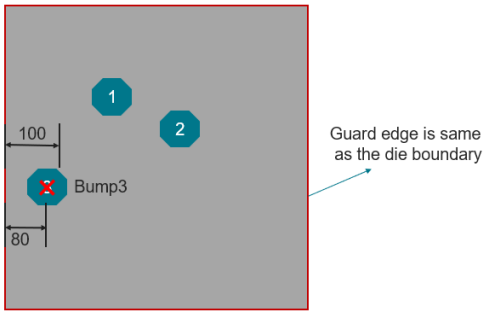
`-relative_assignment`	Checks whether the net assignment of the target bump is equivalent to corresponding relative object. If not, it issues an error mess places a violation marker at the geometry center of the target bumps:
	• For `-relative_type embedded bump`, the following error message is displayed:
	`The assignment of $bump $net is not connected to the pin of the relative object $blockName/$pinName $expectedNe`
	• For `-relative_type inst_pin_port`, the following error message is displayed:
	If `-relative_type` is specified as `embedded_bump` and there is no bump in the region being checked, `check_bumps` does not check fi relative assignment and issues the following error message:
	`There is no bump overlapping with the relative object $blockName/$pinName located at {x2 y2} with relative offset stop checking the relative assignment for this relative object.`
	Note: This option can be used only if `-relative_type` is specified.
	Data_type: bool, optional

`-relative_obj {inst_pin_port_list}`	
	Specifies the inst_pin_port list and supports wild cards. The format is `{inst:pin:port ...}` and `port` is of type integer. If `-relative_object` is specified, `check_bumps` checks whether the geometry center of the target bumps is at the same location as t geometry center of the specified port. If not, it issues an error message and places a violation marker on the geometry center of the bumps. In addition: • If no bump overlaps with the specified port, `check_bumps` displays the message that there are no bumps in the design overlappi specified port. • If the specified ports do not exist, an error message is displayed. **Note**: When used with `-selected` or `-region`, the `relative_object` option works only on the specified bumps by selection or area. *Data_type*: string, optional
`-relative_offset x y`	Specifies the offset of bump location compared with the corresponding relative object. This option can be used only if `-relative_` specified. *Default*: `{0 0}` *Data_type*: point, optional
`-relative_type {embedded_bump inst_pin_port}`	
	Specifies the type of relative object: • `embedded_bump`: If this option is specified, `check_bumps` checks whether the geometry center of the target bumps is at the same l the geometry center of the overlapping embedded bumps. If not, it issues an error message and places a violation marker on th center of the target bumps. In addition: ◦ If no bump overlaps with the embedded bumps, `check_bumps` displays an error message as follows: `There is no bump overlapping with the relative object $blockName/$pinName located at {x2 y2} with relative o y}.` ◦ If more than one bump is located at the region being checked, all bumps violating the embedded bump are reported. A sum number of the bumps violating the embedded bump is displayed. Violation markers are placed on the embedded bump as v bumps violating the embedded bump. The violations can be viewed in Violation Browser. ◦ If there are no embedded bumps, an error message is displayed. **Note**: As this check happens on the entire design, you cannot use the `-selected` or `-region` options if `-relative_typeembedde` specified. • `inst_pin_port`: If the type is `inst_pin_port`, you must specify the `-relative_object {inst_pin_port_list}` option. *Data_type*: enum, optional
`-select_violation_bumps`	
	Selects automatically all the bumps that are violating any check rules.

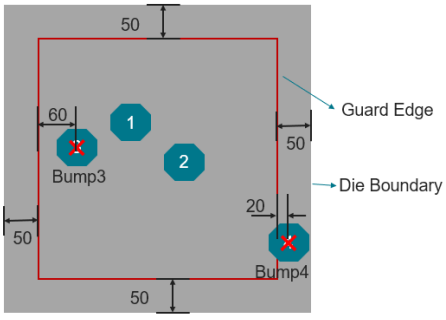
`-selected`	Checks constraints for selected bumps. If `-selected` is used with `-bump_pitch`, `check_bumps` checks the bump pitch only for the selected bumps. If `-selected` is specified w `bump_pitch`, `check_bumps` performs the default checks for the selected bumps. **Note**: This parameter cannot be used with with `-bump_to_pin_pitch` or `-region`. *Data_type*: bool, optional

Examples

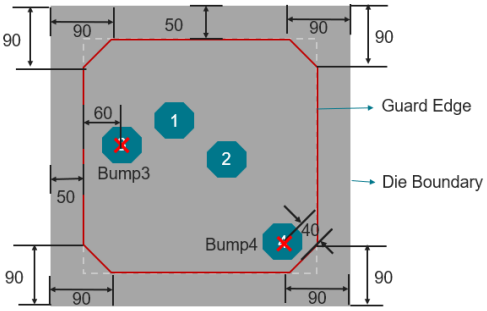
- The following command checks the center-to-center pitch for all bumps. If the center-to-center distance between two bumps is smaller than 100, it reports a violation:
  ```
  check_bumps -bump_pitch 100
  ```
- The following command checks the center-to-center pitch between bump_1 and bump_2:
  ```
  check_bumps -bump_pitch {100 {bump_1 bump_2}}
  ```
- The following command checks the center-to-center pitch for the selected bumps:
  ```
  check_bumps -bump_pitch 100 -selected
  ```
- The following command checks the center-to-center pitch for bumps in the specified area:
  ```
  check_bumps -bump_pitch 100 -region {100 400 600 900}
  ```
- The following command checks whether the bump center to die edge pitch is less than 100 microns:
  ```
  check_bumps -bump_to_edge_pitch 100
  ```
  In the design below, Bump3 is flagged with a spacing violation and a warning message is displayed:



- The following command checks whether the bump center to guard edge pitch is less than 100 microns. The guard edge is offset from the die boundary by 50 microns:
  ```
  check_bumps -bump_to_edge_pitch 100 -edge_offset 50
  ```
  In the design below, Bump3 and Bump4 are flagged with spacing violations and warnings are displayed:



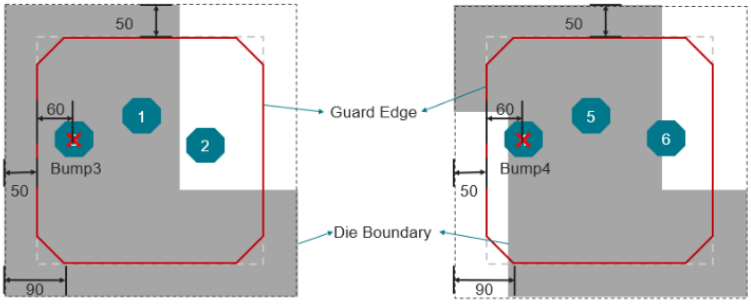
- The following command checks whether the bump center to guard edge pitch is less than 100 microns. The guard edge is offset from the die boundary by 50 microns and the guard corners are offset by 90 microns:
  ```
  check_bumps -bump_to_edge_pitch 100 -edge_offset {50 90}
  ```
  In the design below, Bump3 and Bump4 are flagged with spacing violations and warnings are displayed:



- The following command checks whether the bump center to guard edge pitch is less than 100 microns. The guard edge is offset from the die boundary by 50 microns and the guard corners are offset by 90 microns:

  ```
  check_bumps -bump_to_edge_pitch 100 -edge_offset {50 90}
  ```

  In the rectilinear designs below, Bump3 and Bump4 are flagged with spacing violations and warnings are displayed. However, Bumps2 and Bump6 are DRC free even though they are outside the die boundary because they are still within the guard shape:



- The following command checks the bump assignment and sends the report to `test.rpt`:

  ```
  check_bumps -out_file test.rpt
  ```

  A sample report file is as follows:

```

Bumps with ground assigned: 0 (with bump_connect_target: 0);
Bumps unassigned: 33;
Total bumps: 90;
Signal/PG ratio: NA;
Min center-to-center bump pitch: 100.000
*** End the statistics information for bumps ***

*** Starting Check Bump Overlap ...
*** End Check Bump Overlap ***
Bumps overlap: 0
```

- The following command checks whether bumps are on bump grids:

  ```
  check_bumps -on_bump_grid -out_file bump.rpt
  ```

  When `-on_bump_grid` is specified, other checks are not started. Therefore, the *Bump On Bump Grid* section is the only section in the report file:

  ```
  #...header...#
  *** Starting Bump On Bump Grid ...
  'Bump_295' is off bump grid "Grid_A".
  'Bump_296' is off bump grid "Grid_B".
  'Bump_297' needs to be checked on multiple conflicted bump grids: "Grid_A" on "Layer10" and "Grid_B" on "Layer11".
  'Bump_298' won't be checked. No bump grid on the bump layer: Layer8, Layer9.
  *** End Check Bump On Bump Grid ***
  Bumps off Bump Grid: 2
  Bumps on Multiple Conflicted Bump Grids: 1
  Bumps with No Bump Grid:1
  ```

check_flip_chip_constraints

```
check_flip_chip_constraints
[-help]
[-route_style {manhattan | 45_degree_route}]
```

Reports the status of bump placement and routing contsraints. Use this command to check whether the flip chip routing result meets the settings in the constraints file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `check_flip_chip_constraints` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_flip_chip_constraints`.
`-route_style {manhattan | 45_degree_route}`	Specifies the route style to check, which could be `manhattan` or `45_degree_route`. *Data_type*: enum, optional

Example

- The following command checks for flip chip routing violations of the Manhattan route style:
  ```
  check_flip_chip_constraints -route_style manhattan
  ```

Related Information

- `route_flip_chip`

  - *Flip Chip*

check_io_inst_overlap

```
check_io_inst_overlap [-help]
```

Checks to see if any area I/O instance is overlapped with another area I/O instance. If an overlap occurs, a warning message is dumped to the console window, and the overlapped instances are highlighted in the work area.

Parameters

`-help`	Prints a brief description of the `check_io_inst_overlap` command. For a detailed description of the command, use the `man` command: `man check_io_inst_overlap`

copy_bumps

```
copy_bumps
[-help]
[-assignment]
[-name_format {format}]
-shift {X Y}
{-bumps {bump_list} | -selected }
```

Copies bumps to the specified location with the same pitch constraint. By default, the target bumps after copy are unassigned and named with the default format `Bump_%i` by the tool. Here, `%i` refers to the index of the bump, which starts at one more than the number of existing bumps in the design. Use the option `-name_format` to name the copied bumps. If there are any name collisions, an error is given and the bumps are not copied.

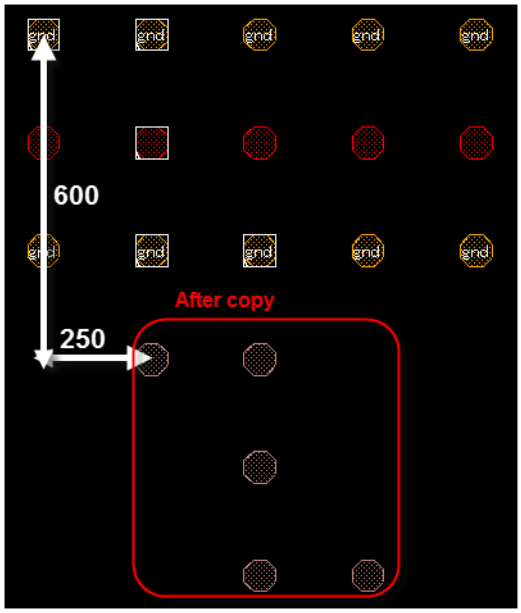
Parameters

`-help`	Prints a brief description that includes type and default information for each `copy_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man copy_bumps`
`-assignment`	Copies the bumps and their assigned signals. *Data_type*: bool, optional
`-bumps {bump_list}`	Specifies names of the bumps to be copied. You can use wildcards in the bump list. *Data_type*: string, optional
`-name_format {format}`	
	Specifies the name format for the target bumps. The format is similar to the `printf` format, except that it uses `%i` for index and `%o` for original name of source bump. `%i` mean the index of bump, which starts at one more than the number of existing bumps in the design. *Data_type*: string, optional
`-selected`	Copies only the selected bumps. *Data_type*: bool, optional
`-shift {X Y}`	Specifies the distance in microns from the source location to the target location in X/Y direction. *Data_type*: string, required

Examples

- The following command copies the selected bumps, `Bump_1` to `Bump_5`, and pastes them with a `{250 -600}` shift. The copied bumps are named `Bump_1_copy`, `Bump_2_copy`, and so on.

  ```
  copy_bumps -selected -shift {250 -600}  -name_format {%o_copy}
  ```



- Assuming that the number of bumps in the design is 15, the following command copies the selected bumps, `Bump_1` to `Bump_5`, and pastes them with a {250 -600} shift. The copied bumps are named `Bump_1_copy_16`, `Bump_2_copy_17`, …, and `Bump_5_copy_20`:

  ```
  copy_bumps -selected -shift {250 -600} -name_format {%o_copy_%i}
  ```

- Assuming that the number of bumps in the design is `15`, the following command copies the selected bumps, `Bump_1` to `Bump_5`, and pastes them with a `{250 -600}` shift. The copied bumps are named `Bump_16`, `Bump_17`, …, and `Bump_20`, according to the default name format:

  ```
  copy_bumps -selected -shift {250 -600}
  ```

create_bump

```
create_bump
[-help]
[-allow_outside_of_die]
[-allow_overlap_control {keep_all keep_existing_bumps keep_new_bumps}]
-cell bumpcell_name
[-check_drc]
[-edge_spacing {left bottom right top}]
[-exclude_bump_area {rect_list}]
[ [-keep_out_region width height] | [-keep_out_pitch value] ]
[-location x y]
[-location_type {cell_center | cell_lower_left | geometry_center | geometry_lower_left}]
[-name_format {string, %i, %r, %c}]
[-orient {r0 r90 r180 r270 mx mx90 my my90}]
[-respect_placement_blockage]
[-return_bumps_name]
[-start_index index]
[-pitch x y [-pattern_full_chip | -pattern_side {side width} | -pattern_array {row column} | -pattern_ring width | -pattern_center {row
column}]]
[-stagger_type type [-stagger_offset value]]
[-relative_type {embedded_bump inst_pin_port block}
  [[-relative_objs {inst_pin_port_list}]
   [-relative_block inst+] [-relative_block_constraint fileName]
   [-relative_assignment] [-relative_offset x y]]]
[{-pattern_full_chip  | -pattern_array {row column} | -pattern_center {row column}} [-start_from <type>]]
```

Creates bumps and instances of bump cells based on the specified pattern. Use one of the following parameters to specify the bump pattern in the chip:

- `-pattern_full_chip`
- `-pattern_side {side width}`
- `-pattern_array {row column}`
- `-pattern_ring width`
- `-pattern_center {row column}`

If none of the above patterns is specified, `create_bump` creates a single bump at the specified location.

Bumps are usually placed in the top design. However, some blocks may also include bumps. Such bumps are called embedded bumps. When implementing the block design, use the following special keywords in the LEF definition for embedded bumps.

- Add following property keywords in the head of tech LEF file

  ```
  PROPERTYDEFINITION
      LAYER LEF58_TYPE STRING ;
  END PROPERTYDEFINITIONS
  ```

- Add PASSIV LAYER definition after AP(top) layer

  ```
  LAYER PASSIV
    TYPE CUT ;
    PROPERTY LEF58_TYPE "TYPE PASSIVATION ; " ;
  END PASSIV
  ```

- Add a same geometry on PASSIV layers with the bump pins

  ```
  MACRO BUMP
  CLASS COVER BUMP ;
    …
      PIN A
    …
        PORT
          LAYER PASSIV ;
          POLYGON 27.985 0 67.565 0 95.55 27.985 95.55 67.565 67.565 95.55 27.985 95.55 0 67.565 0 27.985 ;
          LAYER AP ;
          POLYGON 27.985 0 67.565 0 95.55 27.985 95.55 67.565 67.565 95.55 27.985 95.55 0 67.565 0 27.985 ;
        END
  ```

```
        END A
      END BUMP
```

After the block design is finished, the bumps are dumped out as one port of the pin with PASSIV layer and top layer (AP) as similar as below, tool could check if the port is the embedded bump by PASSIV layer from the top design.

```
PIN DQ0
    DIRECTION INOUT ;
    USE SIGNAL ;
    PORT
      LAYER AP ;
      POLYGON 759.9810 366.7830 799.5610 366.7830
              827.5460 338.7980 827.5460 299.2180
              799.5610 271.2330 759.9810 271.2330
              731.9960 299.2180 731.9960 338.7980 ;
      LAYER PASSIV ;
      POLYGON 759.9810 366.7830 799.5610 366.7830
              827.5460 338.7980 827.5460 299.2180
              799.5610 271.2330 759.9810 271.2330
              731.9960 299.2180 731.9960 338.7980 ;
END
    PORT
…
END
…
END DQ0
```

If you are creating an embedded bump, `create_bump` automatically creates a bump in the top design with the correct net assignment at the same location as the embedded bump.

`create_bump` also enables you to create bumps based on pin location.

Note - During bump placement trials, if you click the *Undo* button (or use the `gui_undo` command) after running `create_bump`, the bump floorplan will return to the state it was in before `create_bump`. If you then click the *Redo* button (or use the `gui_redo` command), the bump floorplan will reapply the changes made by `create_bump`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_bump` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_bump`
`-allow_outside_of_die`	Allows bumps to be created outside of die area. When this option is specified, the tool ignores floorplan constraints when creating a bump array pattern. This option can be used only if `-pattern_array` and `-location` are also specified. *Data_type*: bool, optional
`-allow_overlap_control {keep_all keep_existing_bumps keep_new_bumps}`	

	Specifies the overlap control type. The allowed values for the `-allow_overlap_control` parameter are: • `keep_all` - Keeps all overlapping bumps. • `keep_existing_bumps` - Keeps the existing bumps before calling `create_bump` if there is an overlap. If this option is specified,`create_bump` skips creating a bump if there is an overlap and continues creating the remaining bumps. A warning message is displayed when bump creation is skipped to avoid overlap. • `keep_new_bumps` - Removes the existing bumps before calling `create_bump`, places the newly created bump if there is overlap, and then continues creating the remaining bumps. A warning message is displayed when deleting the existing bumps to avoid overlap. If the status of the existing bumps to be deleted is covered or fixed, a warning is displayed and the new bumps overlapping with the covered or fixed old bumps are not kept. ⚠ `create_bump`: • Checks overlaps between regular bumps by checking for pin overlaps on bumps. • Checks overlaps between dummy bumps by checking for OBS overlap. • Checks overlaps between dummy bumps and regular bumps by checking for OBS and bump pin overlap. *Data_type*: enum, optional
`-cell` *bumpcell_name*	Specifies the name of the bump cell, which is used to create bumps. *Data_type*: string, required
`-check_drc`	Checks DRC rules and does not create a bump at any location where there is a violation. A suitable warning message is also issued. For example, as indicated in the following diagram, no bump is created at the location where a short violation is detected when `-check_drc` is specified with `create_bump`.  Bump creation without -check_drc Bump creation with -check_drc In addition, a warning such as the following is displayed: `**WARN: (IMPSIP-9068): New bump at (0.000, 75.000) has short violation and skipped.` Currently, `create_bump -check_drc` checks for the following types of violations: • Short violation • Min spacing violation • Cut spacing violation • EOL (end of line) violation *Data_type*: bool, optional
`-edge_spacing {`*left bottom right top*`}`	
	Specifies the minimum distances in microns to the edge of the chip from the lower left or center of the outermost bumps. The `-location_type` value determines which point of the bump (lower-left or center of the cell or geometry) is used to compute the distance to the edge. The arrays start at the left, bottom location and extend to the right and top. *Data_type*: string, optional
`-exclude_bump_area {`*rect_list*`}`	

	Specifies the area to be excluded from bump placement. No bump geometry is allowed inside the specified area. It supports multiple rectangles, such as `-exclude_bump_area {llx1 lly1 urx1 ury1 llx2 lly2 urx2 ury2 ...}`. *Data_type*: string, optional
`-keep_out_pitch value`	Defines a circular keep-out area with the bump center as the center and the specified pitch value as the radius. By default, the tool will not create a bump at a location if an existing bump violates the center-to-center pitch at that location, as shown below.  If the bump-center-to-bump-center pitch at a location is smaller than the specified keep-out pitch value, the tool displays a warning. Whether the tool then retains the existing bumps in the overlap region or replaces them with the new bumps depends on the `-allow_overlap_control` parameter setting: • If `-keep_out_pitch` is specified but `-allow_overlap_control` is not specified, the tool keeps the existing bumps and does not add new bumps in the overlap region. This is the same behavior as when `-keep_out_pitch` is specified along with `-allow_overlap_control keep_existing_bumps`. • If `-keep_out_pitch` is specified along with `-allow_overlap_control keep_new_bumps`, the tool keeps the newly added bumps and deletes the existing bumps. If the bump-center-to-bump-center pitch equals the specified keep-out pitch value, the tool creates bumps without any violations. *Data_type*: float, optional
`-keep_out_region width height`	Defines a dynamic, keep-out region where bumps are not going to be created if there are existing bumps in that region. The keep-out region is a box area of the specified width and height, and its center is the same as the bump center. By default, if you specify `-keep_out_region` and there are existing bumps in the region, the tool displays a warning and keeps the existing bumps in the overlap area. Specify `-allow_overlap_control keep_new_bumps` if you want to keep the new bumps and delete existing ones in the case of overlap in the specified keep-out region. *Data_type*: point, optional
`-location x y`	Specifies the `x` and `y` coordinates of the start point for bump creation based on location type. The unit is micron. For different bump patterns, the `-location` coordinates have different meanings for the start point: • For `-pattern_full_chip`, `-pattern_side {bottom width}`, `-pattern_side {left width}`, `-pattern_array {row column}`, `-pattern_ring width`, the start point is the location of the lower-left bump in the bump pattern. • For `-pattern_side {top width}`, the start point is the location of the upper-left bump in the bump pattern. • For `-pattern_side {right width}`, the start point is the location of the lower-right bump in the bump pattern. • For `-pattern_center {row column}`, the start point is the center of the bump pattern. If the location violates the spacing rule defined by the option `-edge_spacing`, the tool issues a warning but still uses the `-location` value for the start point. *Data_type*: point, optional
`-location_type {cell_center | cell_lower_left | geometry_center | geometry_lower_left}`	

	Specifies the location type for bump creation. The default type is `cell_center`. *Data_type*: enum, optional
`-name_format {`*`string, %i, %r, %c`*`}`	
	Specifies the format for the bump name like a `printf` format, except that it uses `%i` for index, `%r` for row number, and `%c` for column number. The index starts at one more than the number of existing bumps in the design, unless `-start_index` is specified and increments for each bump created. This means if there are no bumps in the design, the index starts at `1` and if there are 100 bumps in the design, the index starts at 101. The default name format is `Bump_%i`. Therefore, if there are no bumps in the design, the tool generates bumps named `Bump_1`, `Bump_2`, and so on, by default. Some examples of the possible format are: • `-name_format` *`prefix_%i_string_%r_%c_suffix`* • `-name_format %i` • `-name_format` *`bumpname`* If there are any name collisions, an ERROR occurs and the bump pattern is not created. *Data_type*: string, optional
`-orient {r0 r90 r180 r270 mx mx90 my my90}`	
	Specifies the orientation of the bump for bump generation. Use this option if you are creating a pillar bump. A pillar bump can be rectangular and you may rotate the pillar bump by 90/180/270 degrees to alleviate package and chip routing problem. *Default:* `r0` **Note**: If you are creating a regular C4 bump, which is either octagonal or square in shape, rotation does not change its footprint in silicon. *Data_type*: enum, optional
`-pattern_array {`*`row column`*`}`	Creates an array of bumps. The bump starts at the coordinates specified with `-location`, and extends to the number of *`row`* and *`column`* values given from the start corner specified using `-start_from`. *Data_type*: string, optional
`-pattern_center {`*`row column`*`}`	Creates an array of bumps that is centered on the center of the chip and that extends for the *`row`* and *`column`* values given. The center point can optionally be set directly with `-location`. The starting corner of the array can be specified using the `-start_from` parameter. *Data_type*: string, optional
`-pattern_full_chip`	Creates an array of bumps covering the chip. The array starts at the closest to boundary point set by `-edge_spacing` at the corner specified by `-start_from` and extends until within `-edge_spacing` of the chip boundary for the opposite sides. You can optionally directly specify the `-location` value for the starting point, in which case `-edge_spacing` affects only the two opposite edges of the array. For examples, see the Examples section below. *Data_type*: bool, optional
`-pattern_ring` *`width`*	Creates a ring of bumps around the boundary of the chip that is *`width`* bumps wide, where *`width`* is an integer value. The ring extends until within `-edge_spacing` of the chip boundary, starting at the lower-left value allowed by `-edge_spacing`. You can optionally directly specify the `-location` value for the lower-left bump location, in which case `-edge_spacing` only affects the right and top edges of the array. The `-pitch` *`x`* value is the spacing between bumps inside one ring, and the `-pitch y` value is the spacing between two rings. For examples, see the Examples section below. *Data_type*: int, optional

`-pattern_side {side width}`	Creates an array of bumps along one side of the chip. The array is the length of the side, and *`width`* bumps wide, where *`width`* is an integer value. The legal *`side`* names are: `left`, `top`, `right`, `bottom`. The array starts at the left/bottom controlled by `-edge_spacing`, and extends until within `-edge_spacing` of the top/right sides. You can optionally directly specify the `-location` value for the lower-left bump location for bottom/left sides, the upper-left bump for the top side, or lower-right for the right side. For examples, see the Examples section below. *Data_type*: string, optional
`-pitch x y`	Specifies the distance between bump centers in microns. `-pitch {x y}` is interpreted in different ways for different bump patterns. • For `full_chip`, bottom_side row, top_side row, left_side column, right_side column, array {row column}, and center {row column}: ◦ `-pitch x` means the distance between the bump centers in a row or horizontal. ◦ `-pitch y` means the distance between the bump centers in column or vertical. • For `ring ring_number`: ◦ `-pitch x` means the distance between the bump centers in the ring. ◦ `-pitch y` means the distance between rings from the bump center. *Data_type*: point, optional
`-relative_assignment`	Assigns the corresponding net of the relative object to the bump being created. This option can be used only if `-relative_type` is specified. If `relative_assignment` is specified and `-relative_type` is: • `embedded_bump`: `create_bump` searches the top netlist for the net connected to the pin of the embedded bump and assigns it to the created bump. • `inst_pin_port`: You must also specify `-relative_objs {inst_pin_port_list}`. `create_bump` then searches the top netlist for the net connected to the specified pin and assigns it to the created bump. • `block`: You must also specify `-relative_block {inst+}`. `create_bump` then searches the top netlist for the net connected to the top layer pins of the specified blocks and assigns it to the created bump. **Note**: This option is used with `-cell`, `-start_index`, `-name_format`, `-orient`, -allow_overlap_control , `-relative_type`, `-relative_objs` and `-relative_offset`. An error message is displayed if it is used with any other option. *Data_type*: bool, optional
`-relative_block inst+`	Specifies the block list for creating top-level bumps based on block pins on the top layer. The `-relative_block` parameter must be specified when `-relative_type` is set to `block`. The `-relative_block` parameter supports wildcards. For example, you can specify `-relative_block *`. *Data_type*: (inst)+, optional
`-relative_block_constraint fileName`	

	Specifies the filename of the block constraint to be used for creating top-level bumps based on block pins on the top layer. The `-relative_block_constraint` parameter is optional and can be used only when `-relative_type block` is specified.
	
	`create_bump` parses the constraint file specified with `-relative_block_constraint` and creates bumps based on the instance pins specified with `-relative_block`. The top-level bump is created at the center of the block pin geometries. Note that bumps are created on a block pin only if it is on the top layer of a design.
	
	The constraint format for bumps based on a block pin is as follows:
	
	`BUMP_ON_BLOCK_PIN`
	`  MACRO` *`marco_name_list`*
	`  PIN [`*`pin_name_list`*`] [SINGLE|MULT]`
	`  PORT [SINGLE|MULT]`
	`  GEOMETRY_SHAPE RECT/POLY`
	`  GEOMETRY_SHORT_EDGE` *`min_value`* `[:`*`max_value`*`]`
	`  GEOMETRY_LONG_EDGE` *`min_value`* `[:`*`max_value`*`]`
	`  NET` *`net_list_name`*
	`END BUMP_ON_BLOCK_PIN`
	
	Note: If a constraint file is specified, the tool creates bumps only on the block pins that are specified in the constraint file. If you do not specify a constraint file, the tool creates a single bump for each block pin on the top layer for the specified blocks. If a constraint file is specified but is empty, the tool does not create any bumps because no block pin is specified in the constraint file.
	
	To see the use model and examples of the `BUMP_ON_BLOCK_PIN` constraint, refer to the "Bump Creation" section in the Flip Chip Methodologies chapter in the *User Guide*.
	
	Data_type: string, optional

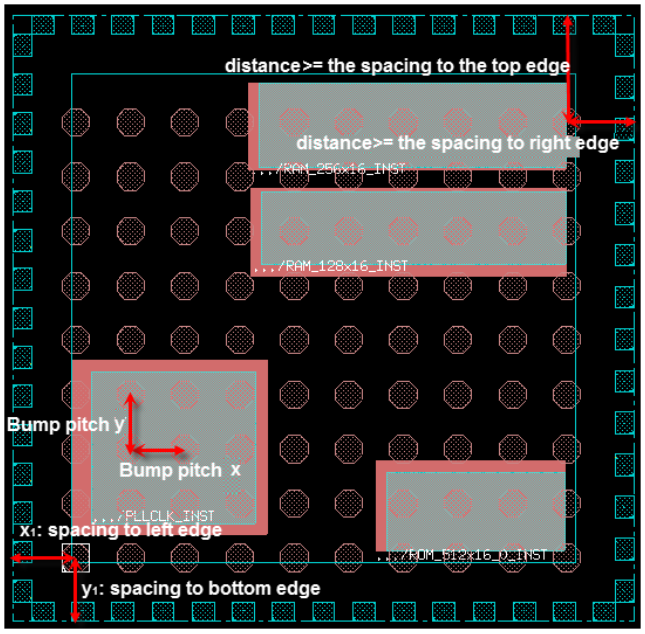
`-relative_objs {`*`inst_pin_port_list`*`}`	
	Specifies the inst_pin_port list and supports wild cards. The format is `{inst:pin:port ...}` and `port` is of type integer. When the `-relative_objs` option is specified, bumps are created by default at the geometry center of the specified ports. The bump is named *`$blockName-$pinName-Port_$portNumber-embeddedBump_$index`*, where: • *`$blockName`* is the name of the block in the top design which has the corresponding embedded bump. • *`$pinName`* is the name of the pin in LEF which has the corresponding embedded bump. • *`$portNumber`* is the number of the port on which the created bump is based. **Example**: `Avd_test_1-DQ0-Port_1-embeddedBump_1` You can reset the default settings by using the `-start_index` and `-name_format` options. **Note**: This option is used with `-cell`, `-start_index`, `-name_format`, `-orient`, -allow_overlap_control-relative_type, -relative_assignment and -relative_offset. An error message is displayed if it is used with any other option. *Data_type*: string, optional
`-relative_offset` *`x y`*	Specifies the offset of bump location compared with the relative object. The geometry center of the created bump is the geometry center of the relative object plus the offset. This option can be used only if `-relative_type` is specified. **Note**: This option is used with `-cell`, `-start_index`, `-name_format`, `-orient`, -allow_overlap_control, `-relative_objs` and `-relative_assignment`. An error message is displayed if it is used with any other option. *Data_type*: point, optional
`-relative_type {embedded_bump inst_pin_port block}`	

	Specifies the type of the relative object: • `embedded_bump`: When the `embedded_bump` type is specified, `create_bump` automatically creates a bump at the same location as the embedded bump. The bump is named *`$blockName/$pinName/embeddedBump_$index`*, where: ◦ *`$blockName`* is the name of the block in the top design that has the corresponding embedded bump. ◦ *`$pinName`* is the name of the pin in LEF that has the corresponding embedded bump. You can reset the default settings by using the `-start_index` and `-name_format` options. If there are already overlapping bumps for some embedded bumps, `create_bump` skips creating bumps for those embedded bumps but continues to create bumps for remaining embedded bumps and issues the following warning message. `WARNING (#): There is(are) overlap bump(s) with the embedded bump $blockName/$pinName located at {x2 y2} with relative offset {x y}. Skip creating bump for it.` After all bumps are created, `checkBump` displays a summary of the number of embedded bumps for which the tool failed to create bumps. • `inst_pin_port`: When the `inst_pin_port` type is specified, `create_bump` creates bumps as per the *`inst_pin_port_list`* you specify with `-relative_objs`. Therefore, if you specify `-relative_type` as `inst_pin_port`, you must specify the `-relative_objs {inst_pin_port_list}` option. • `block`: When the `block` type is specified, `create_bump` automatically creates bumps at the same location as that of the specified block pin, which must be on the top routing layer of the design. The `-relative_block` parameter must be specified when `-relative_type` is set to `block`. *Data_type*: enum, optional
`-respect_placement_blockage`	Specifies that the bumps being created, including dummy bumps, should not overlap any placement blockages. *Data_type*: bool, optional
`-return_bumps_name`	Returns the names of the bumps generated. If `create_bump` fails to generate any bumps, the tool returns an empty string. *Data_type*: bool, optional
`-stagger_offset` *value*	Specifies the offset between different rows or columns in microns. This option only works with `-pattern_side`. *Data_type*: float, optional
`-stagger_type {odd_rows odd_columns even_rows even_columns trapezoid }`	
	Specifies the stagger type pattern. The `-stagger_type` parameter cannot be used with `-pattern_ring`. You can use the `-stagger_offset` parameter along with `-stagger_type` to specify the offset of bumps between rows or columns in the generated bump pattern. The allowed values for the `-stagger_type` parameter are: • `odd_rows` - Creates a bump array with the odd rows shifted to the right by the specified stagger offset value. • `odd_columns` - Creates a bump array with the odd columns shifted up by the specified stagger offset value. • `even_rows` - Creates a bump array with the even rows shifted to the right by the specified stagger offset value. • `even_columns` - Creates a bump array with the even columns shifted up by the specified stagger offset value. • `trapezoid` - Creates bumps are created in a trapezium pattern. This stagger type is supported only with `-pattern_side`.  For examples of how `-stagger_offset` affects different `-stagger_type` patterns, refer to the Examples section below. *Data_type*: enum, optional
`-start_from {lower_left upper_left lower_right upper_right}`	

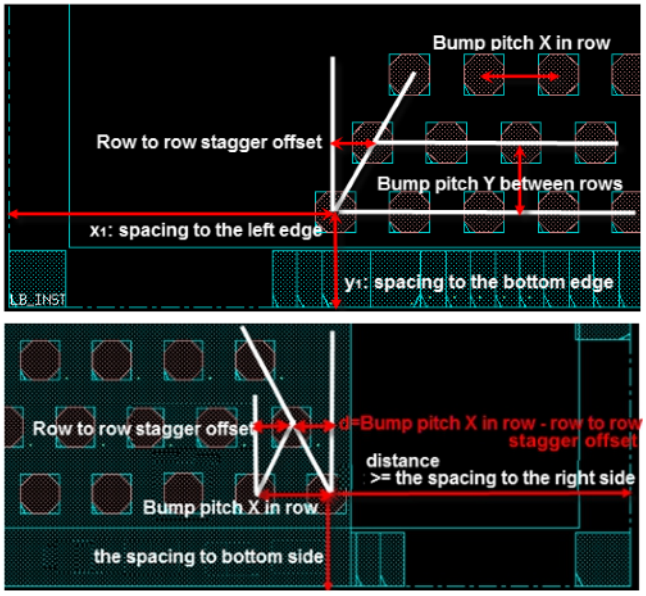
	Specifies the starting corner for creating an array of bumps. This option can be used only if `-pattern_array`, `-pattern_center`, or `-pattern_full_chip` is specified. **Note**: Bumps are always indexed by row first, irrespective of the `-start_from` value. For examples of using `-start_from`, refer to the Examples section below. *Default*: `lower_left` *Data_type*: enum, optional
`-start_index` *index*	Specifies the starting number of the index for bumps to be created. *Data_type*: int, optional

Examples

- The following command creates a single bump at the lower-left corner of the bump cell box:
  ```
  create_bump -cell BUMPCELL -location_type cell_lower_left -location {0 0}
  ```
- The following command uses the default location type setting and creates an array of bumps with bump cell that has the same size as the bump bounding box for the macro BUMPCELL:
  ```
  create_bump -cell BUMPCELL -pitch {x y} -edge_spacing {x1 y1 x2 y2} -pattern_full_chip
  ```



- The following command creates a full bump matrix on the chip with the spacing constraint {`400 500 450 600`} and bump pitch {`80 120`}. The names of the created bumps honor the default naming format `Bump_%i`, where `%i` means the index:
  ```
  create_bump -cell BUMPCELL -pitch {80 120} -edge_spacing {400 500 450 600} -pattern_full_chip
  ```
- The following command creates a 3-row array of bumps along the bottom of the chip:
  ```
  create_bump -cell BUMPCELL -pitch {X Y} -edge_spacing {x1 y1 x2 0} -pattern_side {bottom 3} -stagger_offset X
  ```

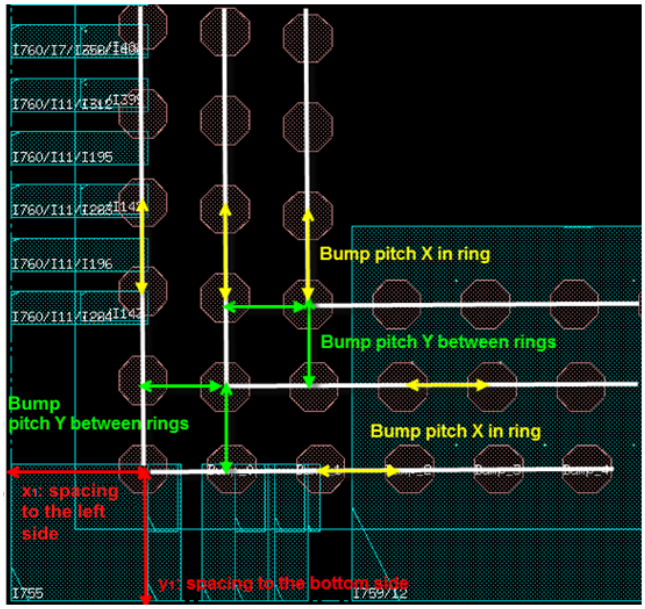


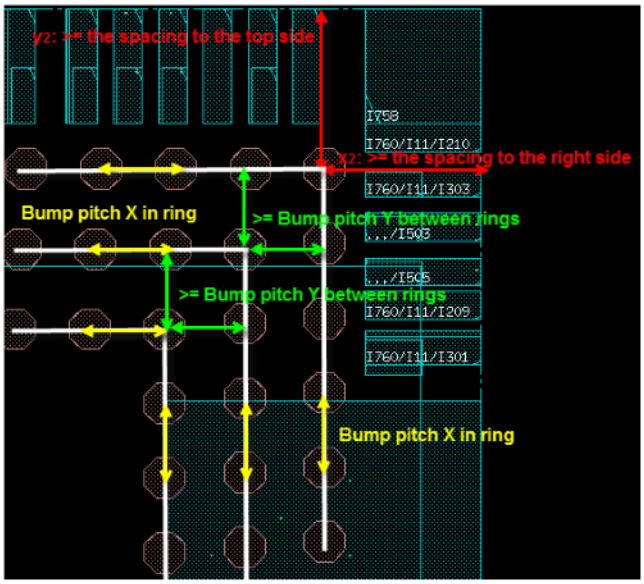
- The following command creates a 3-row bump pattern on the bottom side with stagger offset `50` and bump pitch {`80 120`}. The names of the created bumps honor the format of `bottom_%i`, where `%i` means the index:

  ```
  create_bump -name_format bottom_%i -cell BUMPCELL -pitch {80 120} -edge_spacing {400 400 500 0} -pattern_side {bottom 3} -
  stagger_offset 50
  ```

- The following command creates a ring of bumps around the boundary of the chip that is 3 bumps wide:

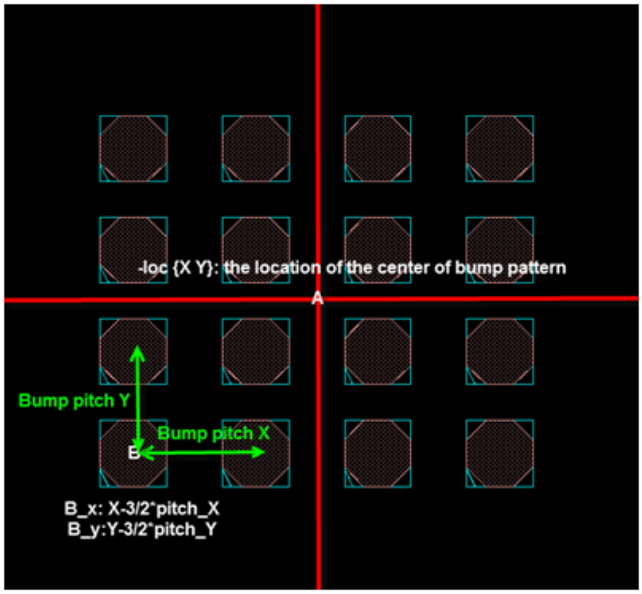
  ```
  create_bump -cell BUMPCELL -pitch {X Y} -edge_spacing {x1 y1 x2 y2} -pattern_ring 3
  ```





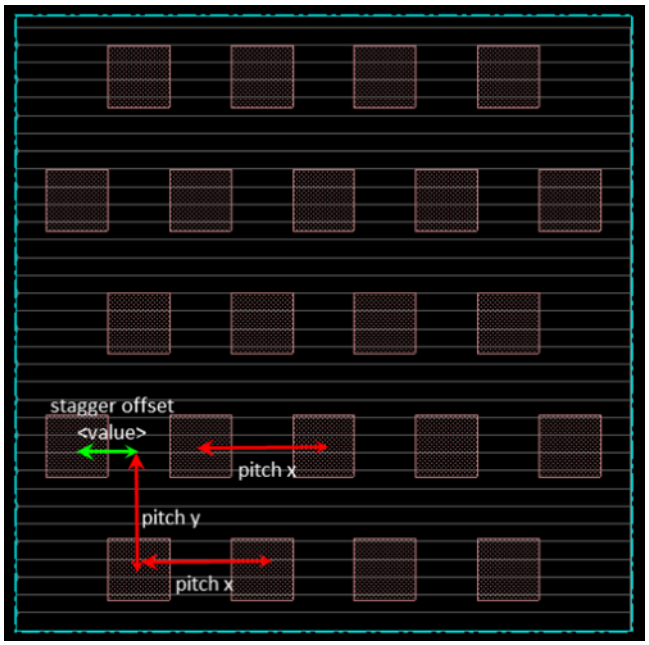
- The following command creates a 4x4 array of bumps that is centered on the point defined by `-location`:

  `create_bump -cell BUMPCELL -pitch {X Y} -location {X Y} -pattern_center {4 4}`

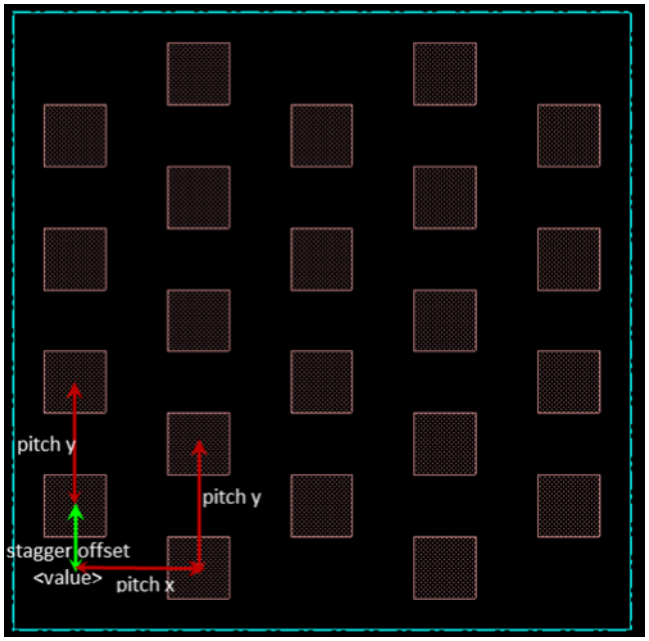


- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type odd_rows` stagger pattern:

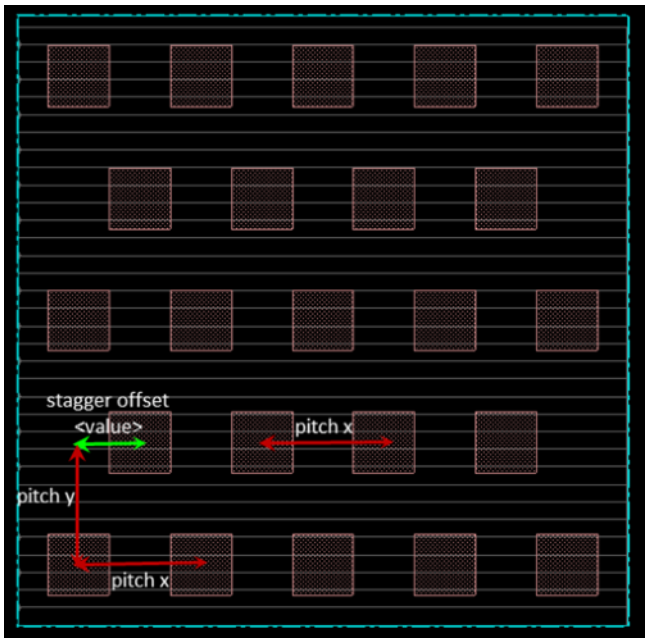
  `create_bump -cell BUMPCELL -location {loc_x loc_y} -pitch {pitch_x pitch_y} -pattern_array {5 5} -stagger_type odd_rows -stagger_offset value`



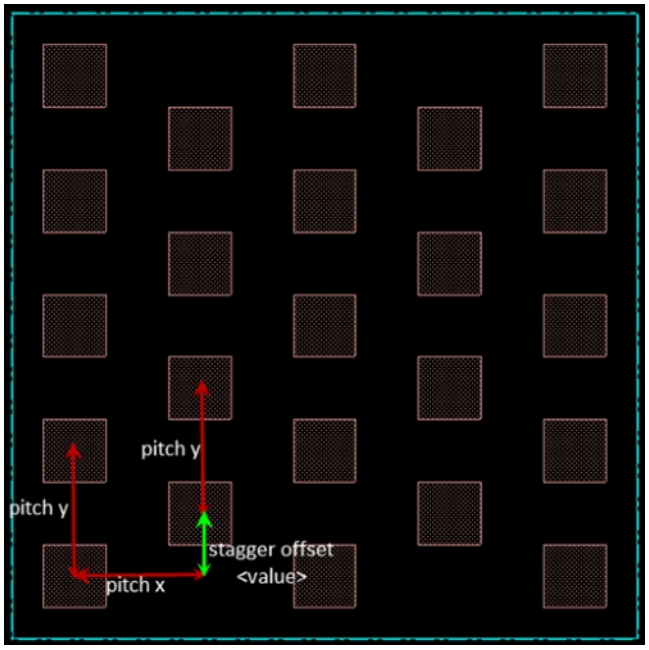
- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type odd_columns` stagger pattern:
  `create_bump -cell BUMPCELL -location {loc_x loc_y} -pitch {pitch_x pitch_y} -pattern_array {5 5} -stagger_type odd_columns -stagger_offset value`



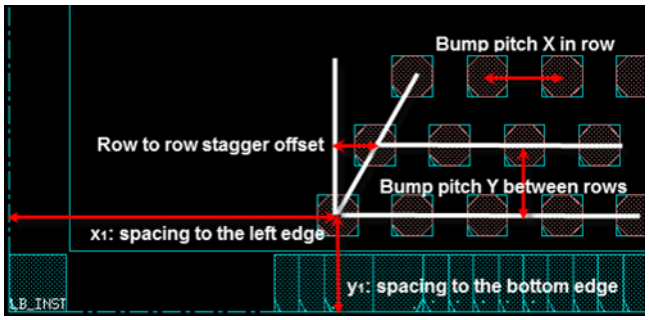
- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type even_rows` stagger pattern:
  `create_bump -cell BUMPCELL -location {loc_x loc_y} -pitch {pitch_x pitch_y} -pattern_array {5 5} -stagger_type even_rows -stagger_offset value`



- The following example shows how `-stagger_offset` can be used to create a 5X5 array of bumps in `-stagger_type even_columns` stagger pattern:
  `create_bump -cell BUMPCELL -location {loc_x loc_y} -pitch {pitch_x pitch_y} -pattern_array {5 5} -stagger_type even_columns -stagger_offset value`

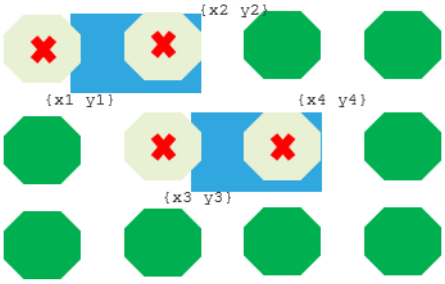


- The following example shows how `-stagger_offset` can be used with `-stagger_type trapezoid` stagger pattern to create a 3-row bump pattern on the bottom side:
  `create_bump -cell BUMPCELL -edge_spacing {left bottom right top} -pitch {pitch_x pitch_y} -pattern_side {bottom 3} -stagger_type trapezoid -stagger_offset value`



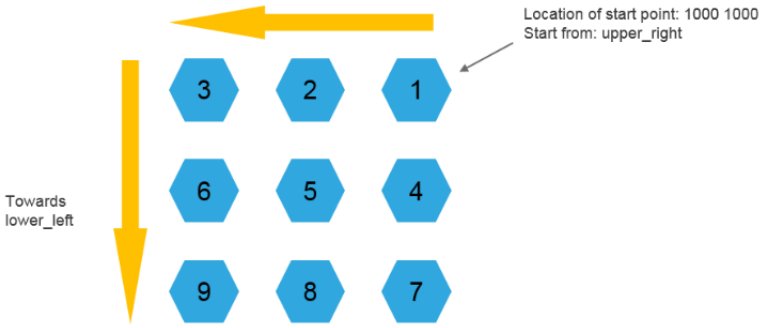
- The following command creates a 3X4 array of bumps but does not place bumps in the:
  - rectangular area with lower left corner at {x1 y1} and upper right corner at {x2 y2}
  - rectangular area with lower left corner at {x3 y3} and upper right corner at {x4 y4}

```
create_bump -cell BUMPCELL -location {x y} -pattern_array {3 4} -exclude_bump_area {x1 y1 x2 y2 x3 y3 x4 y4}
```



- The following command creates a 3X3 array of bumps with the upper-right corner of the array starting at point (1000, 1000):

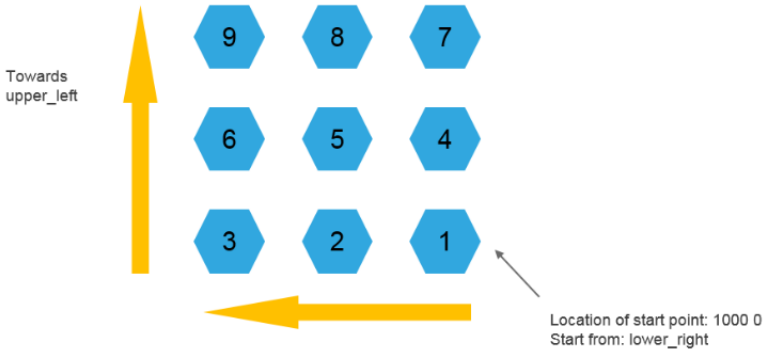
```
create_bump -pattern_array {3 3} -location 1000 1000 -cell BUMP  -pitch 200 200 -start_from upper_right
```



The array starts from the upper right and continues towards lower left.

- The following command creates a 3X3 array of bumps with the lower-right corner of the array starting at point (1000, 0):

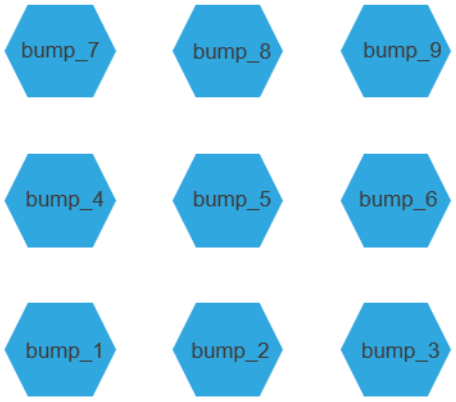
```
create_bump -pattern_array {3 3} -location 1000 0 -cell BUMP -pitch 200 200 -start_from lower_right
```



The array starts from the lower right and continues towards upper left.

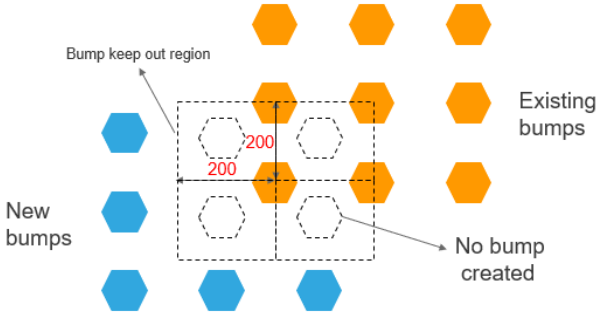
- The following command creates a 3X3 array of bumps at the specified location and returns the names of the bumps generated:

```
create_bump -pattern_array {3 3} -location 0 1000 -cell BUMP -pitch 200 200 -return_bumps_name
> bump_1 bump_2 bump_3 bump_4 bump_5 bump_6 bump_7 bump_8 bump_9
```



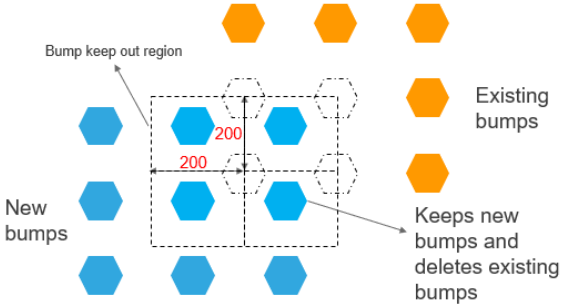
- The following command creates a 3X3 bump array and does not add new bumps in the specified keep-out region in the case of an overlap:

```
create_bump -pattern_array {3 3} -location 200 200 -cell BUMP -pitch 200 200 -keep_out_region {200 200}
```



- The following command creates a 3X3 bump array and does not add new bumps in the specified keep-out region in the case of an overlap:

```
create_bump -pattern_array {3 3} -location 200 200 -cell BUMP -pitch 200 200 \
-keep_out_region {200 200} -allow_overlap_control keep_new_bumps
```



- The following command creates a 5X5 bump array and allows bumps to be created outside of the die area:

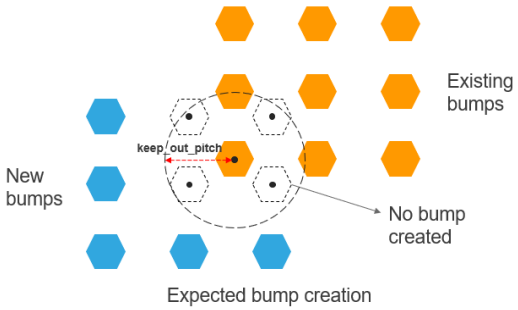
```
create_bump -cell BUMPCELL -start_from upper_right -location 0 0 -pitch 100 100  -pattern_array {5 5} -allow_outside_of_die
```

- The following command parses the `1.const` constraint file and creates bumps based on the specified instance pins:

```
create_bump -cell BUMPCELL -relative_type block -relative_block {BLOCK_LIST} -relative_block_constraint 1.const -relative_assignment
```

- The following command creates a 3X3 bump array and does not add new bumps in the circular area defined by the specified keep-out pitch in the case of an overlap:

```
create_bump -pattern_array {3 3} -location 200 200 -cell BUMP -pitch 200 200 -keep_out_pitch 200
```



- The following command creates a 3X3 bump array and adds new bumps in the circular area defined by the specified keep-out pitch in the case of an overlap:

```
create_bump -pattern_array {3 3} -location 200 200 -cell BUMP -pitch 200 200 \
 -keep_out_pitch 200 -allow_overlap_control keep_new_bumps
```

create_bump_connect_target_constraint

```
create_bump_connect_target_constraint
[-help]
{-bumps list_of_bumps | -selected }
{ {-io_inst instance_name
        [ {-pin_name pin_name | -net net_name}
          [-port_num value]]}
  | -pg_connect_type {ioring corering stripe iopin}}
```

Adds a string property in one or multiple bumps. If any of the specified/selected bump has a property value already, Innovus checks whether the new property value is exactly the same as the existing one. If not, the new property value is concatenated to the existing property string and separated by a space.

Using this command, you can add either a complete port numbering property (`inst:pin:port`) or an incomplete property, such as `inst` or `inst:pin` to PG bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_bump_connect_target_constraint` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_bump_connect_target_constraint`
`-bumps` *list_of_bumps*	Adds bump connect target constraint on specified bumps. The option `-bumps` can accept wildcards. In case of multiple bumps being specified, the same property is added onto all the bumps. *Data_type*: string list, required
`-io_inst` *instance_name*	Specifies the connect target instance. If only `-io_inst` is specified and `-net` or `-pin_name` is not specified, the tool automatically finds the most suitable geometries in the instance specified by *instance_name*. *Data_type*: string, required
`-net` *net_name*	Specifies the connect target net name. **Note:** This option cannot be used with `-pin_name`. *Data_type*: string, optional
`-pg_connect_type {ioring corering stripe iopin}`	
	Specifies the PG connect type. Connection type can be I/O Ring (`ioring`), Core Ring (`corering`), Stripe (`stripe`), or I/O Pin (`iopin`). *Data_type*: enum, required
`-pin_name` *pin_name*	Specifies the connect target pin name. **Note:** This option cannot be used with `-net`. *Data_type*: string, optional
`-port_num` *value*	Specifies the connect target port number. *Data_type*: int, optional
`-selected`	Adds bump connect target constraint on selected bumps. If multiple bumps are selected, the same property is added onto all the bumps. *Data_type*: bool, required

Examples

- The following command adds `bump_connect_target` property onto `Bump_1` on `VDD` net. Then `Bump_1` pairs with `PORT1` under the PIN connecting to `VDD` net of arealo `IOPADS_INST/esd`.
  ```
  create_bump_connect_target_constraint -bumps Bump_1 -io_inst IOPADS_INST/esd -net VDD -port_num 1
  ```
- The following command adds `bump_connect_target` property onto `Bump_1`. Then `Bump_1` pairs with `PORT2` under the PIN whose name is `vdd!` of instance `DTMF_INST/PLLCLK_INST`. `PORT2` is required with PORT `CLASS BUMP` attribute in LEF.

```
create_bump_connect_target_constraint -bumps Bump_1 -io_inst DTMF_INST/PLLCLK_INST -pin_name vdd! -port_num 2
```

create_signal_pin

```
create_signal_pin
[-help]
[-ignore_floating_pins]
{-inst inst_name_list | -pins pin_name_list}
```

Promotes signal pins in the IO pad/block to the top-level design as a physical pin for specified instances or pins. The instance's cell type should be either CLASS PAD AREAIO or CLASS BLOCK. The pins to be promoted should have geometry on the top layer. You can choose to ignore floating pins.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_signal_pin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_signal_pin`
`-ignore_floating_pins`	Ignores the floating pins. If this parameter is not specified when promoting pins to the top level, the tool converts the floating pins in the instance to pgTerms because these pins are not logically connected to any terminal on the top level. *Data_type*: bool, optional
`-inst inst_name_list`	Specifies the names of instances for which pins need to be promoted. **Note**: This option cannot be used with `-pins`. *Data_type*: string list, required
`-pins pin_name_list`	Lists specific pins that are to be promoted to the top level. The specified pins should be hierarchical. **Note**: This option cannot be used with `-inst`. *Data_type*: (pin)+, optional

Examples

- The instance `lna_inst` has a signal pin called `data1_i`. The pin `data1_i` has a port geometry shape on the top layer. The lef for the `lna` cell is as follows:

```
MACRO lna

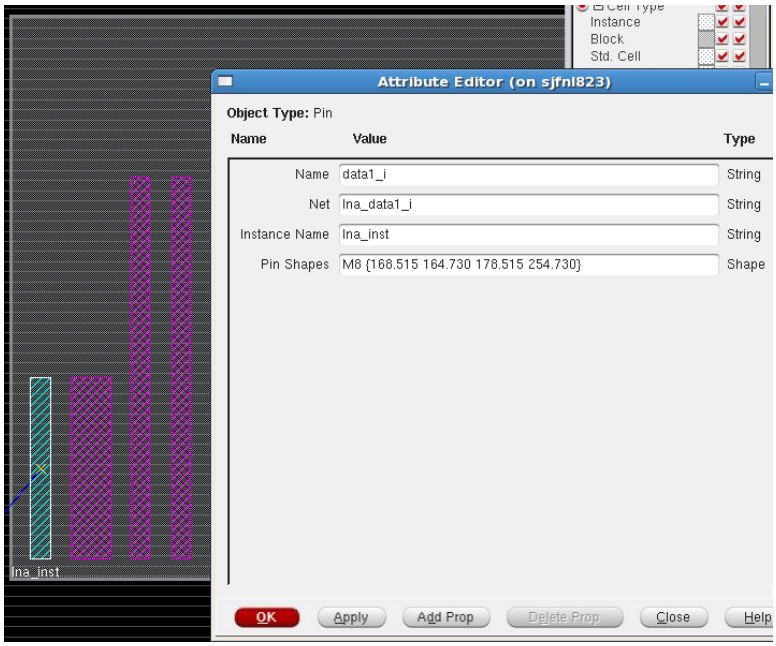
CLASS BLOCK ;

...
  PIN data1_i
    DIRECTION INPUT ;
    USE SIGNAL ;
    PORT
        CLASS BUMP ;
        LAYER METAL8 ;
        RECT   10.00 10.00   20.00 100.00 ;
    END
  END data1_i
...
END lna
```

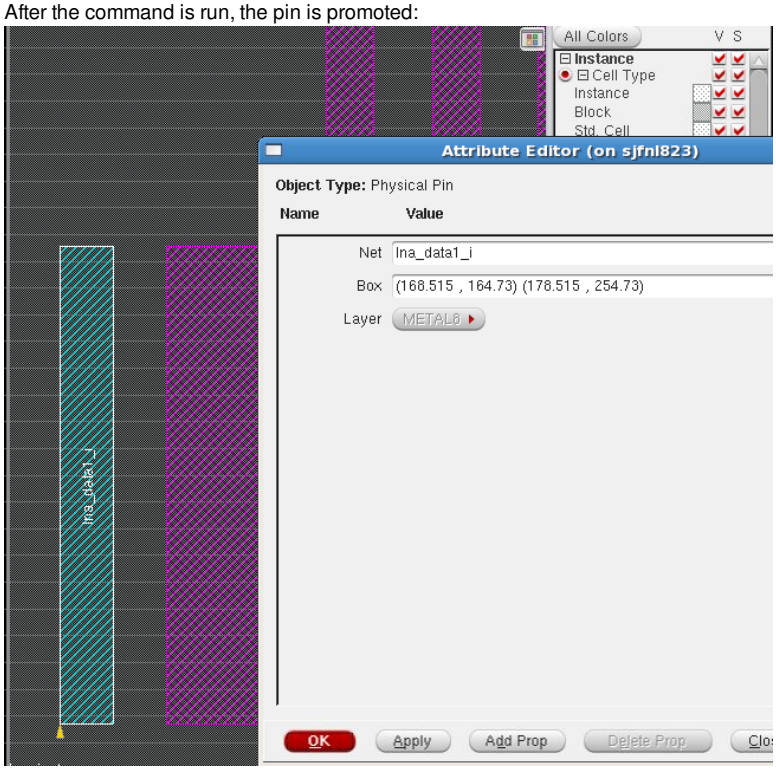
  The following command creates a signal pin for the instance `lna_inst`:

```
create_signal_pin -inst lna_inst
```

  - Before this command is run, the pin is local to `lna_inst`:



- After the command is run, the pin is promoted:



- The following command promotes the specified pins to the top level:

```
create_signal_pin -pins {lna_inst/data1_i lna_inst/data2_i phy/QS_PADP}
```

delete_area_io_fillers

```
delete_area_io_fillers
[-help]
-cell fillerCellName
[-inst fillerInstanceName]
[-prefix prefix]
{-area_io_row_cluster aioRowClusterName | -all_area_io_row_cluster}
```

Deletes area I/O filler cell instances. Use this command after using the `add_area_io_fillers` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_area_io_fillers` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man delete_area_io_fillers`
`-all_area_io_row_cluster`	Deletes all area I/O filler cells from all area I/O row clusters. *Data_type*: bool, required
`-area_io_row_cluster aioRowClusterName`	Specifies the area I/O row cluster name where all area I/O filler cells will be deleted. **Note:** This parameter overrides `-all_area_io_row_cluster`, i.e If you specify both, `-area_io_row_cluster aioRowClusterName` and `-all_area_io_row_cluster` parameters, then only `-area_io_row_cluster aioRowClusterName` is valid. *Data_type*: string, required
`-cell fillerCellName`	Specifies the name of the area I/O filler cell to delete. *Data_type*: string, required
`-inst fillerInstanceName`	Specifies the name of the area I/O filler instance name to delete. *Data_type*: string, optional
`-prefix prefix`	Specifies the prefix name of the area I/O filler cell instance to be removed. *Data_type*: string, optional

Example

- The following command deletes a filler cell from all area I/O row clusters:
  ```
  delete_area_io_fillers -cell AO_123 -all_area_io_row_cluster
  ```

Related Information

- `add_area_io_fillers`

delete_bump_connect_target_constraints

```
delete_bump_connect_target_constraints
[-help]
{-bumps list_of_bumps | -selected | -all }
[-io_inst instance_name [-pin_name pin_name [-port_num value]]]
```

Deletes existing properties on specified, selected, or all bumps. If a bump has multiple values for the property, use `-io_inst`, `-pin_name` and `-port_num` to filter out the matched property value for deletion. If only `-io_inst` is specified, then all property values for the pad are deleted. If only `-io_inst` and `-pin_name` are specified, then all property values for the pin are deleted. If the specified property value cannot be found for a bump, Innovus prints an error message for the bump only and continues to process other bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `delete_bump_connect_target_constraints` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man delete_bump_connect_target_constraints`
`-all`	Deletes bump connect target constraint on all bumps. *Data_type*: bool, required
`-bumps list_of_bumps`	Deletes bump connect target constraint on specified bumps. The `-bumps` option can accept wild cards. *Data_type*: string list, required
`-io_inst instance_name`	Deletes the bump connect target constraint related to the specified instance. *Data_type*: string, optional
`-pin_name pin_name`	Deletes the bump connect target constraint related to the specified pin. **Note:** This option can be used only if you specify `-io_inst`. *Data_type*: string, optional
`-port_num value`	Deletes the bump connect target constraint related to the specified port number. **Note:** This option can be used only if you specify `-io_inst` and `-pin_name`. *Data_type*: int, optional
`-selected`	Deletes bump connect target constraint on selected bumps. Multiple bumps may be selected. *Data_type*: bool, required

Examples

- The following command removes `bump_connect_target` property on `Bump_1` which pairs with `VDD` PIN of instance `IOPADS_INST/esd`.
  ```
  delete_bump_connect_target_constraints -bumps Bump_1 -io_inst IOPADS_INST/esd -pin_name VDD
  ```
- The following command removes all `bump_connect_target` properties on `Bump_1`.
  ```
  delete_bump_connect_target_constraints -bumps Bump_1
  ```

Related Information

- `create_bump_connect_target_constraint`
- `get_pin_port_number`

delete_bumps

```
delete_bumps
[-help]
[-all]
[-bumps bump+]
[-floating]
[-overlap_area_io]
[-overlap_blockages]
[-overlap_keep_out bumpCellName]
[-overlap_macro]
[-selected]
```

Removes bumps from the design. Use this command anytime after creating a bump.

Deletion of assigned bumps is also supported. If any of the bumps being deleted is assigned, `delete_bumps` displays a WARNING message and deletes all specified non-routed bumps, assigned as well as unassigned.

If you click *Undo* (or run the `gui_undo` command) after running `delete_bumps`, the changes made by `delete_bumps` are cancelled out and the following bump properties are recovered:

- Name
- Location
- Port number properties
- Fixed status
- Placement status

On clicking *Redo* (or running the `gui_redo` command), the bump floorplan will revert to the status before undo.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `delete_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man delete_bumps`
`-all`	Deletes all bumps. *Data_type*: bool, optional
`-bumps bump+`	Specifies the names of the bumps to be deleted. You can use wildcards in the bump name list. *Data_type*: (bump)+, optional
`-floating`	Deletes bumps which are not assigned to any nets. *Data_type*: bool, optional
`-overlap_area_io`	Deletes bumps that overlap with the area I/O cells. You must first select the area I/O cells in the design display area, then use this c *Data_type*: bool, optional
`-overlap_blockages`	Deletes all bumps that overlap routing blockages on the same layer. For example, if a bump on layer M7 overlaps a routing blockag when you use this parameter. *Data_type*: bool, optional
`-overlap_keep_out bumpCellName`	
	Deletes specified bumps that overlap the bump keep out zone. *Data_type*: string, optional
`-overlap_macro`	Deletes all bumps that overlap the selected macros. You must first select the macros in the design display area, then use this comm *Data_type*: bool, optional
`-selected`	Deletes selected bumps. You must first select the bumps in the design display area, then use this command to delete the bumps. *Data_type*: bool, optional

Examples

- The following command deletes all non-routed bumps, assigned as well as unassigned, in the current design:
  ```
  delete_bumps -all
  ```
- The following command deletes all selected bumps, whether assigned or unassigned:
  ```
  delete_bumps -selected
  ```

- flip_chip_via_to_pad_honor_min_spacing
- flip_chip_wire_to_pad_honor_min_spacing

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `flip_chip` category, use the following command:

```
get_db -category flip_chip
```

flip_chip_allow_layer_change

`flip_chip_allow_layer_change {true | false}`

Default: `false`

Data_type: bool, read/write

Turns on the layer change feature, when set to `true`. Only the PIO mode supports this feature. Both Manhattan and 45-degree routing support this constraint.

Different setting for routing layers will have the different behaviors as shown in the following examples. Assume the top RDL is `TOP_RDL` and the second top RDL is `2nd_RDL`:

- Use `TOP_RDL` as much as possible and `2nd_RDL` is used only when a single layer cannot finish routing in case of cross-over:
  ```
  flip_chip_bottom_layer TOP_RDL flip_chip_top_layer TOP_RDL
  ```
- Freely change layers so that the tool will use the layer resources by its intelligence
  ```
  flip_chip_bottom_layer 2nd_RDL flip_chip_top_layer TOP_RDL
  ```

Related Commands

- `route_flip_chip`

flip_chip_allow_routed_bump_edit

`flip_chip_allow_routed_bump_edit {true | false}`

Default: `true`

Data_type: bool, read/write

Specifies whether Innovus should check routing status of bumps before allowing manipulation. By default, the tool ignores routing status and allows manipulation of routed bumps. Manipulation actions include moving, deleting, re-assigning, and swapping. Set this attribute to `false` if you want the tool to check routing status of bumps and disallow manipulation of routed bumps.

Related Commands

- `assign_bumps`
- `assign_signal_to_bump`
- `copy_bumps`
- `delete_bumps`
- `swap_bump_assignment`
- `unassign_bumps`
- `align_selected`
- `flip_or_rotate_object`
- `move_obj`
- `space_selected`

flip_chip_auto_pairing_file

`flip_chip_auto_pairing_file` *`filename`*

Default: `""`

Data_type: string, read/write

Specifies the output file name to dump out `route_flip_chip` auto pairing information for bump to I/O connection. Depending on the design, the format of the output file can be as follows:

- If the connection between the bump and the instance is known, the format is:

```
create_bump_connect_target_constraint -bumps bump_name -io_inst inst_name
```

- If the connection between the bump and the instance pin is known, the format is:
  ```
  create_bump_connect_target_constraint -bumps bump_name -io_inst inst_name -pin_name pin_name
  ```
- If the connection between the bump and the pin port of the instance is known, the format is:
  ```
  create_bump_connect_target_constraint -bumps bump_name -io_inst inst_name -pin_name pin_name -port_num port_number
  ```

Related Commands

- route_flip_chip
- create_bump_connect_target_constraint

flip_chip_bottom_layer

```
flip_chip_bottom_layer layer_name
```

Default: ""

Data_type: string, read/write

Specifies the bottom-most metal layer by layer number or layer name that the software can use when routing bumps.

Related Commands

- place_peripheral_ios
- route_flip_chip

flip_chip_bump_use_octagon_shape

```
flip_chip_bump_use_octagon_shape {true | false}
```

Default: `false`

Data_type: bool, read/write

Controls how `route_flip_chip` handles special bumps with multiple shapes:

- When this attribute is set to `true`, the tool uses an octagonal shape to mimic the special bump.
- When this attribute is set to `false`, the tool:
  - Uses the bump's exact LEF description if the bump is simple enough.
  - May replace the bump shape with an octagonal shape if the bump is not simple according to the tool's internal criterion.

Note: When the special bump is replaced with an octagonal shape, the routing quality may be improved, but there may be DRC violations.

Related Commands

- route_flip_chip

flip_chip_check_bump_access_directions

```
flip_chip_check_bump_access_directions {true | false}
```

Default: `false`

Data_type: bool, read/write

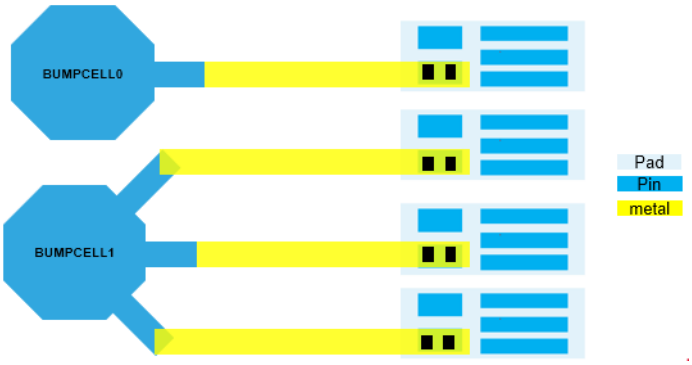
Specifies whether `route_flip_chip` should check the access direction of bump cells. Use this attribute if you have an octagonal bump pad structure with a pre-drawing wire for outside access, where the pre-drawing wire is a pin in the bump LEF.

- When this attribute is set to `true`, `route_flip_chip` checks the bump LEF to detect the bump access direction and then connects the pad to the bump pre-routed wire based on the detected direction. If the pre-routed wire is a 45-degree wire, the `manhattan` routing style is not supported.
  Note that one bump cell can have multiple access directions.
- When this attribute is set to `false`, `route_flip_chip` skips checking bump access direction.

Note: This attribute is applicable only for `route_flip_chip -target connect_bump_to_pad`. If this option is used for `route_flip_chip -target connect_bump_to_ring_stripe`, `route_flip_chip` will ignore the setting and display a warning.

In the example below, `route_flip_chip` checks the bump LEF to detect the bump access directions and then connects the pads to the bump pre-routed wires based on the detected directions:

```
> set_db flip_chip_check_bump_access_directions true
> route_flip_chip -target connect_bump_to_pad -route_engine global_detail
```



Related Commands

- `route_flip_chip`

flip_chip_compaction

`flip_chip_compaction {true | false}`

Default: `false`

Data_type: bool, read/write

Turns on compaction routing, when set to `true`.

In the flip chip post-route stage, the compaction function pushes the routing as close as possible to bumps in order to leave more routing resource for subsequent routing steps, such as P/G bump connections or general power routing.

Note: This feature cannot be used with resistance driven and diffpair routings because the compaction action may change the wire length and routing pattern. This feature does not support two-layer RDL routing.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_connect_power_cell_to_bump

`flip_chip_connect_power_cell_to_bump {true | false}`

Default: `false`

Data_type: bool, read/write

Connects all power bumps to the I/O cell pin. It does not connect to a power or ground stripe or ring.

When used with the `route_flip_chip -target signal` parameter, you can connect power bumps to I/O power pads. To make this type of connection, you need the following information:

- The Verilog netlist must contain the I/O power pad, for example:
  ```
  VDDCELL VDD_INST (.PAD());
  ```
- The LEF macro pin must contain the USE POWER statement, for example:
  ```
  MACRO VDDCELL
  PIN PAD
  ```

```
    USE POWER;
```

To improve the quality of routing in situations where there may be many power bumps in the design, you can pair power bumps to power cells by using this attribute in conjunction with the `flip_chip_constraint_file` attribute. For example:

```
set_db flip_chip_connect_power_cell_to_bump true
```

```
set_db flip_chip_constraint_file pair.const
```

where `pair.const` specifies the following information:

```
### Syntax: net pad [pad2] bump [bump2] ###
```

```
PAIR
```

```
VDD IOPADS_INST/esd Bump_90_9_8
```

```
END PAIR
```

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_constraint_file

```
flip_chip_constraint_file file_name
```

Default: `""`

Data_type: string, read/write

Specifies the file that contains constraints for flip chip routing. For more information, see "*Useful Constraints for Flip Chip Routing*" in the Flip Chip Methodologies chapter of the *User Guide.*

To set the constraint file, you can use this attribute as follows:

```
set_db flip_chip_constraint_file pair.const
```

where `pair.const` specifies the following information:

```
### Syntax: net pad [pad2] bump [bump2] ###
```

```
PAIR
```

```
VDD IOPADS_INST/esd Bump_90_9_8
```

```
END PAIR
```

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

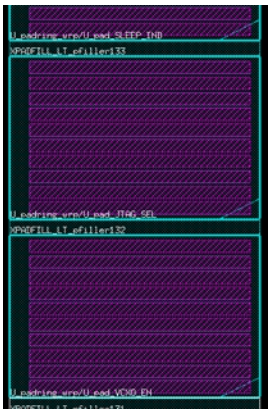
flip_chip_drop_via_on_all_shapes

```
flip_chip_drop_via_on_all_shapes {true | false}
```

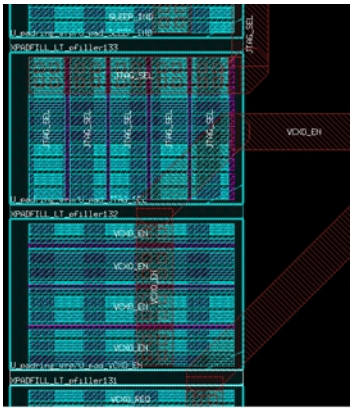
Default: `false`

Data_type: bool, read/write

Drops vias on all defined geometries. Consider the pin shape below:



For the given shape, the routing result will be as follows when `flip_chip_drop_via_on_all_shapes` is set to `true`:



Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_drop_via_on_power_mesh

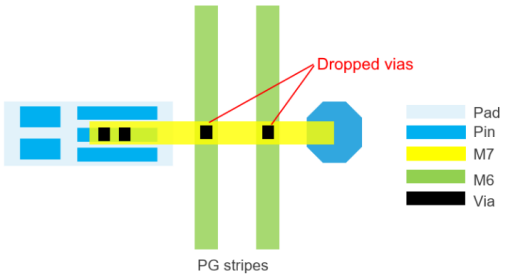
`flip_chip_drop_via_on_power_mesh` *`layer_name`*

Default: `""`

Data_type: string, read/write

Specifies the number or name of the metal layer that can be used by the tool for dropping a via on a PG mesh. `route_flip_chip` automatically drops a via on the PG mesh on the specified metal layer if the PG RDL route crosses the PG mesh. For example:

```
set_db flip_chip_drop_via_on_power_mesh M6
set_db flip_chip_connect_power_cell_to_bump true
route_flip_chip -target connect_bump_to_pad -route_engine global_detail
```



The via is dropped only if there is no DRC violation due to the via drop.

The `flip_chip_drop_via_on_power_mesh` attribute does not affect the routing results from PG bumps to pad.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_extra_config

`flip_chip_extra_config` *`file_name`*

Default: ""

Data_type: string, read/write

Specifies the name of an extra configuration file.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_finger_direction

`flip_chip_finger_direction {n|e|s|w}`

Default: `n`

Data_type: enum, read/write

Specifies the main expansion direction for PG finger routing. The default direction is North.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_finger_max_width

`flip_chip_finger_max_width` *`value`*

Default: `0.0`

Data_type: double, read/write

Specifies the maximum routing width for one wire segment of the PG finger. By default, there is no constraint on the max width; `route_flip_chip` uses `MAXWIDTH` in LEF. If this constraint is not specified in LEF, `route_flip_chip` uses the maximum width possible.

If there is a conflict between the user-specified constraint and the LEF rule, the LEF rule is used as the maximum width.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_finger_min_width

`flip_chip_finger_min_width` *`value`*

Default: `0.0`

Data_type: double, read/write

Specifies the minimum routing width for one wire segment of the PG finger. The default is the RDL minimum width defined in LEF. If there is a conflict between the user-specified constraint and the LEF rule, the LEF rule is used as the minimum width.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_finger_target_mesh_layer_range

`flip_chip_finger_target_mesh_layer_range` *`layer_range`*

Default: `""`

Data_type: string, read/write

Specifies the target mesh layer range of the power mesh that will be connected for finger routing. If not specified, no layer of the power mesh will be connected.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_honor_bump_connect_target_constraint

`flip_chip_honor_bump_connect_target_constraint {true | false}`

Default: `false`

Data_type: bool, read/write

Enables port numbering routing, when set to `true`.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_ignore_pad_type_check

`flip_chip_ignore_pad_type_check {true | false}`

Default: `true`

Data_type: bool, read/write

Specifies whether or not CLASS PAD cells are supported in the flip chip flow.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_lower_layer_route_width

`flip_chip_lower_layer_route_width` *`value`*

Default = `0`, *Min* = `0.000000`, *Max* = `10000000000.000000`

Data_type: double, read/write

Specifies a different value for lower routing layer. Unit is in microns.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_lower_layer_prevent_diagonal_routing

`flip_chip_lower_layer_prevent_diagonal_routing {true | false}`

Default: `false`

Data_type: bool, read/write

Prevents diagonal routing for lower layer, when set to `true`.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_multi_pad_routing_style

`flip_chip_multi_pad_routing_style {default serial star}`

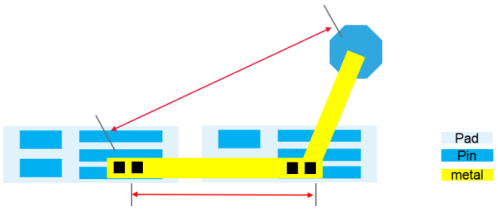
Default: `default`

Data_type: enum, read/write

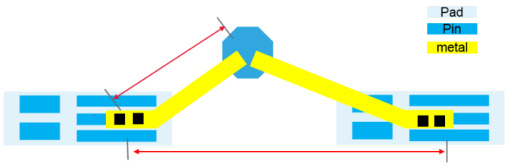
Specifies the routing style for multi-pad routing:

- `default`: The flip chip router (`route_flip_chip`) connects a bump to multiple pads with multiple different wires as shown below:

- `serial`: `route_flip_chip` connects a bump first to one pad and then to the other pad, as shown below, provided that the distance from the bump to either pad is more than the distance between the two pads:

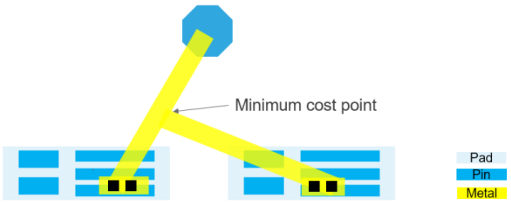


If the distance from the bump to any pad is shorter than the distance between the two pads, `route_flip_chip` reverts to the default behavior of multiple wire connection even if `flip_chip_multi_pad_routing_style` is set to `serial`.



This mode supports only two-pad routing.

- `star`: `route_flip_chip` connects a bump first to the closest pad. It then finds a minimum cost point on its routing path and connects this point to another pad as shown below:



The minimum cost point could be anywhere on the first routing path, including its beginning and end.

Both the `serial` and `star` modes are useful for saving routing resources in complex designs as they share the routing between pads. However, the `serial` mode supports only two-pad routing. Use the `star` mode if you want to route more than two pads.

Note: The `flip_chip_multi_pad_routing_style` works only if the `flip_chip_multiple_connection multiple_pads_to_bump` is specified. For example, to use the `star` mode, you should specify the following commands before running `route_flip_chip`:

```
set_db flip_chip_multiple_connection multiple_pads_to_bump
set_db multi_pad_routing_style star
```

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_multiple_connection

`flip_chip_multiple_connection {multiple_pads_to_bump | multiple_bumps_to_pad | default}`

Default: `default`

Data_type: enum, read/write

Specifies routing connections between multiple pads and bumps. You can specify one of the following options:

- `multiple_pads_to_bump`
  Enables routing from multiple pads to one bump in parallel. This option is supported by both AIO and PIO routing styles.
- `multiple_bumps_to_pad`
  Enables routing from multiple bumps to one pad in parallel. This option is supported by both AIO and PIO routing styles.
- `default`
  Enables routing from one bump to one pad in parallel. This means there is no multiple connection.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_pg_mesh_direction

`flip_chip_pg_mesh_direction {default | horizontal | vertical}`

Default: `default`

Data_type: enum, read/write

Specifies the routing direction of the PG mesh. You can specify one of the following values for this option:

- `default` - Uses the preferred routing direction defined in the Tech LEF.
- `horizontal` - Uses the horizontal routing direction.
- `vertical` - Uses the vertical routing direction.

The `flip_chip_pg_mesh_direction` attribute can be used only if `flip_chip_route_pg_style` is set to `mesh`.

Related Commands

- route_flip_chip

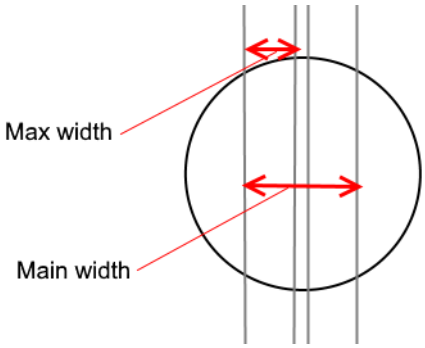
flip_chip_pg_mesh_main_width

`flip_chip_pg_mesh_main_width value`

Default: `0.0`; *Min*: `0`; *Max*: `10000000000`

Data_type: double, read/write

Specifies the main width of the PG mesh. This attribute can be used only if `flip_chip_route_pg_style` is set to `mesh`.



Related Commands

- route_flip_chip

flip_chip_pg_mesh_max_width

`flip_chip_pg_mesh_max_width value`

Default: `0.0`; *Min*: `0`; *Max*: `10000000000`

Data_type: double, read/write

Specifies the maximum width of the routing wire in a PG mesh. This attribute can be used only if `flip_chip_route_pg_style` is set to `mesh`.

By default there is no constraint on the maximum width. `fcroute` uses `MAXWIDTH` in the Tech LEF. If there is a conflict between the value you specify and the LEF rule, the tool uses the LEF rule as the maximum width.

Related Commands

- route_flip_chip

flip_chip_pg_mesh_width

`flip_chip_pg_mesh_width value`

Default: `""`

Data_type: string, read/write

Specifies the exact routing width of the PG mesh. If only one value is specified with `-pg_mesh_width`, the value is applicable for the width of both horizontal and vertical wires. If two values are specified, the first value is applicable for the width of horizontal wires and the second value is applicable for the width of vertical wires.

This attribute can be used only if `flip_chip_route_pg_style` is set to `mesh`.

Related Commands

- route_flip_chip

flip_chip_prevent_diagonal_wire_access_bumps

`flip_chip_prevent_diagonal_wire_access_bumps {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies whether or not diagonal wires can be used to access bumps.

Related Commands

- `route_flip_chip`

flip_chip_prevent_via_under_bump

`flip_chip_prevent_via_under_bump {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies whether or not vias are generated directly under the bump. If you set this parameter to `true`, the vias generated are prevented from connecting directly to the bump.

This option is available for both signal and power bumps.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_prevent_via_under_bump_extension

`flip_chip_prevent_via_under_bump_extension` *`value`*

Default: `0.0`

Data_type: double, read/write

Specifies a spacing value to define an extension area around the bump in which vias should not be dropped. The spacing value must be greater than or equal to `0`.

This option can be used only if `flip_chip_prevent_via_under_bump` is set to `true`.

The following examples illustrate how the `flip_chip_prevent_via_under_bump` and `flip_chip_prevent_via_under_bump_extension` attributes can be used to control the spacing around bumps when vias are dropped:

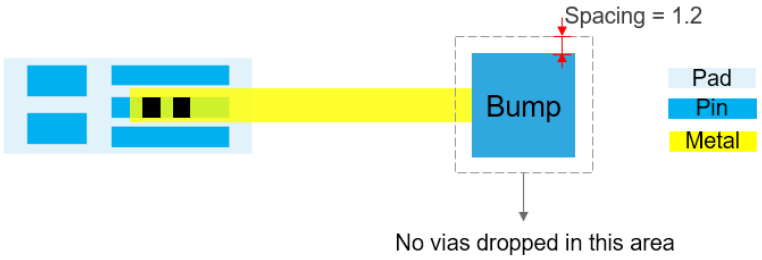
- In the example below, no vias are dropped directly under the bump as `flip_chip_prevent_via_under_bump` is set to `true`:

```
> set_db flip_chip_prevent_via_under_bump true
> route_flip_chip -target connect_bump_to_pad -route_engine global_detail
```

  Additionally, if `flip_chip_prevent_via_under_bump_extension` is set to `0`, the same result is achieved.

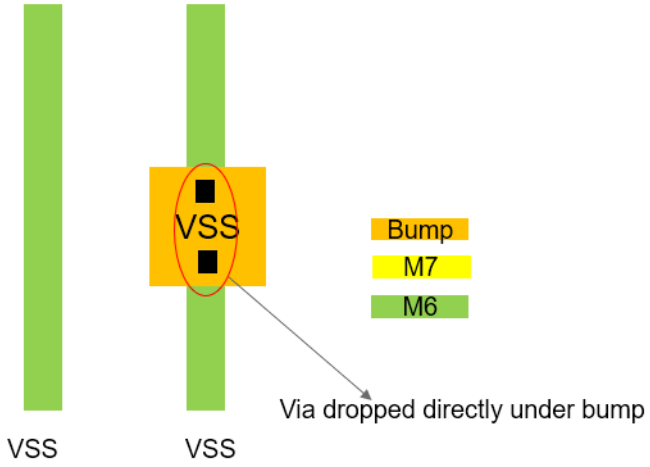
- In the example below, no vias are dropped in the extension area defined around the bump:

```
> set_db flip_chip_prevent_via_under_bump true
> set_db flip_chip_prevent_via_under_bump_extension 1.2
> route_flip_chip -target connect_bump_to_pad -route_engine global_detail
```



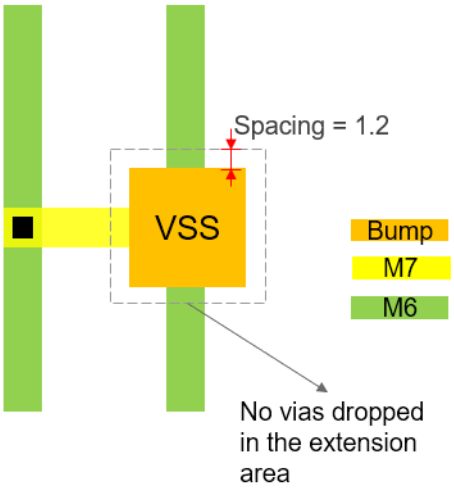
- In the example below, vias are dropped directly under the power bumps as `flip_chip_prevent_via_under_bump` is set to `false`:

```
> set_db flip_chip_prevent_via_under_bump false
> route_flip_chip -target connect_bump_to_ring_stripe
```



- In the example below, no vias are dropped in the extension area defined around the power bumps:

```
> set_db flip_chip_prevent_via_under_bump true
> set_db flip_chip_prevent_via_under_bump_extension 1.2
> route_flip_chip -target connect_bump_to_ring_stripe
```



Related Commands

- `route_flip_chip`

flip_chip_route_pg_style

`flip_chip_route_pg_style {none finger mesh}`

Default: `none`

Data_type: enum, read/write

Specifies the routing pattern for flip chip route power routing:

- `none`: For normal PG routing
- `finger`: For PG finger routing style, in which you need to specify the routing direction. This option must be used with `route_flip_chip -region` option.
- `mesh`: For mesh-style PG routing on the redistribution layer (RDL). This option is used to increase PG density. If you specify PG mesh routing, you must specify the main width of the PG mesh by using the `flip_chip_pg_mesh_main_width` parameter.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_route_style

`flip_chip_route_style {manhattan | diagonal}`

Default: `diagonal`

Data_type: enum, read/write

Determines the type of routing, either `manhattan` or `diagonal`.

Note: `diagonal` routing style does not work in conjunction with the following `route_flip_chip` parameter:

- `-double_bend_route`

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_route_width

`flip_chip_route_width` *`value`*

Default: `0.0`

Data_type: double, read/write

Connects wires to bumps using the specified route width not wider than the I/O pad pin.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_top_layer

`flip_chip_top_layer` *`layer_name`*

Default: ""

Data_type: string, read/write

Specifies the top-most metal layer by layer number or layer name that the software can use when routing bumps.

Related Commands

- `place_peripheral_ios`
- `route_flip_chip`

flip_chip_via_abut_bump

`flip_chip_via_abut_bump {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies that via should abut the bump only if routing can be done successfully.

With `flip_chip_via_abut_bump` set to `true`	Without `flip_chip_via_abut_bump` set to `true`
	 In this case, via is dropped inside bump as shown above. This is the default setting.

Related Commands

- `route_flip_chip`

flip_chip_via_to_pad_honor_min_spacing

`flip_chip_via_to_pad_honor_min_spacing` *`value`*

Default: `0.0`

Data_type: double, read/write

Specifies the minimum spacing between the bump/pad and a via.

Related Commands

- `route_flip_chip`

flip_chip_wire_to_pad_honor_min_spacing

`flip_chip_wire_to_pad_honor_min_spacing` *`value`*

Default: `0.0`

Data_type: double, read/write

Specifies the minimum spacing between the bump/pad and a wire.

Related Commands

- `route_flip_chip`

get_bond_pad

```
get_bond_pad
[-help]
-io_inst InstName
[-pin pinName]
```

Gets the current stagger position of a bond pad on a specified I/O instance.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_bond_pad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_bond_pad`
`-io_inst instName`	Specifies the name of the I/O instance whose bond pad position is reported. *Data_type*: string, required
`-pin pinName`	Specifies the name of the pin inside the instance. *Data_type*: string, optional

Example

- The following command gets the current stagger position of the bond pad on I/O instance `pad_addr[30]`:
  ```
  get_bond_pad -io_inst {pad_addr[30]}
  ```
  Returns:
  ```
  Bond Pad Name = BUMPIN_337, Position = I
  ```

Related Information

- `check_bond_pad_spacing`
- `place_bond_pad`
- `place_bond_pad_by_stagger`
- `reset_fixed_bond_pad`
- `set_bond_pads_to_fixed`
- `space_bond_pads`

get_physical_info

```
get_physical_info
[-help]
[-highlight]
{-obj string | -selected }
[-shapes {ring stripe followpin iowire corewire blockwire padring blockring fillwire fillwireopc drcfill none}]
[-user_class {subclass_name_list}]
[-type {connection | routing_path}]
```

Gets the physical connection or routing path between IO pads and bumps. For example, you can select a bump or specify bump name to get information about connected IO pad. Alternatively, you can select or specify an IO pad and get information about connected bumps. You can specify IO pads by pad name, instancen:pin combination, or instance:pin:port combination.

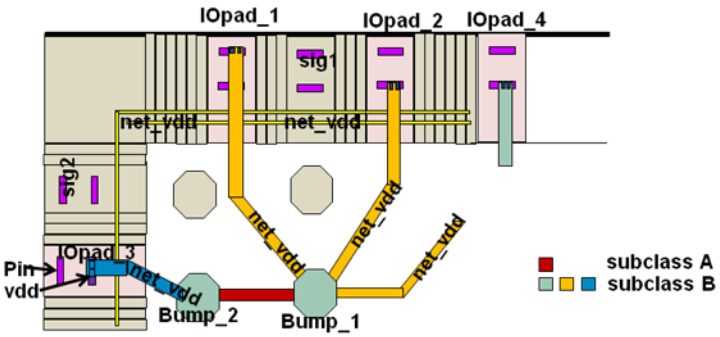
Use this command to check connections after RDL routing, either manual or through `route_flip_chip`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_physical_info` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_physical_info`
`-highlight`	Highlights the routing path. *Data_type*: bool, optional
`-obj string`	Specifies the object from which to get the physical information. For bump, specify the complete bump name.For IO pad, specify one of the following: • *instance_name* • *instance_name:pin_name* • *instance_name:pin_name:port_number* *Data_type*: string, optional
`-selected`	Gets the physical information for the selected object. *Data_type*: bool, optional
`-shapes {ring stripe followpin iowire corewire blockwire padring blockring fillwire fillwireopc drcfill none}]`	
	Specifies the shapes of the wires and vias to be checked. The default value is `iowire`. *Data_type*: (enum)+, optional
`-type {connection | routing_path}`	
	Specifies the type of the physical information to return. The default type is `connection`. • `connection`: Returns the objects that are physically connected to the object you have specified or selected. For example, if you have selected an IO pad, it returns the names of the bump that are connected with the IO pad. If you have selected or specified a bump, it returns the IO pads connected to the bump, using the format *`ioInst:pin:port`*. • `routing_path`: Returns the pointer list of the wires and vias that are physically connected to the object you have selected or specified. *Data_type*: enum, optional
`-user_class {subclass_name_list}`	Specifies the subclass name of the wires and vias to be checked. You can specify multiple subclass names enclosed in braces. You can also use wildcards while specifying subclass names. *Data_type*: string, optional

Examples

Consider the following design.



For this design, `get_physical_info` reports information as follows:

- `get_physical_info -obj {IOpad_1:vdd:1}`
  Returns `{Bump_1}`
- `get_physical_info  -type connection -obj {Bump_1}`
  Returns `{IOpad_1:vdd:1 IOpad_2:vdd:2  Bump_2}`
- `get_physical_info -obj {Bump_1} -user_class B`
  Returns `{IOpad_1:vdd:1 IOpad_2:vdd:2}`
- `get_physical_info -type routing_path -obj {Bump_2}`
  Returns `{0x2aaaba6c0ab0 0x2aaaba6c0b40 0x2aaaba6c0b70}`

Related Information

- `route_flip_chip`
- Flip Chip Methodologies chapter in the *User Guide*

get_pin_port_number

```
get_pin_port_number
[-help]
[-bumps bump_list]
[-geometry_height {min [max]}]
[-geometry_width {min [max]}]
[-layer string]
[-region x1 y1 x2 y2]
{[-io_inst_cell cell_name | -io_inst instance_name] [-selected]}
{-pin pin_name | -net net_name}
```

Determines suitable ports available for a bump. The command has the following functions:

- Check if the IO pad has a standard LEF definition.
- Suggest suitable ports for flip chip routing on the specified instance based on the pin name or nets in a specified area.
- Filter ports by layer, geometry size, and area. Only the ports that match the specified filter rules are returned by `get_pin_port_number`.
- Consider routing between bumps and ports to return the combinations of `{bump:inst:pin:port}` if the bumps for which ports are to be found are specified.

`get_pin_port_number` returns a port number string list. You can use `set result [get_pin_port_number]` or `catch {get_pin_port_number} result` to get the result.

The following commands provide additional support for the port numbering feature. Use these commands to add, edit, and delete bump properties easily:

- create_bump_connect_target_constraint
- delete_bump_connect_target_constraints
- update_bump_connect_target_constraints

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_pin_port_number` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_pin_port_number`
`-bumps` *bump_list*	Finds suitable ports for the specified bumps based on the smallest distance. This option supports only 1:1 pairing between ports and bumps. Therefore, if the number of ports is different from the number of bumps, pairing is based on the smaller number. `get_pin_port_number` allows empty bumps or bumps assigned to the same net as the pin. If the assigned net is different from the net with which the pin is connected, `get_pin_port_number` issues an error message and quits. *Data_type*: string, optional
`-geometry_height {`*min* `[`*max*`]}`	
	Specifies the minimum and maximum values for the height of the target port's geometry. If you specify only one value, the height is taken as equal to the specified value. Only ports that match the specified height criterion are returned by `get_pin_port_number`. *Data_type*: string, optional
`-geometry_width {`*min* `[`*max*`]}`	
	Specifies the minimum and maximum values of the width of the target port's geometry. If you specify only one value, the width is taken as equal to the specified value. Only ports that match the specified width criterion are returned by `get_pin_port_number`. *Data_type*: string, optional
`-io_inst` *instance_name*	
	Finds pin port number of the specified instance. Wild cards are supported in *instance_name*. *Data_type*: string, required
`-io_inst_cell` *cell_name*	

	Finds the pin port number of the instance of the specified cell. Wild cards are supported in *cell_name*. *Data_type*: string, required
-layer *string*	Filters target ports by layer. If you specify this parameter, only ports on the specified layer are returned. You can specify either layer name or layer ID, such as M8. *Data_type*: string, optional
-net *net_name*	Finds the port number on the pin connected to the specified net. *Data_type*: string, required
-pin *pin_name*	Finds the port number on the specified pin. *Data_type*: string, required
-region *x1 y1 x2 y2*	Specifies the area in which the command will be used. findPInPortNumber returns port numbers overlapping with the specified area. *Data_type*: rect, optional

-selected	Finds suitable ports for the selected instance and bumps:
	• If only bumps are selected, get_pin_port_number first finds the ports satisfying the specified filtering rules and then considers the routing between these ports and the selected bumps.
	• If only IO instances are selected:
	  ◦ If only one IO instance is selected, get_pin_port_number finds the ports satisfying the specified filtering rules.
	  ◦ If more than one IO instance is selected, get_pin_port_number issues an error message stating that only a single IO instance is supported for this option and then quit.
	• If both IO instances and bumps are selected:
	  ◦ If only one IO instance is selected, get_pin_port_number first finds the ports satisfying the specified filtering rules and then considers the routing between these ports and the selected bumps.
	  ◦ If more than one IO instance is selected, get_pin_port_number issues an error message stating that only a single IO instance is supported for this option and then quit.
	Data_type: bool, required

Examples

- The following command suggests port numbers on instances named `IOPADS_INST/esd*` for the pins connected to net `VDD`.

  ```
  get_pin_port_number -io_inst IOPADS_INST/esd* -net VDD
  ```

  The tool returns a list of suitable port numbers as follows:

  ```
  IOPADS_INST/esd:VDD:1 IOPADS_INST/esd1:VDD:1
  ```

- The diagram below depicts an IO instance `padring/inst1` with three ports for `PIN PADVDDE` on the same layer and with the same size. The bumps `Bump_1`, `Bump_2`, `Bump_3`, and `Bump_4` are empty.

  - The following command finds ports of the pin `PADVDDE` on the instance `padring/inst1` that meet the specified area constraint:

    ```
    get_pin_port_number -io_inst padring/inst1 -pin PADVDDE -region "50 100 300 250"
    ```

    For the instance depicted in the diagram above, the command returns `{padring/inst1:PADVDDE:1}`.

  - The following command finds ports of the pin `PADVDDE` on the instance `padring/inst1` that meet the specified area constraint:

    ```
    get_pin_port_number -instName padring/inst1 -pinName PADVDDE -area "550 120 650 350"
    ```

    For the instance depicted, the command returns `{padring/inst1:PADVDDE:2 padring/inst1:PADVDDE:3}`. Both `port2` and `port3` are returned as they overlap with the specified area constraint.

  - The following command finds suitable ports of the pin `PADVDDE` on the instance `padring/inst1` for the specified bump:

    ```
    get_pin_port_number -instName padring/inst1 -pinName PADVDDE -bumps Bump_2
    ```

    For the instance depicted, the command returns `{Bump_2:padring/inst1:PADVDDE:2}`.

  - The following command finds suitable ports of the pin PADVDDE on the instance padring/inst1 for the specified bumps:

    ```
    get_pin_port_number -instName padring/inst1 -pinName PADVDDE -bumps {Bump_1 Bump_2 Bump_3 Bump_4}
    ```

    For the instance depicted, the command returns `{Bump_1:padring/inst1:PADVDDE:1 Bump_2:padring/inst1:PADVDDE:2 Bump_3:padring/inst1:PADVDDE:3}`.

gui_show_bump_connections

```
gui_show_bump_connections
[-help]
[-honor_color]
[-multi_bumps_to_pad]
[-multi_pads_to_bump]
[-remove]
[[[-net net_list] [-bump bump_list] [-io_inst io_inst_list] [-selected]]|[[-bump_type {all | power | signal}] [-target {pad | ring}]]]
```

Displays the connection as a flightline between a power/ground (PG) bump and a PG I/O pad, during signal bump assignment. You can remove the flightlines between the bumps and I/O pads by using `gui_show_bump_connections -remove`.

For both signal and power pins, `gui_show_bump_connections`, by default, displays a long pin connection with the correct location, instead of the center of the pin.

Note: `gui_show_bump_connections` honors the port tag information in bumps for both signal and power flightline for multiple pad and multiple bump routing.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_show_bump_connections` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_show_bump_connections`
`-bump_type {all | power | signal}`	
	Specifies the connecting bump type, which could be: • `all` - All the bump types • `power` - Power bump • `signal` - Signal bump *Default*: `all` *Data_type*: enum, optional
`-bumps` *bump_list*	Specifies bumps for which flightlines are to be displayed. *Data_type*: string, optional
`-honor_color`	Colors flightlines according to the settings defined with the `read_bump_color_map_file` command. *Data_type*: bool, optional
`-io_insts {`*io_inst_list*`}`	
	Specifies IO instances or blocks for which flightlines are to be displayed. Specified IO instances should be CLASS PAD AREAIO instances. Specified blocks should have at least one pin port in CLASS BLOCK cell containing the CLASS BUMP property. *Data_type*: string, optional
`-multi_bumps_to_pad`	
	Connects multiple bumps to one pad. *Data_type*: bool, optional
`-multi_pads_to_bump`	
	Connects multiple pads to one bump. *Data_type*: bool, optional
`-nets` *net_list*	Specifies nets for which flightlines are to be displayed. *Data_type*: string, optional
`-remove`	Removes the bump connections. *Data_type*: bool, optional
`-selected`	Displays flightlines for selected bumps and IO instances in bold. *Data_type*: bool, optional
`-target {pad | ring}`	
	Specifies the connecting target, which could be a `pad` or a `ring`. *Data_type*: enum, optional

Examples

The following command displays flightlines for bumps `Bump_1` and `Bump_2`.

```
gui_show_bump_connections -bumps {Bump_1 Bump_2}
```

place_bond_pad

```
place_bond_pad
[-help]
[-bond_pad padName]
[-fix]
{-io_inst instName | -selected}
[-pin pinName]
[-position {inner middle outer}]
```

Places a bond pad on a specified I/O instance. It defines the stagger position of a specified bump on a single or selected set of I/O instances.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `place_bond_pad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man place_bond_pad`
`-bond_pad` *padName*	Specifies the name of the bond pad. *Data_type*: string, optional
`-fix`	Assigns a fixed status to the specified bond pad. This restricts other bond pad commands from modifying the bond pad. *Data_type*: bool, optional
`-io_inst` *name*	Specifies the name of the I/O instance of where the bond pad will be placed. *Data_type*: string, required
`-pin` *pinName*	Specifies the name of the pin inside the instance. *Data_type*: string, optional
`-position {inner middle outer}`	
	Defines the stagger position of the specified bond pad on the specified I/O instance. You can stagger the position of the bond pad using the `inner`, `middle`, and `outer` positions. *Data_type*: enum, optional
`-selected`	Places a selected bond pad on the specified I/O instance. You must first select the bond pad in the design display area, then use this parameter to place the bond pad on the specified I/O instance. *Data_type*: bool, required

Related Information

- `check_bond_pad_spacing`
- `get_bond_pad`
- `place_bond_pad_by_stagger`
- `reset_fixed_bond_pad`
- `set_bond_pads_to_fixed`
- `space_bond_pads`

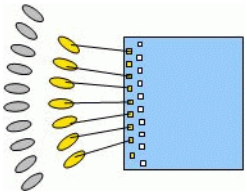
place_bond_pad_by_stagger

```
place_bond_pad_by_stagger
[-help]
[-bond_pad position padName position padName...]
{-pattern pattern_string | -start_stagger_position {inner middle outer}}
[-pin pinName]
{{-first_io_inst_name instName [-last_io_inst instName]} | {[-side {east west north south}] [-ring number]} | -all}
```

Generates a staggered wirebond pad pattern on top of an existing I/O ring. In this design methodology, bond pads are separate LEF macro definitions from the I/O driver cells, but are placed on top of the I/O driver cells to form the combined bond pad and I/O driver circuitry.

The command only supports `CLASS PAD` instances.

To produce the staggered pattern, multiple bond pad cells are defined in the LEF for each
I/O cell, each with its bond pad in a specific location corresponding to an outer, middle, or inner stagger position. The bond pads are defined such that when placed on the I/O cell, any one of them will connect to the I/O cell pin with no or minimal RDL routing.



Innovus generates a stagger pattern by selecting the outer, middle, or inner stagger bond pad to place on each I/O cell based on the location of that I/O instance in the I/O ring and the pattern that is being generated. If the order of the I/O cells is changed, or if cells are added or deleted, the stagger pattern may be regenerated. Because the bond pad macros are separately defined, they can be easily swapped with bond pads of different stagger positions without changing the logic of the design.

To define the relationship between the bond pads and I/O cells in the LEF file,
the following properties must be defined in each LEF file where they are referenced:

```
PROPERTYDEFINITIONS

     PIN bondPadOuter STRING;

     PIN bondPadMiddle STRING;

     PIN bondPadInner STRING;

     PIN ioCellOriginX REAL;

     PIN ioCellOriginY REAL;

     MACRO ioCellOffsetX REAL;

     MACRO ioCellOffsetY REAL;

 END PROPERTYDEFINITIONS
```

The LEF macros define the property values as follows:

```
MACRO IOCELL

     CLASS PAD ;

     ...

     SIZE 50.0 BY 225 ;

     ...

     PIN PAD

         PROPERTY bondPadOuter "BUMPA BUMPA1 BUMPD" ;

         PROPERTY bondPadMiddle "BUMPB" ;

         PROPERTY bondPadInner "BUMPC" ;

         PROPERTY ioCellOriginX 25.0 ;

         PROPERTY ioCellOriginY 0.0 ;

     END PAD

 END IOCELL
```

```
MACRO BUMPA
     CLASS COVER BUMP
     ...
     PROPERTY ioCellOffsetX -40 ;
     PROPERTY ioCellOffsetY -70 ;
 END BUMPA
```

Innovus automatically names the stagger bond pads as:

*IoCellInstName*_PAD*#*

Here:

- *IoCellInstName* - Specifies the instance name of the I/O cell on which the bond pad is being placed.
- *#* - Specifies the incremented bond pad number. The number `1` is used for all single pad I/O cells. This number is incremented when there are multiple bond pads on a single I/O cell.
  For example, if I/O cell `CKdiff` contained two pins, two bond pads would be placed on this cell and named as `CKdiff_PAD1` and `CKdiff_PAD2`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `place_bond_pad_by_stagger` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man place_bond_pad_by_stagger`
`-all`	Specifies that bond pads will be placed on all I/O instances. *Data_type*: bool, optional
`-bond_pad` *`position padName position padName...`*	
	Specifies which bond pad and position to use when multiple bond pads are specified in the LEF file for a given inner (i), middle (m), or outer (o) position. For example, If there are three outer bond pads specified in the LEF file, you can use this parameter to choose which bond pad to use as the outer bond pad. *Default*: The software uses the first bond pad in the list of bond pads for a given position. *Data_type*: string, optional
`-first_io_inst_name` *`instName`*	
	Specifies the name of the first I/O instance of where bond pads will be placed. You can use this parameter in conjunction with the `-last_io_inst` parameter. If multiple pins exist in the instance, you can use the `-pin` parameter to specify which pin to start with. **Note:** Bond pads are placed in a clock-wise pattern from the starting I/O instance (`-first_io_inst_name`) to the last I/O instance (`-last_io_inst`) if applicable. *Data_type*: string, optional
`-last_io_inst` *`instName`*	Specifies the name of the last I/O instance of where bond pads will be placed. You can use this parameter in conjunction with the `-first_io_inst_name` parameter. **Note:** Bond pads are placed in a clock-wise pattern from the starting I/O instance (`-first_io_inst_name`) to the last I/O instance (`-last_io_inst`). *Data_type*: string, optional
`-pattern` *`pattern_string`*	Specifies the stagger pattern of the bond pads on the I/O instances. *`pattern_string`* specifies any combination of `i` (inner), `m` (middle), and `o` (outer). *Data_type*: string, optional
`-pin` *`pinName`*	Specifies the name of the pin inside the instance. If the instance specified by the `-first_io_inst_name` parameter contains multiple pins, you use this parameter to specify which pin to start with. *Data_type*: string, optional
`-ring` *`number`*	Specifies which ring to operate on with ring 1 being the outer most ring. The ring number is incremented by one as you get closer to the core. For a three-ring design, the inner most ring is ring 3. *Data_type*: int, optional
`-side {east west north south}`	
	Specifies the geographical side of the die. You can specify the `east`, `west`, `north`, or `south` side of the die. *Data_type*: enum, optional
`-start_stagger_position {inner middle outer}`	
	Specifies the starting stagger position of the specified bond pad (`-bond_pad`) on the specified I/O instance (`-first_io_inst_name`). The default stagger position sequence is `inner`, `middle`, and `outer`. If you start with a stagger position of `middle`, the next bond pad is placed in an `outer` stagger position followed by a bond pad placed in an `inner` stagger position. *Data_type*: enum, optional

Examples

- The following command places bond pads on all I/O instances using a stagger pattern of inner, outer, and middle and using bond pad `BUMPA1` at the outer position:
  ```
  place_bond_pad_by_stagger -all -pattern iom -bond_pad o BUMPA1
  ```
- The following command places bond pads on the I/O instances of the outer most ring (East side) starting with a bond pad placed in the middle stagger position:
  ```
  place_bond_pad_by_stagger -side east -start_stagger_position middle -ring 1
  ```
- The following command places bond pads from I/O instance `abc` to I/O instance `xyz`, starting with pin `PAD` of I/O instance `abc` and using an inner, inner, outer stagger pattern:
  ```
  place_bond_pad_by_stagger -first_io_inst_name abc -last_io_inst xyz -pin PAD -pattern iio
  ```

read_bump_color_map_file

```
read_bump_color_map_file
[-help]
bump_color_file
```

Loads the bump color map file to change the color of assigned bumps. The command supports all the colors specifed in the Qt color table. A list of recognized color names can be found at `http://www.w3.org/TR/SVG/types.html#ColorKeywords`.

The bump color map file supports wildcards for ease of use. For example, instead of specifying `tdigit[1] green`, `tdigit[2] green` and so on, you can specify `tdigit* green` in the bump color map file to color all `tdigit` bumps green.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `read_bump_color_map_file` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man read_bump_color_map_file`
`bump_color_file`	Specifies the name of the bump color map file to load. *Data_type*: string, required

Example

- The following command loads the bump color map file `BumpColor.Map` and assigns colors to bumps in the design:
  ```
  read_bump_color_map_file BumpColor.Map
  ```
  Output:
  ```
  port_pad_data_out[8] wheat
  tdigit* green
  ```

Related Information

- `assign_bumps`

read_flip_chip_property

```
read_flip_chip_property
[-help]
in_file
[-only_bump_connect_target_constraint]
```

Reads the text file containing flip chip property information, including virtual connection area property. After the file is loaded, the virtual connection area property is added to IO pads and can be displayed and used for flip chip flow. The `read_flip_chip_property` command prints an error message if the following errors occur:

- Type error of property name
- Instance/pin not found
- Metal layer not found
- Size is zero or minus

Parameters

`-help`	Prints out the command usage that includes type and default information for each `read_flip_chip_property` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man read_flip_chip_property`
in_file	Specifies the bump and IO pad property text file, containing virtual connection area property information. *Data_type*: string, required
`-only_bump_connect_target_constraint`	Reads only the bump connect target constraints. *Data_type*: bool, optional

Example

The following command reads only the bump connect target constraints from the `test2` input file:

```
read_flip_chip_property test2 -only_bump_connect_target_constraint
```

Related Information

- `read_io_update`
- `write_flip_chip_property`

- Tools Menu chapter in the *Menu Reference*
  - *Flip Chip*

read_io_update

```
read_io_update
[-help]
[-check_only]
in_file
```

Reads a simple ASCII file which contains the bump and instance information.

The input die abstract file is a simple ASCII file that consists of bump and I/O instance information only; these are the only two objects that can be modified by SiP Layout.

- If a bump is defined in the db and not defined in the input file, the bump gets deleted from the db.
- If the instance names in the input file and db do not match, an error is displayed.
- If the nets referenced in the bump section in the input file do not exist in the db, an error is displayed.

Parameters

`-help`	Prints out the command usage that includes type and default information for each `read_io_update` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man read_io_update`
`-check_only`	Reports differences between the input file and the design in memory. This is an optional parameter. This parameter only generates a report and does not update the die. *Data_type*: bool, optional
in_file	Specifies a file containing the state of I/O drivers and bumps (placement and assignments). This is a required parameter. The information from this file is updated in the database. *Data_type*: string, required

Related Information

- `read_flip_chip_property`
- `read_package`
- `write_flip_chip_property`
- Flip Chip Methodologies chapter in the *User Guide*
- Tools Menu chapter in the *Menu Reference*
  - *Flip Chip*

read_package

```
read_package
[-help]
package_file
```

Reads the package file dumped out by the System-in-Package (SiP) layout in XML format and displays the package ball/finger location in the Innovus floorplan view. The command also displays the flight lines from the IO pads to fingers for a wire-bond design or from bumps to package balls for a flip chip design.

The package overlay schema dumped out by SiP includes bond finger, package balls, and many other package objects. `read_package` displays all the package objects for a wire-bond or flip chip design, such as BGA_BALL, BOND_FINGER, BONDWIRE and ROUTE, in the Innovus main window. The exact information displayed depends on the package overlay file dumped out by SiP. You can turn on or turn off the display of specific package objects using the Custom tab of the Color Preferences form in Innovus. You can view attributes of a selected package object using Attribute Editor.

Parameters

`-help`	Prints out the command usage that includes type and default information for each `read_package` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man read_package`
`package_file`	Specifies the name of the package file. *Data_type*: string, required

report_probe_pins

```
report_probe_pins [-help]
```

Generates a report of all probe pins that are used for package-level design and testing. If no probe points exist, the software returns the following message:

```
"No Probe Points Defined"
```

Note: You can set or delete probe points using the `set_probe_pin` or `reset_probe_pin` commands, respectively.

Parameters

`-help`	Prints a brief description of the `report_probe_pins` commabd. For a detailed description of the command, use the `man` command: `man report_probe_pins`

Example

- The following command generates a report of all probe pins:
  `report_probe_pins`

Related Information

- `reset_probe_pin`
- `set_probe_pin`

report_special_routes

```
report_special_routes
[-help]
[-nets netName]
[-center_line]
[-out_file report_name]
[[ [-by_layer]
   [-highlight_45_layer layerName]
   [-length_threshold value]
   [-resistance_file resFileName]
   [-selected]
   [-summary]
   [-wire_length]
   [-wire_segment]]
 | [-interposer_route
   [[-exclude_nets netName]
    [-interposer_layers layerName]
    [-interposer_route_constraint_file ircFileName]]]]
```

Reports the length of all RDL routes (SPECIALNETS) created with the `route_flip_chip` command. This includes support for Manhattan and 45-degree routes. You can report the wire length of each SPECIALNET and report the SPECIALNETS that are greater in length than the specified threshold value.

Use the `-by_layer` and `-wire_segment` options to report the width and length of the special nets per layer and wire segment.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_special_routes` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_special_routes`

`-by_layer`	Reports on layers of each special net. Here's a sample format of the report when the `-by_layer` option is specified:
	`NET: port_pad_data_in[0] TOTAL SEGMENTS 4 WIRE LENGTH 303.4980 VIAS 1`
	`LAYER 8(METAL8) TOTAL LENGTH 303.4980`
	`IOWIRE SEGMENTS 4 WIRE LENGTH 303.4980 VIAS 1`
	Data_type: bool, optional

`-center_line`	Specifies that routing length is calculated by center line. That is, the sum of wire center line is used to calculate wire length. Without this parameter, the routing length is calculated as sum of wire segments. *Data_type*: bool, optional
`-exclude_nets netName`	
	Specifies the net names to be excluded. This option can be used only if `-interposer_route` is specified. *Data_type*: string, optional
`-highlight_45_layer layerName`	
	Highlights (in yellow) all nets with 45-degree routing on the specified layer in the design display area. *Data_type*: string, optional
`-interposer_layers layerName`	
	Specifies the interposer layers. Use this option to report the maximum and minimum routing length from tap via to tap via and from bum This option can be used only if `-interposer_route` is specified. *Data_type*: string, optional

`-interposer_route`	Reports the interposer route statistics, including maximum, minimum, and average wire length of the interposer routing. `report_special` `set_integration_route_constraint` to decide which nets are in one group. The `set_integration_route_constraint` constraints are e by using the `-interposer_route_constraint_file` option.
	The report format is as shown below:
	`### Header ###`
	`### Total Nets of Interposer Route ###`
	`Total nets: <total nets number>`
	`Layer: Layer_name`
	`Net with Max wire length: <net name + net length>`
	`Net with Min wire length: <net name + net length>`
	`Average wire length:`
	
	`### Net Group <group_name1> ###`
	`Total nets: <nets number in group>`
	`Layer: Layer_name`
	`Net with Max wire length:`
	`<net name> :`
	`net length :`
	`Euclidean distance:`
	`Manhattan distance:`
	`Net with Min wire length:`
	`<net name> :`
	`net length :`
	`Euclidean distance:`
	`Manhattan distance:`
	`Average wire length:`
	`Nets name:`
	
	`### Net Group <group_name2> ###`
	`Total nets: <nets number in group>`
	`Layer: Layer_name`
	`Net with Max length: <net name + net length>`
	`...`
	`Net with Min length: <net name + net length>`
	`...`
	`Average wire length:`
	`Nets name:`
	`...`
	The *`group_name`* of the nets is obtained from `set_integration_route_constraint -name` *`group_name`*. If `-name` is not specified, the tool us
	For example: `### Net Group <1> ###`

`-interposer_route_constraint_file` *`irc_file`*	
	Specifies the name of the interposer route constraint file. This option can be used only if `-interposer_route` is specified.
`-length_threshold` *`value`*	

	Reports on the SPECIALNETS that are greater in length than the specified value. These values are listed in the output file specified by -ou *Data_type*: float, optional
-nets netName	Reports on the wire length of each SPECIALNET fora specified net. **Note:** You must use this parameter in conjunction with the -wire_length or -length_threshold parameters. *Data_type*: string, optional
-out_file *report_name*	
	Specifies the report file name. *Data_type*: string, optional
-resistance_file resFileName	
	Specifies the resistance file name (fcroute.res) generated by fcroute if srouteFCReport *file name* is specified in the config file and h not match the max resistance constraint defined in the fcroute constraint file. *Data_type*: string, optional
-selected	Reports the length of the selected wire segments for each special net. *Data_type*: bool, optional
-summary	Summarizes the wire length and VIAs for special nets. Here's a sample format of the report when -summary is specified: *Data_type*: bool, optional

```

Total Wire Length of All Special Nets: 1243.5270
```

`-wire_segment`	Reports on the wire segments of each special net. Here's a sample format of the report when `-wire_segment` is specified:
	
	`NET: port_pad_data_in[1] TOTAL SEGMENTS 4 WIRE LENGTH 251.9120 VIAS 1`
	`WIRESEGMENT 1 SHAPE Vertical LENGTH 110.7050 674.7200 880.7200 686.7200 991.4250`
	`WIRESEGMENT 2 SHAPE 45degree LENGTH 76.3320 620.7450 985.4250 686.7200 1051.4000`
	`WIRESEGMENT 3 SHAPE Horizontal LENGTH 38.3550 588.3900 1039.4000 626.7450 1051.4000`
	`WIRESEGMENT 4 SHAPE Vertical LENGTH 26.5200 588.3900 1039.4000 597.3900 1065.9200`
	`IOWIRE SEGMENTS 4 WIRE LENGTH 251.9120 VIAS 1`
	
	Data_type: bool, optional

`-wire_length`	Reports on the wire length of each `SPECIALNET`. *Data_type*: bool, optional

Example

- The following command reports the wire length of each `SPECIALNET` and lists it in the `spwire.rpt` report file:
  `report_special_routes -out_file spwire.rpt -wire_length`

  Example report file:

reset_bumps_fixed_assign

```
reset_bumps_fixed_assign
[-help]
{-all | -bumps {bump1 bump2...}}
```

Removes the bump assignment status from a specified list of assigned bumps that were set with the `set_bumps_fixed_assign` command. The software updates the DEF file by removing the `+FIXEDBUMP` attribute from the specified group of assigned bumps to indicate that they are now in an unfixed state.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_bumps_fixed_assign` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reset_bumps_fixed_assign`
`-all`	Removes the bump assignment status from all bumps. *Data_type*: bool, required
`-bumps {bump1 bump2...}`	Removes the bump assignment status from a specified list of assigned bumps. *Data_type*: string, required

Examples

- The following command removes the bump assignment status from all bumps:
  `reset_bumps_fixed_assign -all`
- The following command removes the bump assignment status from bumps `bumpA` and `bumpB`:
  `reset_bumps_fixed_assign -bumps {bumpA bumpB}`

Related Information

reset_fixed_bond_pad

```
reset_fixed_bond_pad
[-help]
{{-io_inst InstName [-pin pinName]} | -selected}
```

Unassigns the fixed status of a specified bond pad.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_fixed_bond_pad` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reset_fixed_bond_pad`
`-io_inst instName`	Specifies the name of the I/O instance whose bond pad's fixed status will be unassigned. *Data_type*: string, required
`-pin pinName`	Specifies the name of the pin. *Data_type*: string, optional
`-selected`	Unassigns the fixed status of a selected bond pad. You must first select the bond pad in the design display area, then use this parameter to unassign the fixed status. *Data_type*: bool, required

Example

- The following command unassigns the fixed status of the bond pad on I/O instance `pad_addr[30]`:
  ```
  reset_fixed_bond_pad -io_inst {pad_addr[30]}
  ```

Related Information

- `space_bond_pads`

reset_probe_pin

```
reset_probe_pin
[-help]
{{-inst InstName -pin pinName} | -bump bumpName }
```

Unsets a pad or bump as a probe point. Probe points are used for package-level design and testing. To set or report on probe points, use the `set_probe_pin` or `report_probe_pins` commands, respectively.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `reset_probe_pin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man reset_probe_pin`
`-bump bumpName`	Specifies the instance name of the bump. *Data_type*: string, required
`-inst InstName`	Specifies the name of the I/O instance. *Data_type*: string, required
`-pin pinName`	Specifies the name of the pin on the I/O instance that will be unset as a probe point. *Data_type*: string, required

Example

- The following command unsets the `PAD` pin of `Bump_1` as a probe point:
  ```
  reset_probe_pin -inst Bump_1 -pin PAD
  ```

Related Information

- `report_probe_pins`
- `set_probe_pin`

route_flip_chip

```
route_flip_chip
[-help]
[-bottom_layer layerName]
[-connect_in_region]
[-connect_tsv_to_bump] | [-connect_tsv_to_pad] | [-connect_tsv_to_ring_stripe]
[-constraint_file filename]
[-delete_existing_routes]
[-double_bend_route]
[-eco | -incremental]
[-extra_config fileName]
[-jog_control {no_jog | jog_on_the_same_layer | jog_on_different_layers}]
[-keep_drc]
[-min_escape_distance unit]
[-msg_rate int]
[-nets {net_name_list | <filename | ~<filename} | -selected_bumps]
[-only_global]
[-overflow_map]
[-region {x1 y1 x2 y2}]
[-route_engine {detail global_detail}]
[-route_pg_style {none finger mesh}]
[-route_width real]
[-spread_wires_factor value]
[-straight_connections {straightwithdrcclean | straightwithchanges}]
-target {connect_bump_to_ring_stripe | connect_bump_to_pad}
[-top_layer layerName]
[-user_class subclass_string]
[-verbose]
```

Specifies that power routing and signal routing recognize the bumps specified in a flip chip design.

- The command supports all the `LEF 5.7` syntax to determine which power/ground pin shape on the I/O driver cell must be connected to a bump. For more information, see the "Performing Area I/O Placement" section in the Data Preparation chapter of the *Innovus Stylus Common UI User Guide*.
- The command supports mixed-mode designs in the detail and global_detail modes.
- The command, by default, reads the FE database to get all information. The default value of the variable, `set rda_global (srouteUseFEDB)` must be set to `1`. For the command to read information from the LEF file, the `set rda_global (srouteUseFEDB)` variable must be set to `0`.

Use this command after importing the design.

You can perform connect_bump_to_pad routing (`-target connect_bump_to_pad`) using the detail or global_detail routing styles. Each routing style supports a specific set of `route_flip_chip` command parameters. The following table lists the routing style support for each parameter.

Note: The following table might not be readable when viewed with the Unix `man` command. Check the `route_flip_chip` command description in the *Text Command Reference* to view the table.

route_flip_chip Parameters	-route_engine	
	detail	**global_detail**
-region {x1 y1 x2 y2}	X	X1
-connect_in_region	X	
-connect_tsv_to_bump	X	
-connect_tsv_to_pad	X	
-connect_tsv_to_ring_stripe	NA	NA
-constraint_file filename	X	X
-delete_existing_routes	X	X
-double_bend_route	X	X
-eco	X	X
-extra_config fileName	X	X

`-only_global`		X
`-incremental`		X
`-jog_control {no_jog | jog_on_the_same_layer | jog_on_different_layers}`	X	
`-keep_drc`	X	X
`-bottom_layer` *layerName*	X	X
`-top_layer` *layerName*	X	X
`-min_escape_distance` *unit*	X	X
`-msg_rate` *int*	X	X
`-nets {`*net_name_list* `| <filename | ~<filename}`	X	X
`-overflow_map`		X
`-route_width` *real*	X	X
`-selected_bumps`	X	X
`-spread_wires_factor` *value*	X	X
`-straight_connections {straightwithdrcclean | straightwithchanges}`	NA	NA
`-target {connect_bump_to_ring_stripe | connect_bump_to_pad}`	NA	NA
`-verbose`	X	X

X[1]	When run incrementally, the `route_flip_chip` global_detail mode partially supports area-based routing in the specified coordinates (`route_flip_chip -region {`*x1 y1 x2 y2*`} -incremental`) for the area in which the net is routed.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `route_flip_chip` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man route_flip_chip`

`-bottom_layer` *layerName*	Specifies the bottom-most metal layer number / `LEF` layer names that the software can use when routing bumps.
	Default: If you do not specify this parameter, all layers are used.
	For example, you can specify the metal layer numbers, `8` and `2`, as follows:
	`route_flip_chip -target connect_bump_to_ring_stripe -route_width 4.0 -top_layer 8 -bottom_layer 2`
	You can also specify the `LEF` layer names, `METAL7` and `METAL1`, as follows:
	`route_flip_chip -target connect_bump_to_ring_stripe -route_width 4.0 -top_layer METAL7 -bottom_layer METAL1`
	Data_type: string, optional

`-connect_in_region`	Specifies that connections from all sources within the specified area can connect only to targets that are also inside that area. **Note:** This parameter is only available if you also specify the `-region` parameter. *Default:* If you do not specify this option the software makes connections from all sources within the specified area to targets both inside and outside the specified area. *Data_type*: bool, optional

`-connect_tsv_to_bump`	Connects TSVs to signal bumps. Use the `-connect_tsv_to_bump` parameter with `-target connect_tsv_to_pad`. This parameter cannot be used along with `-connect_tsv_to_pad` and `-connect_tsv_to_ring_stripe`, which provide other routing options. **Note:** Different layers have different types of bumps. It is recommended that you route the bump on the back side and front side separately using the `srouteExcludeBumpType` statement in the extra configuration file. *Data_type*: bool, optional
`-connect_tsv_to_pad`	Connects TSVs to IO pads. Use the `-connect_tsv_to_pad` parameter with `-target connect_bump_to_pad`. *Data_type*: bool, optional
`-connect_tsv_to_ring_stripe`	Connects TSV with power net to the power mesh. Use the `-connect_tsv_to_ring_stripe` parameter with `-target connect_bump_to_ring_stripe`. For more information, see "TSV/Bump/Back Side Metal Modeling in Innovus" section of the Design Methodology for 3D IC with Through Silicon Via chapter in the *Innovus Stylus Common UI User Guide*. *Data_type*: bool, optional
`-constraint_file` *`filename`*	Specifies the file that contains constraints for flip chip routing. For more information, see "Useful Constraints for Flip Chip Routing" in the Flip Chip Methodologies chapter of the *Innovus Stylus Common UI User Guide.* *Data_type*: string, optional
`-delete_existing_routes`	Specifies that the software will remove existing connections when you use the `route_flip_chip` command multiple times. *Default:* The software maintains existing connections each time you issue the `route_flip_chip` command. **Note:** If you specify the `-region` parameter, existing routes are always preserved, even if you also specify the `-delete_existing_routes` parameter. *Data_type*: bool, optional
`-double_bend_route`	Allows double-bend routing on segments between a bump pin and a pad pin.  **Note:** Segments that connect directly to a bump pin or pad pin are always routed at 90 degrees. *Default*: Off *Data_type*: bool, optional
`-eco`	Enables ECO mode flip chip routing. When you specify this parameter, `route_flip_chip` automatically performs typical ECO routing steps, such as deleting existing routing results or re-routing affected nets, whenever there is an ECO change. For more information, see the "ECO Routing" section in the Flip Chip Methodologies chapter of the *Innovus Stylus Common UI User Guide*. **Note:** The `-eco` parameter cannot be used along with `-incremental`. *Data_type*: bool, optional
`-extra_config` *`filename`*	Specifies the name of an extra configuration file. This file contains additional route_flip_chip commands that provide more control over the routes to bumps. For example, `route_flip_chip -target connect_bump_to_pad -route_engine global_detail -extra_config mixmode.config` For more information, see "Useful Extra Configurations for Flip Chip Routing" in the Flip Chip Methodologies chapter of the *Innovus Stylus Common UI User Guide.* *Data_type*: string, optional

`-incremental`	Runs the global_detail mode incrementally when pre-routes are already in the design, without deleting or re-routing the pre-routes. **Note:** The `-incremental` parameter cannot be used along with `-eco`. *Data_type*: bool, optional
`-only_global`	Executes the global router to provide you with the routability statistics. This is helpful for optimizing mode. *Data_type*: bool, optional
`-jog_control {no_jog | jog_on_the_same_layer | jog_on_different_layers}`	
	Specifies that jogs are allowed during routing to avoid DRC violations. You must specify either the `-jog_control` parameter or the `-straight_connections` parameter. If you specify the `-jog_control` parameter, you can also specify one of the following options: • `no_jog`: Specify this option if you prefer the software to make straight connections between targets, and to change layers instead of jog to avoid DRC violations. If you do not specify this option, the route uses both layer changes and jogging to avoid DRC violations. • `jog_on_the_same_layer`: If the route must jog to avoid a DRC violation, the jog occurs on the same layer whenever possible. This can result in routing in the non-preferred direction. • `jog_on_different_layers`: If the route must jog to avoid a DRC violation, the jog occurs on the layer that is in the preferred routing direction whenever possible. *Data_type*: (enum)+, optional
`-keep_drc`	If specified, the command `delete_drc_markers` will not run implicitly when executing the `route_flip_chip` command, hence retaining the DRC violations. Otherwise, the command `clearDrc` runs implicitly when executing the `route_flip_chip` command by default, purging all the violation markers. *Data_type*: bool, optional
`-min_escape_distance` *value*	Specifies the minimum distance from the edge of the pin to the edge of the wire segment. *Data_type*: float, optional
`-msg_rate` *int*	Specifies the interval at which progress messages are generated. If you specify `1`, the software generates every progress message; if you specify `2`, the software generates every other progress message, and so on. *Default:* `0` *Data_type*: int, optional
`-nets {`*net_name_list* `| <filename | ~<filename}`	
	Specifies the nets to be connected or excluded from connection. *Default:* If you do not specify the `-nets` parameter, the software connects all power and ground nets in the design. Use one of the following options: • *net_name_list*: Specifies names of the nets to be connected. To specify more than one net, enclose the net names in braces and separate the names with a space. **Note:** As the `-nets` option accepts a maximum of 4096 string characters directly, use the *net_name_list* option if the number of nets to be connected is not very high. If a large number of nets need to be connected, use the `<filename` option or `~<filename` option with `-nets`. • `<filename`: Specifies the name of a text file containing the list of nets to be connected. Use this option if the number of nets to be connected is high. In the text file, separate net names with commas or the newline, space, or tab character. Wildcards can be used when specifying net names in the text file. • `~<filename`: Excludes the nets in the specified text file during flip chip routing. Use this option if the number of nets to be excluded is much lower than the number of nets to be connected. Wildcards can be used when specifying net names in the text file. *Data_type*: string, optional

`-overflow_map`	Displays the thermal map using the width and spacing parameters specified in the extra configuration file. To display the thermal map in the floorplan view in the GUI, select *All Colors* which opens the Color Preferences form, then select *GCell Overflow*. **Note:** The routing congestion can also be displayed using the `set_layer_preference` command. (`set_layer_preference gcellOvflow -isVisible 1`)  *Data_type*: bool, optional
`-region {x1 y1 x2 y2}`	Specifies the coordinates for detail routing. You must enclose the x and y coordinates in curly braces and separate them with a space. **Notes:** • Innovus issues a warning message if you specify area constraints in the flip chip route global_detail mode. (`route_flip_chip -route_engine global_detail`) • If `-route_pg_style` is specified as `finger`, the PG finger is routed in the area specified with `-region`. If `-route_pg_style` is not specified or specified as `none`, area I/O routing is done within the coordinates specified with `-region`. *Data_type*: rect, optional
`-route_engine {detail | global_detail}`	
	Selects between detail and global_detail routing styles. The `detail` mode supports area-based routing (`route_flip_chip -region`). However, the `global_detail` mode partially supports area-based routing only if you set the `-incremental` parameter. You can run `route_flip_chip` in the `global_detail/detail` mode when pre-routes are already in the design, without deleting or re-routing the pre-routes. By default, this feature is true for `route_flip_chip -target connect_bump_to_pad -route_engine detail`. For the `global_detail` mode, you should add the `-incremental` parameter to enable this feature. *Default*: `global_detail` *Data_type*: enum, optional
`-route_pg_style {none finger mesh}`	
	Specifies the routing pattern for flip chip route power routing: • `none`: For normal PG routing • `finger`: For PG finger routing style, in which you need to specify the routing direction. This option must be used with `route_flip_chip -region` option. PG finger routing improves usability and provides better IR drop by lowering rail resistance. • `mesh`: For mesh-style PG routing on the redistribution layer (RDL). This option is used to increase PG density. If you specify PG mesh routing, you must specify the main width of the PG mesh by using the `flip_chip_pg_mesh_main_width` attribute. *Default:* `none` *Data_type*: enum, optional

`-route_width` *real*	Connects wires to bumps using the specified width only, regardless of the size of the bump or the source to which the bump connects. *Default:* When using the `global_detail` routing style, `route_flip_chip` determines the width of the route as the bump width or I/O cell pin width that is connected to the bump, whichever is smaller. When using the detail routing style, `route_flip_chip` does not restrict the size of the RDL route to the width of the I/O cell pin and can route a wire that is larger in width than the specified I/O cell pin width. To override the above default setting for detail routing style, you can use the `srouteUseSpecifiedWidthForTopLayer TRUE` and `srouteRouteWidthForLowerLayer` *db_unit* variables in the extra configuration file. This forces `route_flip_chip` to use user-defined width for the top layer connecting to the bump and the lower layer. **Note:** `The route_flip_chip` command considers the route width value from the constraint file if it is higher than `route_flip_chip -route_width`, to enable splitting of wires. *Data_type*: float, optional
`-selected_bumps`	Routes the selected bumps. The selected bumps can be either power bumps or signal bumps. *Data_type*: bool, optional
`-spread_wires_factor` *value*	Specifies automatic spreading of wires during bump routing in order to prevent any SI violations. The *value* is applied as a multiple of the minimum spacing that is required. *Data_type*: float, optional
`-straight_connections {straightwithdrcclean | straightwithchanges}`	
	Specifies that only straight connections are made between targets and that jogs are not allowed during routing. This option is available only with `route_flip_chip -target connect_bump_to_ring_stripe`. You must specify either the `-straight_connections` parameter or the `-jog_control` parameter. If you specify the `-straight_connections` parameter, you can also specify one or both of the following options: • `straightwithdrcclean`: Leaves a route open if a straight connection cannot reach a target without causing a DRC violation. If you do not specify this option, the software makes a straight connection to a target, even if the route creates a DRC violations. • `straightwithchanges`: Permits the route to change to another layer to avoid DRC violations. If you do not specify this option, the software makes only straight connections on the same layer. *Data_type*: enum, optional
`-target {connect_bump_to_ring_stripe | connect_bump_to_pad}`	
	Specifies the type of the bumps to be routed. **Note:** For `-target connect_bump_to_ring_stripe`: • If `-route_pg_style` is specified as `finger`, the power bumps are routed in the finger routing style. • If `-route_pg_style` is not specified or specified as `none`, the power bumps are routed in normal PG routing style. *Data_type*: enum, required
`-top_layer` *layerName*	Specifies the top-most metal layer number / `LEF` layer names that the software can use when routing bumps. *Default:* If you do not specify this parameter, all layers are used. *Data_type*: string, optional
`-user_class` *subclass_string*	
	Assigns specified string as a subclass name to the wires and vias created. *Data_type*: string, optional
`-verbose`	Specifies that each progress message appears in the log file and the Innovus console. *Data_type*: bool, optional

route_point_to_point

```
route_point_to_point
[-help]
[-constraint_file filename]
[-drop_via_in_trace]
[-nets {[netName | -1] [layerName | -1] [(x y)]}]
[-pins {[instName | -1] [pinName | -1] [(x y)]}]
[-route_layer {bot[:top[:step]] [,bot[:top[:step]]]}]
[-route_style {manhattan | double_bend | diagonal}]
[-spacing spacingValue]
[-split {layerBase maxWidth:value [gap:value] [style:RIVER|MESH]}]
[-user_class subclass_name]
[-width widthValue]
[{[-use_exact_location] [-guide_point {{x1 y1} {x2 y2}...} [-keep_partial]]} [-offset {x y}]]
```

Specifies routing constraints to perform point-to-point routing between I/O pad pins and bumps, and wires and bumps for SPECIALNETS (only) that are defined in the DEF file.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `route_point_to_point` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man route_point_to_point`
`-constraint_file fileName`	
	Specifies the name of the file that contains the nets defined in the DEF file. *Data_type*: string, optional
`-drop_via_in_trace`	Drops all possible vias in the trace. *Data_type*: bool, optional
`-guide_point {{x1 y1} {x2 y2}...}`	
	Specifies guiding points for routing. `x` and `y` values are real values in micron. You can specify up to 256 guiding points. The P2P router routes through all the usable guiding points in an order of distance to/from target. This feature allows you to control P2P router more precisely on pin selection. *Data_type*: (point)+, optional
`-keep_partial`	Keeps routed segments when routing with guide points fails partially. **Note:** This parameter can be used only with `-guide_point`. *Data_type*: bool, optional
`-nets {netName | -1 [layerName | -1] (x y)}`	
	Specifies net options, such as net name, net layer, and location coordinates. The `layerName` can now also be the TSV layer name. *Data_type*: string, optional
`-offset {x y}`	Defines the maximum search offset from the original user click location. **Note:** This parameter can be used only with `-use_exact_location`. *Data_type*: point, optional
`-pins {[instName | -1] [pinName | -1] [(x y)]}`	
	Specifies the pin options, such as the instance name, the pin name, or the location coordinates. *Data_type*: string, optional
`-route_layer {bot[:top[:step]] [,bot[:top[:step]]]}`	
	Specifies the route layer. *Data_type*: string, optional

`-route_style [manhattan | double_bend | diagonal]`	
	Specifies the routing style options for performing the point-to-point routing. • `diagonal`  • `manhattan`  • `double_bend`  *Data_type*: enum, optional
`-spacing spacingValue`	Specifies the route spacing, in micrometers. *Data_type*: float, optional
`-split {layerBase maxWidth:value [gap:value] [style:RIVER|MESH]}`	

	Splits the wire segment based on the maximum width and splitting style.
	The router gets the maximum width value from the layer information; the router does not split the wire segment when the wire width does not exceed the layer's maximum width.
	• `maxWidth:value`: `Specifies the maximum width for splitting.`
	• `gap:value`: Specifies the splitting gap.
	• `style:RIVER|MESH`:Specifies the splitting style:
	  ◦ `RIVER`: Allows only one crossing of the split wire.
	  ◦ `MASH`: Allows crossing of all of split wires and also drops all the crossing sections.
	Data_type: string, optional

`-use_exact_location`	Uses the exact location that you click to perform routing. You can use the optional -offset parameter to define the maximum search offset from the original user click location. If the location does not fulfill the pin access requirements, P2P router performs an auto search to find a new access point. **Note:** If the `-use_exact_location` parameter is not specified, P2P finds the start end locations on the user-clicked object on its own. *Data_type*: bool, optional
`-user_class subclass_name`	Assigns the specified string as a subclass name to the wires and vias created. *Data_type*: string, optional
`-width widthValue`	Specifies the route width, in micrometers. *Data_type*: float, optional

Examples

The following command performs diagonal style point-to-point routing between the I/O pad pin `newIo_2` and bump `Bump_41_0_4` on route layer `M8`, having a default route width of `0.44` micrometers, and a spacing of `0.46` micrometers:

```
route_point_to_point -route_layer M8:M8 -width 0.44 -spacing 0.46 -route_style diagonal -pins {newIo_2 -1 (-21.3115 535.932)} -pins
{Bump_41_0_4 port_pad_data_in[10] (76.507 482.032)}
```

set_bond_pads_to_fixed

```
set_bond_pads_to_fixed
[-help]
{{-io_inst InstName [-pin pinName]} | -selected}
```

Assigns a fixed status to a specified bond pad. This restricts other bond pad commands from modifying the bond pad.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_bond_pads_to_fixed` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_bond_pads_to_fixed`
`-io_inst` *instName*	Specifies the name of the I/O instance whose bond pad will be assigned as fixed. *Data_type*: string, required
`-pin` *pinName*	Specifies the name of the pin inside the instance. *Data_type*: string, optional
`-selected`	Assigns a fixed status to a selected bond pad. You must first select the bond pad in the design display area, then use this parameter to assign the fixed status. *Data_type*: bool, required

Example

- The following command assigns a fixed status to the bond pad in I/O instance `pad_addr[30]`:
  ```
  set_bond_pads_to_fixed -io_inst {pad_addr[30]}
  ```

Related Information

- `check_bond_pad_spacing`
- `get_bond_pad`
- `place_bond_pad`
- `place_bond_pad_by_stagger`

set_bump_master

```
set_bump_master
[-help]
-cell bumpMasterName
[-from_bump_cell bumpMasterName]
[-location_type {cell_center cell_lowerleft geometry_center geometry_lowerleft}]
{-net netName | -all | -bumps bump_list | -selected}
```

Enables you to replace the cell master for specified bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_bump_master` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_bump_master`
`-all`	Specifies that all bumps will use the new cell master specified using the `-cell` parameter. *Data_type*: bool, optional
`-bumps bump_list`	Specifies the list of bumps for which you want to change the bump master. Use this parameter if you want to change the cell master of specific bumps, which may or may not have the same cell master originally. *Data_type*: string list, optional
`-cell bumpMasterName`	
	Specifies the name of the new cell master. *Data_type*: string, required
`-from_bump_cell bumpMasterName`	
	Specifies the name of the old cell master. Use this parameter to replace the cell master of bumps using a specific bump master. *Data_type*: string, optional
`-location_type {cell_center cell_lowerleft geometry_center geometry_lowerleft}`	
	Specifies the location type. *Default*: `cell_lowerleft` *Data_type*: enum, optional
`-net netName`	Specifies that all bumps connected to the specified net will use the new cell master. For example, if the *netName* is VDD, all connected bumps will use the cell master specified using the `-cell` parameter. *Data_type*: string, optional
`-selected`	Changes the bump master of selected bumps to the new cell master as specified using the `-cell` parameter. *Data_type*: bool, optional

Examples

- The following example changes the cell master of selected bumps from `BUMPCELL` to `BGA_PAD`:
  ```
  set_bump_master -cell BGA_PAD -selected -from_bump_cell BUMPCELL
  ```
  Note: The change happens only for those of the selected bumps that originally belonged to `BUMPCELL`. If a selected bump belongs to a cell master other than `BUMPCELL`, its cell master is not changed.
- The following command changes the cell master of all the bumps connected to the net `int` to `BUMP_PWR`:
  ```
  set_bump_master -cell BUMP_PWR -net int
  ```
- The following command changes the cell master of all the bumps in the design to `BUMP_PWR`:
  ```
  set_bump_master -cell BUMP_PWR -all
  ```
- The following command changes the the cell master of all the bumps connected to the net `int` to `BUMP_PWR` and specifies their location type as `geometry_center`:
  ```
  set_bump_master -cell BUMP_PWR -net int -location_type geometry_center
  ```

Related Information

- Flip Chip Methodologies chapter in the *User Guide*

set_bumps_fixed_assign

```
set_bumps_fixed_assign
[-help]
{-all | -bumps {list} | -cells {list}}
```

Fixes a specified group of assigned bumps to keep them from being reassigned. The software updates the DEF file by adding the `+FIXEDBUMP` attribute to the specified group of assigned bumps to indicate that they are now in a fixed state. You can use the `write_def` command to view the bumps with the `+FIXEDBUMP` attribute. Use this command after bumps are assigned with the `assign_bumps` command or defined in the I/O file with the signal name.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_bumps_fixed_assign` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_bumps_fixed_assign`.
`-all`	Fixes all of the assigned bumps. *Data_type*: bool, optional
`-bumps list`	Fixes the assigned bumps that are specified in the bump name *list*. *Data_type*: string, optional
`-cells list`	Fixes the assigned bumps that are specified in the bump site *list*. *Data_type*: string, optional

Example

- The following command fixes all of the assigned bumps:
  ```
  set_bumps_fixed_assign -all
  ```

Related Information

- `assign_bumps`
- `set_bumps_place_status`
- `reset_bumps_fixed_assign`

  - *Flip Chip*

set_bumps_place_status

```
set_bumps_place_status
[-help]
{-bump Name | -selected}
-status {placed fixed cover}
```

Sets the bump placement status.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_bumps_place_status` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_bumps_place_status`.
`-bump Name`	Specifies the name of the bump to set the placement status. *Data_type*: string, required
`-selected`	Specifies to set the bump placement status for the selected bump. *Data_type*: bool, required
`-status {placed fixed cover}`	Specifies the bump placement status. *Data_type*: enum, required

Example

- The following command sets the placement status of the bump `Bump_53_2_5` to `fixed`:
  ```
  set_bumps_place_status -status fixed -bump Bump_53_2_5
  ```
  Note: You can also double-click the bump to change the placement status from `placed` to `fixed`.

set_probe_pin

```
set_probe_pin
[-help]
{{-inst instName -pin pinName} | -bump bumpName}
```

Sets a pad or bump as a probe point. Probe points are used for package-level design and testing. To delete or report on probe points, use the `reset_probe_pin` or `report_probe_pins` commands, respectively.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_probe_pin` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_probe_pin`
`-bump bumpName`	Specifies the instance name of the bump. *Data_type*: string, required
`-inst InstName`	Specifies the name of the I/O instance. *Data_type*: string, required
`-pin pinName`	Specifies the name of the pin on the I/O instance that will be set as a probe point. *Data_type*: string, required

Example

- The following command sets pin `PAD` of I/O instance `Bump_1` as a probe point:
  ```
  set_probe_pin -inst Bump_1 -pin PAD
  ```

Related Information

- `report_probe_pins`
- `reset_probe_pin`

set_special_route_type

```
set_special_route_type
[-help]
[-stop_layer Metal_layer]
-stop_type_list swire_type_list
-type {blockring blockagewire blockwire corewire drcfill fillwireopc fillwire followpin iowire notype padring ring stripe}
{-bump_cell bumpCellList | -pin {{inst1 pin1} {inst2 pin2}...}}
```

Sets special routing wires to a particular shape type so that they can be written out into a DEF file using the `-special_shape` parameter of the `write_def_by_section` command. This makes data filtering easier by enabling customized selection and output of special routing shape types. The output data is very specific and can be easily managed as storage size is small.

The `set_special_route_type` command works by tracing special wires and vias that touch bumps or instance pins through to a stop-layer or special wire stop type. All the traced special wires and vias are marked with a particular wire type. The `write_def_by_section -special_shape` command is then used to write out the special type routes and vias.

Note: Use the `set_special_route_type` and `write_def_by_section` commands in sequence. Save the design before you modify the shape types so that you can recover the original design with `read_def`.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_special_route_type` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_special_route_type`
`-bump_cell` *`bumpCellList`*	Specifies the list of bump cells. If this option specified, the tracing starts from any special wires and vias that touch the named bump cells. **Note:** This option cannot be used with `-pin`. *Data_type*: string list, required
`-pin {{`*`inst1 pin1`*`} {`*`inst2 pin2`*`}...}`	
	Specifies a list of pairs of instances and their pins. If this option specified, the tracing starts from any special wires and vias that touch the named instance pin pairs. **Note:** This option cannot be used with `-bump_cell`. *Data_type*: string list, required
`-stop_layer` *`Metal_layer`*	Specifies the metal layer at which tracing should stop. *Data_type*: string, optional
`-stop_type_list` *`swire_type_list`*	
	Specifies the special-wire types used in tracing. When a special wire with a shape type that is not included in the list is encountered, tracing stops. The legal list of *`swire_type_list`* are the DEF SPECIAL ROUTE SHAPE types. *Data_type*: string list, required
`-type {blockring blockagewire blockwire corewire drcfill fillwireopc fillwire followpin iowire notype padring ring stripe}`	
	Sets the marked special wire to the specified wire type (DEF SPECIAL ROUTE SHAPE type). *Default*: `iowire` *Data_type*: enum, required

Example

- The following command traces special wires and vias that touch the named bump cells. Tracing stops when a special wire of type other than `iowire` is encountered. The marked special wire is set to `iowire`.

```
set_special_route_type -bump_cell {bc*} -stop_type_list {iowire} -type iowire
```

Related Information

- `read_def`
- `write_def_by_section`

space_bond_pads

```
space_bond_pads
[-help]
[-spread]
```

Spaces bond pads and the corresponding area I/O instances based on the constraints returned by the `getCellDist()` Tcl script.

The command distributes excess space until all the bond pads reach their maximum spacing constraint returned by the `getCellDist()` Tcl script or until the time when no extra space is left between the instances.

The initial distribution of space occurs for the clusters of instances that have the first or the last bond pads in the row. The remaining iterations equally distribute the remaining space between each I/O. The I/O instances that are in the end are placed at minimum spacing to the die edges, both on the left and right sides of the die.

The I/O pads will snap to I/O sites and the corresponding bond pads (bumps) will shift accordingly.

You can define the constraints in the `getCellDist()` Tcl script as follows:

```
proc getCellDist { xp yp xn yn padPosition padCount side ioRow staggerPos ioName }
```

Here:

- *xp yp* - Specifies the x and y coordinates of a previous bond pad having the same stagger position. If first, the location is 0, 0.
- *xn yn* - Specifies the x and y coordinates of the previous neighboring bond pad having any stagger position. If first, the location is 0, 0.
- *padPosition* - Specifies the position of the bond pad. The position can be i (inner), m (middle), or o (outer).
- *padCount* - Specifies the current bond pad count for bond pads at the same stagger position. For example, 1 for the first inner bond pad, 2 for the second inner bond pad, and so on.
- *side* - Specifies the n (North), s (South), e (East), or w (West) side of the bond pad.
- *ioRow* - Specifies the I/O row.
- *staggerPos* - Specifies the stagger type.
- *ioName* - Specifies the name of the I/O.

Note:

- The bond pad spacing for North and South is done from left to right.
- The bond pad spacing for East and West is done from bottom to top.
- The bond pad spacing for each side and ring is done independently.

After using the `spaceBondPad` command, you can use the `check_bond_pad_spacing` command to check the bond pad spacing.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `space_bond_pads` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man space_bond_pads`
`-spread`	Removes any extra spacing that may exist between I/O cells, which were placed based on the rules defined in the `getCellDist()` Tcl script, and evenly distributes the extra space between all of the I/O cells in that row. You can use this parameter if there are large gaps (spaces) between I/O cells. *Data_type*: bool, optional

swap_bump_assignment

```
swap_bump_assignment
[-help]
[[-from {nameList} -to {nameList}] | -circle_offset value]
```

Swaps signal between selected instances (I/O pads or bumps).

To swap bump assignments in a circle, determine the value of offset you want to use. Assuming that the value of offset is `N`, the number of the selected bumps is `M`, the order of the input bump is `$index`, and the name of the bump with `$index` is `bump_$index`, you can swap bump assignments in a circle by using the the following command:

```
swap_bump_assignment -from {bump_1 bump_2 bump_3 ... bump_$index} -to {bump_[1+N] bump_[2+N] bump_[3+N]... bump_[$index+N-M]}
```

Parameters

`-help`	Prints a brief description of the `swap_bump_assignment` command. For a detailed description of the command, use the `man` command: `man swap_bump_assignment`
`-circle_offset value`	Specifies the offset value to swap bumps in circle. The value should be be positive and less than the number of the selected bumps. For example, if you select the bumps `bump1`, `bump2`, `bump3`, `bump4`, and `bump5` in the GUI and specify `-circle_offset` as `2`, the result of signal swapping will be as follows: `bump1(S1) bump2(S2) bump3(S3) bump4(S4) bump5 (S5) -> bump1(S4) bump2(S5) bump3(S1) bump4(S2) bump5 (S3)` *Data_type*: int, optional
`-from nameList`	Specifies the names of bumps from which signal is to be swapped. *Data_type*: string, optional
`-to nameList`	Specifies the names of bumps to which signal is to be swapped. *Data_type*: string, optional

Related Information

  - *Flip Chip*

unassign_bumps

```
unassign_bumps
[-help]
{-all | -bumps {list} | -cells {list} | -selected}
```

Removes the Verilog signal names from bumps, which removes the connection between bumps and I/O pins. The original connection will remain in the Verilog and is connected when the bump is reassigned. If the bump is assigned, it will appear in the DEF `SPECIALNETS` section with the signal (net) name. Use this command after bumps are assigned with the `assign_bumps` command or defined in the I/O file with the signal name, but without the `-fixed` constraint.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `unassign_bumps` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man unassign_bumps`
`-all`	Removes all the connections between bumps and I/O pins and removes the signal assignment of the bumps. *Data_type*: bool, optional
`-bumps list`	Removes only the connections between bumps and I/O pins contained in the bump name list. *Data_type*: string, optional
`-cells list`	Removes only the connections between bumps and I/O pins contained in the site list. *Data_type*: string, optional
`-selected`	Specifies to unassign the bump(s) selected in the design in the GUI. *Data_type*: bool, optional

Examples

- The following command unassigns all of the bumps:
  ```
  unassign_bumps -all
  ```
- The following command unassigns the (named) bumps `bumpA` and `bumpB`:
  ```
  unassign_bumps -bumps {bumpA bumpB}
  ```

Related Information

- `assign_bumps`
- `check_bumps`
- `delete_bumps`

update_bump_connect_target_constraints

```
update_bump_connect_target_constraints
[-help]
{-bumps list_of_bumps | -selected }
{-io_inst instance_name
  {[-to_io_inst instance_name]
   [-pin_name pin_name {[-to_pin_name pin_name]
                       [{-port_num value -to_port_num value}]}]}}
```

Modifies the property values on bumps. You can change the instance name, pin name, and port name on specified or selected bumps.

Parameters

`-help`	Prints a brief description that includes type and default information for each `update_bump_connect_target_constraints` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man update_bump_connect_target_constraints`
`-bumps list_of_bumps`	Edits the bump connect target constraint on specified bumps. The `-bumps` option accepts wild cards. *Data_type*: string list, required
`-io_inst instance_name`	Specifies the name of the instance for which you want to change the bump connect target constraint. *Data_type*: string, required
`-pin_name pin_name`	Specifies the name of the pin for which you want to change the bump connect target constraint. *Data_type*: string, optional
`-port_num value`	Specifies the port number for which want to change the bump connect target constraint. *Data_type*: int, optional
`-selected`	Edits the bump connect target constraint on selected bumps. Multiple bumps can be selected. *Data_type*: bool, required
`-to_io_inst instance_name`	Specifies the instance name to change to in the bump connect target constraint. *Data_type*: string, optional
`-to_pin_name pin_name`	Specifies the pin name to change to in the bump connect target constraint. *Data_type*: string, optional
`-to_port_num value`	Specifies the port number to change to in bump connect target constraint. *Data_type*: int, optional

Example

- The following command modifies `bump_connect_target` property on `Bump_1` to change pairing between `Bump_1` and instance `IOPADS_INST/esd` from `PORT1` to `PORT2`. `PORT1` and `PORT2` are under `VDD` PIN of instance `IOPADS_INST/esd`.
  ```
  update_bump_connect_target_constraints -bumps Bump_1 -io_inst IOPADS_INST/esd -pin_name VDD -port_num 1 -to_port_num 2
  ```

  - *Flip Chip*

update_bump_name

```
update_bump_name
[-help]
-from current_pattern
[-selected]
-to new_pattern
```

Modifies the names of selected or specified bumps according to the specified pattern.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `update_bump_name` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man update_bump_name`
`-from current_pattern`	
	Specifies the name of a single bump or a pattern for the names of the bumps to be edited. The pattern is a regular expression, such as `{Bump_\d+}` or `{Bump_(\d)(\w+)}`, which can be referred in TCL. When specifying a pattern, the opening and closing braces are required. *Data_type*: string, required
`-selected`	Modifies the names of selected bumps. *Data_type*: bool, optional
`-to new_pattern`	Specifies the new name or name format for target bumps. When specifying a name format, the opening and closing braces are required. *Data_type*: string, required

Examples

- The following command modifies the names of all bumps that have the pattern `Bump_\d+`, such as `Bump_1` and `Bump_12`, to bumps with pattern `signal_\d+`, such as `signal_1` and `signal_12`:
  ```
  update_bump_name -from {Bump_} -to {signal_}
  ```
- The following command modifies the name of the `Bump_1_1_1` bump to `signal_bump`:
  ```
  update_bump_name -from {Bump_1_1_1} -to {signal_bump}
  ```
- The following command modifies the names of all bumps that have the pattern `Bump_(\d)_(\d)_(\d)` to bumps named `1_1_1_signal`, `1_1_2_signal`, and so on:
  ```
  update_bump_name -from {Bump_(\d)_(\d)_(\d)} -to {\1_\2_\3_signal}
  ```

write_flip_chip_property

```
write_flip_chip_property
[-help]
out_file
```

Saves the bump and pad properties, including virtual connection area information, in the bump and IO pad property file. The property file is a manually editable text file. Virtual connection area records are separated by new lines in the file.

Parameters

`-help`	Prints out the command usage that includes type and default information for each `write_flip_chip_property` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man write_flip_chip_property`
`out_file`	Specifies the bump and pad property file name. *Data_type*: string, required

Example

The following command saves the bump and pad properties, including virtual connection area information, in a file named `test2`:

```
write_flip_chip_property test2
```

add_area_io_fillers

```
add_area_io_fillers
[-help]
{-cell fillerCellName | -cells {fillerCellName1 fillerCellName2 ...}}
[-prefix prefix]
[-area_io_row_cluster aioRowClusterName | -all_area_io_row_cluster]
[-set_preplaced]
[-only_esd]
[-only_shoulder]
[-only_gap]
[-power_domain powerDomainName]
```

Adds area I/O filler cell instances. Use this command during or after floorplanning. You can also use the command after the placement of manually created area I/Os.

The command,

- by default, adds area I/O filler cells to all the area I/O clusters if you do not specify the `-area_io_row_cluster` and `-all_area_io_row_cluster` parameters.
- adds filler cells in all the blank sites of the specified area I/O row clusters if you do not specify the `-only_esd`, `-only_gap` and `-only_shoulder` parameters.
- uses any LEF `CLASS PAD` or `CLASS PAD AREAIO` for adding the area I/O filler cells. By default the command uses LEF `CLASS PAD SPACER` to add filler cells, and also adds filler cells using any LEF `CLASS PAD` displaying a warning in Innovus.
- does not allow overlapping of filler cells and places non-overlapping filler cells.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_area_io_fillers` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man add_area_io_fillers`
`-all_area_io_row_cluster`	Adds AIOFiller cells to all the area I/O clusters. *Data_type*: bool, optional
`-area_io_row_cluster` *aioRowClusterName*	Specifies the area I/O row cluster name. AIO filler cells are added only to this cluster. *Data_type*: string, optional
`-cell` *fillerCellName*	Specifies the name of the area I/O filler cell to be added. *Data_type*: string, optional
`-cells {`*fillerCellName1 fillerCellName2 ...*`}`	Specifies the list of area I/O filler cells that fill the gaps in I/O row clusters. Adds the largest filler cell first, followed by smaller filler cells. *Data_type*: string, optional
`-only_esd`	Specifies to add ESD (electrostatic discharge) cells with the filler cell name in the area I/O row clusters. *Data_type*: bool, optional
`-only_gap`	Specifies to add the filler cells with the filler cell name to fill all the gaps in the area I/O row clusters. *Data_type*: bool, optional
`-only_shoulder`	Specifies to add shoulder cells with the filler cell name in the area I/O row clusters. *Data_type*: bool, optional
`-power_domain` *powerDomainName*	Specifies the name of the power domain in which the area I/O filler cells are to be added. *Data_type*: string, optional
`-prefix` *prefix*	Specifies the prefix name to be appended for the added area I/O filler cell instance. *Data_type*: string, optional
`-set_preplaced`	Sets the status of the area I/O filler cells as preplaced. *Data_type*: bool, optional

Examples

- The following command fills all area I/O row clusters on `ESD`, `shoulder`, and `gap` sites with a filler cell `A0_123` with preplaced status:
  ```
  add_area_io_fillers -cell A0_123 -set_preplaced
  ```
- The following command adds area I/O filler cells,`IOFILL` and `IOFILL_HALF`,to fill all the gaps in all area I/O row clusters:
  ```
  add_area_io_fillers -all_area_io_row_cluster -only_gap -cells { IOFILL IOFILL_HALF }
  ```

add_area_io_rows

```
add_area_io_rows
[-help]
-site site_name
{-bump bumpId | -location x y}
[-dx x_dist] [-dy y_dist]
[-orient {r0|r90|r180|r270|mx|mx90|my|my90}]
[-horizontal | -vertical]
[-esd esites_no...]
[-shoulder site_no...]
[-cluster_halo space]
[-num num]
[-abut_row]
[-row name]
[-no_snap]
[-soft]
[{-row_cluster_array_x elem1 | -row_cluster_array_y elem2} {-pitch_x dist | -pitch_y dist}]
```

Adds area I/O rows. Use this command during or after floorplanning.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `add_area_io_rows` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man add_area_io_rows`
`-abut_row`	When creating two I/O rows that abut each other, this option specifies that one of them will be in a flip orientation to the other. *Data_type*: bool, optional
`-bump bumpId`	Specifies the bump ID that is used to specify the start point of the row area. The `-bump` parameter creates IO rows from the center point of the specified bump. For example, when you specify -bump 17_1_1, the row will be created from the center point of this bump. The length of row is controlled by other options. *Data_type*: string, required
`-cluster_halo space`	Specifies the distance, in microns, around the boundary of a row cluster to prevent other cells from being placed near it. *Data_type*: float, optional
`-dx x_dist`	Offsets the reference point, in microns, to the first I/O row on the `x` axis. *Data_type*: float, optional
`-dy y_dist`	Offsets the reference point, in microns, to the first I/O row on the `y` axis. *Data_type*: float, optional
`-esd esites_no...`	Reserves the sites in the row as electrostatic discharge cells (ESD). For example: `-esd 2,7` **Note:** Use only when you create cluster rows with multiple sites. **Note:** Do not use the `-soft` option with this option. *Data_type*: string, optional
`-horizontal`	Creates horizontal rows. *Data_type*: bool, optional
`-location x y`	Specifies the lower left `x` and `y` coordinate reference points, in microns, of the new I/O row. *Data_type*: point, required

`-no_snap`	Adds the area IO row at the exact location specified by the `add_area_io_rows -location` coordinates rather than snapping the row to the standard cell placement grid. *Data_type*: bool, optional
`-num` *num*	Specifies the number of sites. *Data_type*: int, optional
`-orient {r0|r90|r180|r270|mx|mx90|my|my90}`	Specifies the orientation for the row. See *Orientation Key* below for more information. *Default*: `r0` *Data_type*: enum, optional
`-pitch_x` *dist*	Specifies the distance between bump centers, in microns, in the `x` direction. *Data_type*: float, optional
`-pitch_y` *dist*	Specifies the distance between bump centers, in microns, in the `y` direction. *Data_type*: float, optional
`-row` *name*	Specifies a user-defined instance name for an added IO Row or a prefix for multiple rows, as in a matrix. If only one row is added, the name is used exactly as specified. If multiple rows are added, a number prefix is appended to the name. *Data_type*: string, optional
`-row_cluster_array_x` *elem1*	Specifies the x dimensions of the row cluster array size. For example, to create a 5 x 8 row array, `-row_cluster_array_x 5 -row_cluster_array_y 8` *Data_type*: int, optional
`-row_cluster_array_y` *elem2*	Specifies the y dimensions of the row cluster array size. For example, to create a 4 x 6 row array, `-row_cluster_array_x 4 -row_cluster_array_y 6` *Data_type*: int, optional
`-shoulder` *site_no...*	Reserves the sites in a row as shoulder cells. For example: `-shoulder 1,10` **Note:** Use only when you create cluster rows with multiple sites. **Note:** Do not use `-soft` option with this option. *Data_type*: string, optional
`-site` *siteName*	Specifies the site name for the area I/O row. *Data_type*: string, required
`-soft`	Creates a reef or cluster that can be collapsed if no I/O cells are placed in the available spaces within the reef or cluster. Use this parameter if the cluster site is not fully placed so that standard cells can be placed in these spaces if I/O cells are not placed there. **Note:** Do not use the `-esd` or `-shoulder` options with this option. *Data_type*: bool, optional
`-vertical`	Creates vertical rows. *Data_type*: bool, optional

Orientation Key

The following table is a key to row orientation:

Value	Definition

`r0`	No rotation
`mx`	Mirror through X axis
`my`	Mirror through Y axis
`r180`	Rotate counter-clockwise 180 degrees
`mx90`	Mirror through X axis and rotate counter-clockwise 90 degrees
`r90`	Rotate counter-clockwise 90 degrees
`r270`	Rotate counter-clockwise 270 degrees
`my90`	Mirror through Y axis and rotate counter-clockwise 90 degrees

Examples

- The following command creates an I/O row with site name `IO1` at the location related to the center of the bump selected in the design window. There is a 5 x 7 row array and each element in the array is separated by `100` µm in both the `x` and `y` axes. Each row has `8` sites.

  ```
  add_area_io_rows -site IO1 -bump 0x33457a -horizontal -num 8 -row_cluster_array_x 5 -row_cluster_array_y 7 -pitch_x 100 -pitch_y 100
  ```

- The following command creates a soft I/O row cluster with a `15.0` micron halo around it:

  ```
  add_area_io_rows -site IO3 -location 0.0 0.0 -dx 230 -dy 58.8 -num 7 -orient r0 -vertical -soft -abut_row -cluster_halo 15.0
  ```

- The following command creates an IO Row with a user-defined name:

  ```
  add_area_io_rows -site IO1 -row newrow -location 0 0 -dx 0 -orient r0 -vertical -num 1
  ```

Related Information

add_dummy_boundary_wires

```
add_dummy_boundary_wires
[-help]
-layers layer_name | { layer_name_list ... }
[-masks mask_number | { mask_number_list ... }]
[-shape {blockring | blockagewire | blockwire | corewire | drcfill| fillwireopc | fillwire | followpin | iowire | none | padring | ring |
stripe} ]
[-short_wires wire_length | { wire_length_list ... }]
[-space space_value | { space_value_list ... }]
```

Add wires on the first and last tracks in the direction parallel to preferred routing direction with specified layers.

Note: DRC rules define forbidden regions near the design boundary edges that are parallel to the preferred routing direction of a layer. Any wires in these regions cannot project to the design boundary directly. Using the `add_dummy_boundary_wires` command you can add wires that shadow the design boundary such that no routing wires in the forbidden regions can project to the design boundary. This helps to avoid DRC violations.

Note: The `add_dummy_boundary_wires` command enables long dummy wires to honor route blockages by default.

Note: The `add_dummy_boundary_wires` command honors routing blockages and adds dummy wires along the routing blockages when the track box overlaps with them. The dummy wires do not cross partial routing blockages around the design boundary. It keeps the wires at the boundary and discontinues them when there is a routing blockage.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `add_dummy_boundary_wires` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_dummy_boundary_wires`
`-layers layer_name | { layer_name_list ... }`	

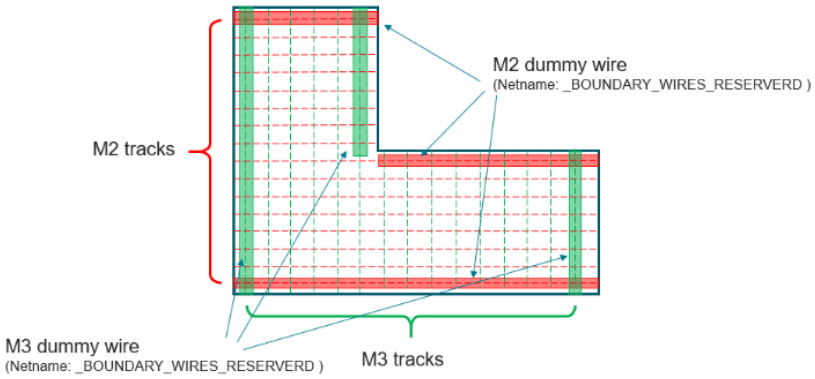
	Specifies the layers on which the dummy boundary wires are added.
	Note: The net name of the dummy wires is "`_BOUNDARY_WIRES_RESERVED`".
	Note: You can specify the *layerName* as a number, abbreviation or as a layer name defined in LEF. For example, *layerName* can be specified as 2, M2 or Metal2.
	`add_dummy_boundary_wires -layers {metal2 metal3} //full name works`
	`add_dummy_boundary_wires -layers {M2 M3} //abbreviated name works`
	`add_dummy_boundary_wires -layers {2 3} ///layer number works`
	Data_type: string, required

`-masks mask_number | { mask_number_list ... }`	Specifies one or multiple mask numbers which short dummy boundary wires snap to. The number of specified mask values should match the number of the specified layers in option layers. *Data_type*: string, optional
`-shape {blockring | blockagewire | blockwire | corewire | drcfill| fillwireopc | fillwire | followpin | iowire | none | padring | ring | stripe}`	
	Specifies the shape of the dummy boundary wires. *Default:* `none` *Data_type*: string, optional
`-short_wires wire_length | { wire_length_list ... }`	Specifies one or multiple set of lengths of short dummy boundary wires and space between them. The number of specified shortWires values should be twice of the number of specified layers in option layers. *Data_type*: string, optional
`-space space_value | { space_value_list ... }`	Specifies one or multiple space values to design boundary. **Note**: The space value is the distance between the design boundary and the start or end of the wire for 90 corner. The space value does not apply to 270 corner. *Default:* `0` *Data_type*: string, optional

Examples

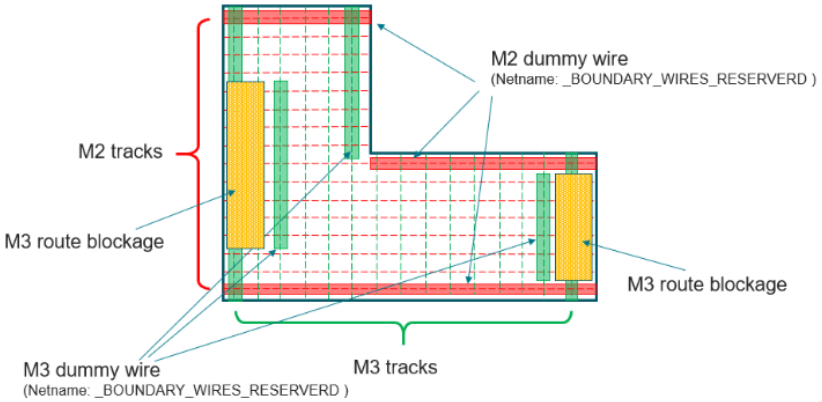
- The following command adds dummy wires on layers metal2 and metal3:

```
add_dummy_boundary_wires -layers {M2 M3}
```



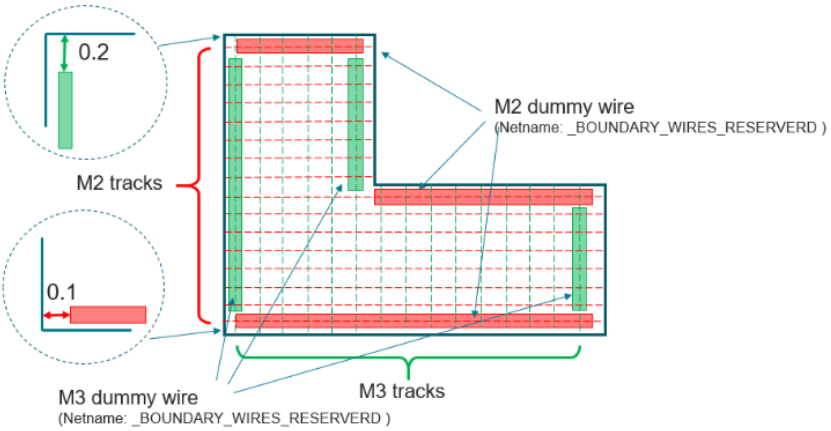
- The following command adds dummy wires on layers metal2 and metal3. Dummy wires will honor route blockages by default on Metal3 :

```
add_dummy_boundary_wires -layers {M2 M3}
```



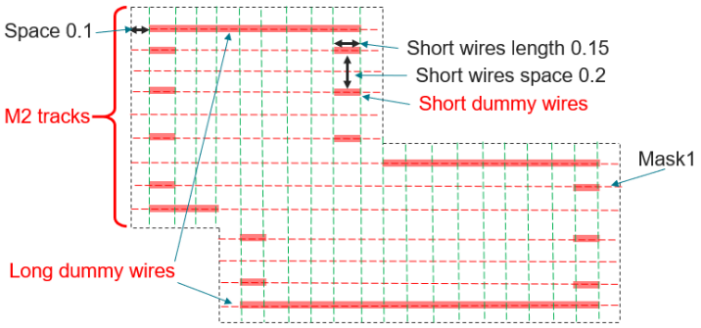
- The following command adds dummy wires with space value on layers metal2 and metal3:

```
add_dummy_boundary_wires -layers {M2 M3} -space {0.1 0.2}
```



- The following command adds long dummy wires with specified space and short dummy wires with specified length, space and mask on layers metal2:

```
add_dummy_boundary_wires -layers M2 -space 0.1 -short_wires {0.15 0.2} -masks 1
```



Related Information

- `legalize_floorplan`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

add_fences

```
add_fences
[-help]
[-flow {2G}]
[-for_partition]
[-rectangle_shape]
[-target_density float]
[ [-hinst {hinst(s)}] | [-module {module(s)}] | [-inst_group {inst_group(s)}] ]
```

Automatically draws partition fences that enclose all their children flexModel guides. It helps to improve the usability of the prototyping flow. The recommended use model for automatically generating fences is as follows:

1. Run `proto_design` to place flexModel guides/fences.
2. Manually adjust/move flexModels to shorten timing paths.
3. Run the following commands to analyze the floorplan and check timing. Repeat step 2 and 3 if needed
   a. `place_opt_design`
   b. `route_early_global`
   c. `time_design -proto`
   d. `read_timing_debug_report -proto`
4. Select flexModels for partitions and define partitions.
5. Run `add_fences` to create fences that enclose all their children flexModel guides.

Note: If no option is specified then the command draws fences for all existing defined partitions.

Parameters

`-flow {2G}`	Enables the Auto-Fence Generation 2G flow to draw the fence shapes automatically. When this flow is enabled, the mixed-placement capability is leveraged to give optimal module placement distribution. A fence is generated for each target module after considering target utilization, boundary gaps and I/Os. The Auto-Fence Generation 2G flow involves the following key steps:  • Running flat global mixed placement • Creating the fence based on the module cells placement distribution and control the utilization. • Polishing the fence so not to block any channel or I/O access *Data_type*: float, optional

`-for_partition`	When specified, it enables the partition fence generation capability. When this option is not specified, the power domain fence generation capability is enabled by default.  *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `add_fences` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_fences`
`-hinst {hinst(s)}`	Specifies the list of hierarchical instance names to draw fences. This option can be used if you only want to create a fence for a specific master or clone. You can use wildcards. **Note:** It can not be used for both master and clones. *Data_type*: string, optional
`-inst_group {inst_group(s)}`	Specifies list of instance group names to draw fences. You can use wildcards. *Data_type*: string, optional
`-module {module(s)}`	Specifies list of partition modules to draw fences. This option should be used for master/clone partitions. *Data_type*: string, optional
`-rectangle_shape`	When specified, only rectangle shaped fences are generated. *Data_type*: bool, optional
`-target_density float`	Specifies the target utilization value. *Default*: Core Utilization *Min*: 1e-07 *Max*: 1 *Data_type*: float, optional

Example

- The following command enables the auto-fence generation 2G flow and creates fences for the $PowerDomainNameList group.
  ```
  add_fences -flow 2G -inst_group $PowerDomainNameList
  ```
- The following command enables the auto-fence generation 2G flow and creates fences for specified hierarchical instance(s).
  ```
  add_fences -flow 2G -hinst $hInstNameList -for_partition
  ```

Related Information

- `proto_design`
- Prototyping Methodologies chapter in the *Innovus Stylus Common UI User Guide*

add_interposer_route_block

```
add_interposer_route_block
[-help]
-cell cell_name
-inst clone_name
-location {x y}
-orient {r0 r90 r180 r270 mx my mx90 my90}
```

Adds the clone blocks. It transforms the similar unrouted areas to a clone partition, which repeats the same routing pattern as the routed master block. This command enables you to replicate the routed master block multiple times with different orientations.

Note: Before using the `add_interposer_route_block` command, you must launch another Innovus session for loading the initial DB followed by using `create_interposer_route_block` command to create the routed master block partition by specified box. This is used to generate master block partition and top DB.

Parameters

`-cell cell_name`	Specifies the master cell name that needs to be repeated. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `add_interposer_route_block` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_interposer_route_block`
`-inst clone_name`	Specifies the clone block name. *Data_type*: list, required
`-location {x y}`	Specifies the clone block's origin location. **Note:** The relative location between clone block's origin and the terms should exactly be the same with the master. Otherwise, the wire of clone blocks will be shift accordingly after assemble design. **Note:** The snapping grid of the created block honors the `floorplan_snap_block_grid` attribute settings. *Data_type*: point, required
`-orient {r0 r90 r180 r270 mx my mx90 my90}`	
	Specifies the orientation of the clone block compared with the master. *Data_type*: enum, required

Examples

- The following command replicates the routing pattern of the master cell (`master_block`) to the clone block (`clone_block_1`) at location x1 y1 at orientation r0.
  ```
  add_interposer_route_block -cell master_block -inst clone_block_1 -location {x1 y1} -orient r0
  ```
- The following command repeats replicating the routing pattern of the master cell (`master_block`) to the clone block (`clone_block_2`) at location x2 y2 at orientation r180.
  ```
  add_interposer_route_block -cell master_block -inst clone_block_2 -location {x2 y2} -orient r180
  ```

- "Repeating Routing Patterns in Interposer Designs" in the *Innovus Stylus Common UI User Guide*

add_io_fillers

```
add_io_fillers
[-help]
-cells {name_list}
[-fill_any_gap]
[-filler_orient r0 | r90 | r180 | r270 | mx | mx90 | my | my90]
[-from coord]
[-prefix prefix]
[-side {top | bottom | left | right}]
[-to coord]
[-io_ring row_number]
[-use_small_io_height]
[-logic [-derive_connectivity ]]
```

Adds I/O instances in the I/O box. The I/O instances are added between the gap of existing I/O pad instances where the gap is large enough for the I/O instance. Use this command during or after floorplanning.

Note: Before using `add_io_fillers`, run the connect_global_net command to provide global-net-connection rules for supply pins of the added fillers. Without these rules, the built-in design-rule checks of `add_io_fillers` will not be accurate.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `add_io_fillers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_io_fillers`
`-cells {name_list}`	Specifies the name list of the I/O filler cells to be added. *Data_type*: list, required
`-derive_connectivity`	Derives connectivity for I/O fillers. *Data_type*: bool, optional
`-fill_any_gap`	Forces the I/O filler instance into a gap even though the gap (clearance) is not large enough. *Default*: If you do not specify this parameter, it does not force a filler instance. *Data_type*: bool, optional
`-filler_orient r0 | r90 | r180 | r270 | mx | mx90 | my | my90`	
	Specifies the orientation value of the filler cell. The orientation value can be r0, r90, r180, r270, mx, mx90, my, or my90. *Default*: r0 *Data_type*: string, optional
`-from coord`	Specifies the starting offset from the edge for adding fillers. The values are in micrometers. **Note:** The `-from` and `-to` parameters are intended to be used with the `-side` parameter to indicate a range. This command is applicable to peripheral I/O only; therefore, it is only one dimensional. *Data_type*: float, optional
`-io_ring row_number`	Specifies the row number for inserting fillers in a multiple I/O row design. *Minimum*: 0 *Maximum*: 1 *Data_type*: int, optional
`-logic`	Enables the creation of I/O filler instances for non-physical I/O cells. The added IO fillers are not marked as physical only cells. They are saved in netlist if user does `write_netlist`. *Data_type*: bool, optional
`-prefix prefix`	Specifies the prefix name for the new I/O filler instances. *Default*: `filler` *Data_type*: string, optional

`-side {top | bottom | left | right}`	
	Specifies the side as top side, bottom side, left side, and right side of the I/O box. *Default*: If you do not specify this parameter, all sides are specified. *Data_type*: string, optional
`-to` *coord*	Specifies the ending offset from the edge for adding fillers. The values are in micrometers. **Note:** The `-from` and `-to` parameters are intended to be used with the `-side` parameter to indicate a range. This command is applicable to peripheral I/O only; therefore, it is only one dimensional. *Data_type*: float, optional
`-use_small_io_height`	Specifies that the filler cell should be inserted between I/O pads only when the smallest I/O pad has the same height as the height of the filler cell. For example, consider that there are I/O pads A, B, C, D, and E. Out of these, A, B, and E are the same height, and C and D have a height double that of A, B, and E. Assume that you want to insert an I/O filler cell F, which has the same height as A, B, and E. If you do not specify the `-use_small_io_height` parameter, the cell F will be inserted between A and B, B and C, C and D, and D and E. However, if you specify the `-use_small_io_height` parameter, the cell F will be inserted between A and B, B and C, and D and E. However, the cell will not be inserted between C and D, because both C and D have a height different from F. *Data_type*: bool, optional

Examples

- The following command adds I/O instances to the I/O pad area on all sides wherever there is space between existing I/O pads. The added I/O pad filler instance names have a prefix PAD8.
  ```
  add_io_fillers -cells PAD8 -prefix PAD8
  ```
- The following command adds I/O instances to the I/O pad area on the top side from 200 micrometers. The added I/O pad filler instance names have a prefix PAD8.
  ```
  add_io_fillers -cells PAD8 -prefix PAD8 -side top -from 200
  ```
- The following command adds I/O instances to the I/O pad area on the left side to 300 micrometers. The added I/O pad filler instance names have a prefix PAD8.
  ```
  add_io_fillers -cells PAD8 -prefix PAD8 -side left -to 300
  ```

add_io_insts

```
add_io_insts
[-help]
[-cells {name list}]
[-orient orient] -prefix {name list} [-spacing value] [-spread]
{{-ref_inst inst_name [-counter_clockwise ]} |
{-selected [-counter_clockwise ]} |
{-repeat num [-skip num]
[-in_selected | {[-side {n | w | s | e}] [-io_ring num]} | -io_row name]} | -location {x y}}
```

Specifies constraints for insertion of power and ground I/O instances in the I/O ring or in the I/O rows. This command inserts physical IO cells into design following constraints. It is used during floorplanning. If you do not specify any of the following parameters, the command `add_io_insts` adds I/Os for all I/O cells, on all sides and for all I/O rings.

- `-io_ring num`
- `-side`
- `-io_row name`

Parameters

`-cells {name list}`	Specifies one or more cells. Adds one I/O for each cell that was specified. *Data_type*: string, optional
`-counter_clockwise`	Specifies the counter-clockwise direction to add the new I/O instance. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `add_io_insts` parameter.For a detailed description of the command and all of its parameters, use the man command: `man add_io_insts`
`-in_selected`	Repeatedly inserts new I/O instance(s) within the selected I/O cell(s). *Data_type*: bool, required
`-prefix {name list}`	Specifies the instance name prefix for the new I/O. This must match with the number of cells that are specified. *Data_type*: string, required
`-io_ring num`	Specifies the I/O ring number in which the new I/O instance is added. *Default*: 0 *Data_type*: int, optional
`-io_row name`	For the new I/O row flow, adds I/Os on the specified I/O row. *Data_type*: string, optional
`-location {x y}`	Adds the new I/O instance at the location specified by *x y* coordinates. **Note**: You cannot use this parameter in conjunction with the `-ref_inst` or `-selected` parameters. *Data_type*: point, required
`-orient orient`	Specifies the orientation of the new I/O instance. You can specify one of the following values: `r0`, `r90`, `r180`, `r270`, `mx`, `mx90`, `my`, and `my90`. Use this parameter with `-cells` and `-location` parameters. **Note**: When specifying the `-ref_inst` or `-selected` parameters, the software uses the orientation from those instances. See Orientation Key for more information. *Default*: `r0` *Data_type*: string, optional

`-ref_inst` *inst_name*	Specifies the name of the reference instance and adds the new I/O instance above or below the reference instance in clockwise direction. *Default*: Clockwise direction of the reference instance. *Data_type*: string, optional
`-repeat` *num*	Repeatedly adds new I/O instances every number (num) of cells that you specify. *Default*: Adds instances in the clockwise direction of the reference instance. *Data_type*: int, required
`-selected`	If `-repeat` is specified, this parameter adds the new I/O instance(s) in the selected cell(s) in clockwise direction of the selected instance. If `-repeat` is not specified, this parameter changes the selected cells as referenced cells and adds new I/O instances in the referenced cells, in the default clockwise direction. *Data_type*: bool, required
`-side {n | w | s | e}`	Specifies the side on which the new I/O instance is added. *Default*: `n` *Data_type*: string, optional
`-skip` *num*	Skips the number (num) of cells specified, before adding the first I/O instance. This happens only when `-repeat` num is specified. *Data_type*: int, optional
`-spacing` *value*	Specifies the spacing value, in microns, between the I/O instances. *Data_type*: float, optional
`-spread`	Evenly replaces all the I/O cells on the same row where the new I/O instance was added. This prevents overlapping of I/O cells. If you do not specify this parameter, the command still adds the new I/Os even if overlapping occurs. **Note**: The `add_io_insts` command works for both the I/O flows, the old flow and the new row based pad placement flow. In the new flow, each time you add a new I/O instance, the I/Os on the I/O rows with the existing constraints are replaced. In this situation, if all the existing I/Os do not have any specific constraint defined, then the replacement of the I/Os also resolves overlapping each time when the I/O cell is added, evading the usage of `-spread` option. *Data_type*: bool, optional

Example

- The following command adds new I/O instance il to cell BUMPCELL at lower-left x location 100 and lower-left y location 100:
  ```
  add_io_insts -prefix il -cells BUMPCELL -location 100 100
  ```
- The following command inserts the I/O instance newIo for the cell PVDD on the West side of the I/O box, skipping 3 I/O's (from below) on the West side and repeating the insertion of I/O's every 2 instances.
  ```
  add_io_insts -cells PVDD -repeat 2 -prefix newIo -side w -skip 3 -spread
  ```

add_io_row_fillers

```
add_io_row_fillers
[-help]
-cells {filler_cell_name_list ...}
[-logic]
[-prefix prefix]
[[-io_row name | -power_domain power_domain_name]
[-filler_orient r0 | r90 | r180 | r270 | mx | mx90 | my | my90]]
[-from coord] [-to coord]
[-fill_any_gap]
[-use_small_io_height]
[-ignore_site_type]
```

Adds I/O filler cells in the I/O rows. The I/O filler cells are added between the gap of existing I/O pad instances where the gap is large enough for the I/O cell. Use this command during or after floorplanning.

Parameters

`-cells {`*`filler_cell_name_list ...`*`}`	
	Specifies the name of the filler cell(s) to add in the I/O row. *Data_type*: string, required
`-fill_any_gap`	Forces the I/O filler instance into a gap even though the gap (clearance) is not large enough. *Default*: If you do not specify this parameter, it does not force a filler instance. *Data_type*: bool, optional
`-filler_orient r0 | r90 | r180 | r270 | mx | mx90 | my | my90`	
	Specifies the orientation value of the filler cell. The orientation value can be r0, r90, r180, r270, mx, mx90, my, or my90. Default: `r0` *Data_type*: string, optional
`-from` *`coord`*	Specifies the coordinates of a specified starting range where I/O filler cells are added. The values are in micrometers. *Data_type*: float, optional
`-help`	Outputs a brief description that includes type and default information for each `add_io_row_fillers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_io_row_fillers`
`-ignore_site_type`	Ignores the I/O row site type. *Data_type*: bool, optional
`-io_row` *`name`*	Specifies the name of the I/O row to add the filler cell. *Data_type*: string, optional
`-logic`	Adds logical I/O fillers to net list in top module. *Data_type*: bool, optional
`-power_domain` *`power_domain_name`*	
	Adds I/O filler instances to the I/O rows associated with the specified power domain. *Data_type*: string, optional
`-prefix` *`prefix`*	Specifies the prefix name to be appended for the added I/O row filler cell. *Data_type*: string, optional
`-to` *`coord`*	Specifies the coordinates of a specified ending range where I/O row filler cells are added. The values are in micrometers. *Data_type*: float, optional
`-use_small_io_height`	Specifies that the filler cell should be inserted between I/O pads only when the smallest I/O pad has the same height as the height of the filler cell. For example, consider that there are I/O pads A, B, C, D, and E. Out of these, A, B, and E are the same height, and C and D have a height double that of A, B, and E. Assume that you want to insert an I/O filler cell F, which has the same height as A, B, and E. If you do not specify the `-use_small_io_height` parameter, the cell F will be inserted between A and B, B and C, C and D, and D and E. However, if you specify the `-use_small_io_height` parameter, the cell F will be inserted between A and B, B and C, and D and E. However, the cell will not be inserted between C and D, because both C and D have a height different from F. *Data_type*: bool, optional

Example

- The following command adds I/O instances to the I/O pad area on all sides wherever there is space between existing I/O pads. The added I/O pad filler instance names have a prefix PAD8.

```
add_io_row_fillers -cells PAD8 -prefix PAD8
```

add_physical_cell

```
add_physical_cell
[-help]
[-cell string]
[-generate_template_only string]
[-input_file filename]
[-insert_row_area_boundary]
[-average_window | { [-insert_near_boundary ] [-box {x1 y1 x2 y2}] [-minimal_number_of_tcd integer]}]
[-verify_window {x y}[ [-verify_only ][-x_step double] [-y_step double] ] ]
```

Provides a flexible way to insert and check physical cells. It can be used to assign a specific area for physical insertion, not only the die area.

Note: The `add_physical_cell` command is suitable for inserting physical cells as a pattern. The class of these cells must be block and not core. The `add_physical_cell` command is not when the class of the physical cells is core and there is no requirement for inserting cells in a pattern.

Parameters

`-average_window`	When specified, it changes the window calculation approach to average. The size of windows for inserting cell is the average of the core box. The insertion will be done not exactly in accordance with the size defined in spec file.  *Data_type*: bool, optional
`-box {x1 y1 x2 y2}`	Specify the bounding box of the physical cell in `x1 y1 x2 y2`. For example, the following command inserts the cell DTCDCELL in the (*x1 y1 x2 y2)* box. `add_physical_cell -cell DTCDCELL -input_file SPECFILE -box {x1 y1 x2 y2}`  *Data_type*: box, optional
`-cell string`	Specify the physical cell name. *Data_type*: string, optional

`-generate_template_only` *string*	Generates a template file to guide how to define spec file for DTCD, ICOVL and LinerCell. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `add_physical_cell` parameter. For a detailed description of the command and all of its parameters, use the man command: `man add_physical_cell`

`-input_file` *filename*	Specify the spec file for physical cells.
	Note: The inserted physical cells must be specified in a spec file. This file specifies the information related to the dimensions and spacing physical cells. The tool will insert physical cells according to these specifications.
	Here is an example of a spec file:
	`**********`
	`DTCD Cell cell_name`
	`WinSizeX  # x dimension of DTCD insertion grid box`
	`WinSizeY  # y dimension of DTCD insertion grid box`
	`MacroSpacing  # spacing between DTCD cell and macro`
	`DTCDSpacing  # spacing between DTCD cells`
	`PlaceBlockSizeX  # x dimension of padded placement blockage around DTCD cell`
	`PlaceBlockSizeY  # y dimension of padded placement blockage around DTCD cell`
	`RouteBlockSizeX  # x dimension of padded routing blockage around DTCD cell`
	`RouteBlockSizeY  # y dimension of padded routing blockage around DTCD cell`
	`End`
	`**********`
	Data_type: string, optional

`-insert_near_boundary`	Inserts physical cells near boundary.
	Note: When the window size is not exactly divided by gridbox size, you may not get physical cells near boundary.
	For example:
	`add_physical_cell -cell DTCDCELL -input_file SPECFILE`
	 	No physical cells near boundary, for the window size could not be exactly divided by gridbox size.
	`add_physical_cell -cell DTCDcell -input_file SPECFILE -insert_near_boundary`
	 	Additional physical cells are inserted near boundary
	Data_type: bool, optional

`-insert_row_area_boundary`	Inserts LinerCell around row area boundary. *Data_type*: bool, optional
`-minimal_number_of_tcd` *integer*	Specifies the the minimal number of DTCD that must be inserted. If the current windows size definition (*WinSizeX* and *WinSizeY*) cannot fit this requirement, the window size is shrunk automatically. *Data_type*: int, optional

`-verify_only`	Only verifies the physical cells to inserted. It does not actually insert them.
	Note: The `-verify_window`, `-x_step`, and `-y_step` parameters are used to specify the size of the window to verify.
	For example:
	`add_physical_cell -cell DTCDCELL -input_file SPECFILE -verify_window 100 100 -x_step 100 -y_step 100 -verify_only`
	 	Only verify the physical cell in gridbox, do not insert.
	`add_physical_cell -cell DTCDCELL -input_file SPECFILE -verify_window 100 100 -x_step 100 -y_step 100`
	 	Verify and insert the physical cells
	Data_type: bool, optional

`-verify_window {`*x y*`}`	Specifies the size of window for verifying the physical cells to be inserted. *Data_type*: point, optional
`-x_step` *double*	Specifies the x step of the verify window. *Data_type*: double, optional

`-y_step` *double*	Specifies the y step of the verify window. *Data_type*: double, optional

Example

- The following command inserts the cell DTCDCELL in the *(x1 y1 x2 y2)* box based on the spec specified in the SPECFILE.
  ```
  add_physical_cell -cell DTCDCELL -input_file SPECFILE -box {x1 y1 x2 y2}
  ```
- The following command only verifies the cell DTCDCELL in the grid box. It does not insert the cell.
  ```
  add_physical_cell -cell DTCDCELL -input_file SPECFILE -verify_window 100 100 -x_step 100 -y_step 100 -verify_only
  ```

align_selected

```
align_selected
[-help]
-side {right | left | center | top | bottom | middle}
[-refer_to_first]
[-mix]
```

Aligns objects (instances, modules, or blockages) vertically or horizontally in the floorplan. Use this command after selecting two or more objects in the design display area.

Parameters

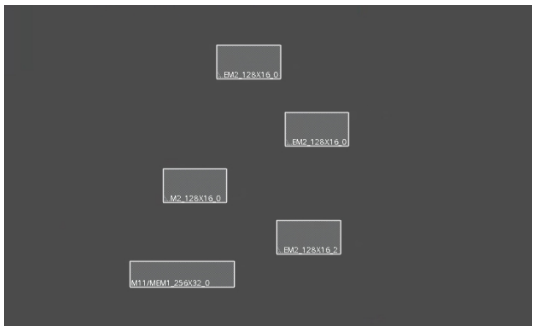
`-help`	Outputs a brief description that includes the type and default information for each `align_selected` parameter. For a detailed description of the command and all of its parameters, use the man command: `man align_selected`
`-mix`	Considers all the selected objects together while aligning them. *Data_type:* bool, optional
`-refer_to_first`	If you specify this option, the first selected object is the reference object. *Data_type:* bool, optional
`-side {right | left | center | top | bottom | middle}`	
	Specifies the vertical and horizontal alignment for the selected objects. Choose one of the following: • `right`: Specifies vertical right alignment. • `left`: Specifies vertical left alignment. • `center`: Specifies vertical center alignment. • `top`: Specifies horizontal top alignment. • `bottom`: Specifies horizontal bottom alignment. • `middle`: Specifies horizontal middle alignment. *Data_type:* string, required

Example

- The following command aligns the selected objects (Block) vertically to the left:

```
align_selected -side left
```

Before:

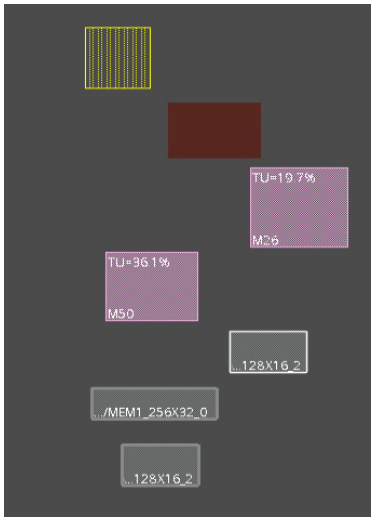


After:

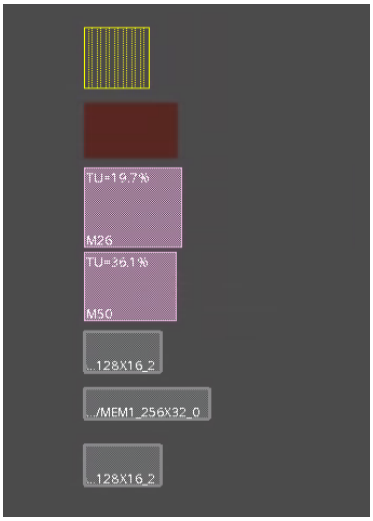
- The following command aligns the selected objects (Blockage、Module、Block) vertically to the left：

```
align_selected -side left -mix
```

Before:



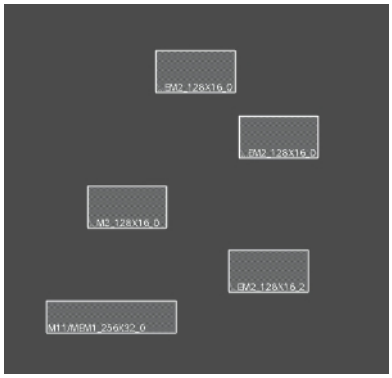
After:



- The following command aligns the selected objects (Block) vertically to the left：

```
alignObject -side left -referToFirst
```

Before：



After：

check_floorplan

```
check_floorplan
[-help]
[-out_file file_name]
[-report_density]
```

Checks the quality of the floorplan to detect potential problems before the design is passed on to other tools. This highlights the cells in the design display area with violation markers, where applicable. Use this command after specifying the floorplan data or running an initial floorplan. Run check_floorplan on your final floorplan file.

Notes:

- The `floorplan` category attributes that you define are used automatically whenever you run the `check_floorplan` command.
- Innovus honors the FinFET grid and automatically checks for the FinFET definition. If it detects a FinFET definition it enables support and sets the placement grid as FinFET grid by default. Since the height of all placeable objects must be a multiple of FinFET grid and the origin of these objects must be snapped to the FinFET grid. The check_floorplan command checks if all the supported objects (die box, core box, standard cell rows, I/O rows, blocks, IO pads, and standard cells) are aligned with FinFET grid and reports DRC violations.
- The `check_floorplan` command can check if the row's orientation is correct according to related tech site's SYMMETRY definition. It flags when Y SYMMETRY is missing from techlef CORE site definition.
- The `check_floorplan` command checks the pin snapping result.
  - For min width pins, it checks whether the pin center is snapped to the routing track with the same color.
  - For fat pins, it checks whether the pin center is snapped to the routing track and decides if the pin center should snap to the same or opposite colored routing track.
- The `check_floorplan` command checks if power stripes are on routing track for 10nm DPT layers (Metal1, Metal2, Metal3). It also checks power vias upper and lower metal shapes if they are not entirely covered by other power stripes on the same layers. Additionally it also checks if multi-height rows conflict with PG rails. In case of a conflict, a violation is reported.
- You can use the `check_floorplan` command to check if there are any existing overlaps between group boxes and power domain boxes as the box for a group should not physically overlap with the box for a power domain.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_floorplan`
`-out_file file_name`	Outputs detailed information for the specified checks. *Data_type:* string, optional
`-report_density`	Reports target utilization (TU) and effective utilization (EU) for the entire design, fences, and regions (partitions, power domains, and regular fences). *Data_type:* bool, optional

Example

- The following command checks the floorplan and writes the detailed information to the details.txt file. It also reports the final core utilization:
  ```
  check_floorplan -out_file details.txt -report_density
  ```

Related Information

- `floorplan` Category Attributes
- `check_design`
- `check_floorplan_space`
- `create_floorplan`
- Floorplanning the Design chapter in the *Innovus User Guide*

check_floorplan_space

```
check_floorplan_space
[-help]
[-out_file filename]
[-in_file filename | -track_utilization layer_id value layer_id value ...]
[-clear_markers]
```

Checks the floorplan for spacing rule violations and saves the violation information in a report. A marker is displayed at each violation spot. You can use the command at any point in the design flow.

Parameters

`-clear_markers`	Clears all space violation markers. *Data_type*: bool, optional
`-in_file filename`	Specifies the file that contains the spacing rules. A constraint file is a text file that can contain a list of seeds to use when generating fences and module guides, and basic relative, spacing and orientation constraints to follow during macro placement. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `check_floorplan_space` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_floorplan_space`
`-out_file filename`	Writes the spacing rule violation information to the specified file. *Data_type*: string, optional
`-track_utilization layer_id value layer_id value ...`	
	Specifies the track utilization value on each routing layer from bottom to top, for example, `Metal1 value Metal2 value`. If the layer track utilization value is not specified, the default value is used. **Note:** The `check_floorplan_space` command supports the model based space checker. It takes user provided track utilization numbers and technology information stored in the LEF file to estimate required minimum channel width between placed macros. This estimated minimum channel width (demand) is then compared to actual channel width (supply) in floorplan. A violation marker is displayed in GUI over the channel in which the supply is less than the demand. *Data_type*: list, optional

Related Information

check_macro_lower_left_on_track

```
check_macro_lower_left_on_track
[-help]
-use_layer_offset
-use_m2_m3_track
```

By default, checks whether the lower left coordinates (x1, y1) of hard macros are at the intersection of M1/M2 tracks, and reports an error in Innovus if they are not. This is based on the assumption that Ml1 and M2 are both specified in opposite directions in a 65nm process. You can use this command after the floorplan is ready and want to make sure hard macro is on tracks.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_macro_lower_left_on_track` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_macro_lower_left_on_track`
`-use_layer_offset`	Checks pin alignment in a block against the layer offset of the design library. *Data_type*: bool, optional
`-use_m2_m3_track`	Checks the location of the macro against M2/M3 tracks if both M1 and M2 are specified in the same horizontal direction in a 40nm process. *Data_type*: bool, optional

Example

- The following command checks whether the lower left coordinates (llx, lly) of hard macros are at the intersection of Metal1/Metal2 tracks:
  ```
  check_macro_lower_left_on_track -use_layer_offset -use_m2_m3_track
  ```

Related Information

- `check_macro_place_constraint`
- `set_macro_place_constraint`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

check_macro_place_constraint

```
check_macro_place_constraint
[-help]
```

Checks the constraints of macros which will be honored during the macro placer. To define the constraints of macros, use the `set_macro_place_constraint` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_macro_place_constraint`

Related Information

check_ufc

```
check_ufc
[-help]
fileName
[-include_all_rules]
[-report_file string]
[-report_unplaced_block]
[-selected_rules string]
```

Checks the floorplan based on the user specified UFC rules defined in the UFC file and reports violations. These violations can be seen in the *Violation Browser*.

Note: The Unified Floorplan Constraints (UFC) methodology is a powerful Innovus capability that can define several rules on floorplan objects, check specified rules, and report the violations with rule name as well as severity. The violations can be shown in the violation browser. UFC also provides the ability to automatically fix specific violations. It can add routing blockages, snap macro location, adjust core shape to fix corresponding violations. In addition, UFC also provides the ability to exclude rules from checking for specified objects.

Usage Model:

- Load the Design.
- Create a UFC file with floorplan rules.
- Run UFC checking. (`check_ufc`)
- Fix reported violations. (`fix_floorplan`)

Note: The check_ufc command honors the `floorplan_no_cut_row` attribute that specifies if rows are not required to be cut before operations. With `floorplan_no_cut_row false` or not specified, the `check_ufc` command will work based on the current row shape. If there are rules for rows in the UFC file and the rows are not cut before, there will be many wrong violations reported out. So the rows for objects like insts, place blockages are expected to cut out before using the `check_ufc` command. If rows are not cut before the check_ufc command is run, with `floorplan_no_cut_row true`, the tool identifies the rows have not been cut before. It calls the `split_row` command to get a cut row shape during the `check_ufc` command. The `split_row` command cuts the rows for insts, hinsts, place blockages, route blockages, power domains, groups, or bumps by default. The check_ufc command will work based on the cut row shape. The actual row shape is not changed after these operations. You can still get the expected check result for row's rule without running the `split_row` before.

Parameters

fileName	Specifies the name of file containing the rules or constraints. *Data_type*: string, required
-help	Prints a brief description that includes type and default information for each `check_ufc` parameter. For a detailed description of the command and all of its parameters, use the man command: `man check_ufc`
-include_all_rules	Enables the tool to report the summary of violations for all rules. *Data_type*: bool, optional
-report_file *string*	Specifies the name of the file that saves the report summary. *Data_type*: string, optional
-report_unplaced_block	Enables the tool to show the number of unplaced macros in summary. *Data_type*: bool, optional

-selected_rules *string*	Specifies that only the selected rules will be checked.
	Note: The `-selected_rules` parameter supports the variable format for specifying the rule list.
	For example, you can define a rule in the UFC file and then use the `check_ufc` command to check the rule.
	`set sanity_rules 'A C'`
	`check_ufc file.ufc -selected_rules $sanity_rules`
	Here, rule A and C will be checked
	Data_type: string, optional

Example

- The following command checks the floorplan based on the *DMTB_ENC.ufc* file that contains the user specified UFC rules:

```
check_ufc DMTB_ENC.ufc
```

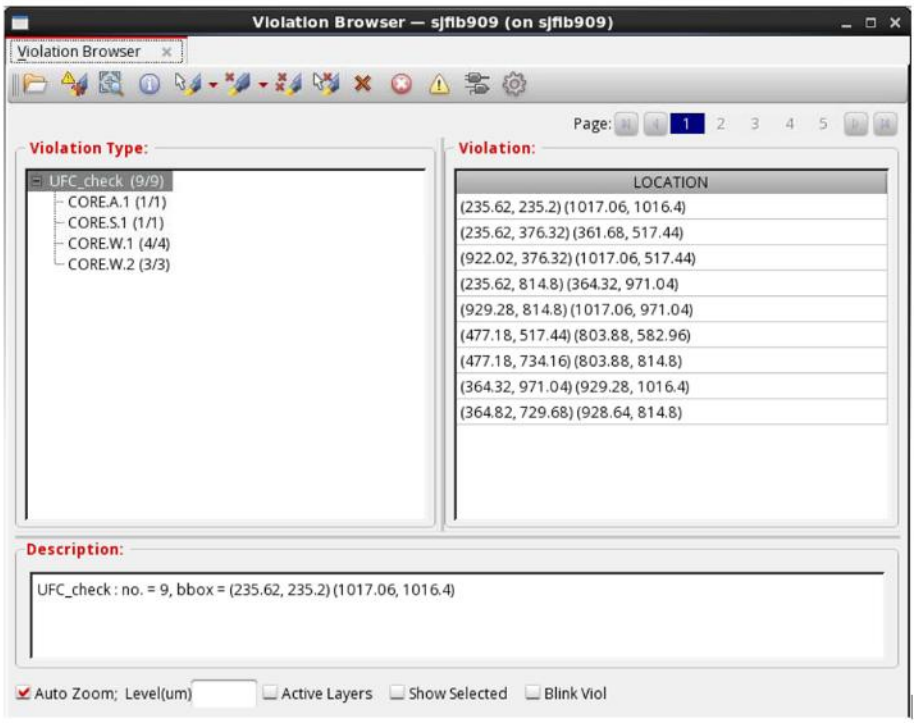
The input UFC file is like this:

```
set_area_rule -name CORE.A.1 -obj [available_sites] {.area < 500} \
  -description {The area of available sites should be lesser than 500}
set_width_rule -name CORE.W.1 -obj [available_sites] -direction horizontal -type simple {.width > 200} \
  -description {The horizontal simple width of available sites must be larger than 200}
set_width_rule -name CORE.W.2 -obj [available_sites] -direction vertical -type simple {.width > 100} \
  -description {The vertical simple width of available sites must be larger than 100}
set_spacing_rule -name CORE.S.1 -obj [base_cells -if {.name ==ram_256x16A}] -ref [base_cells -if {.name == rom_512x16A}] -direction
vertical {on_grid (.spacing-0.1,0.2)} \
  -description {The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1}
set_spacing_rule -name CORE.S.2 -obj [base_cells -if {.name ==rom_512x16A}] -ref [base_cells -if {.name == ram_128x16A}] -direction
vertical {.spacing > 10} \
  -description {The vertical spacing between macro rom_512x16A and ram_128x16A must larger than 10}
```

Following is an example of report summary of UFC checking after running the check_ufc command. The violations can be seen in the Violation Browser.

```
-------------------------Summary of UFC Checking ---------------------------------------
RuleName Count  Description                                                          ViolatedObjects
........ .....  ............................                                         ..........................
CORE.A.1   1    The area of available sites should be lesser than 500                available_sites
CORE.S.1   1    The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1
 DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST
CORE.W.1   4    The horizontal simple width of available sites must be larger than 200   available_sites
CORE.W.2   3    The vertical simple width of available sites must be larger than 100     available_sites
```

The violations can be seen in the Violation Browser.



- The following command checks the floorplan based on the *DMTB_ENC.ufc* file and includes all the rules:

```
check_ufc -include_all_rules
```

Following is an example of report summary:

```
-------------------------Summary of UFC Checking ---------------------------------------
RuleName Count  Description                                                          ViolatedObjects
........ .....  ............................                                         ........................
CORE.A.1   1    The area of available sites should be lesser than 500                available_sites
CORE.S.1   1    The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1
 DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST
CORE.W.1   4    The horizontal simple width of available sites must be larger than 200    available_sites
CORE.W.2   3    The vertical simple width of available sites must be larger than 100     available_sites
CORE.S.2   0    The vertical spacing between macro rom_512x16A and ram_128x16A must be larger then 10
```

- The following command checks the floorplan based on the *DMTB_ENC.ufc* file and includes all the rules:
  ```
  check_ufc -include_all_rules -report_unplaced_block
  ```

  Following is an example of report summary:

  ```
  -------------------------Summary of UFC Checking ---------------------------------------
  RuleName Count  Description                                                          ViolatedObjects
  ........ .....  ............................                                         ........................
  CORE.A.1   1    The area of available sites should be lesser than 500                available_sites
  CORE.S.1   1    The vertical spacing between macro ram_256x16A and rom_512x16A must be 0.2*n + 0.1
   DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST
  CORE.W.1   4    The horizontal simple width of available sites must be larger than 200    available_sites
  CORE.W.2   3    The vertical simple width of available sites must be larger than 100     available_sites
  CORE.S.2   0    The vertical spacing between macro rom_512x16A and ram_128x16A must be larger then 10
  **WARN: (IMPFP - 10100): There are 1 unplaced blocks. { DTMF_INST/PLLCLK_INST}. Tool doesn't check and fix violations for these blocks.
  ```

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

convert_fence_to_lef

```
convert_fence_to_lef
[-help]
hinst
[partition_cell]
```

Converts a specified hierarchical instance or partition name to a LEF block. Use this command after floorplanning the design.

Note: This command runs `commit_partitions` and `write_partitions` for the specified partition as if it was at the top-level. This will overwrite any partition or hierarchical instance that is specified in the .lef file in the top partitioned subdirectory. In addition, the *ptnname.def* file will overwrite the partition's *ptn.def* subdirectory file.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `convert_fence_to_lef` parameter. For a detailed description of the command and all of its parameters, use the man command: `man convert_fence_to_lef`
hinst	Specifies the hierarchical instance cell name. *Data_type*: string, required
partition_cell	Specifies the partition name. If this is not specified, the command uses the hierarchical instance cell name as the partition name. *Data_type*: string, optional

Example

The following command converts the results_conv hierarchical instance to a LEF block.

```
convert_fence_to_lef results_conv
```

Related Information

- `commit_partitions`
- `write_partitions`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

copy_obj

```
copy_obj
[-help]
```

Copies the selected placement or routing blockages. Use the `paste_obj` command to paste the copied object to the required location. You can use the `copy_obj` command any time after floorplanning the design. You can also copy selected placement and routing blockages from the GUI by using the Copy tool. To access the Copy tool, choose *Edit - Copy* from the menu bar or press `F3` after clicking the *Copy* widget ( ) on the toolbar.

Note: The `copy_obj` command currently works only for placement and routing blockages. Use the `edit_copy` command to copy wires or vias.

Parameters

`-help`	Prints a brief description of the `copy_obj` command. For a detailed description of the command, use the man command: `man copy_obj`

Related Information

- `paste_obj`
- `edit_copy`
- `move_obj`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

create_boundary_constraint

```
create_boundary_constraint
[-help]
[-floating]
-type {fence region guide cluster}
{-hinst hinst_name | -group group_name}
[-rects {{x1 y1 x2 y2} ...} | -polygon {{x1 y1} {x2 y2} ...}]
```

Creates a boundary constraint for an hinst or a group. Use this command after importing the design.

Parameters

`-floating`	Creates a floating boundary constraint. **Note:** It does not support rectilinear shapes. **Note:** You can use the `-floating` parameter for the `fence` or `region` type of instance groups only. The floating region/fence constraint allows the entire region/fence to move as a cluster across the core area. *Data_type*: bool, optional
`-group group_name`	Specifies the name of the group for which to add the boundary constraint. *Data_type*: (group), optional
`-help`	Outputs a brief description that includes the type and default information for each `create_boundary_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_boundary_constraint`
`-hinst hinst_name`	Specifies the name of the hinst for which to add the boundary constraint. *Data_type*: (hinst), optional
`-polygon {{x1 y1} {x2 y2} ...}`	Specifies the vertices of the polygon boundary, in microns. *Data_type*: (point)+, optional
`-rects {{x1 y1 x2 y2} ...}`	Specifies the vertices of the rectangular boundary, in microns. • *x1*: Specifies the lower left x coordinate of the boundary. • *y1*: Specifies the lower left y coordinate of the boundary. • *x2*: Specifies the upper right x coordinate of the boundary. • *y2*: Specifies the upper right y coordinate of the boundary. *Data_type*: (rect)+, optional
`-type {fence region guide cluster}`	Specify the type of the boundary constraint to create. You can specify: • `fence`: Specify to create a fence. • `region`: Specify to create a region. • `guide`: Specify to create a guide. • `cluster`: Specify to create a cluster. **Note:** A cluster (also called softGuide) is similar to a guide constraint except there are no fixed locations. This provides stronger grouping for the instances under the same soft guide. *Data_type*: enum, optional

Example

- The following command creates a fence constraint for hierarchical instance SH17 at the specified location:
  ```
  create_boundary_constraint -hinst SH17 -type fence -rects {100 100 4898 4898}
  ```
- The following command creates a guide constraint for group adder1 at the specified location:
  ```
  create_boundary_constraint -group adder1 -type guide -rects {834.2000 1012.0000 2498.4000 3087.0000}
  ```
- The following command creates a cluster constraint for a hierarchical instance:
  ```
  create_boundary_constraint -hinst top/sub_module1/sub_sub_module2 -type cluster
  ```

Related Information

  - Module Constraint Types

create_bump_grid

```
create_bump_grid
[-help]
-grid_name string
-layers string
-origin {x y}
-pitch {x y}
```

Creates a bump grid. A bump grid is a grid for bump/TSV placement that helps in guiding bump placement and bump alignment.

Note:

- When you use the `write_partitions` command, the tool recalculates the offset so that a bump can be aligned after assemble.
- The write_floorplan command saves the bump grid definition into *.fp file.
- The read_floorplan command loads the bump grid file while reading the design.

Parameters

`-grid_name string`	Specifies the bump grid name. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `create_bump_grid` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_bump_grid`
`-layers string`	Specifies the layer names. You can specify the layer of a relative bump pin for this option. *Data_type*: string required
`-origin {x y}`	Specifies the coordinates of the origin of the bump grid. *Data_type*: point, required
`-pitch {x y}`	Specifies the spacing between two bumps. The first value (x) defines the horizontal spacing and the second value (y) defines the vertical spacing. *Data_type*: point, required

Example

- The following command creates a bump grid named myGridFront_9x9:

```
create_bump_grid -grid_name myGridFront_9x9 -layers {UBM UBM1} -origin {50 50} -pitch {9 9}
```

Related Information

- `delete_bump_grid`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

create_exclusive_groups

```
create_exclusive_groups
[-help]
[group_name]
[-gap double]
[-min_gap double]
[-exclusive_groups string | -mutually_exclusive_groups string]
```

Creates exclusive regions. Exclusive regions specified for a particular group cannot be placed/overlapped with it but they can overlap on each other/ any other region in the core area.

Sample Script

Following is a sample script to create exclusive groups:

```
create_group $group_name -type region
update_group -name $group_name -add -objs insts
create_group $group_name1 -type region
update_group -name $group_name1 -add -objs insts
create_exclusive_groups $group_name -exclusive_groups {$groups_name1}
```

Parameters

`-exclusive_groups string`	Specifies the groups/regions that cannot be placed/overlapped with the specified group name. For Example: If regions B,C,D are defined as exclusive regions to A. Instances from B,C,D can never be placed on A. Other regions which are not defined exclusive to region A can be placed or overlapped with region A. *Data_type*: string, optional
`-gap double`	Specifies the value of the gap, in microns, that is maintained among the exclusive groups. *Default*: 5 (microns) *Data_type*: double, optional
`group_name`	Specifies the name of the created group. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_exclusive_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_exclusive_groups`
`-min_gap double`	Specifies the value of the minimum gap, in microns, that is maintained among exclusive groups. *Data_type*: double, optional
`-mutually_exclusive_groups string`	Specifies the groups which need to be excluded with each other. You can independently use this option to specify and create multiple mutually exclusive groups. **Note:** If a group has already been defined as an exclusive groups, then a second setting for this group using the `create_exclusive_groups` command will give display an error that suggests you to reset the exclusive groups attributes to default value. If you want to create mutually exclusive groups, then reset the exclusive groups attributes using the `delete_exclusive_groups` command and then create the mutually exclusive groups using the `create_exclusive_goups -mutually_exclusive_groups` command. *Data_type*: string, optional

Examples

- The following commands define `gr_300` as an exclusive region to gr_200:

```
create_group gr_200 -type region
update_group gr_200 DTMF_INST/TDSP_CORE_INST/EXECUTE_INST/acc_reg*
create_group gr_300 -type region
update_group gr_300 DTMF_INST/TDSP_CORE_INST/EXECUTE_INST/top_reg_*
create_exclusive_groups gr_200 -exclusive_groups gr_300
```

- The following commands defines instance groups A, B, C to be mutually exclusive groups with a space of 10 microns between each other.

```
create_exclusive_groups -mutually_exclusive_groups {A B C} -gap 10
```

Related Information

- `create_group`
- `update_group`
- `delete_exclusive_groups`

create_floorplan

```
create_floorplan
[-help]
[-core_margins_by {io | die}]
[-die_size_by_io_height {min |max}]
[-flip {f | s | n}]
[-floorplan_origin {center | llcorner}]
[-match_to_site]
[-no_resize]
[-no_snap_to_grid]
[-overlap_same_site_row]
{-box_size {die_box io_box core_box} |
-core_size {w h left bottom right top} |
-die_size {w h left bottom right top} |
-core_density_size {aspect_ratio [row_density [left bottom right top]]} |
-stdcell_density_size {aspect_ratio [std_cell_density [left bottom right top]]} |
-keep_shape_density util}
[-site name | -site_only name]
```

Specifies the floorplan dimensions by size; or by die, I/O, or core coordinates. The `create_floorplan` command initializes the floorplan and calls the `add_tracks` command to create new routing tracks. By default the `add_tracks` command calculates the optimum spacing between tracks and ignores the pitch values in the tech LEF. When you use the *Specify Floorplan* form (or specify the floorplan through the floorplan command), the floorplan is resized automatically - relatively floorplan constraints are automatically derived on the fly for blocks, fixed standard cells, fixed pre-routes, and blockages. The floorplan is linearly adjusted as follows:

- Spacing among blocks is evenly adjusted
- The size of the modules and black boxes is evenly adjusted.
- The fixed pre-routes and I/Os are automatically adjusted.

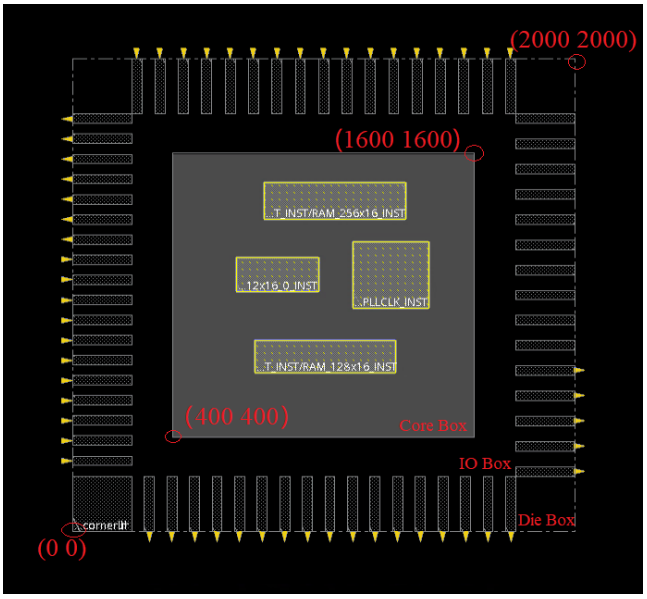
Note: The `create_floorplan` command checks if the specified IO box and core box is within limits of die box and displays an error message if they are outside the die box.

Parameters

`-box_size {die_box io_box core_box}`

Specifies all three boxes of the floorplan, `die_box`, `io_box`, `core_box`. The following command creates floorplan by specifying a core box size of 1200 x 1200,io box size of 1600 x 1600 and die box size of 2000 x 2000.

```
create_floorplan -box_size {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600}
```



Data_type: list, required

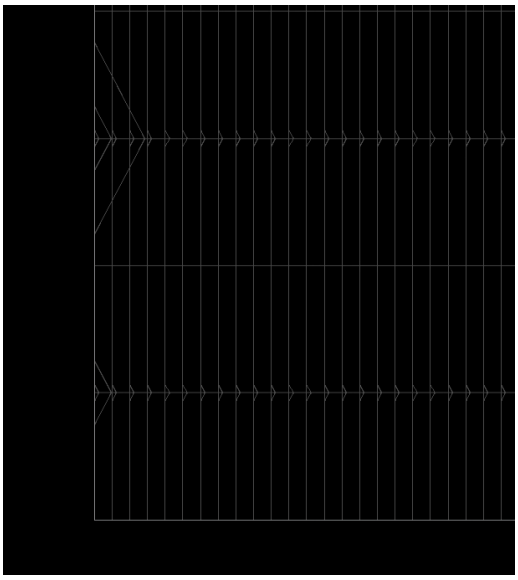
`-core_density_size {aspect_ratio [row_density [left bottom right top]]}`

	Specifies the chip's core dimensions as the ratio of the height divided by the width. If a value of 1.0 is used, a square chip is defined. A value of 2.0 will define a
	rectangular chip with height dimension that is twice the width dimension.
	• *aspect_ratio*: Specifies the aspect ratio value.
	• *row_density*: Specifies a row density value.
	`row_density = (std area + block/macro area) / core area`
	• *left*: Specifies the margin from the outside edge of the core box to the left.
	• *bottom*: Specifies the margin from the outside edge of the core box to the bottom.
	• *right*: Specifies the margin from the outside edge of the core box to the right.
	• *top*: Specifies the margin from the outside edge of the core box to the top.
	The following command creates floorplan by specifying the core dimensions aspect ratio of 1.0,row density of 0.5,and the spacing between core edge to each io box edge of 300.
	`create_floorplan -site tsm3site -core_density_size {1.0 0.5 300 300 300 300} -core_margins_by io`
	 	
	Data_type: list, required

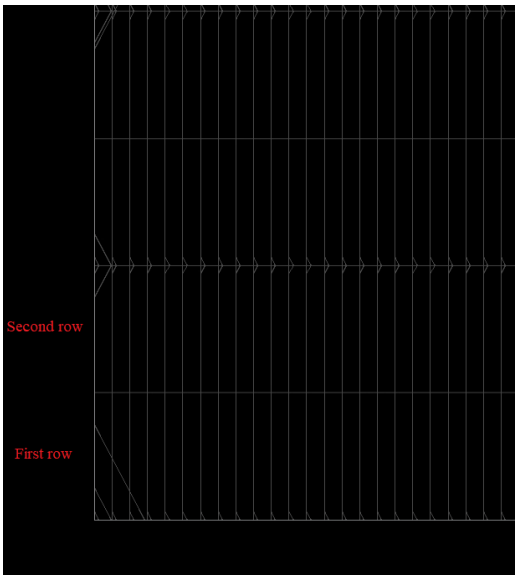
`-core_margins_by {io | die}`	
	Specifies whether the core margins are calculated using the core-to-IO boundary or the core-to-die boundary. *Default*: `io` *Data_type*: enum, optional
`-core_size {w h left bottom right top}`	

	Specifies the core size and the spacing, in micrometers, between the core edge, which is the margin between the outside edge of the core (head) box. • *w*: Specifies the core box's width value. • *h*: Specifies the core box's height value. • *left*: Specifies the margin from the outside edge of the core box to the left. • *bottom*: Specifies the margin from the outside edge of the core box to the bottom. • *right*: Specifies the margin from the outside edge of the core box to the right. • *top*: Specifies the margin from the outside edge of the core box to the top. The following command creates floorplan by specifying a core size of 1000 x 1000, and the spacing between core edge to each die edge of 300. `create_floorplan -site tsm3site -core_size{1000 1000 300 300 300 300} -core_margins_by die`  *Data_type*: list, required
-die_size {w h left bottom right top}	

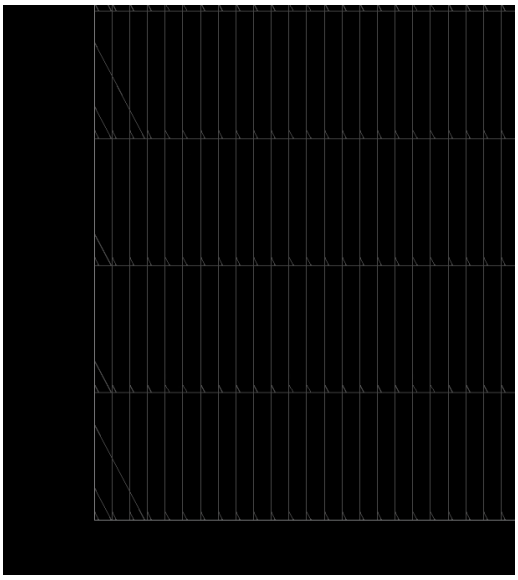
	Specifies the die size and the spacing, in micrometers, between the die edge, which is the margin between the outside edge of the die. • *w*: Specifies the die's width value. • *h*: Specifies the die's height value. • *left*: Specifies the margin from the outside edge of the core to the left of the I/O boundary. • *bottom*: Specifies the margin from the outside edge of the core to the bottom of the I/O boundary. • *right*: Specifies the margin from the outside edge of the core to the right of the I/O boundary. • *top*: Specifies the margin from the outside edge of the core to the top of the I/O boundary. The following command creates floorplan by specifying a die box size of 1500 x 1500,and the spacing between core edge to each die edge of 300. `creat_floorplan -die_size {1500 1500 300 300 300 300}`  *Data_type*: list, required
`-die_size_by_io_height {min | max}`	
	Specifies whether the maximum I/O height or the minimum I/O height should be used for die size calculation. *Default*: `min` *Data_type*: string, optional
`-flip {f | s | n}`	
	Specifies the orientation of the bottom row in the core area. • `f`: Specifies that the first row flips from the bottom up. • `n`: Specifies no row flipping. • `s`: Specifies that the second row flips from the bottom up. `create_floorplan -box_size {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600} -flip f`



```
create_floorplan -box_size {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600} -flip s
```



```
create_floorplan -box_size {0 0 2000 2000 200 200 1800 1800 400 400 1600 1600} -flip n
```



Default: `f`

Data_type: enum, optional

`-floorplan_origin {center | llcorner}`	
	Specifies whether the origin of the floorplan should be at the center or at the lower left corner. *Default*: `llcorner` (lower left corner) *Data_type:* enum, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_floorplan`
`-keep_shape_density` *`util`*	Specifies the target utilization after resize. *Data_type:* float, required
`-match_to_site`	Adjusts the width of the die area such that it is an integer multiple of the width of the IO site or core site. *Data_type*: bool, optional
`-no_resize`	Checks if there is a need to do floorplan if everything is the same. *Data_type*: bool, optional
`-no_snap_to_grid`	Specifies that the core box (or die box) boundary will not be snapped to the nearest metal pitch even if the if the specified die/ core box size is not an integer multiple of the smallest metal pitch. This prevents the input floorplan boxes from being changed. *Data_type*: bool, optional

`-overlap_same_site_row`	Specifies that same-site rows can overlap with one another. Single height rows must not overlap. Only double or multiple-height rows can overlap, and in sections that are multiple of single height any other overlap section size will cause the rows to be ignored. Example: `create_floorplan -core_size {1000 1000 300 300 300 300} -overlap_same_site_row` Before:  After:  *Data_type*: bool, optional

`-site name`	Specifies a core row site. *Data_type*: (site), optional
`-site_Only name`	Creates rows only for the specified site. *Data_type*: (site), optional
`-stdcell_density_size {aspect_ratio [std_cell_density [left bottom right top]]}`	

	Determines the core and module sizes by standard cell density.
	• *aspect_ratio*: Specifies the aspect ratio value.
	• *std_cell_density*: Specifies a standard cell density value.
	`std_cell_density = std cell area/(core area - block/macro area)`
	• *Left*: Specifies the margin from the outside edge of the core box to the left.
	• *Bottom*: Specifies the margin from the outside edge of the core box to the bottom.
	• *Right*: Specifies the margin from the outside edge of the core box to the right.
	• *Top*: Specifies the margin from the outside edge of the core box to the top.
	The following command creates floorplan by specifying the core dimensions aspect ratio of 1.0,standard cell density of 0.5,and the spacing between core edge to each io box edge of 300.
	`create_floorplan -stdcell_density_size {1.0 0.5 300 300 300 300}`
	 	
	Data_type: list, required

Examples

- The following command creates floorplan by specifying a core size of 1000 x 1000, and the spacing between core edge to each die edge of 300.
  `create_floorplan -site tsm3site -core_size {1000 1000 300 300 300 300} -core_margins_by die`
- The following command creates floorplan by specifying the core dimensions aspect ratio of 1.0, core density of 0.5, and the spacing between core edge to each io box edge of 300.
  `create_floorplan -site tsm3site -core_density_size {1.0 0.5 300 300 300 300} -core_margins_by io`
- The following command creates a new floorplan containing all the sites in the original floorplan
  `create_floorplan -core_size {...}`
- The following command automatically shrinks or expands the block-level floorplan boundary, proportionally, in the X and Y directions, trying to meet the specified target core utilization 75.
  `create_floorplan -keep_shape_density 75`

create_group

```
create_group
[-help]
[-floating]
[-is_physical_hier]
-name group_name
[-type {fence region guide cluster}]
[-density value [-aspect_ratio value]]
[-rects {{x1 y1 x2 y2} ...} | -polygon {{x1 y1} {x2 y2} ...}]
```

Creates a new instance group, even outside the core boundary. Use this command after importing the design.

Note: Groups are used to create a new logical hierarchy unit, and normally all power domains associate with a group which always have a boundary constraint fence. The boundary constraint fence means a standard cell belonging to this group cannot be placed outside and only a standard cell belonging to this group can be placed inside. Cadence recommends that this physical-logical coherence should not be violated. The coherence requirement does not only apply for groups, but also pertains to all hinsts and groups as long as they have boundary constraint fence.
In other words, if fence A belongs to fence B in logical, then fence A must be placed inside fence B.

Parameters

`-aspect_ratio value`	Specifies the aspect ratio. If this is not specified, 1 is the default. *Data_type*: float, optional
`-density value`	Specifies a placement density percentage. Use the decimal format, where 0.75 is for 75% density. *Minimum*: `0` *Maximum*: `1` *Data_type*: float, optional
`-floating`	Creates a floating instance group. **Note:** It does not support rectilinear shapes. **Note:** You can use the `-floating` parameter for the `fence` or `region` type of instance groups only. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_group`
`-is_physical_hier`	Specifies that the created group is a physical hierarchy. By default, the created group is not saved back to the netlist. *Data_type*: bool, optional

`-name group_name`	Specifies the name of the created group. A group is created to contain hierarchical instances, instances (leaf instances) or other groups.
	Note: In the nested partitions scenario, to add a module to be within a module, you must include the hinst name of the module in which you want the new module to be in, within the group name.
	For example,
	`create_group -name i_a/bc -type region`
	`update_group -name i_a/bc -add -hinsts i_a/b update_group -name i_a/bc -add -hinsts i_a/c`
	Data_type: string, required

`-polygon {{x1 y1} {x2 y2} ...}`	Specifies the point list of the polygon for *fence*, *region* and *guide*. *Data_type*: (point)+, optional

`-rects {{x1 y1 x2 y2} ...}`	Specifies the coordinates of the rectangle for *fence*, *region* and *guide*. • `x1`: Specifies the lower left x coordinate of the box. • `y1`: Specifies the lower left y coordinate of the box. • `x2`: Specifies the upper right x coordinate of the box. • `y2`: Specifies the upper right y coordinate of the box. **Note**: Since a fence should not cross multiple power domains, the `create_group` command should only be used to group objects in the same power domain (otherwise the design may become unplaceable). *Data_type*: (rect)+, optional
`-type {fence region guide cluster}`	Specifies the type of the group to create. You can specify: • `fence`: Specify to create a group of fences. • `region`: Specify to create a group of regions. • `guide`: Specify to create a group of guides. • `cluster`: Specify to create a group of clusters. *Data_type*: enum, optional

Examples

- The following command creates group adder1:
  ```
  create_group -name adder1 -type fence
  ```
- The following command creates group gusher_4 and its placement guide at the specified location:
  ```
  create_group -name gusher_4 -type guide -rects {2345.3 9962.1 4930.0 18244.8}
  ```
- The following command creates group adder2 with 80% of the area occupied by the instance area with an aspect ratio of 2:
  ```
  create_group -name adder2 -type cluster -density 0.8 -aspect_ratio 2
  ```

create_interposer_route_block

```
create_interposer_route_block
[-help]
-box {x1 y1 x2 y2}
-cell cell_name
-dir dir_name
-inst master_name
```

Creates the master block. It transforms the routed domain to a master partition block that enrolls all the special routes.

Note: If the design does not have a routing pattern that can be treated as a master block, the functionality of the `create_interposer_route_block` command can be replaced by loading the LEF file of the master partition that has the same routing pattern using the `read_physical -add_lefs` command. After this, the `add_interposer_route_block` command can be used directly.

Parameters

`-box {x1 y1 x2 y2}`	Specifies the master block's bounding box. **Note**: The snapping grid of the created block honors the `the floorplan_snap_block_grid` attribute settings. *Data_type*: box, required
`-cell cell_name`	Specifies the master cell name. *Data_type*: string, required
`-dir dir_name`	Specifies the directory name that will contain the partition information and files. The tool creates the directory and saves the information and files for the top and master block partition automatically after the `create_interposer_route_block` command is used. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `create_interposer_route_block` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_interposer_route_block`
`-inst master_name`	Specifies the master block name. **Note:** The default orientation of the created master block is R0. *Data_type*: string, required

Examples

- The following command transforms the routed domain to a master partition block.
  ```
  create_interposer_route_block -cell cell_name -inst master_block -box {llx lly urx ury} -dir PTN
  ```

create_io_row

```
create_io_row
[-help]
{-site site_name [{-side {N | W | S | E}
[-row_margin value]
[-begin_offset value]
[-end_offset value | -length len | -number_row_sites nr] } |
{-corner {BL | BR | TR | TL} [-x_offset value] [-y_offset value]}}]
[-orient {r0 | r90 | r180 | r270}]
[-name row_name]} | {-derive_by_cells} | {-derive_by_selection}
```

Creates new I/O rows and edits the existing I/O rows. You can use this command in the floorplanning stage.

Note: Before creating I/O rows for I/O row based pad placement, you need to set the I/O row flag using the `set_io_flow_flag` command.

Parameters

`-begin_offset value`	Specifies the starting location of the I/O row from the die edge. • For a horizontal row, this value is the lower X value. • For a vertical row, this value is the lower Y value. *Default*: 0, starting from the die edge. *Data_type*: float, optional
`-corner {BL | BR | TR | TL}`	
	Specifies the location of the corner cell. This can be: • `BL`: Bottom Left • `BR`: Bottom Right • `TR`: Top Right • `TL`: Top Left *Default*: `BL` *Data_type*: string, optional
`-derive_by_cells`	Creates an I/O row for all the I/O cells in the design. *Data_type*: bool, required
`-derive_by_selection`	Creates an I/O row only for the selected I/O cells. **Note:** When you specify this parameter, some I/O rows may overlap depending on the I/O cell distribution. *Data_type*: bool, required
`-end_offset value`	Specifies the end location of the I/O row from the die edge. • For a horizontal row, this value is the higher X value. • For a vertical row, this value is the higher Y value. *Default*: 0, ending from the die edge. *Data_type*: float, optional
`-help`	Outputs a brief description that includes type and default information for each `create_io_row` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_io_row.`
`-length len`	Specifies the length of the row, in µmeters, starting from the die edge or `-begin_offset value`. *Data_type*: float, optional
`-name row_name`	Specifies the name of the I/O row to be created. *Data_type*: string, optional

`-number_row_sites` *nr*	Specifies the number of sites to define the length of the row. **Note:** You can either specify `-end_offset` or `-length` or `-number_row_sites` each time you run the `create_io_row` command. *Data_type*: int, optional
`-orient {r0 | r90 | r180 | r270}`	
	Specifies the orientation of the created row. If you do not specify this parameter, the default orientation for each side starting from the row on the south side is r0, rotate r90 for the next side, and so on... as follows: • r0 - South West • r90 - South East • r180 - North East • r270 - North West The default order of orientation is South, East, North, and West. *Data_type*: string, optional
`-row_margin` *value*	Specifies the distance, in µmeters, from the row edge to the die edge. The row edge is `top' for a North side row, `bottom' for a South side row, `left' for a West side row, and `right' for an East side row. *Data_type*: float, optional
`-side {N | W | S | E}`	Specifies the side on which the row is to be created. If you do not specify the side, by default, one row is created on all sides (South, East, North, and West). *Data_type*: string, optional
`-site` *site_name*	Specifies the name of the site defined in the LEF library. *Data_type*: string, required
`-x_offset` *value*	Specifies the distance, in µmeters, from the left or right edge of the corner row to the die edge. *Data_type*: float, optional
`-y_offset` *value*	Specifies the distance, in µmeters, from the top or bottom edge of the corner row to the die edge. *Data_type*: float, optional

Example

- The following command creates I/O rows based on the existing pad placement.
  ```
  create_io_row -derive_by_cells
  ```
- The following command creates I/O row at north side with offset 30 from left side, offset 20 from right side and row margin 15 from top side.
  ```
  create_io_row -name IO_ROW_N -begin_offset 30 -end_offset 20  -row_margin 15 -side N -site IO -orientation r180
  ```
- The following command creates I/O row at bottom left corner to place corner IO with offset 10 in x and y direction.
  ```
  create_io_row -name IO_ROW_BL  -x_offset  10  -y_offset  10  -corner BL -site corner -orientation r0
  ```

create_logic_hierarchy

```
create_logic_hierarchy
[-help]
[-commit]
-hinst_name string
-module_name string
[-objs string]
[-selected]
```

Creates a new logical hierarchy for the specified hierarchical instances. The `create_logic_hierarchy` command changes the netlist, CPF, SDC, Scan DEF, and floorplan constraints for the newly created hierarchy.

Parameters

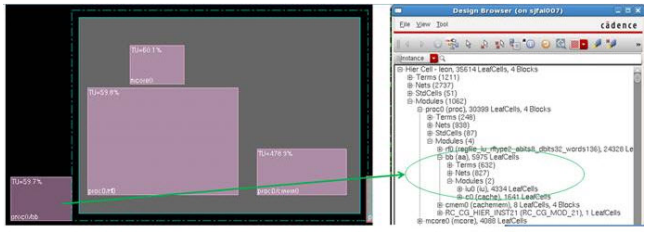
`-help`	Outputs a brief description that includes the type and default information for each `create_logic_hierarchy` parameter. For detailed description of the command and all its parameters, use the man command: `man create_logic_hierarchy`.
`-module_name string`	Specifies the new cell name. *Data_type*: string, optional
`-commit`	Specifies the commit group result. *Data_type*: bool, optional
`-hinst_name string`	Specifies the new hier inst name. *Data_type*: string, required
`-objs string`	Specifies the list of hinst and/or instance groups. *Data_type*: string, optional
`-selected`	Specifies that grouping is done for the current selected hinsts or instant groups. *Data_type*: bool, optional

Examples

- After using the following command, you can create a new Hinst name `proc0/bb` whose cell name is `aa` and add module `proc0/c0` and `proc0/iu0` to Hinst `proc0/bb`.

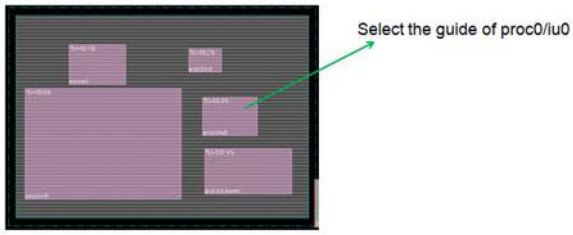
  ```
  create_logic_hierarchy -commit -module_name aa -hinst_name proc0/bb -objs {proc0/c0 proc0/iu0}
  ```

  
  The module `proc0/c0` and `proc0/iu0` will be moved to group `proc0/bb`.

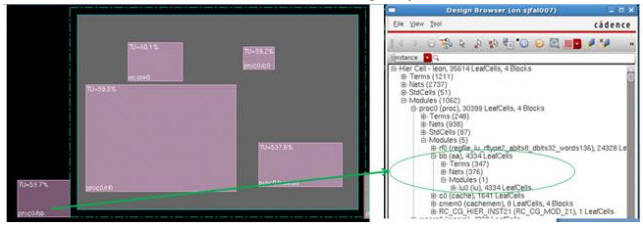
  


- After using the following command, you can create a new Hinst name `proc0/bb` whose cell name is `aa` and add selected module (it is `proc0/iu0` in this case) to Hinst `proc0/bb`.

```
create_logic_hierarchy -commit -module_name aa -hinst_name proc0/bb -selected
```



The module `proc0/iu0` will be moved to group `proc0/bb`.



Note: It will not create group result without `-commit` option of `create_logic_hierarchy` command. Without the `-commit` option, the netlist of the design is not changed.

create_pg_model_for_macro_place

```
create_pg_model_for_macro_place
[-help]
{-file string}
```

Enables you to create pg models for the concurrent macro placement. This command can save pg modeling to a Tcl file from the existing floorplan. You can use this command after the existing floorplan has been power planned.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_pg_model_for_macro_place` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_pg_model_for_macro_place`
`-file string`	Specifies the name of the file to which PG model details are written. *Data_type*: string, required

Example

After restoring the initial DB with power mesh, the following command can be used to create pg models for macro placement;

```
create_pg_model_for_macro_place -file golden_mimic_power_mesh.tcl
```

Related Information

create_pg_pin

```
create_pg_pin
[-help]
{-on_die {-selected | -net net_name}
[-width float]
[-length float]} |
{-name [-net net_name]
[-geometry layername x1 y1 x2 y2]}
[-dir {undefined | input | output}]
```

Creates a power/ground pin as per the specified coordinates of the physical shape. You can use this command to create a power/ground pin without having to first create a power stripe with the `add_stripes` command.

- If the `-geom` parameter is not specified, only the logical pin is created.
- If the `-geom` parameter is specified, the physical pin is also created.
- If a logical power/ground pin exists before this command is run, the net name will be ignored if it is specified.
- If a logical power/ground pin does not exist before this command is run:
  - If a net has been specified with the -net parameter, the power/ground pin will be created and attached to the net specified.
  - If a net name has not been specified, the net name is assumed to be the same as the pin name. In this case, the power/ground pin will be created and attached to that nets.

Parameters

`-dir {undefined | input | output}`	
	Specifies the direction of the power/ground pin. You can specify one of the following: • `undefined`: Specifies that the direction of the pin is not defined. • `input`: Specifies that the direction of the pin is input. • `output`: Specifies that the direction of the pin is output. *Data_type:* enum, optional
`-geometry layername x1 y1 x2 y2`	
	Specifies the geometry of the physical pin. • *`layername`*: Specifies the layer on which the power/ground pin will be created. The *`layeid`* can range from 1 to n, where, the maximum value for n is the top most routing layer. **Note:** Layers can also be specified using layer names (for example, Metal1, Metal2, Metal3) or the LEF layer names. • *`x1`*: Specifies the lower-left x coordinate, in microns, of the power/ground pin. • *`y1`*: Specifies the lower-left y coordinate, in microns, of the power/ground pin. • *`x2`*: Specifies the upper-right x coordinate, in microns, of the power/ground pin. • *`y2`*: Specifies the upper-right y coordinate, in microns, of the power/ground pin. *Data_type:* string, optional
`-help`	Outputs a brief description that includes the type and default information for each *`create_pg_pin`* parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_pg_pin`
`-length float`	Specifies the length of the power/ground pin. *Default*: Same as the width *Data_type:* float, optional
`-net net_name`	Specifies the name of the net to which the power/ground pin will be attached. *Data_type:* string, optional
`-on_die`	Creates power/ground pin on the die. *Data_type:* bool, optional
`-name`	Specifies the name of the power/ground pin. *Data_type:* string, optional
`-selected`	Creates power/ground pin on the die, for all selected stripes. *Data_type:* bool, optional
`-width float`	Specifies the width of the power/ground pin. *Default*: width of the stripe. *Data_type:* float, optional

Examples

- This example is for the case where a logical pin name has not been defined prior to running the command and a net name has been specified.
  The following command creates a power/ground pin named pgpin_A on layer Metal2 and attaches the pin to the net net_A. The pin coordinates are 7 (x1), 3 (y1), 17 (x2), and 23 (y2).
  ```
  create_pg_pin -geometry Metal2 7 3 17 23 -net net_A pgpin_A
  ```
- This example is for the case where a logical pin name has not been defined prior to running the command and a net name has not been specified.
  The following command creates a power/ground pin named pgpin_B on layer Metal3 and attaches the pin to the net pgpin_B. The pin coordinates are 7 (x1), 3 (y1), 17 (x2), and 23 (y2). As the net name was not specified, the net name is assumed to be the same as the pin name.

```
create_pg_pin -geometry Metal3 7 3 17 23 pgpin_B
```

- This example is for the case where a logical pin name has already been defined prior to running the command.
  The following command creates a power/ground pin named pgpin_C on layer Metal5. The pin coordinates are 7 (x1), 3 (y1), 17 (x2), and 23 (y2). In this case, the logical pin name was already defined prior to running the command, and so a net name is not required. Even if a net name were specified, it would have been ignored.
  ```
  create_pg_pin -geometry Metal5 7 3 17 23 pgpin_C
  ```
- This example is for the case where the net name is not specified and the -geom parameter has not been specified.
  The following command creates a logical pin names pgpin_D. The net name is assumed to be the same as the pin name and no physical pin is created.
  ```
  create_pg_pin pgpin_D
  ```
- This example is for the case where the pin is created on the die attached to net vdd with a width of 2 and a length of 3.
  ```
  create_pg_pin -on_die -net vdd -width 2 -length 3
  ```

Related Information

  - Create P/G Pin

create_physical_pin

```
create_physical_pin
[-help]
[-allow_outside_boundary]
-name pin_name
[-net net_name]
[-same_port]
{{-layer layer_name {-rect {x1 y1 x2 y2} | -polygon {x1 y1 x2 y2 ... xn yn}} } }
```

Adds a new physical pin-shape to a top-level port (DEF PIN). You can use this command to add more PG (power/ground) pin-shapes to an existing PG port. It will also create a new PG port if there is not already a PG port.

Note: It can add shapes to top-level signal ports, but this is not recommended. Multiple shapes for a signal port may cause flow problems (the router will not connect the different pin shapes, etc.) and should only be done with expert knowledge of the flow implications. It will not create a new signal port (You must use ECO commands to add a new signal port).

Parameters

`-allow_outside_boundary`	Do not check whether the specified rectangle is inside the design boundary. *Data_type:* bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_physical_pin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man` create_physical_pin
`-layer layer_name`	Specifies the LEF (or OA) layer name, or the routing layer index value. For example, 1 for first routing layer, 2 for second routing layer. *Data_type:* string, optional
`-name pin_name`	Specifies the name of the top-level port (DEF PIN name) to add shapes to. If it does not exist, then `-net net_name` is used to find a top-level port instead. If `net_name` does not already have a top-level port, and it is a PG net, then a new port named `pin_name` will be created for `net_name`. *Data_type:* string, required
`-net net_name`	Specifies the name of the net. This is ignored if a top-level port named *pin_name* already exists. *Data_type:* string, optional
`-polygon {x1 y1 x2 y2 ... xn yn}`	Specifies the coordinates of each vertex of the shape. *Data_type:* (point)+, optional
`-rect {x1 y1 x2 y2}`	Specifies the coordinates of the rectangular shape. • *x1* Specifies the lower-left x coordinate, in microns, of the physical pin. • `y1`: Specifies the lower-left y coordinate, in microns, of the physical pin. • `x2`: Specifies the upper-right x coordinate, in microns, of the physical pin. • `y2`: Specifies the upper-right y coordinate, in microns, of the physical pin. *Data_type:* rect, optional
`-same_port`	Specifies that the physical pin shapes will be added to the first DEF PORT. If this parameter is not specified, each pin shape is created on a separate DEF port. Normally each PG shape should be on a separate port so each one is connected separately to the PG mesh at the next level up. *Data_type:* bool, optional

Examples

- The following command adds a physical pin-shape to the top-level term named VSS (e.g. DEF PIN named VSS).
  ```
  create_physical_pin -name VSS -layer Metal2 -rect {7 3 17 23}
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

create_place_blockage

```
create_place_blockage
[-help]
{ { [ -polygon {{x1 y1} {x2 y2}...} | -rects { { lx1 ly1 ux1 uy1 } { lx2 ly2 ux2 uy2 } ... }
    | -all_partitions | -all_macros ]
    [-inst  inst_name  | -hinst  hinst_name ] }
    [-name  place_blockage_name  | -use_prefix ]
    [{-type {hard soft partial macro_only}} [-density  value ] [-exclude_flops ]]
    [-no_cut_by_core ] [-snap_to_site ] }
[{-inst  inst_name  | -hinst  hinst_name  | -all_partitions | -all_macros }
 [-cover ]
[-inner_ring_by_side { x1 y1 x2 y2 } | -inner_ring_by_edge  { edge1 edge2 edge3 ... } ]
[-outer_ring_by_side { x1 y1 x2 y2 } | -outer_ring_by_edge  { edge1 edge2 edge3 ... } ] ]
```

Creates cell placement blockages that can be placed. A placement blockage is a floorplan object used to block standard cell placements. Use this command after importing the design.

Parameters

`-all_macros`	For each macro creates a placement blockage covering that macro (.is_macro attribute on inst db objects). *Data_type*: bool, optional
`-all_partitions`	For each partition creates a placement blockage covering that partition. *Data_type*: bool, optional
`-cover`	By default the parameters (`-outer_ring_by_edge` and `-outer_ring_by_side`) used to create placement blockages around the outside of the object, create toroidal placement blockages. The `-cover` parameter combined with these parameters creates a solid placement blockage, otherwise the `-cover` parameter does nothing. *Data_type*: bool, optional
`-density value`	Specifies the maximum density allowed for partial or soft blockages. The value is in steps of 5 between 5 and 100, with units of percent. For example, a partial placement value of 75 means that up to 75 percent placement density is allowed in the area. **Note**: The `-density` and `-exclude_flops` parameters can only be used in combination with the `-type partial` or `-type soft` parameter. *Minimum*: 5 *Maximum*: 100 *Data_type*: inst, optional
`-exclude_flops`	Specifies that flops and latches will not be placed in the blockage during global placement. **Note**: The `-density` and `-exclude_flops` parameters can only be used in combination with the `-type partial` or `-type soft` parameter. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_place_blockage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_place_blockage`
`-hinst hinst_name`	Specifies the name of the hierarchical instance on which the placement blockage is to be applied. An `hinst` db object works too. *Data_type*: (hinst), optional
`-inner_ring_by_edge {edge1 edge2 edge3 ...}`	

	Creates a hollow ring of placement blockage around the inside of the object(s) specified. *edgeN* is the width in microns of the blockage created inside the Nth edge. *edge1* is the vertical edge starting at the left corner of the leftmost edge with the lowest y coordinate as placed, and proceeding clockwise through the other edges. **Note** : • The `-inst` , `-hinst` , `-all_macros`, or `-all_partitions` parameters must be specified with this parameter. • There must be an *edgeN* specified for every edge of the object(s). • Enclose the *edgeN*s in double-quotes, curly braces, or [list ...]. *Data_type*: string, optional
`-inner_ring_by_side {x1 y1 x2 y2 }`	
	Creates a hollow ring of placement blockage around the inside of the object(s) specified. *bottom* is the width in microns of the blockage created on bottom edges, etc. **Note**: • The `-inst`, `-hinst`, `-all_macros`, or `-all_partitions` parameters must be specified with this parameter. • `The -inner_ring_by_side` parameter can be used with rectilinear objects. • Enclose the *bottom...left* values in double-quotes, curly braces, or [list ...]
`-inst inst_name`	Specifies the name of the instance on which the placement blockage is to be applied. An `inst` db object works too. *Data_type*: (inst), optional
`-name place_blockage_name`	
	Specifies the name of the placement blockage. **Note:** Placement blockage names need not be unique. **Note:** If neither `-name` nor `-use_prefix` parameters are specified, then the created place blockage is named `defScreenName`. *Data_type*: string, optional
`-no_cut_by_core`	Specifies that placement blockages should not be truncated at the core boundary. Placement blockage will always be truncated at the die boundary. *Data_type*: bool, optional
`-outer_ring_by_edge { edge1 edge2 edge3 ...}`	
	Creates a hollow ring of placement blockage around the outside of the object(s) specified. *edgeN* is the width in microns of the placement blockage along the Nth edge. *edge1* is the vertical edge starting at the left corner of the leftmost edge with the lowest y coordinate as placed, and proceeding clockwise through the other edges. **Note**: • The `-inst`, `-hinst` , `-all_macros`, or `-all_partitions` parameters must be specified with this parameter. • There must be an *edgeN* specified for every edge of the object(s). • By default, a toroid of blockage is created around the specified object(s). Use the `-cover` parameter to create a solid blockage over the objects with the specified additional halo of blockage. • Enclose the *edgeN*s in double-quotes, curly braces, or [list ...]. *Data_type*: string, optional
`-outer_ring_by_side {x1 y1 x2 y2 }`	

	Creates a hollow ring of placement blockage around the outside of the object(s) specified. `bottom` is the width in microns of the placement blockage along the bottom edge(s) of object(s) specified, etc. **Note**: • The `-inst`, `-hinst`, or `-all_partitions` parameters must be specified with this parameter. • The `-outer_ring_by_side` parameter can be used with rectilinear objects. • By default, a toroid of blockage is created around the specified object(s). Use the -cover parameter to create a solid blockage over the objects with the specified additional halo of blockage. • Enclose the *bottom...left* in double-quotes, curly braces, or [list ...].
`-polygon {{ x1 y1 } { x2 y2 } ...}`	
	Specifies the polygon vertices of the blockage, in microns. *Data_type*: (point)+, optional
`-rects { { lx1 ly1 ux1 uy1 } { lx2 ly2 ux2 uy2 } ... }`	
	Specifies the box vertices of the blockage, in microns. *Data_type*: (rect)+, optional
`-snap_to_site`	Snaps the newly created placement blockage to a row site. *Data_type*: bool, optional
`-type { hard | soft | partial | macro_only}`	
	Specifies the type of blockage to be created. • `hard`: Neither standard cell instances nor macros may be placed in the blockage. This is the default. • `soft`: Only buffers, inverters, isolation cells, clock gates, tie cells and level shifters are allowed to be placed inside the soft blockages. All other cells are placed outside the soft placement blockage. You can optionally specify cells and instances that are allowed or forbidden to be placed inside soft blockages by using the `set_selective_blockage_gate` or `reset_selective_blockage_gate` commands. • `partial`: In conjunction with the `-density` parameter alone or with the `-density` and `-exclude_flops` parameters together, creates a placement blockage that has a maximum density as specified (and sometimes excludes flops and latches too). • `macro_only`: Enables the `proto_design` command to keep macros out of the placement blockage; however, it enables standard cells to be placed inside the box as if no blockage is present. Macro-Only blockage is represented as "0" percent partial blockage in floorplan file, DEF file, and in Innovus DB. *Default*: `hard` **Note**: Alternatively, you can create different types of placement blockages using the *Set Placement Blockage Options* form or after creating the placement blockage, you can double-click on the object in the design display area to open the *Attribute Editor* and select from four blockage types. *Data_type*: enum, optional
`-use_prefix`	Specifies that the placement blockages should be named with a prefix defined by `floorplan_default_blockage_name_prefix` attribute. Names are of the form `prefix_<int>` *Data_type*: bool, optional

Examples

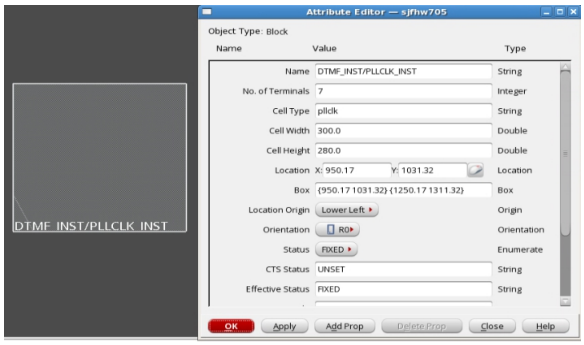
- The following command creates a soft blockage, `softBlockage2` in the design area:

```
create_place_blockage -type soft -rects { { 3442.3600 3739.2000 3511.6500 5716.6300 } } -name softBlockage2
```

- The following command creates a hard blockage covers the block instance of DTMF_INST/PLLCLK_INST:

```
create_place_blockage -type hard -inst DTMF_INST/PLLCLK_INST -cover
```

Before:

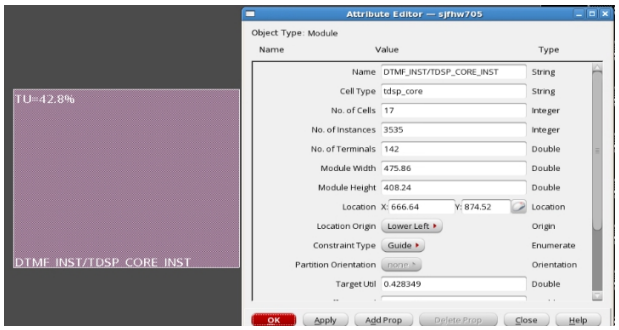


After:

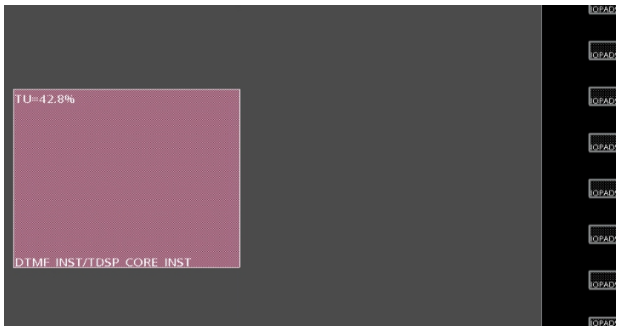
- The following command creates a hard blockage for hierarchical instance (Module) of DTMF_INST/TDSP_CORE_INST:

```
create_place_blockage -type hard -hinst DTMF_INST/TDSP_CORE_INST -cover
```

Before:



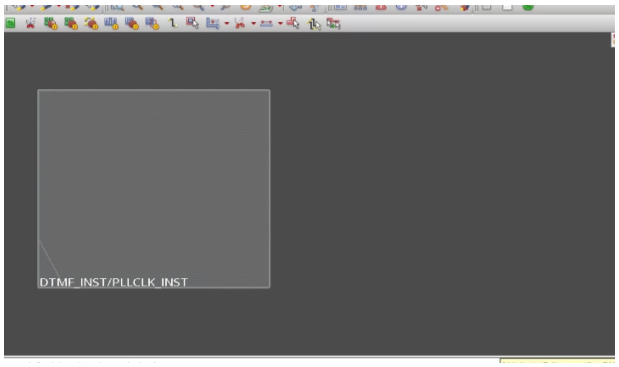
After:



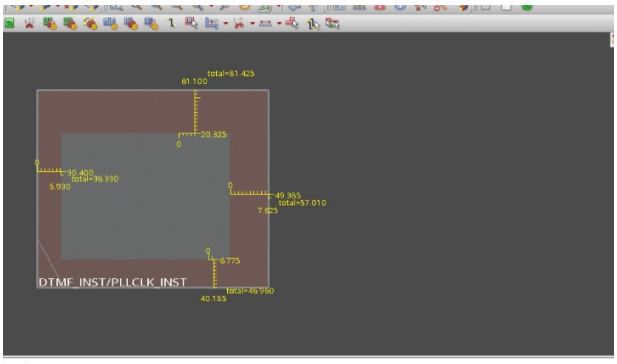
- The following command creates a hollow ring of placement blockage inside of the object:

```
create_place_blockage -type hard -inst DTMF_INST/PLLCLK_INST --inner_ring_by_edge {30 40 50 60}
```

Before:



After:



- The following command shows the functionality of the option `noCutByCore`:

```
create_place_blockage -rects {{952 1690 1291 1899}}
```

```
create_place_blockage -rects {{952 1690 1291 1899}} -no_cut_by_core
```

create_place_halo

```
   create_place_halo
[-help]
-halo_deltas left bottom right top
[-snap_to_site]
[-orient orientation]
[-insts name | -all_macros | -all_black_boxes | -all_commit_partitions | -all_blocks | -all_io_pads | -cell name]
```

Adds a halo to a block. A halo is an area that prevents the placement of standard cells within the specified halo distance from the edges of a hard macro, black box, or committed partition in order to reduce congestion. A block halo value is specified based on the current block orientation. Use this command during or after floorplanning. You can use the `delete_place_halo` command to delete halos.

Parameters

`-all_black_boxes`	Add halo around all black boxes. *Data_type*: bool, optional
`-all_blocks`	Add halo around all hard macros, black boxes, and committed partitions. *Data_type*: bool, optional
`-all_commit_partitions`	Add halo around all committed partitions. *Data_type*: bool, optional
`-all_io_pads`	Add halo around all IO pads. *Data_type*: bool, optional
`-all_macros`	Add halo around all hard macros. *Data_type*: bool, optional
`-cell name`	Add halo around all instances of cell `name`. *Data_type*: string, optional
`-halo_deltas left bottom right top`	
	Specifies the halo width on 4 sides. These values are floats, units are microns. Halo deltas are specified in relation to a block in R0 orientation (`left` is applied to the left edge of block oriented R0). For non-R0, the halo deltas are rotated/flipped according to the blocks's orientation (for block oriented MY, the `left` halo delta specifies the width of the halo along the *right* side of the inst in the floorplan). See `-orient` • `left`: the width of the halo along the left edge of insts having halos added. • `bottom`: the width of the halo along the bottom edge of objects having halos added. • `right`: the width of the halo along the right edge of objects having halos added. • `top`: the width of the halo along the top edge of objects having halos added. *Data_type*: rect, required
`-help`	Outputs a brief description that includes the type and default information for each `create_place_halo` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_place_halo`
`-insts name`	Add halo around named insts. You can use wildcards (* or ?) for specifying instance names. You cannot specify a list of names. You cannot use objects instead of names. *Data_type*: insts, optional
`-orient orientation`	Pre-rotate/flip the halo deltas using `orientation` before applying them. `orientation` can be `R0, R90, R180, R270, MX, MX90, MY, or MY90` (lower case values work too). *Data_type*: string, optional
`-snap_to_site`	Snaps the halo to site boundaries. *Data_type*: bool, optional

Example

The following command adds a halo around block `xy_inst`:

```
create_place_halo -halo_deltas 10 20 30 40 -insts xy_inst
```

If `xy_inst` is R0, the halo width is 10 along the left edge and 30 along the right edge. If the block is MY, the halo width is 30 along the *left* edge in the floorplan, and 10 along the *right* edge in the floorplan.

The following command adds a halo around all insts with cells of type `myDRAMCell`:

```
create_place_halo -halo_deltas 10 20 30 40 -cell myDRAMCell -orient MY
```

If the inst is oriented R0, then the *left* edge width of the halo is 30 in the floorplan, and the *right* edge width of the halo is 10.

  - Edit Halo

create_relative_floorplan

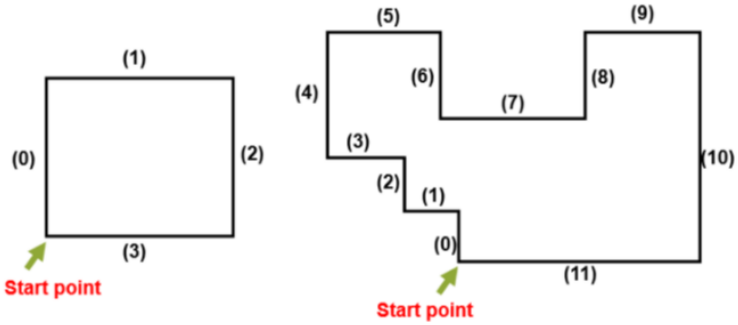
```
create_relative_floorplan
[-help]
{{{-place obj_name_list | -reshape obj_name_list} [-ref ref_obj_name_list]}}
[-place obj_name_list {-ref_type {{object core_boundary die_boundary}...}
 -horizontal_edge_separate {{ref_edge_horizontal y_offset obj_edge_horizontal}...}
 -vertical_edge_separate {{ref_edge_vertical x_offset obj_edge_vertical}...}}
[[-bbox {{none target reference both}...}]
 [-orient {{r0 r90 r180 r270 mx my mx90 my90}...}]]]
[-reshape obj_name_list { -dimension {{width height}...} }
[ [-fixed_edges {{edge1 edge2}...}] [-density {value}] [-offset {value}]]]
```

The `create_relative_floorplan` command captures and defines the placement relationship of floorplan objects independently from the actual coordinates in a floorplan, and resizes modules or blackboxes based on other floorplan objects, even outside the core boundary. You can use this command after importing the design.

Note: The `create_relative_floorplan` command accepts an array of objects. You can capture and define the placement relationship of an array of floorplan objects using just one command.

Note: You can use `write_floorplan_script -sections relative_fplan` to save relative floorplan info.

Note: The edges are numbered as 0,1,2,3... from the low left corner in the clockwise direction. The left edge closest to the origin that has the smallest x,y coordinates is taken as the first zero edge. An even edge number donates a vertical edge and an odd edge number donates a horizontal edge. The following figure shows how to count the edges for a rectangle and rectilinear object.



Parameters

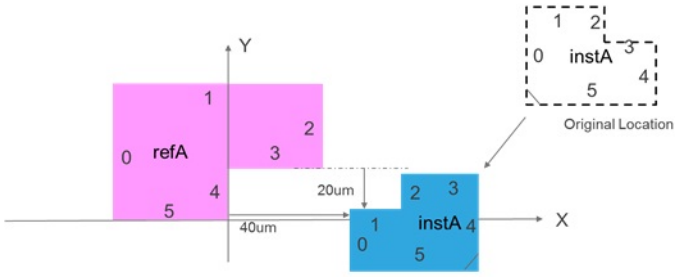
`-bbox {none target reference both}`	
	Specifies whether to use a bounding box instead of the rectilinear shape of target or reference object. *Default*: `none` *Data_type:* (enum)+, optional
`-density value`	Specifies the target utilization (TU). By default, reshaping the object will keep the current TU. *Data_type:* string, optional
`-dimension {width height}`	Specifies the width or height of the referenced object as the reference dimension. *Default*: `width` *Data_type:* (enum)+, optional
`-fixed_edges {edge1 edge2}`	Specifies that the reshape object will be stretched while fixing two perpendicular edges. *Default*: `{-1 0}` *Data_type:* string, optional
`-horizontal_edge_separate {ref_edge_horizontal y_offset obj_edge_horizontal}`	
	Specifies the vertical spacing between the horizontal edge of the target and reference objects. *Data_type:* string, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_relative_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_relative_floorplan`
`-offset value`	Specifies the offset value from the reference object in the specified dimension. *Data_type:* string, optional
`-orient {r0 r90 r180 r270 mx my mx90 my90}`	
	Specifies the orientation of the target object. *Default*: `r0` *Data_type:* (enum)+, optional
`-place obj_name_list`	Specifies the target object to place. It can be hInst, inst, group, power_domain, pin_guide, blockages, or port. *Data_type:* string, optional
`-ref ref_obj_name_list`	Specifies the reference object name. It can be hInst, inst, group, power_domain, pin_guide, blockages, port, or pin. It cannot be used with `-ref_type core_boundary` or `-ref_type die_boundary`. *Data_type:* string, optional
`-ref_type {object core_boundary die_boundary}`	
	Specifies the type of reference. *Default:* `object` *Data_type:* (enum)+, optional
`-reshape obj_name_list`	Specifies the target object to reshape. It can be hInst, group, power_domain, pin_guide, or blockages. *Data_type:* string, optional
`-vertical_edge_separate {ref_edge_vertical x_offset obj_edge_vertical}`	
	Specifies the horizontal spacing between the vertical edge of the target and reference objects. *Data_type:* string, optional

Examples

Placing an Instance According to a Rectilinear Object

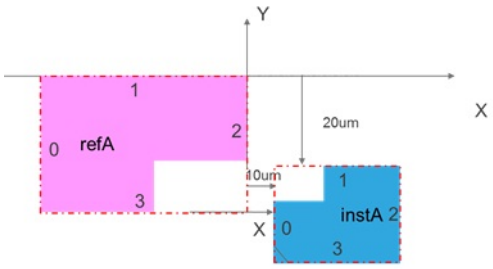
- The following command places an object with respect to a rectilinear object:

```
create_relative_floorplan -place instA -ref_type object -ref refA -orient MY \
        -horizontal_edge_separate {3 -20 1} -vertical_edge_separate {4 40 0}
```



- The following command places an object with respect to the bounding box of a rectilinear object:

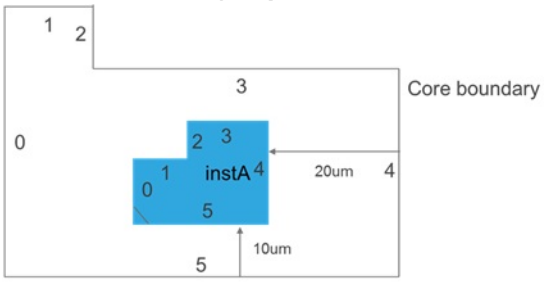
```
create_relative_floorplan -place instA -ref_type object -ref refA \
        -horizontal_edge_separate {1 -20 1} -vertical_edge_separate {2 10 0} -bbox both
```



Placing an Instance According to the Core Boundary

- The following command places an object with respect to the core boundary:

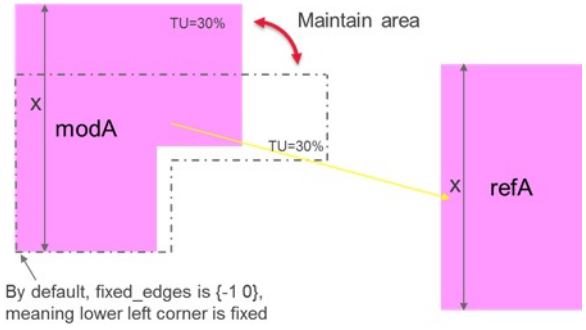
```
create_relative_floorplan -place instA -ref_type core_boundary \
       -horizontal_edge_separate {5 10 5} -vertical_edge_separate {4 -20 4}
```



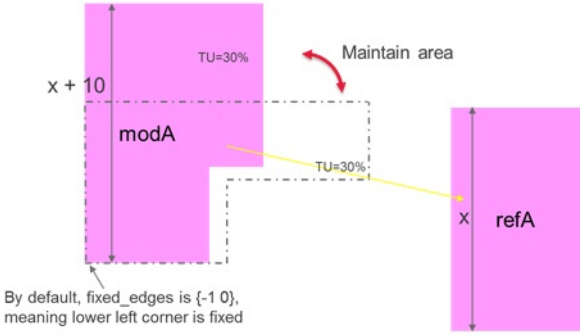
Reshaping an Instance in a Reference Dimension while Maintaining its Current Area

The following commands reshape an object based on a specified height while maintaining its current area:

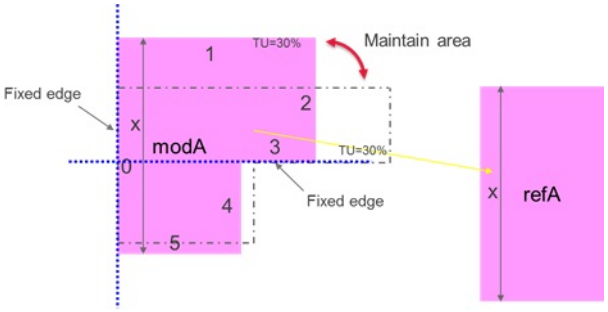
- `create_relative_floorplan -reshape modA -ref refA -dimension height`



- `create_relative_floorplan -reshape modA -ref refA -dimension height -offset 10`

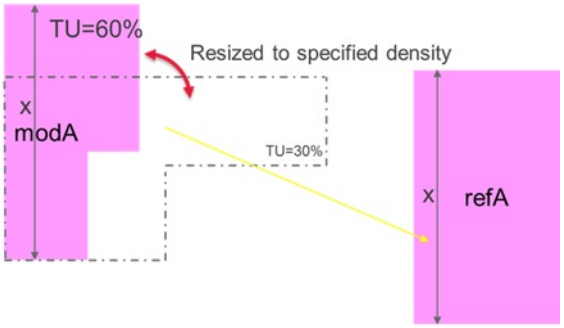


- `create_relative_floorplan -reshape modA -ref refA -fixed_edges {0 3} -dimension height`



Reshaping an Instance while Maintaining a Target Utilization Value

- The following command reshapes an object based on a specified height maintaining a target utilization value:
  `create_relative_floorplan -reshape modA -ref refA  -dimension height -density 0.6`



Placing multiple floorplan objects

- The following command places obj1, obj2, and obj3:

```
create_relative_floorplan -place {obj1 obj2 obj3} -ref {ref1 ref2 ref3} -ref_type {reftype1 reftype2 reftype3} -
horizontal_edge_separate {-1 0 -1,-1 0 -1,-1 0 -1} -vertical_edge_separate {0 -100 2,0 -100 2,0 -100 2} -bbox {both target target} -
orient {MX90 R90 R90}
```

create_resize_blockage

```
create_resize_blockage
[-help]
[-name blockage_name]
[-is_resizeable]
-area x1 y1 x2 y2
```

Adds a size blockage object that controls the behavior of the resize line under a covered area. The object area prevents floorplan objects in this area from being resized and maintains the alignment and minimum space between these objects during floorplan resize. By default resize line can not go through size blockage, which means, objects under size blockage stay fixed after floorplan resize.

Adds a size blockage object that controls the behavior of the resize line under a covered area. The object area prevents floorplan objects in this area from being resized and maintains the alignment and minimum space between these objects during floorplan resize. Size blockage is special kind of blockage that is only honored by the resize_floorplan command. By default resize line can not go through size blockage, which means, objects under size blockage stay fixed after floorplan resize. You can use this command before using the `resize_floorplan` command.

Parameters

`-area x1 y1 x2 y2`	Specifies the lower left x coordinate, lower left y coordinate, upper right x coordinate, and upper right y coordinate respectively of the size blockage area. *Data_type*: rect, required
`-help`	Outputs a brief description that includes type and default information for each `create_resize_blockage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_resize_blockage`
`-is_resizeable`	Specifies that the size blockage can be resized, however alignment and the minimum space between the objects in the blockage area will be maintained during floorplan resize. When this options is specified, the resize line can go through size blockage. But it can not turn direction inside blockage. The benefit of using this option is if objects (for example, macros) under size blockage are aligned before calling `resize_floorplan`, they will stay aligned after the command. *Data_type*: bool, optional
`-name blockage_name`	Specifies the name of the size blockage. *Data_type*: string, optional

Example

The following command creates a size blockage.

```
create_resize_blockage -name sizeBlkg1 -area 400 400 500 500
```

create_route_blockage

```
create_route_blockage
[-help]
[-fills]
[-inst name]
{-layers layer_name | {layer_name_list ...}  | -all {cut route drc_region trim_metal}}
{-rects {{x1 y1 x2 y2} ...} | -polygon {{x1 y1} {x2 y2} ...} | -cover }
[-mask integer]
[-no_wrong_way]
[-name blk | -use_prefix ]
[-except_pg_nets | -pg_nets ]
[-except_pg_nets | -pg_nets | -partial integer]
[-spacing float | -design_rule_width float]
```

Creates a routing blockage object that can be moved even outside the core area. The object area prevents routing of specified metal layers, signal routes, and hierarchical instances in this area. Use this command during partition floorplanning.

Parameters

`-all {cut route drc_region trim_metal}`	
	Provides a quick way to specify layer types if all layers of the type are to be blocked. You can specify multiple layer types with this param • `cut`: Specify to create blockages on all cut layers. • `route`: Specify to create blockages on all routing layers. • `drc_region`: Specify to create routing blockages on drc region layers. • `trim_metal`: Specify to create routing blockages on all trim metal layers. *Data_type*: (enum)+, optional
`-cover`	Specifies that a routing blockage of the same size as the specified block instance (`-inst name`) will be created on top of the instance. Th *Data_type*: bool, optional
`-design_rule_width float`	
	Specifies that the blockage has a width of *effective_width* for the purposes of spacing calculations. If you specify `-design_rule_width`, **Type:** The *effective_width* is a real number greater than 0, in microns. *Data_type*: float, optional
`-except_pg_nets`	Specifies that the routing blockage is to be applied on a signal net routing and not on power or ground net routing. Use this option to blo allow power connections to go through the blockage. **Note:** Blocking the signal net routing helps in avoiding crosstalk or coupling caused by signal routes. *Data_type*: bool, optional
`-fills`	Specifies that the routing blockage is to be applied on metal fills. *Data_type*: bool, optional
`-help`	Prints a brief description that includes the type and default information for each `create_route_blockage` parameter. For a detailed descri `man create_route_blockage`
`-inst name`	Specifies the name of the instance on which the routing blockage is to be applied. **Note:** When the `-cover` parameter is specified, the `-inst` parameter must also be specified. However, when the `-inst` parameter is spec *Data_type*: inst, optional
`-layers layer_name | {layer_name_list ...}`	

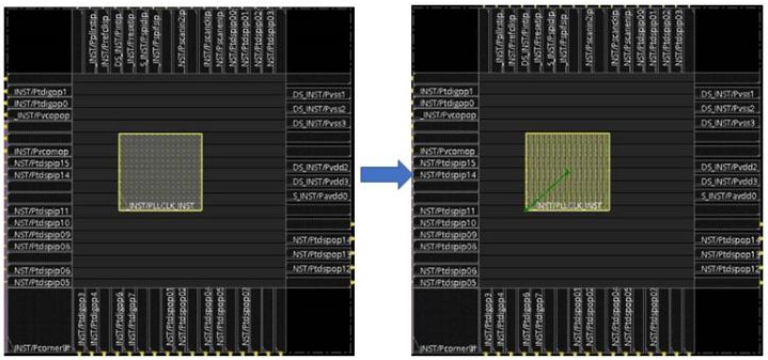
	Specifies the layer or list of layers on which the routing blockage is to be applied. The allowed layers are routing layer, cut layer, drc regi **Note:** The values specified with this parameter will override any default blockage layers specified with the `set_route_blockage_default` *Default*: If you do not specify this parameter, the Innovus software will check if any default blockage layers have been specified with the `set_route_blockage_default_layer` command will be used. If no, the default is metal3 if the number of layers is greater than 3, or metal2 **Note**: You must specify the *layer_name* as a number or as a layer name defined in LEF. For example, *layer_name* can be specified as 2 *Data_type*: (layer)+, optional
`-mask integer`	Blocks routing layers with specified masks. Layers with other masks can still be routed through the blockage. **Note:** • The default value of the `-mask` parameter is 0. This implies that all the specified layers will be blocked. • If the `-mask` parameter is specified with an integer value greater than 0, then both layers with specified mask and uncolored layers are Example. If `-mask 1` is specified, it blocks mask 1 and uncolored routes. • If more than one layers are associated with a mask, the mask is applied to all of them. • If the `-mask` parameter is specified, the tool checks if the mask is suitable for all of the specified layers. If not, it displays an ERROR m • The NanoRoute router and the `check_drc` command honor the `-mask` parameter. *Default*: 0 *Data_type*: int, optional
`-name blk`	Specifies the layer name of the route blockage. *Data_type*: string, optional
`-no_wrong_way`	When this parameter is specified, wrong way routing is avoided in the region. Both router and verify_drc will report DRC if any jogs are p *Data_type*: bool, optional
`-partial integer`	Specifies the density for partial routing blockages. It causes the global router to only use up to the specified percent of the routing resour routes on that layer in the area. For example, `-partial 75` means only 75% of routing resource in a gcell is available for global routing, and this will affect the final dema This can be useful if the router consistently creates too much congestion in a specific area. If you add a partial routing blockage in that a overlapping partial routing blockages, the lowest density percentage of the blockages will be used in the overlapping region. For examp routing blockage with 50 percent density, the density of the overlapping region will be 50 percent. **Note:** You can attach a partial routing blockage to a block instance with `-inst` if the congestion is related to the boundary and pins of a s **Note:** The `-design_rule_width`, `-except_pg_nets`, `-pg_nets`, and `-spacing` parameters are not allowed for partial routing blockages. *Minimum*: 0 *Maximum*: 100 *Data_type*: int, optional
`-pg_nets`	Specifies that the routing blockage is to be applied only on power or ground net special routes and not on signal nets. This option affects when they are used for PG nets. It does not affect signal routing of PG nets done by `route_early_global`. NanoRoute, which is used to c connections, is also not affected by this option. Use this option during power planning to prevent power routes from getting too close to b channels. **Note:** This option cannot be used with `-except_pg_nets`. *Data_type*: bool, optional
`-polygon {{x1 y1} {x2 y2} ...}`	
	Specifies the polygon vertices of the blockage, in microns. **Note:** Although `create_route_blockage` can be be used to create triangular blockages, metal fill does not currently support triangular rou *Data_type*: (point)+, optional
`-rects {{x1 y1 x2 y2} ...}`	

	Specifies the coordinates of a list of blockage areas.
	Data_type: (rect)+, optional
	For example, the following command creates a routing blockage object on metal layers 1, 4, and 5:
	`create_route_blockage -rects {0 0 100 100} -layer {metal1 metal4 metal5}`
	Note: You can also add variables to specify the blockage area. For example,
	`set box "0 0 100 100"`
	`create_route_blockage -rects $box`

`-spacing` *float*	Specifies the minimum spacing allowed between the blockage and any other routing shape. If you specify `-spacing`, you cannot specify T**ype:** The float is a real number greater than or equal to 0, in microns. *Data_type*: float, optional
`-use_prefix`	Specifies that the routing blockages should be named with a prefix. *Data_type*: bool, optional

Example

- The following command creates a routing blockage object to block metal3 routing in this area:
  `create_route_blockage -rects {2353.8000 7123.000 2653.8000 8298.2000} -layers metal3`
- The following command creates a routing blockage object on metal layers 1, 4, and 5:
  `create_route_blockage -rects {0 0 100 100} -layers {metal1 metal4 metal5}`
- The following command creates a routing blockage object on metal layers 1, 4 and blocks the signal net routing:
  `create_route_blockage -rects {10 18 1782 2300} -layers {metal1 metal4} -except_pg_nets`
- The following command creates a routing blockage object having polygon vertices (10, 10), (10, 15), (15, 15), (15, 20), (20, 20), (20, 10) on the metal layer 1:
  `create_route_blockage -polygon {10 10 10 15 15 15 15 20 20 20 20 10} -layers metal1`
- The following command creates a routing blockage object on top of the the specified block instance that is of the same size the instance.
  `create_route_blockage -inst DTMF_INST/PLLCLK_INST -cover`



- The following command creates a routing blockage object all the layers:
  `create_route_blockage -name inist1_fill_blk -fills -rects [get_db [get_db insts inst_U1] .place_halo_bbox] -layers *`
- The following command creates a routing blockage on metal fills only:
  `create_route_blockage -rects {500 400 600 500} -layers metal1 -fills`
- The following command creates a routing blockage on power or ground net special routes only and not on signal nets.
  `create_route_blockage -rects {0 0 100 100} -layers metal1 -pg_nets`

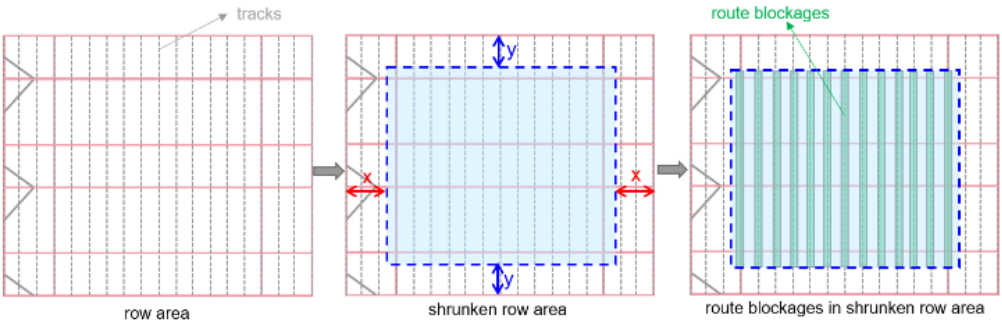
Related Information

- `delete_route_blockages`
- `set_route_blockage_default_layer`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

create_route_blockage_along_track

```
create_route_blockage_along_track
[-help]
-align_track string
[-consider_cells_as_macros string]
[-consider_macros_as_cells string]
[-edge_shrink {x y}]
-layer string
[-no_cut_row]
```

Creates routing blockages that are aligned to specified tracks which are in the shrunken row area. Use this command during partition floorplanning.



Note:

- Routing blockages are also created with align to the track which is near to the shrunken row area with less than half of layer width.
- Routing blockages honor rectilinear row area.

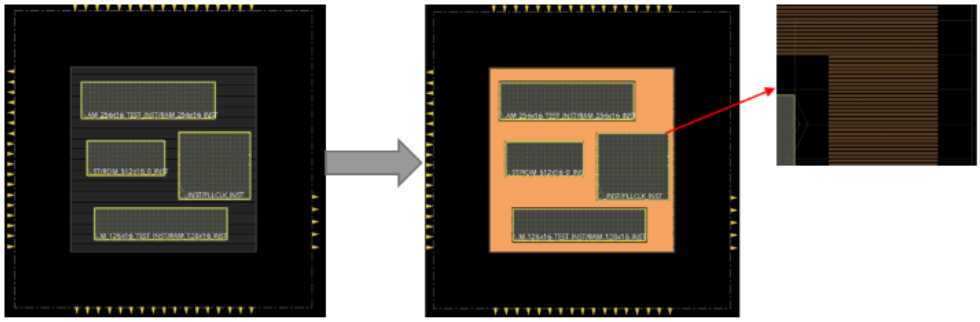
Parameters

`-align_track string`	Specifies the track layer to which the route blockages align to. *Data_type*: string, required
`-help`	Prints a brief description that includes the type and default information for each `create_route_blockage_along_track` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_route_blockage_along_track`
`-consider_cells_as_macros string`	
	Specifies the names of the cells that are considered as macros. Blockages are not created over them. *Data_type*: string, optional
`-consider_macros_as_cells string`	
	Specifies the names of the cells that are considered as std cells. Blockages are created over them. *Data_type*: string, optional
`-edge_shrink {x y}`	Shrinks row area from the edge in X and Y direction. *Data_type*: point, optional
`-layer string`	Specifies the name of the layer on which the tool creates routing blockages for steam out. *Data_type*: string, required

`-no_cut_row`	Specifies whether the blockages to be added should be based on the no-cut row site area even if the row site area is not cut in the design. • Without the `-no_cut_row` parameter, the tool will create route blockages based on the current row area. So the rows for objects like insts, place blockages are expected to be cut out before running the `create_route_blockage_along_track` command to get expected results. • With the `-no_cut_row` parameter, the tool will identify the rows have not been cut before and will call the `split_row` command to get a cut row shape during the action. The route blockage is created based on the cut row shape. The actual row shape will not be changed. • The f`loorplan_no_cut_row true` attribute has the same use with this option. Example: In the following illustration, the rows are not cut before. Now, without the `-no_cut_row` parameter, the tool will create a route blockage over the place blockage and the inst. With the `-no_cut_row` parameter, the tool will not create route blockage over them.  *Default:* false *Data_type*: bool, optional

Example

- The following command creates a routing blockage on layer M2. The route blockages align to track layer M2:
  `create_route_blockage_along_track -layer M2 -align_track M3 -edge_shrink {5 5}`



Related Information

- `delete_route_blockages`
- `set_route_blockage_default_layer`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

create_route_halo

```
create_route_halo
[-help]
{ {-bottom_layer bottom_layer -space halo_value -top_layer top_layer} | -litho_halo }
{-all_blocks | -block block_name_list | -cells cell_name_list | -insts instance_name | -design_halo }
```

Adds a routing halo for blackboxes, hard macros, or block-level designs. A routing halo significantly reduces the possibility of long wire routing within the specified area, thus helping reduce signal integrity violations at the top- and/or block-level designs. A routing halo is honored only by the signal router. The signal router treats routing on the specific routing layers in the routing halo area as very high cost routing. However, perpendicular routing or straight connections to pins are acceptable. The special router does not honor routing halos. To block special routing, use routing blockages instead. You can specify a routing halo for:

- hard macros or blackboxes
- block-level designs
- partitions

For the bottom-up hierarchical flow, use this command to specify routing halo for a block at the top-level design or at the block-level design. The routing halo can be stored as an instance and/or design property and can be viewed through the attribute editor for the instance block. The routing halo can be saved to or restored from a floorplan file. Use this command after importing a design.

Notes:

- For top-down hierarchical flow, specify routing halo for a partition through the `create_partition` command or through the *Specify Partition* form.
- A halo is not allowed on std-cells (cells with CLASS CORE SITE) and is written out as ROUTEHALO in DEF. A design halo is written out as a DEF design FE_ROUTING_HALO property and a litho halo is written out as a DEF component LITHOHALO property.

Parameters

`-all_blocks`	Specifies that the routing halo should be added to all blocks in the design. *Data_type*: bool, required
`-block` *block_name_list*	Specifies that the routing halo should be added to the specified blocks. A block name must be an instance name and not a cell master name. The specified blocks should be separated by a space. *Data_type*: list, required
`-bottom_layer` *bottom_layer*	Specifies the bottom layer for the routing halo. **Note**: Even though the `-bottom_layer`, `-space`, and `-top_layer` parameters are optional, it's important to specify all of them together. *Data_type*: string, required
`-cells` *cell_name_list*	Specifies that the routing halo should be added to all insts of the specified cell names. *Data_type*: list, required
`-design_halo`	Specifies that the routing halo should be added at the block-level design. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `create_route_halo` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_route_halo`
`-insts` *instance_name*	Specifies that the routing halo should be added to the specified instance. This parameter can be useful for adding halo for I/O cells. *Data_type*: list, required
`-litho_halo`	Adds a litho halo to the instances on each routing layer with `LEF LITHOMACROHALO` defined. **Note**: The `-litho_halo` parameter cannot be specified with the `-design_halo` parameter. These parameters are mutually exclusive. **Note**: The `-litho_halo` parameter requires some `LEF LITHOMACROHALO` values to be set. **Note**: A halo is not allowed on std-cells (cells with CLASS CORE SITE) and is written out as ROUTEHALO in DEF. A design halo is written out as a DEF design FE_ROUTING_HALO property and a litho halo is written out as a DEF component LITHOHALO property. *Data_type*: bool, required
`-space` *halo_value*	Specifies the routing halo value in microns. *Minimum*: 0 *Maximum*: 1.79769313486232e+308 *Data_type*: float, required
`-top_layer` *top_layer*	Specifies the top layer for the routing halo. *Data_type*: string, required

Examples

- The following command adds a routing halo of 10 microns to all blocks and specifies that the top and the bottom layers for the routing halo are Metal7 and Metal1, respectively.
  ```
  create_route_halo -space 10 -top_layer Metal7 -bottom_layer Metal1 -all_blocks
  ```
- The following command adds a routing halo of 5 microns to the specified blocks and specifies that the top and the bottom layers for the routing halo are Metal2 and Metal1, respectively.
  ```
  create_route_halo -block DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST DTMF_INST/RAM_128x16_TEST_INST/RAM_128x16_INST -space 5 -top_layer Metal2 -bottom_layer Metal1
  ```

create_route_rule

```
create_route_rule
[-help]
[-add_via {via_name1 via_name2 ...}]
[-exclude_backside_via]
[-generate_via]
[-hard_spacing]
[-init string]
[-min_cut {layer1[:layer2] min_cut ...}]
[-use_via_cut_class string]
[-spacing {layer1[:layer2] spacing ...} |
 -spacing_multiplier {layer1[:layer2] spacing_multiplier}]
[-via {via_name1 via_name2 ...}]
[-width {layer1[:layer2] width ...} |
 -width_multiplier {layer1[:layer2] width_multiplier ...}]
{-name rule_name}
```

Adds a non-default rule for objects. You can also remove vias from the NDR. The command checks the `add_route_via_defs` mode and if the `add_route_vias_auto` attribute is set to `true`, the generated vias is used irrespective of the `-generate_via` option. You can use the command at any point in the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_route_rule` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_route_rule`
`-add_via {`*`via_name1 via_name2 ...`*`}`	
	Adds vias to the existing via list. You can use this parameter to add DFM vias or other custom vias. *Data_type*: string, optional
`-exclude_backside_via`	Prevents inclusion of non-route or backside vias in a newly defined non-default rule. *Data_type*: bool, optional
`-generate_via`	
	Auto-generates vias with the `add_route_via_defs` command. **Note:** If the NDR specified by you is with metal wider than the default rule, it is recommended to use this option for getting better routing results. *Data_type*: bool, optional
`-hard_spacing`	Sets the non-default rule as HARDSPACING. *Data_type*: bool, optional
`-init` *`string`*	Specifies the name of an existing non-default rule from which all values are initialized. **Note:** Other options will overwrite these values. *Data_type*: string, optional
`-min_cut {`*`layer1`*`[:`*`layer2`*`] `*`min_cut ...`*`}`	
	Specifies the minimum cut limit for via layers. *Data_type*: string, optional
`-name` *`rule_name`*	Specifies the name of the non-default rule that is to be added. *Data_type*: string, optional
`-spacing {`*`layer1`*`[:`*`layer2`*`] `*`spacing ...`*`}`	
	Specifies the spacing for routing layers. *Data_type*: string, optional
`-spacing_multiplier {layer1[:layer2]` *`spacing_multiplier`*`}`	
	Spacing multiplier for routing layers. *Data_type*: string, optional
`-use_via_cut_class` *`string`*	Specifies the layer and `cut_class` list to support the LEF/DEF property. *Data_type*: string, optional
`-via {`*`via_name1 via_name2 ...`*`}`	
	Resets and adds the list of via or via rule generate name. *Data_type*: string, optional
`-width {`*`layer1`*`[:`*`layer2`*`] `*`width ...`*`}`	
	Specifies the width for routing layers. *Data_type*: string, optional
`-width_multiplier {`*`layer1`*`[:`*`layer2`*`] `*`width_multiplier ...`*`}`	
	Width multiplier for routing layers. *Data_type*: string, optional

Example

- The following command creates a rule that requires extra spacing. All other values are the same as the default rule.
  ```
  create_route_rule -name default_2x_space -spacing {metal1:metal4 0.2 metal5:metal6 0.4 metal7 0.6}
  ```
- The following command creates a new wide-wire routing rule (double wide on the Mx routing layers, but not the wide layers). Auto-generate vias because the width changed, so the default vias are not correct.
  ```
  create_route_rule -name Mx_2x_wide -width {metal1:metal4 0.20} -generate_via
  ```
- The following command uses existing wide-wire rule, but require 2 cut vias for the Vx layers (via1 to via3)
  ```
  create_route_rule -name Mx_2x_wide_Vx_2cut -init Mx_2x_wide -min_cut {via1:via3 2}
  ```

create_row

```
 create_row
[-help]
-site siteName
[-flip_first_row]
[-limit_rows_in_core]
[-no_check]
[-no_flip_rows]
[-spacing distance]
[-no_abut | -no_abut_first ]
[-area {x1 y1 x2 y2} | -rects {{x1 y1} {x2 y2}...} | -polygon {{x1 y1} {x2 y2}...}]
```

Creates rows for the specified site. The row boundary can be defined by core area or the area that you specify. This command supports the creation of overlapping rows. This command can create only horizontal rows. By default, alternate rows are flipped and all rows are abutted (no spaces between rows).

The following points apply to the usage of this command:

- Rows can be created both inside and outside the core area, but within the die.
- All new rows created in an area must be an integer multiple of any existing rows in the same area.
- Non-integer multiple height rows cannot be created outside power domains.

Use this command after importing a design.

Parameters

`-area {x1 y1 x2 y2}`	
	Create rows in the specified rectangle. (Default is within the core box.) The values are floats, units are microns. Rows are truncated at the die box boundary. Either a tcl list or 4 separate parameters works. • *x1* : Lower left x coordinate. • *y1* : Lower left y coordinate. • *x2* : Upper right x coordinate. • *y2* : Upper right y coordinate. *Data_type*: rect, optional
`-flip_first_row`	Controls the orientation of the first (bottom) row, which is R0 by default. When `-flip_first_row`, the first row's orientation is MX. See `-no_flip_rows`. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_row` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_row`
`-limit_rows_in_core`	By default (none of `-area, -polygon, -rects` specified) rows are created in the core box. When one of `-area, -polygon, -rects` is specified, by default rows are created within the intersection of the die box and the specified rectilinear shape. When one of `-area, -polygon, -rects` and `-limit_rows_in_core` is specified, rows are created within the intersection of the core box and the specified rectilinear shape. *Data_type*: bool, optional
`-no_abut`	Controls where spaces are inserted between rows. By default, spaces are inserted between pairs of rows. When `-no_abut` is enabled spaces are inserted between every row. See `-spacing` and `-no_abut_first`. *Data_type*: bool, optional
`-no_abut_first`	Controls where the first space between rows is inserted. Default is that the first space is inserted after the first (lowest) *pair* of rows, and subsequently after every pair of rows (space inserted between 2nd and 3rd rows, between 4th and 5th rows, etc). When `-no_abut_first`, the first space is inserted after the first (lowest) row, and subsequently after every pair of rows (space inserted between 1st and 2nd rows, then 3rd and 4th rows, etc). See `-spacing` and `-no_abut`. *Data_type*: bool, optional

`-no_check`	Specifies that the row should not be aligned to the existing row and should support redo undo. *Data_type*: bool, optional
`-no_flip_rows`	By default rows have alternating orientation `(...MX R0 MX R0...)`, or when `-no_flip_rows` is specified rows have identical orientation (one of: `...R0 R0 R0...`; or `...MX MX MX...`). See `-flip_first_row`. *Data_type*: bool, optional
`-polygon {{x1 y1} {x2 y2}...}`	
	The X and Y values are floats, units are microns. There must be an even number of points specified. The points specify a polygon in which rows are created. Each pair of points specifies one edge of the polygon, so { X1 Y1 } and { X2 Y2 } specify one edge, { X2 Y2 } { X3 Y3 } specify the next edge, etc. The last edge is specified by { Xlast Ylast } { X1 Y1 }. In the degenerate case (multiple rectilinear areas touching at corners) rows will be created continuously starting at the lowest point. *Data_type*: (point)+, optional
`-rects {{x1 y1} {x2 y2} ...}`	
	The X and Y values are floats, units are microns. There must be an even number of points specified. Pairs of points are used to determine a set of rectangles, where the first point of the pair is LLX, LLY, the second point is URX, URY. Rectangles need not be overlapping. Rows are created in the union of the rectangles defined. Note that for overlapping rectangles, rows are created continuously starting at the first (bottom) row (of the lowest rectangle). For non-overlapping rectangles, rows are created independently starting at the bottom of each rectangle. *Data_type*: (point)+, optional
`-site` *siteName*	Specifies the name of the site to be used for creating the rows. (Objects not allowed.) *Data_type*: string, optional
`-spacing` *distance*	Specifies the width of the space inserted between certain rows. The first (lowest) row is always inserted along the bottom edge of the area having rows added. If `-no_abut` is specified, then space is inserted between every subsequent row. The default is space is inserted between every other row. If `-no_abut_first` is specified, then space is inserted after the first row (and then the third etc). The default is that space is inserted after the second row (and then the 4th etc). Note that `-no_abut` and `-no_abut_first` are mutually exclusive. *Default*: 0.0 um *Data_type*: float, optional

Example

The following command creates rows for the site lt3site within the area defined by the coordinates 376.7, 577.57, 688.94, 725.68. A 1 micron space is inserted between the 1st (lowest) and 2nd rows, the 3rd and 4th rows, etc:

```
create_row -site lt3site -area 376.7 577.57 688.94 725.68 -spacing 1.0 -no_abut_first
```

create_shape

```
create_shape
[-help]
-layer {layer_name_or_pointer}
[-net {net_name}]
[-shape {none ring stripe followpin iowire corewire blockwire fillwire blockagewire padring blockring drcfill fillwireopc}]
[-shield_net {net_name_or_pointer}]
[-status {routed fixed cover shield noshield}]
[-user_class className]
{-rect {x1 y1 x2 y2} | -patch {x1 y1 x2 y2} | -polygon {x1 y1 x2 y2 ...xn yn} |
[-path_segment {x1 y1 x2 y2} -width value
 [-begin_extension value -end_extension value]]}
```

The command `create_shape` adds `DEF SPECIALNETS` wiring shapes to the database. You can use the command at any point in the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_shape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_shape`
`-begin_extension value`	Specify the extension beginning value in microns. *Default*: 0 *Data_type*: float, optional
`-end_extension value`	Specify the extension end value in microns. *Default*: 0 *Data_type*: float, optional
`-layer {layer_name_or_pointer}`	
	Name of the layer or layer pointer. *Data_type*: string, required
`-net net_name`	Name of the net. *Data_type*: string, optional
`-patch {x1 y1 x2 y2}`	Specifies the coordinates of the lower-left and upper-right points of the rectangle for creating the patch wires. *Data_type*: rect, optional
`-path_segment {x1 y1 x2 y2}`	
	The beginning and ending coordinates for the path segment. **Note:** For vertical stripes, x1 and x2 are the same (and are the coordinates of the center of the stripe). Similarly for horizontal stripes. *Data_type*: rect, optional
`-polygon {x1 y1 x2 y2 ...xn yn}`	
	The point list of the polygon, in microns. Note: add shapes to signal nets with `-path_segment` *Data_type*: (point)+, optional
`-rect {x1 y1 x2 y2}`	
	Specifies the coordinates of the lower-left and upper-right points of the rectangle for creating horizontal and vertical wires. *Data_type*: rect, optional
`-shape {none ring stripe followpin iowire corewire blockwire fillwire blockagewire padring blockring drcfill fillwireopc}`	

	Defines the `specialnets` wiring shape. *Default*: `None` *Data_type*: enum, optional
`-shield_net {`*net_name_or_pointer* `}`	
	The name or pointer of the net to be shielded by the via instance. The `-shield_net` option is only allowed when `-status shield` is used. *Data_type*: string, optional
`-status {routed fixed cover shield noshield}`	
	Defines the `specialnets` wiring status. *Default*: `routed` *Data_type*: enum, optional
`-width` *value*	The width in microns. *Data_type*: float, optional
`-user_class`	Defines the attribute class by user. *Data_type*: string, optional

Example

- `-path_segment`: The following command adds a horizontal `pathSeg` to the net with the name `VSS` on layer `METAL1` at the co-ordinates (100, 250, 200 ,250) with a width of 2.5 microns and the begin and end extensions of 1.25 microns.
  Note: Typically, the begin and end extension values are zero for most `DEF SPECIALNETS` wiring, but can be any value that would result in the end of the wire falling on the manufacturing grid.
  ```
  create_shape -net VSS -layer METAL1 -path_segment {100 250 200 250} -width 2.5 -begin_extension 1.25 -end_extension 1.25
  ```
- `-polygon`: This command adds a polygon shaped wire to the net named `VSS` on layer `METAL1` with coordinates specified.
  ```
  create_shape -net VSS -layer METAL1 -polygon {{25.05 25.115} {25.115 25.05} {25.115 24.95} {5.05 4.885} {4.95 4.885} {4.885 4.95} {4.885 5.05} {24.95 25.115}}
  ```
- This command would add a polygon shape swire to snet `VSS` on layer `METAL3` having coordinates similar to the swire belonging to the net `VSS` on layer `METAL1`.
  ```
  create_shape -net VSS -layer METAL3 -polygon [ get_db [ get_db [ get_db nets VSS ] .special_wires -if { .layer.name == METAL1 } ] .polygon ]
  ```

create_special_drc_region

```
  create_special_drc_region
[-help]
[-extend_outer_x float]
[-extend_outer_y float]
[-extend_x float]
[-extend_y float]
[-insts string]
-layer string
```

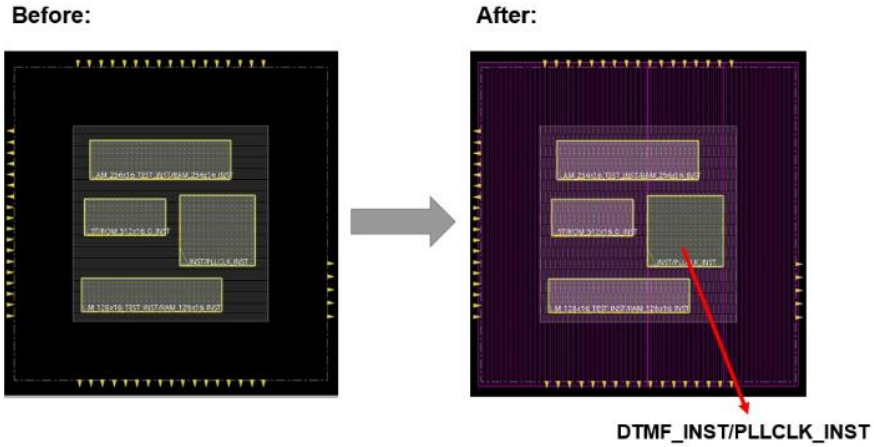
DRC region layers define a special masterslice layer that is used to define the areas of a region on which a set of rules defined in the metal, cut, and/or trim metal layers with the REGION property would be applied. The `create_special_drc_region` command can be used to add drc region blockages in or around the die area except specified macros.

Parameters

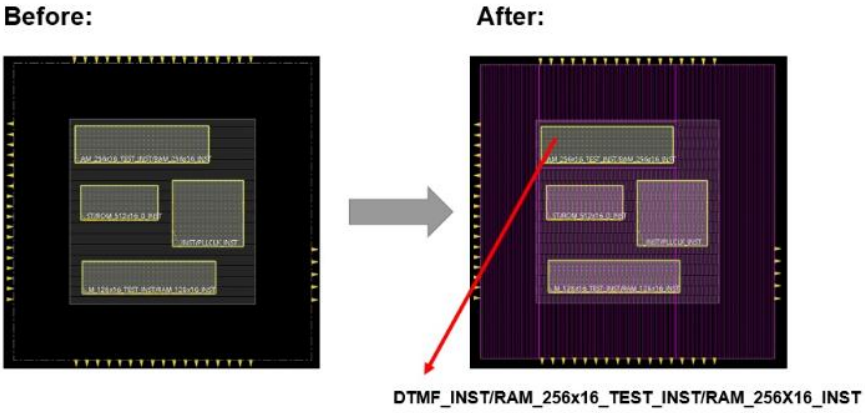
`-extend_outer_x float`	Expands the routing blockage in X direction. *Data_type*: float, optional
`-extend_outer_y float`	Expands the routing blockage in Y direction. *Data_type*: float, optional
`-extend_x float`	Expands the non-routing blockage in X direction. *Data_type*: float, optional
`-extend_y float`	Expands the non-routing blockage in X direction. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_special_drc_region` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_special_drc_region`
`-insts string`	Specifies the name of the hierarchical instance that are to be cut out. **Note:** Wild card characters are not supported while specifying hierarchical instance names. **Note:** All blocks are included if `-insts` is not specified or when `-insts{}` is specified. *Data_type*: string, optional
`-layer string`	Specifies the names of the layers on which the routing blockage is created. *Data_type*: string, optional

Example

- The following command creates a routing blockage on R1 that blocks out `DTMF_INST/PLLCLK_INST`:
  `create_special_drc_region -layer R1 -extend_outer_x 10 -extend_outer_y 20 -insts DTMF_INST/PLLCLK_INST`



- The following command creates a routing blockage on R1 that blocks out `DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST`:
  `create_special_drc_region -layer R1 -extend_x 10 -extend_y 20 -insts DTMF_INST/RAM_256x16_TEST_INST/RAM_256x16_INST`



Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

create_special_mark_layer_shape

```
create_special_mark_layer_shape
[-help]
[-cut_out_block_insts string]
[-extend_outer_x float]
[-extend_outer_y float]
[-extend_x float]
[-extend_y float]
-layer string
```

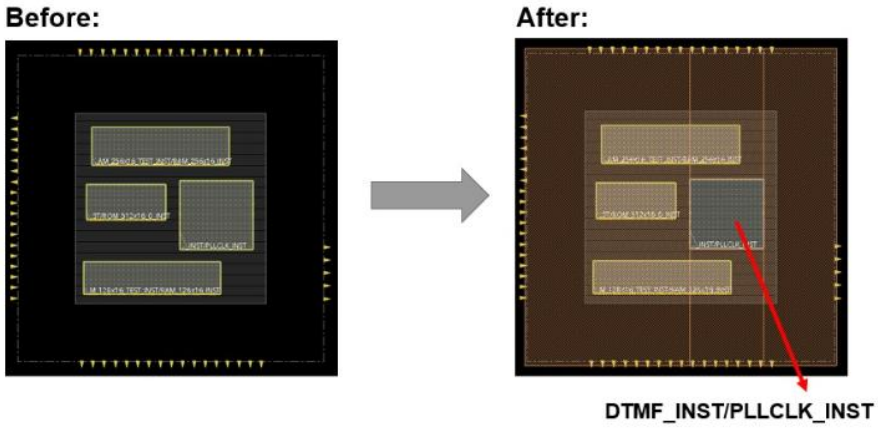
Creates a mark layer shape, using special route. This command enables you to apply one set of rules for the entire design in Innovus by connecting the macro pins around halo of IP blocks. The IPs are selected based on a list which provides the instance name.

Parameters

`-cut_out_block_insts string`	Specifies the name of the instances that are to be cut out. **Note:** All blocks are cut out if `-cut_out_block_insts` is not specified however, if `-cut_out_block_insts {}` is specified then all blocks are NOT cut as this pattern cannot match anything. *Data_type*: string, optional
`-extend_outer_x float`	Expands the mark layer shape in X direction. *Data_type*: float, optional
`-extend_outer_y float`	Expands the mark layer shape in Y direction. *Data_type*: float, optional
`-extend_x float`	Expands the no-mark layer shape in X direction. *Data_type*: float, optional
`-extend_y float`	Expands the no-mark layer shape in Y direction. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `create_special_mark_layer_shape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_special_mark_layer_shape`
`-layer string`	Specifies the names of the layers on which the mark layer shape is to be applied. *Data_type*: string, required

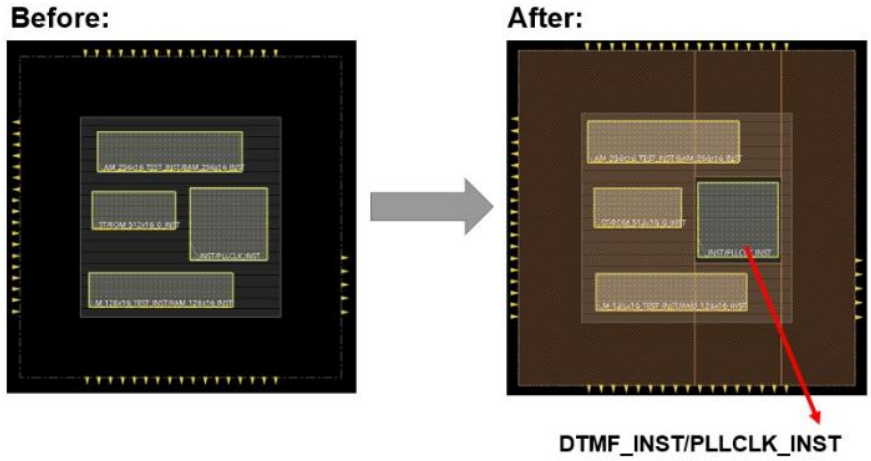
- The following command creates a mark layer shape on M2_P48 that blocks out `DTMF_INST/PLLCLK_INST` and expands the marker layer shape by 10 in X direction and by 20 in Y direction:

  ```
  create_special_mark_layer_shape -cut_out_block_insts DTMF_INST/PLLCLK_INST -extend_outer_x 10 -extend_outer_y 20 -layer M2_P48
  ```



- The following command creates a mark layer shape on M2_P48 that blocks out `DTMF_INST/PLLCLK_INST` and expands the no-mark layer shape by 10 in X direction and by 20 in Y direction:

```
create_special_mark_layer_shape -cut_out_block_insts DTMF_INST/PLLCLK_INST -extend_x 10 -extend_y 20 -layer M2_P48
```



Related Information

create_text

```
create_text
[-help]
[-alignment {center_center center_left center_right lower_center lower_left
             lower_right upper_center upper_left upper_right}]
[-always_display {true | false}]
[-font {euroStyle gothic math roman script stick fixed swedish milSpec}]
[-height value]
-label {string}
[-layer {layer_name_or_pointer}]
[-oa_purpose {string}]
[-orient {mx mx90 my90 r0 r180 r270 r90}]
-point {x y}
```

Adds text to the specified custom layer. You can use the `create_text` command at any point in the design flow. The text added by the command is to annotate comment text and does not show up in a `DEF` output.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_text` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_text`
`-alignment {center_center center_left center_right lower_center lower_left lower_right upper_center upper_left upper_right}`	
	Specifies the alignment of the text. *Data_type*: enum, optional
`-always_display {true | false}`	
	Indicates if the text is always displayed. *Data_type*: enum, optional
`-font {euroStyle gothic math roman script stick fixed swedish milSpec}`	
	Specifies the font style of the text. *Default*: `stick` *Data_type*: enum, optional
`-height` *value*	Specifies the height of the text, in microns. *Data_type*: float, optional
`-label {`*string*`}`	
	Specifies the text string. *Data_type*: string, required
`-layer {`*layer_name_or_pointer*`}`	
	Specifies the layer name or the layer pointer. *Data_type*: string, optional
`-oa_purpose {`*string*`}`	Specifies a user-defined purpose name for OpenAccess text layer purpose pair support. Only values that exist in the library's tech graph are allowed. If the specified name is not a legal purpose name, a warning is displayed and the text is treated as drawing purpose. *Default:* `drawing` *Data_type*: string, optional
`-orient {mx mx90 my90 r0 r180 r270 r90}`	
	Specifies the orientation of the text. *Data_type*: enum, optional
`-point {`*x y*`}`	Specifies the beginning coordinates of the text. It is specified in microns. *Data_type*: point, required

delete_all_density_area

```
delete_all_density_area
[-help]
```

Removes all partial placement blockages from the floorplan. Use this command after importing the design.

Parameters

None

`-help`	Outputs a brief description of the `delete_all_density_area` command. For a detailed description of the command, use the man command: `man delete_all_density_area`

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_all_floorplan_objs

```
delete_all_floorplan_objs
[-help]
```

Removes all floorplan objects. The density screen, obstruction, power strips, and route guides objects are deleted. The guides and block guides are cleared from the design area. The physical instance groups are also cleared from the core area. Use this command after importing the design.

Parameters

None

`-help`	Outputs a brief description of the `delete_all_floorplan_objs` command. For a detailed description of the command, use the man command: `man delete_all_floorplan_objs`

Related Information

- `delete_selected_from_floorplan`

- Floorplan Menu chapter in the *Innovus Stylus Common UI Menu Reference*
  - Clear Floorplan

delete_all_power_preroutes

```
delete_all_power_preroutes
[-help]
```

Removes all power preroutes from the floorplan. Use this command after importing the design.

Parameters

None

`-help`	Outputs a brief description of the `delete_all_power_preroutes` command. For a detailed description of the command, use the man command: `man delete_all_power_preroutes`

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_all_signal_preroutes

```
delete_all_signal_preroutes
[-help]
```

Removes all signal preroutes from the floorplan. Use this command after importing the design.

Parameters

None

`-help`	Outputs a brief description of the `delete_all_signal_preroutes` command. For a detailed description of the command, use the man command: `man delete_all_signal_preroutes`

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_bump_grid

```
delete_bump_grid
[-help]
[-grid_names string | -all ]
```

Removes the bump grid from the design. Use this command anytime after creating a bump grid.

Parameters

`-all`	Deletes all the bump grids. *Data_type*: bool, optional
`-grid_names` *string*	Specifies the name(s) of the bump grid to be deleted. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `delete_bump_grid` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_bump_grid`

Example

- The following command deletes all the bump grids in the current design:
  ```
  delete_bump_grid -all
  ```
- The following command deletes the `myGridFront_9x9` named bump grid:
  ```
  delete_bump_grid -grid_names {myGridFront_9x9}
  ```
- The following command deletes multiple bump girds:
  ```
  delete_bump_grid -grid_names {myGridFront_9x9 myGridFront_25x25}
  ```

Related Information

- `create_bump_grid`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_exclusive_groups

```
delete_exclusive_groups
[-help]
[-all | group_name]
```

Deletes existing exclusive regions for groups. You can use this command after creating exclusive groups. It restores all attributes of exclusive groups

Parameters

`-all`	Deletes all exclusive regions. When specified, the tool resets all existing exclusive groups attributes to their default values. *Data_type*: bool, optional
group_name	Specifies the name of the group to delete. The tool deletes exclusive regions of the specified groups and all other exclusive groups that have been created together. You can specify one or multiple groups after the command. *Data_type*: string, optional
`-help`	Outputs a brief description that includes the type and default information for each `delete_exclusive_groups` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_exclusive_groups`

Examples

- The following command deletes all exclusive regions of groups (A,B,C,D,E,F).
  ```
  delete_exclusive_groups -all
  ```
- The following command deletes exclusive regions of groups A and F.
  ```
  delete_exclusive_groups {A F}
  ```
- The following command deletes exclusive regions of groups (A,B,C).
  ```
  delete_exclusive_groups B
  ```

Related Information

delete_io_fillers

```
delete_io_fillers
[-help]
[-cell {name_list}]
[-from coord]
[-prefix prefix]
[-ring_number num]
[-side {top | bottom | left | right}]
[-to coord]
[-logic [-derive_connectivity]]
```

Deletes I/O filler cell instances from the design. Use this command after filler cells have been added using the `add_io_fillers` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `delete_io_fillers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_io_fillers`
`-cell {name_list}`	Specifies the name list of the I/O filler cells to be removed. *Data_type*: list, optional
`-derive_connectivity`	Deletes connectivity for I/O fillers. *Data_type*: bool, optional
`-from coord`	Specifies the coordinates of the starting location from where I/O filler cells are to be removed. The values are in micrometers. *Data_type*: float, optional
`-logic`	Deletes non-physical logical I/O filler cells created by the `add_io_fillers` command. *Data_type*: bool, optional
`-prefix prefix`	Specifies the prefix of the names of I/O filler instances to be removed. *Data_type*: string, optional
`-ring_number num`	Specifies the number of the ring from which I/O filler cells are to be removed. Use this parameter if you want to delete I/O filler cell instances from only a specific I/O ring in a multiple I/O ring design. *Data_type*: int, optional
`-side {top | bottom | left | right}`	
	Specifies the side as top side, bottom side, left side, and right side of the I/O box from which the I/O filler cells are to be removed. *Default*: If you do not specify this parameter, all sides are specified. *Data_type*: string, optional
`-to coord`	Specifies the coordinates of the ending location till which I/O filler cells are to be removed. The values are in micrometers. *Data_type*: float, optional

Related Information

- `add_io_fillers`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_io_insts

```
delete_io_insts
[-help]
-insts {name1 name2 ...}
```

Deletes the specified I/O instance. You can use this command at any point in the design flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `delete_io_insts` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_io_insts`
`-insts {name1 name2 ...}`	
	Specifies the name(s) of I/O instance(s) to be deleted. *Data_type*: list, required

Example

- The following command deletes the specified I/O instance:
  `delete_io_insts -insts` newIo

Related Information

- `add_io_insts`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_io_row_fillers

```
delete_io_row_fillers
[-help]
-cell {filler_cell_name_list ...}
[-logic]
[-prefix prefix]
[-io_row name]
[-from coord]
[-to coord]
```

Deletes the I/O row filler cells. You can use this command at any point in the design flow.

Parameters

`-cell {filler_cell_name_list...}`	
	Specifies the name of the filler cell(s) to delete from the I/O row. *Data_type*: string, optional
`-from coord`	Specifies the coordinates of a specified starting range where I/O filler cells are to be deleted. The values are in micrometers. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `delete_io_row_fillers` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_io_row_fillers`
`-io_row name`	Specifies the name of the I/O row to delete the filler cell. *Data_type*: string, optional
`-logic`	Deletes non-physical I/O fillers. *Data_type*: bool, optional
`-prefix prefix`	Specifies the prefix name to be appended to the I/O row filler cell to be deleted. *Data_type*: string, optional
`-to coord`	Specifies the coordinates of a specified ending range where I/O row filler cells to be deleted. The values are in micrometers. *Data_type*: float, optional

Example

- The following command deletes the specified I/O instance.
  ```
  delete_io_row_fillers -cell PAD8 -prefix PAD8
  ```

Related Information

- `add_io_row_fillers`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_pg_pins

```
delete_pg_pins
[-help]
[-area {x1 y1 x2 y2}]
[-layers layer_id | {list_of_layer}]
[-net net_name]
[-pg_port]
[-all | -selected ]
```

Deletes power/ground pins as per the specified parameters and reports the number of deleted power/ground pins. You can use this command at any point in the design flow.

Note: The `delete_pg_pins` command only deletes the pin shapes and fterms created using the `create_pg_pin` command. If the power/ground pins are added using the read_floorplan command, then the `delete_pg_pins` command only deletes the pin shapes and keeps the pg pins.

If there is no power/ground pin and pin box definition in the .fp.gz file, and you add the power/ground pins using the `create_pg_pin` command, then Innovus will automatically add the pg fterm for it. In such a case, the `delete_pg_pins` command deletes both pin shapes and pg pins.

Parameters

`-all`	Deletes all the power/ground pins. *Data_type*: bool, optional
`-area x1 y1 x2 y2`	
	Specifies a bounding box for the area in which power/ground pins are to be deleted. *Data_type*: rect, optional
`-help`	Outputs a brief description that includes the type and default information for each `delete_pg_pins` parameter. For a detailed description of use the man command: `man delete_pg_pins`
`-layers layer_id | {list_of_layer}`	
	Specifies the layer(s) on which the power/ground pins are to be deleted. **Note**: Layers can be specified using the LEF layer names or layer ID numbers. *Data_type*: string, optional
`-net net_name`	Specifies the name of the net whose attached power/ground pins are to be deleted. *Data_type*: (net)*, optional
`-pg_port`	Deletes pg ports with pg shape or deletes pg ports based on the net name specified with the `-net` option. *Data_type*: bool, optional
`-selected`	Deletes the selected power/ground pins. *Data_type*: bool, optional

delete_place_halo

```
delete_place_halo
[-help]
[-block | -all_macros | -all_black_boxes | -all_commit_partitions  | -all_blocks | -all_io_pads | -cell name]
```

Removes block halo values for specific blocks or for all blocks. Use this command after running `create_place_halo`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `delete_place_halo` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_place_halo`
`-all_black_boxes`	Specifies the removal of halo values for all black boxes. *Data_type*: bool, optional
`-all_blocks`	Specifies the removal of halo values for all blocks. *Data_type*: bool, optional
`-all_commit_partitions`	Specifies the removal of halo values for all committed partitions. *Data_type*: bool, optional
`-all_io_pads`	Specifies the removal of halo values for all IO pads. *Data_type*: bool, optional
`-all_macros`	Specifies the removal of halo values for all hard macros. *Data_type*: bool, optional
`-cell name`	Specifies the removal of halo values for all instances of a cell. *Data_type*: string, optional
`-block`	Specifies the block where the halo is to be deleted. You can use wildcards (* or ?) for specifying instance names. *Data_type*: string, optional

Example

The following command removes block halo values from a hard macro named cube32:

```
delete_place_halo cube32
```

delete_relative_floorplan

```
delete_relative_floorplan
[-help]
{obj_name_list | -all}
```

Removes the relative floorplan information from the database. It deletes all relative floorplan constraints, all relative constraints for the specified object(s), or removes the last executed relative floorplan action from the database. Use this command after running `create_relative_floorplan`.

Notes:

- The arrows showing relative constraints for the specified objects are removed from the floorplan display.
- The `delete_relative_floorplan` command accepts an array of objects.

Parameters

`-all`	Delete all relative floorplan constraints. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `delete_relative_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_relative_floorplan`
obj_name_list	Deletes all relative constraints for the specified object(s). **Note**: If you do not specify *obj_name_list*, this command removes the last executed relative floorplan action from the database. *Data_type*: string, optional

Example

- The following command deletes obj1, obj2, and obj3 from the database:
  ```
  delete_relative_floorplan {obj1 obj2 obj3}
  ```

Related Information

- `create_relative_floorplan`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

delete_route_blockages

```
delete_route_blockages
[-help]
[-type {all routes fills slots}]
[-layers <layer+> | -all {cut route drc_region trim_metal}]
```

Deletes a routing blockage object. Use this command during partition floorplanning.

Note: The `delete_route_blockages` command matches the layer name and the layer type while deleting routing blockages. If the layer name and the layer type do not match, the specified layer is not deleted and a warning about the mismatch is displayed. This rule is honored by standard layers, cut layers, drc region layers, and trim metal layers. When a list of layers is specified, only the layers matching with the specified layer type are deleted.

Parameters

`-all {cut route drc_region trim_metal}`	
	Provides a quick way to specify layer types if all blockages on that layer type are to be deleted. You can specify multiple layer types with this parameter. • `cut`: Specify to delete blockages on all cut layers. • `route`: Specify to delete blockages on all routing layers. • `drc_region`: Specify to delete routing blockages on drc region layers. • `trim_metal`: Specify to delete routing blockages on all trim metal layers. *Data_type*: (enum)+, optional
`-help`	Outputs a brief description that includes the type and default information for each `delete_route_blockages` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_route_blockages`
`-layers <layer+>`	Specifies the layer, list of layers, or all layers on which the routing blockage is to be deleted. *Data_type*: (layer)+, optional
`-type {all routes fills slots}`	
	Specifies the type of routing blockage to delete. The following options are available: • `all`: Deletes all types of blockages. • `routes`: Deletes the blockages that block routing. • `fills`: Deletes the blockages that block metal-fill. • `slots`: Deletes the blockages that block slots. *Default*: `all` *Data_type*: enum, optional

Examples

- The following commands create a blockage on all metal layers and deletes only on metal3:

```
create_route_blockage -rects 11.2 164.07 95.005 319.205 -all
delete_route_blockages -type all -layers 3
```

Related Information

delete_route_halos

```
delete_route_halos
[-help]
[-litho_halo]
{-all_blocks | -block block_name_list | -cells cell_name_list | -insts instance_name | -design_halo}
```

Deletes a routing halo for a blackbox, hard macro, or block-level design. Use this command after specifying a routing halo for a blackbox, hard macro, or block-level design. You can use the `create_route_halo` command to add routing halos.

Parameters

`-all_blocks`	Deletes the routing halo for all blocks and black boxes. *Data_type*: bool, required
`-block block_name_list`	Deletes the routing halo for the specified blocks. *Data_type*: list, required
`-cells cell_name_list`	Deletes the routing halo for the specified cells. *Data_type*: list, required
`-design_halo`	Deletes the routing halo at the design level. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `delete_route_halos` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_route_halos`
`-insts instance_name`	Specifies that the routing halo should be added to the specified instance. Use this option to delete the halo of an I/O pad instance. *Data_type*: list, required
`-litho_halo`	Deletes the litho routing halo. *Data_type*: bool, optional

Example

```
delete_route_halos -all_blocks
```

Related Information

- `create_route_halo`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*
- Floorplan Menu chapter in the *Innovus Stylus Common UI Menu Reference*
  - Edit Halo

delete_row

```
delete_row
[-help]
{-all | -selected | -site string| -row}
```

Deletes the specified row(s). Use this command after importing a design.

Parameters

`-all`	Specifies that all rows will be deleted. *Data_type*: bool, required
`-help`	Outputs a brief description that includes the type and default information for each `delete_row` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_row`
-row	Specifies the name or id of the row(s) to be deleted. *Data_type*: list, required
`-selected`	Specifies that the selected rows should be deleted. *Data_type*: bool, required
`-site` *string*	Specifies the site for which rows will be deleted. *Data_type*: string, required

Example

The following command deletes rows for the site site0A10.

```
delete_row -site site0A10
```

Related Information

  - Creating and Editing Rows

delete_selected_from_floorplan

```
delete_selected_from_floorplan
[-help]
```

Deletes the currently selected floorplan objects. You can use this command at any point in the design flow.

Parameters

None

`-help`	Outputs a brief description of the `delete_selected_from_floorplan` command. For a detailed description of the command, use the man command: `man delete_selected_from_floorplan`

Related Information

- `delete_all_floorplan_objs`

  - Clear Floorplan

finish_floorplan

```
finish_floorplan
[-help]
[-mask integer]
{ [-auto_halo | [-auto_halo_based_on_pitch [-margin value]] | -add_halo width |
[-fill_place_blockage blockage_type max_gap
   [-density value] [-exclude_flops ][-dead_area float] [-honor_placement_density ]] |
[-fill_route_blockage max_gap [-layers layer_id]
[-cut_layers cut_layer_id]
[-fills ] [-pg_net_exception ]
[-spacing space_value | -design_rule_width width][-dead_area max_dead_area]] |
-add_corner_blockage {x y} | [-drc_region_layer layer+ [-edge_extend {x y}] [-edge_shrink {x y}]] |-add_boundary_end_of_line_blockage | -
add_row_based_region_blockage | -undo ]
[-area {x1 y1 x2 y2}]
[-name_prefix name] }
```

Performs advanced placement-related refinements to a floorplan, to produce a more polished floorplan. The `finish_floorplan` command, can be used on any floorplan, including third-party generated floorplans. You can use the `finish_floorplan` Category Attributes to set the active objects and specify the channel direction for the `finish_floorplan` command to use. The `finish_floorplan` Category Attributes affect the behavior of the `finish_floorplan` command.

Note: The `finish_floorplan` command honors the settings of the `floorplan_no_cut_row` attribute that specifies if rows are not required to be cut before other operations. When the `floorplan_no_cut_row` attribute is disabled, the `finish_floorplan` command adds blockages around the current row/non-row area in the design when the `finish_floorplan_active_objs row` or `finish_floorplan_drc_region_objs nonRowArea` options are set. If rows are not cut before other operations but the `floorplan_no_cut_row` attribute is enabled, the `finish_floorplan` command can work as cut row flow to add blockages around row/non-row area which satisfy row constraints.

Parameters

`-add_boundary_end_of_line_blockage`	Adds end-of-line(EOL) routing blockage with “COREEOLBLOCKAGE” property around active object boundary. This parameter can only work with rows as active objects. For each layer, EOL routing blockage is perpendicular with prefer routing direction.
	Note: A Core EOL blockage rule is used to specify line-end blockages formed from the core edges. The EOL Blockage is defined in LEF as below:
	`PROPERTY LEF58_COREEOLBLOCKAGE "COREEOLBLOCKAGE outwardSize inwardSize [SIDEEXTENSION sideExtension] ;" ;`
	`COREEOLBLOCKAGE outwardSize inwardSize SIDEEXTENSION sideExtension`
	Defines the line-end blockages formed from the core edges in the orthogonal direction of the preferred routing direction of the layer of a design. The blockage is formed by going outward from the core by outwardSize and inward by inwardSize. If SIDEEXTENSION is defined, the blockage is extended by sizeExtension along the direction of the core edge on both sides. These blockages prevent any line-end of a wire end inside it. If a wire goes through the blockage and just touches the far end edge, it is still a violation. If a wire just touches an edge without extending inside the blockage, it is fine. .
	Data_type: bool, optional

`-add_corner_blockage {x y}`	Specifies the width and height of the hard placement blockage that is automatically added around the corner. Example: `finish_floorplan -add_corner_blockage 50 50` Before：  After：  *Data_type*: string, optional
`-add_halo width`	Adds halo of the specified width. *Data_type*: float, optional
`-add_row_based_region_blockage`	When specified, it adds row based region blockages. This parameter adds region layer blockages with “ROWBASED” property in some row areas. **Note:** The row area is determined by standard cells with both such row sites and OBS on the region layer. *Data_type*: bool, optional
`-area {x1 y1 x2 y2}`	Specifies the lower left x coordinate, lower left y coordinate, upper right x coordinate, and upper right y coordinate respectively of the blockage area. *Data_type*: rect, optional

`-auto_halo`	Automatically add halos around every macro in design. For each macro edge, the halo thickness is proportional to pin density on that edge. Example: `finish_floorplan -auto_halo` Before:  After:  *Data_type*: bool, optional

`-auto_halo_based_on_pitch`	Automatically add halos based on the number of pins, routing layer, and layer pitch on the edge. Example: `finish_floorplan -auto_halo_based_on_pitch` Before:  After:  *Data_type*: bool, optional
`-cut_layers` *cut_layer_id*	Specifies the cut layer ID on which the routing blockage is to be applied. *Data_type*: string, optional

`-dead_area` *float*	Specifies the maximum value of dead area.
	Note: A dead area is an island with placeable rows that has a narrow channel connect to main core area. For example, the placeable rows surrounded by macros.
	Example：
	`finish_floorplan -fill_place_blockage hard 300`
	 	
	`finish_floorplan -fill_place_blockage hard 300 -dead_area 90000`
	 	
	Data_type: float, optional

`-density` *value*	Specifies the density of the partial placement blockage. *Data_type*: string, optional

`-design_rule_width width`	Specifies the effective width of the routing blockage. The value is a real number greater than 0. *Data_type*: float, optional
`-drc_region_layer layer+`	Specifies the region layer name list. *Data_type*: string, optional

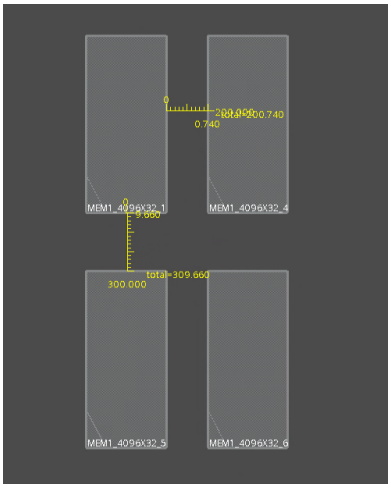
`-edge_extend {x y}`	Specifies that the drc region can be extended from the specified edge. The `-edge_extend` parameter is used for creating drc region blockages by extending from the specified drcRegion objects.
	Note:
	• The specified value for option `-edge_extend` should be equal to or greater than zero. If the specified value is less than zero, treat it as zero.
	• For X/Y direction, if the `-edge_extend` and `-edge_shrink` options are specified at the same time, then Innovus compares the value first and then extends or shrinks. Example, `-edge_extend {3 4}` and `-edge_shrink {2 5}` are specified at the same time, tool will extend 1(3-2) in X-direction and Shrink 1(5-4) in Y-direction.
	Example:
	`set_db finish_floorplan_drc_region_objs hard_blockage`
	`finish_floorplan -drc_region_layer R1 -edge_extend {50 100}`
	 	
	Data_type: point, optional

`-edge_shrink {x y}`	Specifies that the drc region can be shrunk from the specified edge. The `-edge_shrink` parameter is used for creating drc region blockages by shrinking the specified drcRegion objects.
	Note:
	• The specified value for option `-edge_shrink` should be equal to or greater than zero. If the specified value is less than zero, treat it as zero.
	• For X/Y direction, if the `-edge_extend` and `-edge_shrink` options are specified at the same time, then Innovus compares the value first and then extends or shrinks. Example, `-edge_extend {3 4}` and `-edge_shrink {2 5}` are specified at the same time, tool will extend 1(3-2) in X-direction and Shrink 1(5-4) in Y-direction.
	Example:
	`set_db finish_floorplan_drc_region_objs hard_blockage`
	`finish_floorplan -drc_region_layer R1 -edge_shrink {50 100}`
	 	
	Data_type: point, optional

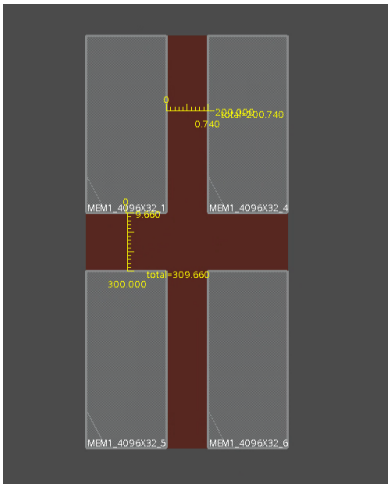
`-exclude_flops`	Specifies that flops and latches will be excluded from the partial placement blockage. **Note**: The `-density` and `-exclude_flops` options must be used with the `-fill_place_blockage` parameter. *Data_type*: bool, optional
`-fill_place_blockage blockage_type max_gap`	

	Adds placement blockages of the specified blockage type (*`blockage_type`*) to fill macro-to-macro, macro-to-boundary, macro-to-OBS, OBS-to-OBS, and boundary-to-OBS gaps up to a specified size (*`max_gap`*).
	For *`blockage_type`*, you can specify soft, hard, or partial.
	For *`max_gap`*, specify a positive value, in microns.
	Example1:
	`finish_floorplan -fill_place_blockage hard 50`
	 	Example2:
	`set_db finish_floorplan_active_objs {macro hard_blockage}`
	`finish_floorplan -fill_place_blockage hard 300`

Before:



After:



Data_type: string, optional

`-fill_route_blockage` *max_gap*

	Adds routing blockage upto a specified size (*max_gap*) Example: `finish_floorplan -fill_route_blockage 50`  *Data_type*: float, optional
`-fills`	Specifies that the routing blockage is to be applied on metalfills. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `finish_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man finish_floorplan`
`-honor_placement_density`	Adds standard cell density check when adding placement blockages. **Note:** • If option the `-density` parameter is not specified with the "`finish_floorplan -fill_place_blockage soft`" command, the density of the created soft blockage is 100. • If there are standard cells in the channel, partial blockages will be created with the density of the current standard cell in the channel when the following command is used: `finish_floorplan -fill_place_blockage hard/soft -honor_placement_density` • If there are standard cells in the channel and the specified density for the partial blockage is less than the density of the current standard cell in the channel, partial blockages will be created with the density of the current standard cell in the channel with the "`finish_floorplan -fill_place_blockage partial -density`" command. • If there are standard cells in the channel and the specified density for partial blockage is larger than the density of the current standard cell in the channel, partial blockages will be created with the specified density when the "`finish_floorplan -fill_place_blockage partial -density`" command is called. *Data_type*: bool, optional
`-layers` *layer_id*	Specifies the layer ID of the route blockage. *Data_type*: string, optional
`-margin` *value*	Specifies the pitch margin when halos are added using `-auto_halo_based_on_pitch`. *Default*: `0.1` *Data_type*: float, optional

`-mask integer`	Specifies the mask number used when adding routing blockages and creating DRC region.
	• The `-mask` parameter enables the `finish_floorplan` command to block routing layers with specified masks when adding routing blockages and creating DRC region. Layers with other masks can still be routed through the blockage.
	• The `-mask` parameter must be used with one or more of `-layers`, `-cut_layers` and `-drc_region_layer` parameters.
	• Only one mask can be specified. The default value of the `-mask` parameter is 0. This implies that all the specified layers will be blocked. Uncolored routes are always blocked.
	• If the `-mask` parameter is specified with an integer value greater than 0, then both layers with specified mask and uncolored layers are blocked.
	Example. If `-mask 1` is specified, it blocks mask 1 and uncolored routes.
	• If more than one layers are associated with a mask, the mask is applied to all of them.
	• If the `-mask` parameter is specified, the tool checks if the mask is suitable for all of the specified layers. If not, it displays an ERROR message and no blockages are created. The number of arguments specified with the –`mask` parameter must be same as the number of arguments specified with the `-layers`, `-cut_layers` and `-drc_region_layer` parameters.
	• The NanoRoute router and the `check_drc` command honor the `-mask` parameter.
	Example:
	• The following command creates routing blockages for blocking mask 2 of M1 layer.
	`finish_floorplan -layers M1 -mask 2 -fill_route_blockage 400`
	• The following command(s) DRC region for mask 1 of PIO layer in core to die area.
	`set_db finish_floorplan_drc_region_objs {core_spacing}`
	`finish_floorplan -drc_region_layer PIO -mask 1 -edge_extend {0.083 0}`
	Default: `0`
	Data_type: int, optional

`-name_prefix name`	Specifies the name prefix for the added blockage to avoid naming conflict with the existing one. *Data_type*: string, optional
`-pg_net_exception`	Specifies that the routing blockage is to be applied on a signal net routing and not on power or ground net routing. *Data_type*: bool, optional
`-spacing space_value`	Specifies the minimum spacing between layers within the routing blockage. The value is a real number greater than or equal to 0. *Data_type*: float, optional
`-undo`	Reverses the previous run of `finish_floorplan`. *Data_type*: bool, optional

Example

- The following commands specify the region layer name list for creating a region layer for the specified DRC region object:
  ```
  set_db finish_floorplan_drc_region_objs macro
  finish_floorplan -drc_region_layer R1
  ```
- The following command creates a dead area with partial placement blockage of gap of 5 microns and density 60:
  ```
  finish_floorplan -dead_area 100 -fill_place_blockage partial 5 -density 60
  ```

Related Information

- `finish_floorplan` Category Attributes
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

finish_floorplan Category Attributes

The root attributes in the `finish_floorplan` category are:

- finish_floorplan_abutted_edge_as_non_row_area
- finish_floorplan_active_objs
- finish_floorplan_add_blockage_direction
- finish_floorplan_drc_region_objs
- finish_floorplan_override

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `finish_floorplan` category, use the following command:

```
get_db -category finish_floorplan
```

finish_floorplan_abutted_edge_as_non_row_area

`finish_floorplan_abutted_edge_as_non_row_area {true|false}`

Default: `true`

Data_type: bool, read/write

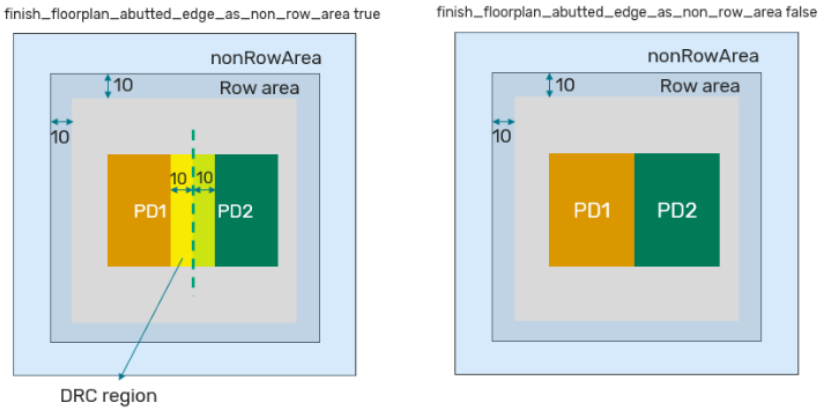
Specifies whether the abutted edge of a power domain should treated be as nonRowArea.

- `true`: The abutted edge of the power domain is treated as nonRowArea with size 0 by default. The tool creates a DRC region around the abutted edge with the `finish_floorplan -edge_extend` parameter option.
- `false`: The abutted edge of the power domain is excluded from nonRowArea. The tool then does not create a DRC region around the abutted edge with the `finish_floorplan -edge_extend` parameter option.

Note: This attribute can only be specified when the `finish_floorplan_drc_region_objs non_row_area` attribute is also specified.

For example:

```
set_db finish_floorplan_drc_region_objs non_row_area
set_db finish_floorplan_abutted_edge_as_non_row_area {true|false}
finish_floorplan -drc_region_layer M1 -edge_extend {10 10}
```



Related Commands

- `finish_floorplan`

finish_floorplan_active_objs

`finish_floorplan_active_objs obj_list`

Default: `{macro macro_halo core}`

Data_type: enum* {macro macro_halo core io_pad io_cell fence hard_blockage soft_blockage partial_blockage route_blockage row}, read/write

Specifies the active object list. The boundaries of the specified active objects are looked at while deciding where to add blockages. Non-active objects are treated like they do not exist by the `finish_floorplan` command.

Active objects can be:

- `core`
- `macro`
- `macro_halo`
- `io_cell`
- `io_pad`
- `fence`
- `hard_blockage`
- `soft_blockage`
- `partial_blockage`
- `route_blockage`
- `routing_blockage`
- `row`

Related Commands

- `finish_floorplan`

finish_floorplan_add_blockage_direction

`finish_floorplan_add_blockage_direction {x | y | xy}`

Default: `xy`

Data_type: enum {x y xy}, read/write

Specifies the direction in which the blockage is added. You specify one of the following options:

- *x*: Fills the channel whose height is less than width.
- *y*: Fills the channel whose width is less than height.
- *xy*: Fills every channel whose smallest size (in X or Y direction) is within Max Gap range.

Related Commands

- `finish_floorplan`

finish_floorplan_drc_region_objs

`finish_floorplan_drc_region_objs obj_list`

Default: `macro macro_halo hard_blockage min_gap core_spacing`

Data_type: enum* {macro macro_halo hard_blockage min_gap core_spacing non_row_area}, read/write

Specifies the drc region object list. The boundaries of the specified drc region objects are looked at while deciding where to add blockages.

The drc region objects can be:

- `core_spacing`

- hard_blockage
- macro
- macro_halo
- min_gap
- non_row_area

Related Commands

- finish_floorplan

finish_floorplan_override

```
finish_floorplan_override {true | false}
```

Default: 0

Data_type: bool, read/write

Overrides old blockages that overlap with the new blockages.

Related Commands

- finish_floorplan

fix_boundary_overlaps

```
fix_boundary_overlaps
[-help]
[-move_area {x1 y1 x2 y2}]
[-groups {string1 string2 ...}]
[-hinsts {string1 string2 ...}]
[-fix_area {x1 y1 x2 y2}]
```

Resolves the overlaps between macros or hierarchical instances (hinsts). This command can also be used to resolve overlaps between instance groups.

Parameters

`-fix_area {x1 y1 x2 y2}`	
	Specifies the coordinates of the area in which overlap needs to be resolved. *Data_type*: rect, optional
`-groups {string1 string2 ...}`	
	Specifies the prefixed group names. Use this parameter if you want to resolve overlaps between only specified groups. *Data_type*: list, optional
`-help`	Prints a brief description that includes type and default information for each `fix_boundary_overlaps` parameter. For a detailed description of the command and all of its parameters, use the man command: `man fix_boundary_overlaps`
`-hinsts {string1 string2 ...}`	
	Specifies the prefixed hinst names. Use this parameter if you want to resolve overlaps between only specified hinsts. *Data_type*: list, optional
`-move_area {x1 y1 x2 y2}`	
	Specifies the area where the floorplan objects can be moved when resolving overlaps. *Data_type*: rect, optional

fix_floorplan

```
fix_floorplan
[-help]
-file fileName
-type {ufc tcic}
[-selected ]
[-report_file string]
[-report_unplaced_block ]
[-break_at_conflict ]
[-honor_snap_block_grid ]
[-selected_rules rule_name_list]
```

Fixes the detected violations as part of the UFC methodology by adding routing blockages around macro, snapping macro location, or re-shaping core shape. The UFC methodology also provides the capability to automatically fix the violations with imported UFC rules.

Note: The Unified Floorplan Constraints (UFC) methodology is a powerful Innovus capability that can define several rules on floorplan objects, check specified rules, and report the violations with rule name as well as severity. The violations can be shown in the violation browser. UFC also provides the ability to automatically fix specific violations. It can add routing blockages, snap macro location, adjust core shape to fix corresponding violations. In addition, UFC also provides the ability to exclude rules from checking for specified objects.

Usage Model:

- Load the Design.
- Create a UFC file with floorplan rules.
- Run UFC checking. (check_ufc)
- Fix reported violations. (fix_floorplan)

You can use the `fix_floorplan` command to fix the detected violations as part of the UFC methodology. It fixes violations by:

- Adding routing blockages around macros
- Snapping macro locations
- Re-shaping core shapes

The UFC methodology also provides the capability to automatically fix the violations with imported UFC rules.

Note: The `fix_floorplan` command tries to fix all the detected floorplan violations by default, however, it currently does not support fixing die size and core size violations. If a floorplan has rule conflicts, then the results after the fix may not be perfect. Cadence recommends you ensure that the rules used are not conflicting and that the die or core size satisfy the rules. Cadence also recommends you contact your Cadence representative if your constraints file comes from a third party, but you want to use the `fix_floorplan` command to fix the violations.

Note: The `fix_floorplan` command honors the `floorplan_no_cut_row` attribute that specifies if rows are not required to be cut before operations. With `floorplan_no_cut_row false` or not specified, the `fix_floorplan` command will work based on the current row shape. If there is any violation for rows, the `fix_floorplan` command will run the `split_row` command to fix. With `floorplan_no_cut_row true`, the tool identifies that the rows should not be cut. The `fix_floorplan` command will fix the row violations by adding place blockages instead of cutting row. The place blockages will be added to the row area that will be cut out and kept after fix_floorplan to satisfy the row constraint. The actual row shape will not be changed after the `fix_floorplan` command.

Parameters

`-break_at_conflict`	Enables the tool to exit from fixing violations when conflict of rules is encountered. You must fix the conflict of rules and then re-run the `fix_floorplan` command. *Data_type*: bool, optional
`-file` *fileName*	Specifies the name of file containing the rules or constraints. *Data_type*: string, required
`-help`	Prints a brief description that includes type and default information for each `fix_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man fix_floorplan`
`-honor_snap_block_grid`	When specified, the `fix_floorplan` command honors the block snap grid defined by the `set_db floorplan_snap_block_grid` attribute. *Data_type*: bool, optional
`-report_file` *string*	Specifies the name of the file that saves the report summary. *Data_type*: string, optional
`-report_unplaced_block`	Enables the tool to show the number of unplaced macros in summary. *Data_type*: bool, optional
`-selected`	Specifies that only the selected objects can be moved to fix violations. **Note:** The `fix_floorplan` command currently only support selected macros. *Data_type*: bool, optional
`-selected_rules` *rule_name_list*	When specified, the `fix_floorplan` command only fixes violations for specified rules. The `-selected_rules` parameter accepts rule names, rule names list, variables, and wildcards. **Note:** When this option is not specified, the `fix_floorplan` command fixes all violations by default. *Data_type*: bool, optional
`-type {ufc tcic}`	Specifies the type of input file. The `fix_floorplan` command supports ufc and tcic files. *Data_type*: enum, required

Example

- The following command fixes the ufc violations based on the rules defined in the DTMF1.ufc file and writes the report to the fix_cmds.tcl file.
  ```
  fix_floorplan -type ufc -file DTMF1.ufc -report_file fix_cmds.tcl
  ```
- The following command fixes the ufc violations for Rule A and Rule B only.
  ```
  fix_floorplan -type tcic -file test.tcic -selected_rules "RuleA RuleB"
  ```

flip_or_rotate_obj

```
flip_or_rotate_obj
[-help]
[-keep_relative]
{-flip {MX | MY} | -rotate {R90 | R180 | R270}}
[-group]
[-objs object]
```

Flips or rotates the selected objects. Alternatively, you can use the "*Flip/Rotate Selected Objects*" form in the Innovus GUI, to flip or rotate an instance. Use this command after importing the design.

Parameters

`-flip {MX | MY}`	Flips the selected object(s) through x axis or y axis. Example: flip_or_rotate_obj `-flip MX` Before:  After:  *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `flip_or_rotate_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man flip_or_rotate_obj`

`-group`	Flips or rotates the bounding box which encloses all the selected objects. Example: `flip_or_rotate_obj -flip MX -group` Before:  After:  *Data_type*: bool, optional
`-keep_relative`	Calls the `create_relative_floorplan` command. With this option enabled, when the anchor objects are rotated, the relative objects are rotated and updated automatically. *Data_type*: bool, optional
`-objs object`	Specifies the name of the object you want to flip or rotate. **Note**: The objects can be modules, groups, placement blockage, routing blockage, hard Macros, special routings, special wires, and special vias (including 45 degree). *Data_type*: string, required
`-rotate {R90|R180|R270}`	Rotates the selected object(s) by 90 or 180 or 270 degrees. *Data_type*: string, required

Example

The following command flips the selected object(s) through the x axis:

```
flip_or_rotate_obj  -flip MX
```

- floorplan_snap_core_grid
- floorplan_snap_die_grid
- floorplan_snap_io_grid
- floorplan_snap_place_blockage_grid
- floorplan_snap_place_blockage_type
- floorplan_user_define_grid
- floorplan_vertical_row

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `floorplan` category, use the following command:

```
get_db -category floorplan
```

floorplan_auto_sync_master_clone

`floorplan_auto_sync_master_clone {busGuides|constraints|stdcells|macros}`

Default: `" "`

Data_type: enum* {busGuides constraints stdcells macros}, read/write

Specifies the objects that automatically sync up from master to clones during add, delete, edit, move, or stretch operations. The sync-up objects include busGuides and macros.

- `busGuides`: Any change (add, delete, edit, move, or stretch) for busGuides in master will sync-up to clones or vice versa.
- `constraints`: Any change (move, stretch, add, delete, or edit) in fence/guide/region of master will sync-up to clones or vice versa.
  - When constraints is not specified, tool will not sync-up any change of fence/guide/region between master and clones.
  - When constraints is specified, tool will auto sync-up any change of fence/guide/region between master and clones when doing moving/stretching/add/delete/edit.
- `stdcells`: Any change (add, delete, edit, move, flip, rotate, or unplace) in standard cells will sync-up to clones or vice versa.
  For example, `set_db floorplan_auto_sync_master_clone {stdcells}`
- `macros`: Any change (add, delete, edit, move, flip, rotate, or unplace) in hard macros in master will sync-up to clones or vice versa.
  For example, `set_db floorplan_auto_sync_master_clone {macros}`

Related Commands

- `finish_floorplan`

floorplan_cells_for_extra_sites

`floorplan_cells_for_extra_sites cell_name`

Default: `" "`

Data_type: string, read/write

Specifies the cell names for which the additional sites will be created. These sites can be used up later in the flow.

Related Commands

- `finish_floorplan`

floorplan_check_types

`floorplan_check_types {basic fence odd_even_site_row macro_pin color alignment_following_pin alignment_partition_clone bus_guide_connectivity feed_through partition_in_partition multi_layer_pin power_domain partition place same_length_site narrow_channel block_only unified_vdd_on_bottom all}`

Default: `basic`

Data_type: enum* {basic fence odd_even_site_row macro_pin color alignment_following_pin alignment_partition_clone bus_guide_connectivity feed_through partition_in_partition multi_layer_pin power_domain partition place same_length_site narrow_channel block_only unified_vdd_on_bottom all}, read/write

Specifies the check types for the `check_floorplan` command.

- `basic`: Checks the basic quality of the floorplan to detect potential problems before the design is passed on to other tools.
- `fence`: Checks the fences.

- `odd_even_site_row`: Checks odd or even site row. It checks if the current row fits to the setting of `setFPlanMode -rowSiteWidth` and `-rowSiteHeight`.
- `macro_pin`: Checks if the macro pins are off track.
- `color`: Checks the color issues of all floorplan objects, such as pins, preRoutes, prePlacedInst, etc.
- `alignment_following_pin`: Checks if the centerline of the followpin is the same as the row's border and matches the power attribute.
- `alignment_partition_clone`: Checks that partition clones are aligned with their master on the power mesh. This checks that the master and clones partitions are inside a core boundary, and ensures that the partition fence instances sizes match the master instance.
- `bus_guide_connectivity`: Checks incorrect overlapping and connectivity.
- `feed_through`: Checks feedthrough buffer insertion.
- `partition_in_partition`: Checks if child partitions reside inside parent partitions.
- `multi_layer_pin`: Checks multi layer pins.
- `power_domain`: Checks the power domains.
- `partition`: Checks the partitions.
- `place`: Checks the placement.
- `same_length_site`: Checks the same length site rule where, in a group of continuous poly stripes with the same length, the number of sites must be >= N. (N is specified by the `floorplan_minimum_sites` attribute.)
- `narrow_channel`: Checks for narrow channels.
- `block_only`: Checks for performance most frequently used in block implementation. Includes: basic, oddEvenSiteRow, macroPin, and color.
- `unified_vdd_on_bottom`: Checks whether all the cells in the design are with the same vdd on bottom.
- `all`: Performs all checks on the floorplan to detect potential problems before the design is passed on to other tools.

Related Commands

- `check_floorplan`

floorplan_cut_off_place_blockage_outside_die

```
floorplan_cut_off_place_blockage_outside_die {true | false}
```

Default: `true`

Data_type: bool, read/write

When creating placement blockages, it cuts the part outside of die and snaps it by default.

Related Commands

- `finish_floorplan`

floorplan_cut_off_route_blockage_outside_die

```
floorplan_cut_off_route_blockage_outside_die {true | false}
```

Default: `true`

Data_type: bool, read/write

When creating routing blockages around inst/Hinst/Partition, it cuts the part outside of die and snaps it by default. If this option is set to false, then the outside part is not cut and snapped.

Related Commands

- `finish_floorplan`

floorplan_default_blockage_name_prefix

`floorplan_default_blockage_name_prefix` *`prefix_name`*

Default: {}

Data_type: string, read/write

Names the prefix for naming placement blockages and routing blockages.

Related Commands

- `create_place_blockage`
- `create_route_blockage`

floorplan_default_power_domain_site

`floorplan_default_power_domain_site {true | false}`

Default: `false`

Data_type: bool, read/write

Create rows based on default power domain site instead of the design's default site.

Related Commands

- `create_floorplan`

floorplan_default_tech_site

`floorplan_default_tech_site` *`string`*

Default: `""`

Data_type: string, read/write

Specifies a site as default technical site. After setting a forced one, the auto-calculating default-technical-site functionality is disabled.

Note: The `write_floorplan`, `read_floorplan`, `init_core_rows` and `check_floorplan` commands honor the default technical site specified using the `floorplan_default_tech_site` attribute.

Related Commands

- `check_floorplan`
- `read_floorplan`
- `write_floorplan`

floorplan_enable_rectilinear_design

`floorplan_enable_rectilinear_design {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies whether the design boundary can be changed to rectilinear shape.

Related Commands

- `check_floorplan`
- `read_floorplan`
- `write_floorplan`

floorplan_extra_sites

`floorplan_extra_sites` *`site_name`*

Default: `" "`

Data_type: string, read/write

Specifies the name for the additional sites that will be created for cells which are not used in the netlist by default. These sites can be used up later in the flow.

Note: Sites for all specified cells should be defined in the LEF.

Related Commands

- `finish_floorplan`

floorplan_force_honor_snap_rule

`floorplan_force_honor_snap_rule {true|false}`

Default: `false`

Data_type: bool, read/write

When enabled, objects are snapped to non-FinFET grids.

Note: If a design has a FinFET grid, during floorplanning, objects will automatically be snapped to the corresponding FinFET grid even if the snap grid is an instance grid, manufacture grid or a placement grid. However, with the `floorplan_force_honor_snap_rule` attribute set to `true`, the instance grid, manufacture grid, and placement grid will not be mapped to the FinFET Instance Grid, FinFET Manufacture Grid, and FinFET Placement Grid respectively.

Related Commands

- `finish_floorplan`

floorplan_include_io_when_init_area

`floorplan_include_io_when_init_area {true | false}`

Default: `false`

Data_type: bool, read/write

While calculating the target utilization (TU), if the variable is set to `true`, the module area is calculated by including the I/O cell. If set to `false`, the area of module is calculated without including the I/O cell.

Related Commands

- `create_floorplan`

floorplan_initial_all_compatible_core_site_rows

`floorplan_initial_all_compatible_core_site_rows {true | false}`

Default: `false`

Data_type: bool, read/write

When enabled, initCoreRow creates SITES which are used by all cells in the library.

Related Commands

- `create_floorplan`

floorplan_keep_rows_when_moving_power_domain

`floorplan_keep_rows_when_moving_power_domain {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies whether to keep all existing rows in power domain when moving, resizing or reshaping a power domain on GUI or by command.

Related Commands

- `create_floorplan`

floorplan_max_io_height

`floorplan_max_io_height {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies that the maximum I/O height should be used to calculate a die box with IO placement. By default minimum IO height is used.

Related Commands

- `check_floorplan`

floorplan_minimum_sites

`floorplan_minimum_sites` *`value`*

Default: 0

Data_type: int, read/write

Specifies the number of minimal sites (N) that the `check_floorplan` command will check for the same length site rule. When the `sameLengthSite` option of the `floorplan_check_types` attribute is specified, this attribute is required.

Related Commands

- `check_floorplan`

floorplan_move_macros_with_constraint

`floorplan_move_macros_with_constraint {guide|region|fence|none|all}`

Default: `fence`

Data_type: `enum* {guide region fence none all}`, read/write

Specifies that the macros move with the constraint modules at the same time.

Related Commands

- `check_floorplan`

floorplan_move_preplaced_std_cell_only

`floorplan_move_preplaced_std_cell_only {true|false}`

Default: `fence`

Data_type: `bool`, read/write

Specifies that only the pre-placed standard cells can move with the constraint modules at the same time.

Related Commands

- check_floorplan

floorplan_move_std_cell_with_constraint

`floorplan_move_std_cell_with_constraint {guide|region|fence|none|all}`

Default: `none`

Data_type: `enum* {guide region fence none all}`, read/write

Specifies that standard cells move with the constraint modules at the same time.

Related Commands

- check_floorplan

floorplan_narrow_channel_threshold

`floorplan_narrow_channel_threshold` *`value`*

Default: 0

Data_type: float, read/write

Reports the narrow channels whose width (in micros) is smaller than the specified value. When the `narrowChannel` option of the `floorplan_check_types` attribute is specified, this attribute is required.

Related Commands

- check_floorplan

floorplan_no_cut_row

`floorplan_no_cut_row {true | false}`

Default: `false`

Data_type: bool, read/write

Specifies that the rows are not required to be cut before other operations. The following commands honor this mode setting:

- create_route_blockage_along_track
- check_ufc
- fix_floorplan
- finish_floorplan

With the `floorplan_no_cut_row` attribute set to `false` or not specified, the tool will run above the mentioned commands based on the current row shape. So the rows for objects like insts, place blockages are expected to be cut out before running these commands to get expected results.

If rows are not cut before run these commands are run and the `floorplan_no_cut_row` attribute is set to `true`, the tool will identify the rows that have not been cut before running these commands. It calls the split_row command to get a cut row shape during these commands action. The `split_row` command cuts the rows for insts, hinsts, place blockages, route blockages, power domains, groups, or bumps by default. These commands will work based on the cut row shape. But the actual row shape is not changed after these operations.

Related Commands

- check_floorplan

floorplan_finfet_inst_grid

`floorplan_finfet_inst_grid {`*`lx ly ux uy`*`}`

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the FinFET instance grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*}.

Where,
The *x_origin y_origin* is the lower left corner of the core box. (For example, the core rows).
The *x_pitch* is the width of the default technical site and separates the vertical grid lines.
The *y_pitch* is the FinFET pitch as defined in the LEF and separates the horizontal grid lines.

Note: The values are in microns.

Related Commands

- check_floorpla

floorplan_finfet_manufacturing_grid

`floorplan_finfet_manufacturing_grid {lx ly ux uy}`

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the FinFET manufacturing grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*}.

Where,
The *x_origin y_origin* is the lower left corner of the die box (the design boundary).
The *x_pitch* is the manufacturing grid value and is defined in the LEF.
The *y_pitch* is the FinFET pitch and is defined in the LEF.

Note: The values are in microns.

Related Commands

- check_floorplan

floorplan_finfet_placement_grid

`floorplan_finfet_placement_grid {lx ly ux uy}`

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the FinFET placement grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*}.

Where,
The *x_origin y_origin* is the lower left corner of the die box (the design boundary).
The *x_pitch* is the pitch of lowest vertical metal layer and separates the vertical grid lines.
The *y_pitch* is the FinFET pitch as defined in the LEF and separates the horizontal grid lines.

Note: The values are in microns.

Related Commands

- check_floorplan

floorplan_inst_grid

`floorplan_inst_grid {lx ly ux uy}`

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the instance grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*}.

Where,
The *x_origin y_origin* is the lower left corner of the core box. (For example, the core rows).

The *x_pitch* is the width of the default technical site and separates the vertical grid lines.
The *y_pitch* is the height of the default technical site and separates the horizontal grid lines.

Note: The values are in microns.

Related Commands

- check_floorplan

floorplan_layer_track_grid

floorplan_layer_track_grid {*lx ly ux uy*}

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the layer_track grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*}.

Where,
The *x_origin y_origin* is the lower left corner of the die box (the design boundary).
The *x_pitch* is the pitch of the lowest vertical metal layer and separates the vertical grid lines.
The *y_pitch* is the pitch of the lowest horizontal metal layer and separates the horizontal grid lines.

Note: The values are in microns.

Related Commands

- check_floorplan

floorplan_manufacturing_grid

floorplan_manufacturing_grid {*lx ly ux uy*}

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the manufacturing grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*} from the LEF global MANUFACTURINGGRID statement.

Where,
The *x_origin y_origin* is the lower left corner of the die box (the design boundary).

Note: Verify the layer .mfg_grid values if the mfg_grid varies per layer.

Related Commands

- check_floorplan

floorplan_placement_grid

floorplan_placement_grid {*lx ly ux uy*}

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the placement grid. The format of the grid is {*x_origin y_origin x_pitch y_pitch*}.

Where,
The *x_origin y_origin* is the lower left corner of the die box (the design boundary).
The *x_pitch* is the pitch of lowest vertical metal layer and separates the vertical grid lines.
The *y_pitch* is the pitch of lowest horizontal metal layer and separates the horizontal grid lines.

Note: The values are in microns.

Related Commands

- check_floorplan

floorplan_power_rail_layer

`floorplan_power_rail_layer` *string*

Default: " "

Data_type: string, read/write

Specifies the layers used for calculating the power/ground on the bottom attribute of the cell or techsite. By default, the lowest metal layer is used.

Related Commands

- check_floorplan

floorplan_row_site_height

`floorplan_row_site_height {any | odd | even}`

Default: `any`

Data_type: enums {any | odd |even}, read/write

Specifies the odd even row height constraints.

Related Commands

- check_floorplan

floorplan_row_site_width

`floorplan_row_site_width {any | odd | even}`

Default: `any`

Data_type: enums {any odd even}, read/write

Specifies the odd even row width constraints.

Related Commands

- check_floorplan

floorplan_snap_all_corners_to_grid

`floorplan_snap_all_corners_to_grid {true|false}`

Default: `false`

Data_type: bool, read/write

Snaps all corners of an object to the grid. It defines the snapping behavior for the kinds of objects: constraint, ptnCut and black box.

Note: This option only works when the snapping grid is user defined grid or FinFET grid.

- When the snapping grid is ManufactureGrid, the object is snapped to the closest grid.
- When the snapping grid is InstanceGrid and PlacementGrid, the object is moved to first snap the LL corner to the closest location and then to snap the UR corner to closest location.
- When the snapping grid is user defined grid, the object is moved to snap the LL corner to the closest location. Then if the `floorplan_snap_all_corners_to_grid` attribute set to true, the object is moved to snap the UR corner to the closest location.
- When the snapping grid is FinFET grid and the `floorplan_snap_all_corners_to_grid` attribute set to true, all corners of the object are snapped to the closest grid. However, if the `floorplan_snap_all_corners_to_grid` attribute set to false, only the LL corner of the object is snapped to the closest location.

Related Commands

- check_floorplan

floorplan_snap_block_grid

floorplan_snap_block_grid {manufacturing | inst | placement | user_define | layer_track | finfet_inst |finfet_manufacturing | finfet_placement}

Default: manufacturing

Data_type: enum {manufacturing | inst | placement | userdefine | layertrack | finfetInst |finfetmanufacturing | finfetplacement}, read/write

Specifies the block snap rules. It can be set to snap to:

- manufacturing: Manufacture Grid
- inst: Instance Grid
- placement: Placement Grid
- user_define: User-define Grid
- layer_track: layer_track Grid
- finfet_manufacturing: FinFET Manufacture Grid
- finfet_inst: FinFET Instance Grid
- finfet_placement: FinFET Placement Grid

Note: For FinFET designs, the default is finfet_manufacturing

Related Commands

- check_floorplan

floorplan_snap_constraint_grid

floorplan_snap_constraint_grid {manufacturing | inst | placement | user_define | layer_track | finfet_inst |finfet_manufacturing | finfet_placement}

Default: inst, read/write

Data_type: enum {manufacturing inst placement user_define layer_track finfet_inst finfet_manufacturing finfet_placement}, read/write

Specify the constraint snap rules. It can be set to snap to:

- manufacturing: Manufacture Grid
- inst: Instance Grid
- placement: Placement Grid
- user_define: User-define Grid
- layer_track: layer_track Grid
- finfet_manufacturing: FinFET Manufacture Grid
- finfet_inst: FinFET Instance Grid
- finfet_placement: FinFET Placement Grid

Note: For FinFET designs, the default is finfet_inst

Related Commands

- check_floorplan

floorplan_snap_core_grid

`floorplan_snap_core_grid {manufacturing | inst | placement | user_define | layer_track | finfet_inst |finfet_manufacturing | finfet_placement}`

Default: `placement`

Data_type: enum {manufacturing inst placement user_define layer_track finfet_inst finfet_manufacturing finfet_placement}, read/write

Specifies the core snap rules. It can be set to snap to:

- `manufacturing`: Manufacture Grid
- `inst`: Instance Grid
- `placement`: Placement Grid
- `user_define`: User-define Grid
- `layer_track`: layer_track Grid
- `finfet_manufacturing`: FinFET Manufacture Grid
- `finfet_inst`: FinFET Instance Grid
- `finfet_placement`: FinFET Placement Grid

Note: For FinFET designs, the default is `finfet_placement`

Related Commands

- `check_floorplan`

floorplan_snap_die_grid

`floorplan_snap_die_grid {manufacturing | inst | placement | user_define | layer_track | finfet_inst |finfet_manufacturing | finfet_placement}`

Default: `placement`

Data_type: enum {manufacturing inst placement user_define layer_track finfet_inst finfet_manufacturing finfet_placement}, read/write

Specifies the die snap rules. It can be set to snap to:

- `manufacturing`: Manufacture Grid
- `inst`: Instance Grid
- `placement`: Placement Grid
- `user_define`: User-define Grid
- `layer_track`: layer_track Grid
- `finfet_manufacturing`: FinFET Manufacture Grid
- `finfet_inst`: FinFET Instance Grid
- `finfet_placement`: FinFET Placement Grid

Note: For FinFET designs, the default is `finfet_placement`

Related Commands

- `check_floorplan`

floorplan_snap_io_grid

`floorplan_snap_io_grid {manufacturing | inst | placement | user_define | layer_track | finfet_inst |finfet_manufacturing | finfet_placement}`

Default: `manufacturing`

Data_type: enum {manufacturing inst placement user_define layer_track finfet_inst finfet_manufacturing finfet_placement}, read/write

Specifies the IO snap rules. It can be set to snap to:

- `manufacturing`: Manufacture Grid
- `inst`: Instance Grid
- `placement`: Placement Grid
- `user_define`: User-define Grid
- `layer_track`: layer_track Grid
- `finfet_manufacturing`: FinFET Manufacture Grid
- `finfet_inst`: FinFET Instance Grid
- `finfet_placement`: FinFET Placement Grid

Related Commands

- `check_floorplan`

floorplan_snap_place_blockage_grid

`floorplan_snap_place_blockage_grid {manufacturing | inst | finfet_inst | finfet_manufacturing | user_define}`

Default: `inst`

Data_type: enum {manufacturing inst finfet_inst finfet_manufacturing user_define}, read/write

Specifies the placement blockage snap rules.

- `manufacturing`: Manufacture Grid
- `inst`: Instance Grid
- `user_define`: User-define Grid
- `finfet_manufacturing`: FinFET Manufacture Grid
- `finfet_inst`: FinFET Instance Grid

Related Commands

- `check_floorplan`

floorplan_snap_place_blockage_type

`floorplan_snap_place_blockage_type {closest | upsize | sequential}`

Default: `closest`

Data_type: enum {closest upsize sequential}, read/write

Specifies a snapping type for placement blockages. The snapping types can be:

- `closest`: The tool snaps all corners of the placement blockage to the closest specified grid, regardless of which direction could increase or decrease the blockage size.
- `upsize`: The tool snaps all corners of the placement blockage to the corresponding closest specified grid in the direction which would increase the objects' size.
- `sequential`: The tool moves the placement blockage to snap the low-left corner to the closest specified grid, then snaps the upper-right corner to the closest grid.

This setting is honored by the following commands:

- `update_floorplan_obj`
- `create_place_blockage {-rects|-polygon}`
- `snap_floorplan -place_blockage`

Related Commands

- check_floorplan

floorplan_user_define_grid

`floorplan_user_define_grid {x_offset y_offset x_pitch y_pitch}`

Default: 0.0 0.0 0.0 0.0

Data_type: rect, read/write

Specifies the user-defined grid. The format is {*x_offset y_offset x_pitch y_pitch*}.

Where,
x_offset y_offset is the offset of the user-defined grid.
x_pitch separates the vertical grid lines.
y_pitch separates the horizontal grid lines.

Note: The values are in microns.

Related Commands

- check_floorplan

floorplan_vertical_row

`floorplan_vertical_row {0 | 1}`

Default: 0

Data_type: int, read/write

Specifies whether the rows in the floorplan are vertical (1) or horizontal (0). By default, the rows in the floorplan are horizontal. Set this variable to `1` to enable vertical rows.

Related Commands

- init_design

get_draw_view

```
get_draw_view
[-help]
```

Returns the design view that was set with the `gui_set_draw_view` command. You can use this command after `gui_set_draw_view`.

Parameters

`-help`	Outputs a brief description of the `get_draw_view` command. For a detailed description of the command, use the `man` command: `man get_draw_view`

Related Information

- `gui_set_draw_view`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

get_io_flow_flag

```
get_io_flow_flag
[-help]
```

Gets the current I/O row flow flag setting. To set the I/O row flow flag, use the `set_io_flow_flag` command.

Parameters

`-help`	Outputs a brief description of the `get_io_flow_flag` command. For a detailed description of the command, use the man command: `man get_io_flow_flag`

Example

- The following command displays the current I/O row flow flag settings:
  ```
  get_io_flow_flag
  ```

Related Information

- `create_io_row`
- `set_io_flow_flag`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

get_macro_place_constraint

```
get_macro_place_constraint
[-help]
[-macro_corner_keepout]
[[-array array_name] |
[-inst string  -orientation ] |
[-cell string  -cell_obs ] |
[-track_adjustment ] |
[-max_io_pin_group_keep_out ] |
[-forbidden_space_to_core ] |
[-forbidden_space_to_macro ] |
[-min_space_to_core ] |
[-min_space_to_macro ] |
[-parallel_run_length ] |
[-align_group string ] |
[-horizontal_stacking ] |
[-vertical_stacking ] |
[-honor_strict_spacing_constraint ] |
[-avoid_abut_macro_edge_with_pins ] |
[-same_length_site ] |
[-pg_resource_model ] |
[-non_default ] |
[-halo_sharing ]]
```

Gets the current value of the macro constraints that are honored by the macro placer. To define the constraints of macros, use the `set_macro_place_constraint` command.

Note: The report displayed when the -array, -cell/-cell_obs, or -inst/-orientation parameters are used can result in long lines on the screen that are supported by ellipses (…) indicating that more information about the macro constraint follows. If you want to get all the information together, Cadence recommends using the `write_macro_place_constraint` command to save all the information into a file.

Parameters

`-align_group string`	Specifies the align group name. *Data_type*: string, optional
`-array array_name`	Specifies the macro array name. *Data_type*: string, optional
`-avoid_abut_macro_edge_with_pins`	When specified, it returns if abutting macro edges with pins must be avoided even if the macro distance is within the forbidden space setting *Data_type*: bool, optional
`-cell_obs string`	When specified, it returns the cell obstruction value. *Data_type*: bool, optional
`-cell string`	Specifies constraints for all instances of the specified cells. *Data_type*: string, optional
`-forbidden_space_to_core`	When specified, it returns the forbidden space to core value. *Data_type*: bool, optional
`-forbidden_space_to_macro`	When specified, it returns the forbidden space to macro value. *Data_type*: bool, optional
`-halo_sharing`	When specified, it returns the halo sharing mode. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `get_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_macro_place_constraint`

`-honor_strict_spacing_constraint`	When specified, it returns if the forbidden spacing and minimum spacing constraints must be honored strictly. *Data_type*: bool, optional
`-horizontal_stacking`	When specified, it returns the horizontal stacking constraint. *Data_type*: bool, optional
`-inst` *string*	Specifies the macros on which the constraints are set. *Data_type*: string, optional
`-macro_corner_keepout`	When specified, it returns the macro corner keepout value *Data_type*: bool, optional
`-max_io_pin_group_keep_out`	When specified, it returns the max height of the I/O pin blockages. *Data_type*: bool, optional
`-min_space_to_core`	When specified, it returns the minimum space to core value. *Data_type*: bool, optional
`-min_space_to_macro`	When specified, it returns the minimum space to macro value. *Data_type*: bool, optional
`-non_default`	When specified, it displays the current settings which are not the default settings. *Data_type*: bool, optional
`-orientation`	When specified, it returns the valid orientations. *Data_type*: bool, optional
`-parallel_run_length`	When specified, it returns the parallel run length value. *Data_type*: bool, optional
`-pg_resource_model`	When specified, it returns the pg resource model details. *Data_type*: bool, optional
`-same_length_site`	When specified, it returns the the minimum number of sites between the vertical edge of two macros. *Data_type*: bool, optional
`-track_adjustment`	When specified, it returns the track adjustment value. *Data_type*: bool, optional
`-vertical_stacking`	When specified, it returns the vertical stacking constraint. *Data_type*: bool, optional

Example

- The following command gets the current value of the macro constraints that are honored by the macro placer.:
  `get_macro_place_constraint`

Related Information

gui_set_draw_view

```
gui_set_draw_view
[-help]
mode
```

Sets the design view in the design display area. You can use this command after importing or restoring the design. To see the current view use `get_draw_view`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `gui_set_draw_view` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_set_draw_view`
mode	Sets the mode. • `amoeba`: Sets the view to Amoeba view. This view displays the outline of the modules and submodules after placement, showing physical locality of the module. • `fplan`: Sets the view to floorplan view. This view displays the hierarchical module and block guides, connection flightlines, and floorplan objects, including block placement, and power and ground nets. • `place`: Sets the view to physical view. This view displays the detailed placements of the module's blocks, standard cells, nets, and interconnects. *Data_type*: string, required

Related Information

- `get_draw_view`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

gui_show_hinst_in_floorplan

```
gui_show_hinst_in_floorplan
[-help]
name
[-add_or_remove {0|1}]
```

Use this command to display modules in the floorplan view whose instance count is smaller than the `set_preference MinFPModuleSize` value. By default, modules whose instance count is less than `MinFPModuleSize` are not displayed (default is 1). The `MinFPModuleSize` variable can be set to a larger value to focus only on larger modules which require floorplanning. You can then display specific smaller modules using this command. For example, use `gui_show_hinst_in_floorplan` if you need to interactively floorplan small regions or fences to control placement of small modules of logic.

Note: You can change the *Min. floorplan Module Size* option in the *Preferences* form in the *Display* menu and import the design. Alternatively, you can use the `set_preference MinFPModuleSize value` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `gui_show_hinst_in_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_show_hinst_in_floorplan`
name	Specifies the name of the hierarchical instance. *Data_type*: string, required
`-add_or_remove {0|1}`	Adds or removes the specified hierarchical instance. Specify 1 to add or 0 to remove. *Data_type*: int, optional

Example

- The following command adds hierarchical instance SH99 in the floorplan view:
  ```
  gui_show_hinst_in_floorplan SH99 1
  ```
- The following command only displays modules with 200 instances or more:
  ```
  set_preference MinFPModuleSize 200
  ```
  If module mcore0/a0 has less than 200 instances you can display it using:
  ```
  gui_show_hinst_in_floorplan mcore0/a0 1
  ```
  To disable its display:
  ```
  gui_show_hinst_in_floorplan mcore0/a0 0
  ```

Related Information

- `set_preference`

gui_show_obj_connectivity

```
gui_show_obj_connectivity
[-help]
[-direction {in|out|all}]
[-level level]
[-line_to_ports]
[-min_connection number]
{-insts string | -ports string | -selected | -reset }
[-through_registers [-all_registers ]]
```

Displays the connections of specified macros, selected macros, or specified ports. You can also display the input and output connectivity separately. By default it displays both.

Parameters

`-all_registers`	Displays all registers found during the analysis. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `gui_show_obj_connectivity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man gui_show_obj_connectivity`
`-direction {in|out|all}`	Specifies the pin direction of objects to be displayed. *Default*: `all` *Data_type*: string, optional
`-insts string`	Specifies the macros for which the connectivity is displayed. *Data_type*: string, optional
`-level level`	Specifies the trace level to display. *Maximum Level*: 10 *Minimum Level*: 1 *Default*: 1 *Data_type*: int, optional
`-line_to_ports`	Displays the display paths from/to primary ports. *Data_type*: bool, optional
`-min_connection number`	Specify the trace minimum connection. *Default*: 1 *Data_type*: int, optional
`-ports string`	Specifies the IO ports for which the connectivity is displayed. *Data_type*: string, optional
`-reset`	Clears the trace macro display. *Data_type*: bool, optional
`-selected`	Displays the connectivity of selected macros. *Data_type*: bool, optional
`-through_registers`	Displays the flight lines going through registers. *Data_type*: bool, optional

Example

The following command displays the connections for blk1 upto level 3:

```
gui_show_obj_connectivity -insts blk1 -level 3
```

init_core_rows

```
init_core_rows
[-help]
[-power_domain string]
```

Regenerates rows for the core area and the power domains in a design with rows based on the current row parameters instead of using the `create_floorplan` command. You can use this command after importing the design.

Note: In a common flow, Innovus goes over all technical sites used in the netlist and creates rows for these sites. It chooses the shortest tech site in the design (with the smallest height and width) as the default-technical-site. All other used tech-sites with integer-multiple height/width are considered as compatible.

Parameters

`-help`	Outputs a brief description of the `init_core_rows` command. For a detailed description of the command, use the `man` command: `man init_core_rows`
`-power_domain string`	Specifies the power domain for which rows are to be created. *Data_type*: string, optional

Related Information

- `create_floorplan`
- `create_row`
- `delete_row`
- `split_row`
- `stretch_rows`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

legalize_floorplan

```
legalize_floorplan
[-help]
[-check_orient]
[-check_site]
```

Legalizes partition locations according to standard cell row orientations and specific design constraints. You can use this command after specifying the floorplan.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `legalize_floorplan` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man legalize_floorplan`
`-check_orient`	Specifies that all partitions snap to the closest `R0` row on the grid. For this rule, the Innovus software assumes that standard cell rows start with an `R0` orientation and continue in an `R0`-to-`MX` pattern. *Data_type*: bool, optional
`-check_site`	Specifies that partitions be placed on grids so that they are legal for all design constraints. *Data_type*: bool, optional

Example

The following command legalizes all the partition locations such that they are snapped to the closest `R0` rows:

```
legalize_floorplan -check_orient
```

Related Information

- `check_floorplan`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

move_group_pins

```
move_group_pins
[-help]
[-depth float]
[-end_location {x y}]
[-expand_spacing_factor float]
[-layer string] -location {x y}
[-no_fixed]
[-spacing float]
[-spread_type string]
[-start_location {x y}]
[-width float]
[-with_overlap]
```

Changes the pin layer, the pin size, pin status, resolves pin overlap, and moves a selected pin or pin group to a specific location. You can use this command after selecting the pin(s) in the move mode (selecting pins in the design display area with the *Move/Resize/Reshape* tool widget).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `move_group_pins` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man move_group_pins`
`-depth float`	Specifies the depth of the pin or pin group, in micrometers. *Data_type*: float, optional
`-end_location {x y}`	Specifies the coordinates where the pins should end when the pins are spread along a range. *Data_type*: point, optional
`-expand_spacing_factor float`	Specifies the value that will be multiplied to the current spacing in tracks. *Data_type*: float, optional
`-layer string`	Specifies the number of the metal layer for the pin or pin group. *Data_type*: string, optional
`-location {x y}`	Specifies the new x and y location for the pin or pin group. *Data_type*: point, required
`-no_fixed`	Specifies that the moved pins or group of pins are not set to the *fixed* status. *Data_type*: bool, optional
`-spacing float`	Specifies the spacing between pins for multi-pin editing. *Data_type*: float, optional
`-spread_type string`	Specifies how spacing between pins is managed while moving grouped-pins. *Data_type*: string, optional
`-start_location {x y}`	Specifies the coordinates where the pins should start when the pins are spread along a range. *Data_type*: point, optional
`-width float`	Specifies the width of the pin or pin group, in micrometers. *Data_type*: float, optional
`-with_overlap`	Specifies that moved pin(s) can overlap. *Data_type*: bool, optional

Example

The following command moves the selected pin group to a new location (10,20):

```
move_group_pins -location 10 20
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*
  - Editing Pins

move_macro_in_hinsts

```
move_macro_in_hinsts
[-help]
{-hinsts {hinst_name(s)} | -all}
```

Moves all hard macros that belong to the specified module into its boundary. You use this command after the module is placed in the core area.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `move_macro_in_hinsts` parameter. For a detailed description of the command and all of its parameters, use the man command: `man move_macro_in_hinsts`.
`-all`	Moves all hard macros that belong to hierarchical modules. *Data_type*: bool, optional
`-hinsts {hinst_name(s)}`	Specifies the name of the hierarchical instance. You can use wildcards (*?) with this parameter. *Data_type*: string, optional

Example

The following command moves all hard macros that belong to modules that have hierarchical instance names that match DTMF_INST/*_TEST_INST into its boundary:

```
move_macro_in_hinst -hinsts DTMF_INST/*_TEST_INST
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

move_obj

```
  move_obj
[-help]
[-group]
{ -point {x y} | { -direction {up down left right} { -distance value | -to {core_box die_box} }}}
{ obj_list | -selected }
```

Moves objects (instances, modules, groups, placement blockage, routing blockage, hard macros, special routings, and I/O pins) vertically or horizontally by a specified distance. The objects can be moved to the die or core box boundary, as specified. You can use this command after selecting one or more objects in the design display area.

Parameters

`-direction {up down left right}`	
	Specifies the vertical and horizontal movement for the selected objects. Choose one of the following: • `up`: Specifies an upward move. • `down`: Specifies a downward move. • `left`: Specifies a left move • `right`: Specifies a right move. *Data_type*: enum, optional
`-distance` *value*	Specifies the distance, in micrometers, that the objects will be moved in the specified direction. *Data_type*: float, optional
`-group`	Moves all the specified or selected objects as a group. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `move_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man move_obj`
obj_list	Specifies the list of objects to move. *Data_type*: (any_object)+, optional
`-point {`*x y*`}`	Specifies the lower left point that the objects will be moved to. *Data_type*: point, optional
`-selected`	Moves the selected object. *Data_type*: bool, optional
`-to {core_box die_box}`	
	Moves the object to the core_box or the die_box boundary, as specified. *Data_type*: enum, optional

Examples

- The following command moves each of selected objects to the left of core boundary:
  ```
  move_obj -selected -direction left -to core_box
  ```
- The following command moves the bounding box of all selected objects to the left of core boundary:
  ```
  move_obj -selected -direction left -to core_box -group
  ```
- The following command moves each of the selected objects to the left with 50um. The same as with option -group:
  ```
  move_obj -selected -direction left -distance 50
  ```
- The following command moves each of the selected objects' low left coordinates to the specified point:
  ```
  move_obj -selected -point {330 410}
  ```
- The following command moves the bounding box's low left coordinates of all selected objects to the specified point:
  ```
  move_obj -selected -point {330 410} -group
  ```

Related Information

- `paste_obj`
- `unplace_obj`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

paste_obj

```
paste_obj
[-help]
```

Pastes copied placement or routing blockages. Use the `copy_obj` command to copy the required object. Use this command any time after floorplanning the design. You can also copy and paste selected placement and routing blockages from the GUI by using the Copy tool. To access the Copy tool, choose *Edit - Copy* from the menu bar or press `F3` after clicking the *Copy* widget ( ) on the toolbar.

Parameters

`-help`	Prints a brief description of the `paste_obj` command. For a detailed description of the command, use the `man` command: `man paste_obj`

Example

- The following commands copy and paste the selected placement and routing blockages:
  ```
  copy_obj
  paste_obj
  ```

Related Information

- `copy_obj`
- `edit_copy`
- `move_obj`

place_area_ios

```
place_area_ios
[-help]
[-only_area_ios]
[-assign_bumps]
[-max_distance distance]
[-fast]
[-packing]
[-ignore_area_ios {list}]
[-ignore_area_io_cells {list}]
[-hard_fence]
```

Places I/O driver cells. The area I/O Library must be loaded when importing the design. Area I/O rows are also required.

Note: Once you run the `place_area_ios -only_area_ios` command to place the area I/Os, you can run `place_peripheral_ios -cells` to specify the cell(s) that must be placed on the periphery.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `place_area_ios` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man place_area_ios`
`-assign_bumps`	If you have unassigned bumps for area I/O instance connections, this connects area I/O instances to the nearest unassigned bumps. This option requires that bump cells and bump locations are already loaded. **Note:** You can also assign bumps after area I/O placement by using the `assignBump` command. *Data_type*: bool, optional
`-fast`	Runs area I/O placement in the fast mode, trading speed for quality. *Data_type*: bool, optional
`-hard_fence`	If specified, restricts the area I/O placement to the power domain fence to which the area I/O's belong to. *Data_type*: bool, optional
`-ignore_area_io_cells` {*list*}	Ignores all area I/O instances that instantiate from the cells specified in the list, during placement. For example, if a cell `PDI` has 2 AIO instances, `test_in_1` and `test_in_2`, this parameter ignores both the instances during placement. *Data_type*: string, optional
`-ignore_area_ios` {*list*}	Ignores all the area I/O cells specified in the list, during placement. Specify this parameter if you already placed the area I/O cells on the periphery and you want to avoid placing the same cells in the core. *Data_type*: string, optional
`-max_distance` *value*	Specifies the maximum allowable distance between the I/O driver cells and the bumps. *Data_type*: int, optional
`-only_area_ios`	Places only area I/O instances. If this option is not specified, the command will also place all standard cell instances and blocks. *Data_type*: bool, optional
`-packing`	Specifies the packing of I/O driver cells within each cluster of rows. This option is only applicable to designs with clusters of I/O rows. *Data_type*: bool, optional

Examples

- The following command places area I/O instances and all standard cell instances, and assign bumps for all chip I/O pins:
  ```
  place_area_ios -assign_bumps
  ```
- The following command places only area I/O cells:
  ```
  place_area_ios -only_area_ios
  ```

Related Information

- `place_peripheral_ios`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

place_blocks_refine

```
place_blocks_refine
[-help]
[[-area {x1 y1 x2 y2} [-selected]]
{-area {x1 y1 x2 y2} | -permute_pack | -mark_step | -read_step step_number
       |-read_mark mark_number}
[-pack_adjustment]
[-io_pin_clearance]]
```

Refines the placement of macros in the floorplan. By default, the `place_blocks_refine` command performs global incremental macro adjustment. You can also adjust specific macro packs, or all of the macros in a specific area of the design. You can use `place_blocks_refine` command after creating an initial floorplan and analyzing the results. Macros must have a status of PLACED in the database in order to use this command.

Parameters

`-pack_adjustment`	Adjusts the way that macros packs are placed, relative to their locations. For example, an array of 16 macros might be placed in four rows of four macros (4 x 4), if they are near the top or bottom of the chip. This might change to eight rows of two macros (8 x 2), if the macros are moved near the left or right edge of the chip.
`-area` *x1 y1 x2 y2*	Adjusts the placement of any macros within the specified area to reduce empty area between them. If you also specify `-selected`, the `place_blocks_refine` command moves the selected macros to the specified area and adjusts their position along with any macros already within the area. *Data_type*: box, optional
`-help`	Outputs a brief description that includes type and default information for each `place_blocks_refine` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man place_blocks_refine`.
`-io_pin_clearance`	Leaves an internally calculated amount of clearance space between placed macros and block I/O pins. Use this parameter to ensure that pins are accessible to the router. *Data_type*: bool, optional
`-mark_step`	Marks an intermediate macro refinement step to save. When you perform incremental macro refinement, each adjustment is considered a step. By default, all incremental steps done with the `place_blocks_refine` command are saved and listed in the log file with a number. Since the manal refinement steps (such as move, rotate, and flip) are not saved by default, you can use this parameter to mark manual refinement steps, or any other important step that you want to save. **Note:** Innovus saves up to 1000 incremental refinement steps in the database and 20 marks before overwriting them. *Data_type*: bool, optional
`-permute_pack`	Adjusts the placement of a selected pack of macros to reduce empty area between them. A pack is a set of macros from the same seed that have similar sizes and aspect ratios and have been grouped together. You must select the macro pack in the main window before using this parameter. You can select one macro to select the entire pack. Macro pack information is stored temporarily in the database. If you quit the Innovus session, the information is lost. *Data_type*: bool, optional
`-read_mark` *mark_number*	Returns the design to the state it was in after the specified marked step (`-mark_step`). For example, to return the design to the state it was in after the step saved as `mark2`, specify: `place_blocks_refine -read_mark 2` You can find the mark numbers listed in the log file. *Data_type*: int, optional

`-read_step` *step_number*	Returns the design to the state it was in after the specified intermediate non-marked step. For example, to return the design to the state it was in after step 4, specify:
	`place_blocks_refine -read_step 4`
	To return the design to the state it was in after the previous adjustment, specify:
	`place_blocks_refine -read_step -1`
	You can find the step numbers listed in the log file.
	Data_type: int, optional

`-selected`	Moves the selected macros to the specified area and adjusts their position along with any macros already within the area. **Note:** You cannot use this parameter without specifying the `-area` parameter. *Data_type*: bool, optional

Example

The following command moves the selected macros to a new area:

```
place_blocks_refine -selected -area 100 100 200 300
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

place_macro_detail

```
place_macro_detail
[-help]
[-verbose ]
```

Legalizes the macros based on constraints such as halo and blockages, forbidden spacing, min-space, etc. To define the constraints of macros, use the `set_macro_place_constraint` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `place_macro_detail` parameter. For a detailed description of the command and all of its parameters, use the man command: `man place_macro_detail`
`-verbose`	Writes the macro movement details to a tcl file. *Data_type*: bool, optional

Example

The following command specifies the minimum space between macro-to-core boundary as 5 and the forbidden space between macro-to-core boundary as 2.

```
set_macro_place_constraint -forbidden_space_to_core 2 -min_space_to_core 5
place_macro_detail
```

Related Information

- `set_macro_place_constraint`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*
- Using the Mixed Placer chapter in the *Innovus Stylus Common UI User Guide*

place_pad_ios

```
place_pad_ios
[-help]
[-row_number number_of_rows]
[-max_io_height]
```

Places the I/O pads evenly from one row to multiple rows. You can use this command after design initialization when the Innovus software automatically places the I/O pads in one row.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `place_pad_ios` parameter. For a detailed description of the command and all of its parameters, use the man command: `man place_pad_ios.`
`-row_number number_of_rows`	Specifies the number of I/O rows needed for the placement. *Data_type*: int, optional
`-max_io_height`	Specifies the maximum height used to calculate the head box. By default, this command uses the minimum height. *Data_type*: bool, optional

Example

The following command places I/O pads in two I/O rows:

```
place_pad_ios -row_number 2
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

place_peripheral_ios

```
place_peripheral_ios
[-help]
[-assign_bump]
[-cells {cellNamePattern}]
[-extra_config fileName]
[-insts {instNamePattern}]
[-io_file fileName]
[-max_io_height]
[-no_random_placement]
[-opt_ios]
[-overflow_map]
[-power_domain powerDomainName]
[-route_constraint_file fileName]
```

Places CLASS PAD AREAIO cells on the die boundary (periphery) in random order. Use this command after the design is loaded.

- The command, by default, honors pre-placed or `FIXED` area I/Os in the design and does not modify their placement when executed.
- The command can place IO pads onto the IO rows that belong to a power domain and optimize the locations of the IO pads for the power domain.
  ```
  place_peripheral_ios -power_domain {VCCQ_MC0 VCCQ_U VCCQ2_E VCCQ_L VCCQ2_H VCCQ_D VCCQ2_C}
  place_peripheral_ios -opt_ios
  ```

  The I/O row information is retrieved from the power domain itself. IO rows need to be created and added to power domain before the placement and optimization. Run `place_peripheral_ios -power_domain {powerDomainName}` for a random placement then use `place_peripheral_ios -opt_ios` for optimized result.

  
  You can use this function to place IO pads in a design that has multiple power domains with IO pads. Innovus recognizes the relationship between the IO pads, IO rows, and power domains and so placement and optimization are automatic.
- The command reads options specified by the `flip_chip` category attributes before placing the CLASS PAD AREA IO cells on the die boundary. It retrieves the constraint file and extra configuration file information from the `flip_chip_constraint_file` and `flip_chip_extra_config` attributes.
- During bump assignment, the command uses resistance constraints that are specified in the constraint file for net(s).
- The `place_peripheral_ios -opt_ios -assign_bump` command also reads the `flip_chip_route_width` value before reassigning the signal bumps in the design.
- When the I/O row flow is enabled (`set_io_flow_flag 1`), the `place_peripheral_ios` command restricts I/O placement in the rows created previously, instead of all possible locations. However, you need to ensure that the I/O rows are created outside the I/O box.
  Command flow:
  ```
  set_io_flow_flag 1
  create_io_row
  ```

```
place_peripheral_ios
```

Note: IO cells must be defined as CLASS PAD on the boundary of the design. The peripheral I/O Library must be loaded when importing the design. Peripheral I/O rows are also required.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `place_peripheral_ios` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man place_peripheral_ios`.
`-assign_bump`	Allows signal bumps to be reassigned to improve routing if the I/O cells have been fixed. *Data_type*: bool, optional
`-cells {cellNamePattern}`	Specifies which area I/O cell(s) must be placed on the periphery. Once you run `place_peripheral_ios -cells` to grab the area I/O cells for placement on the periphery, you can run `place_area_ios -ignore_area_ios {list}` to avoid the placement of these cells in the core area. *Data_type*: string, optional
`-extra_config fileName`	Specifies a file containing user-defined placement options written in `route_special` syntax. *Data_type*: string, optional
`-insts {instNamePattern}`	Specifies which area I/O instance(s) must be grabbed for placement on the periphery. Once you run `place_peripheral_ios -insts` to place the area I/O instances on the periphery, you can run `place_area_ios -ignore_area_ios {list}` to avoid the placement of these instances in the core area. *Data_type*: string, optional
`-io_file fileName`	Specifies the name of a file to control the placement of the I/O cells. Supports the version 3.0 I/O file format. *Data_type*: string, optional
`-max_io_height`	Specifies the maximum height for the I/O row. *Data_type*: bool, optional
`-no_random_placement`	Without options, the `place_peripheral_ios` command randomly places all I/O cells on the periphery. This option inhibits this behavior and optimizes pads without initial placement. *Data_type*: bool, optional
`-opt_ios`	Allows I/O cells to be moved to improve routing if the bumps have been fixed, optimizing the initial placement. *Data_type*: bool, optional

`-overflow_map`	Displays the congestion map using the width and spacing parameters specified in the extra configuration file. To display the congestion map, run the following command to specify the options for the extra configuration file:
	`place_peripheral_ios -no_random_placement -overflow_map -extra_config scripts/global.cfg`
	where:
	`scripts/global.cfg:`
	`srouteBottomLayerLimit 8 /* Assume the intended routing layer range is M8 to M9 */`
	`srouteTopLayerLimit 9`
	`srouteRouteWidth 10000 /* n is the routing width, in db unit - 5u */`
	Data_type: bool, optional

`-power_domain powerDomainName`	Specifies the name of the power domain that consists of peripheral I/Os. The I/O row information can now be retrieved from the power domain itself. *Data_type*: string, optional
`-route_constraint_file fileName`	Specifies a file with constraints to control the placement of the I/O cells. The command uses resistance constraints specified in this file, for cell placement. *Data_type*: string, optional

Example

- The following command places CLASS PAD AREA IO cells on the die boundary (periphery) and allows I/O cells to be moved to improve routing if the bumps have been fixed, optimizing the initial placement:

```
place_peripheral_ios -opt_ios
```

Related Information

plan_design Category Attributes

The root attributes in the `plan_design` category are:

- plan_design_domain
- plan_design_rail_model
- plan_design_total_power

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `plan_design` category, use the following command:

```
get_db -category plan_design
```

plan_design_domain

`plan_design_domain {{pd1 float net1} {pd2 float net2}..}`

Default: `" "` (empty string)

Data_type: string, read/write

Specifies the power, in milliwatts, assigned for nets in power domains.

Note: If the total power or the domain power is not specified, the `plan_design_domain` attribute will estimate it internally based on the instance area.

Related Commands

- `proto_design`

plan_design_rail_model

`plan_design_rail_model {virtual | existing}`

Default: `existing`

Data_type: enum {virtual existing}, read/write

Specifies the power grid to use.

- `virtual`: Use routing blockages to model virtual power grid. These routing blockages are removed after congestion analysis is done.
- `existing`: Use the current power grid.

Related Commands

- `proto_design`

plan_design_total_power

`plan_design_total_power float`

Default: `0`

Data_type: double, read/write

Specifies a target value for the power, in milliwatts, consumed by the design.

Related Commands

- `proto_design`

read_floorplan

```
read_floorplan
file
[-help]
[-no_equalize_partition_hinst]
[-sections {macro | pin | bndry | special_route | pin_constraint}}]
[-xml]
```

Loads a floorplan file. You can use this command after importing the design.

Note:

- When you run the `read_floorplan` command, the Innovus software removes any existing floorplan information and reads in the new information. The `read_floorplan` command honors the blackbox min/max aspect ratio information in the floorplan information file.
- Blocks and instances loaded with this command are set as preplaced.
- The `read_floorplan` command loads the user-specified seed information by default.
- The `loadFPlan` command loads the information related to blockages, tracks, and pin shapes from the *.fp file.

Parameters

file	Specifies the name of the floorplan file that was saved. *Data_type*: string, required
`-help`	Outputs a brief description that includes type and default information for each `read_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man read_floorplan.`
`-no_equalize_partition_hinst`	Disables the snapping capability of the clone partitions to the power grid, such that clones do not necessarily have the same row structure and pattern as their master. *Data_type*: bool, optional
`-sections {macro | pin | bndry | special_route | pin_constraint}`	
	Specifies the objects section in the floorplan file that will be updated. The sections can be macro, pin, brndy, special_route, pin_constraint. **Note:** The `read_floorplan` command supports routing blockages on master slice layers. *Data_type*: string, optional
`-xml`	Reads the floorplan information from the XML format floorplan file. *Data_type*: bool, optional

Example

- The following command loads the floorplan file myFPlan.fp, which was saved in an earlier session:
  ```
  read_floorplan myFPlan.fp
  ```
- The following command loads only the pin constraints data in the present design with other floorplan objects remaining unchanged.
  ```
  read_floorplan myFPlan.fp -sections {pin_constraint}
  ```

Related Information

- `create_floorplan`
- `write_floorplan`
- `floorplan` Category Attributes

- Viewing the Floorplan

read_io_file

```
read_io_file
[-help]
file_name
[-no_die_size_adjust]
[-specified_ios_only]
[-eco [-pads_only | -bumps_only]]
```

Loads an I/O assignment file. You can use this command after importing the design.

Notes:

- By default, the `read_io_file` command will automatically adjust the die size to accommodate all the IOs. If this command is used after floorplanning, it would change the die size defined in the floorplan file. If you do not want the die size to be automatically adjusted, use the `-no_die_size_adjust` parameter.
- During I/O inst placement, the *space* value determines the distance between the current inst and the previous inst. Earlier, while honoring `iopad` spacing, the `read_io_file` command considers the previous inst to be the inst that appears before the current inst when insts are placed according the io_order specified in the I/O assignment file .

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `read_io_file` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man read_io_file`
`-bumps_only`	Loads only bump ECO operations in specified IO file. *Data_type*: bool, optional
`-eco`	Allows I/O ECO change by loading a new I/O file. In a chip-package co-design situation, when I/O Planner (IOP) utility in SiP is used for modifying the I/O and bump information, the modified information needs to be passed to Innovus. When `-eco` is specified, `read_io_file` overwrites the existing setting for I/Os and bumps with the information from the new I/O file. *Data_type*: bool, optional
file_name	Specifies the name of the I/O assignment file. *Data_type*: string, required
`-no_die_size_adjust`	Specifies that the die size should not be adjusted automatically. *Data_type*: bool, optional
`-pads_only`	Loads only IO pad ECO operations in specified IO file. *Data_type*: bool, optional
`-specified_ios_only`	Loads only the IO in the specified IO file. This parameter enables you to place IO cells listed in the I/O assignment file without deleting or moving the IO cells not listed in I/O assignment file. *Data_type*: bool, optional

Example

The following command loads the I/O assignment file `myPinFile.io`:

```
read_io_file myPinFile.io
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

report_floorplan_obj

```
report_floorplan_obj
[-help]
[-power_domain]
```

Prints the properties of selected objects to the console. This command supports only instances and modules. You can use this command after selecting one ore more instances or modules.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_floorplan_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_floorplan_obj`
`-power_domain`	Use this option to output power domain information, as well as check if the objects belong to a power domain. *Data_type*: bool, optional

Example

The following commands select and print property information for module `modA`:

```
select_obj [get_db insts modA]
report_floorplan_obj -power_domain
```

Related Information

- `select_obj`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

report_narrow_channel

```
report_narrow_channel
[-help]
{-width width
[-ignore_placement_blockage ]
[-no_merge_channel_check ]
[-direction {x y xy}]
[-active_objects {macro macroHalo ioPad ioCell core fence hardBlkg softBlkg partialBlkg routeBlkg row}] }
```

Creates a report that contains a list of narrow channels.

Note: The `report_narrow_channel` command returns channel boxes as its return value.

Parameters

`-active_objects {macro macroHalo ioPad ioCell core fence hardBlkg softBlkg partialBlkg routeBlkg row}`	
	Specifies the active objects for narrow channel checking. *Default*: `"core macro macroHalo hardBlkg"` *Data_type*: (enum)+, optional
`-help`	Outputs a brief description that includes the type and default information for each `report_narrow_channel` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_narrow_channel`

`-direction {x y xy}`	Specifies the direction for checking narrow channels. You can specify x, y, or xy.
	Default: `xy`
	Example:
	`report_narrow_channel -width 100 -direction x`
	 	
	`report_narrow_channel -width 100 -direction y`
	 	
	`report_narrow_channel -width 100 -direction xy`
	 	
	Data_type: enum, optional

`-ignore_placement_blockage`	When specified, the placement blockages are ignored while computing channel widths. *Data_type*: bool, optional

`-no_merge_channel_check`	Specifies that the narrow channel error boxes will be merged into contiguous error boxes. Example: `report_narrow_channel -width 100 -direction xy -no_merge_channel_check`  *Data_type*: bool, optional
`-width` *width*	Specifies the width for checking the channels. *Maximum*: `100000` *Minimum*: `0` *Data_type*: float, optional

Example

The following command checks for channels with width 1.0 and ignores placement blockages:
`report_narrow_channel -width 1.0 -ignore_placement_blockage`

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

report_net_groups

```
report_net_groups
[-help]
[-out_file filename]
```

Creates a report that contains net groups and their nets. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_net_groups` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_net_groups`
`-out_file filename`	Specifies the report filename. If no filename is specified, the report is printed to the console window. *Data_type*: string, optional

Example

Check the bump assignment and send the report to `netGrp.rpt`:

```
report_net_groups -out_file netGrp.rpt
```

The output format is the same as the NetGroup section of the floorplan file:

```
# NetGroup Report File
NetGroup: netGroupName_one
    GroupNet net_name_01_in_netGroupName_one
    GroupNet net_name_02_in_netGroupName_one
NetGroup: netGroupName_two
    GroupNet net_name_01_in_netGroupName_two
    GroupNet net_name_02_in_netGroupName_two
```

report_obj_connectivity

```
report_obj_connectivity
[-help]
[-direction {in|out|all}]
[-file file_name]
[-level level]
[-no_split]
[-through_registers]
[-to_ports]
[-insts inst+] | [-ports port+] | [-selected]
```

Reports the connections of specified macros, selected macros, or specified ports. You can also report the input and output connectivity separately. By default it reports both.

Parameters

`-direction {in|out|all}`	Specifies the pin direction of objects to be reported. *Default*: `all` *Data_type*: string, optional
`-file file_name`	Specifies the name of the output report file in which the trace macro results will be saved. *Default*: `<top_module_name>.tmcrpt` *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `report_obj_connectivity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_obj_connectivity`
`-insts inst+`	Specifies the macros to be reported. *Data_type*: string, optional
`-level level`	Specifies the trace level. *Maximum*: 10 *Minimum*: 1 *Default*: 5 *Data_type*: int, optional
`-no_split`	Reports a single object per line.
`-ports port+`	Specifies the IO ports to be reported. *Data_type*: string, optional
`-through_registers`	Reports the through registers between selected objects. *Data_type*: bool, optional
`-to_ports`	Reports the connectivity from the selected objects to IO ports. *Data_type*: bool, optional
`-selected`	Reports the selected macros or IO ports. *Data_type*: bool, optional

Example

The following command reports the selected macros or IO ports:

```
report_obj_connectivity -selected
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

report_off_grid_blocks

```
report_off_grid_blocks
[-help]
```

Reports unsnapped blocks based on the snap preferences (as defined in the *Floorplan Tab* of the *Preferences* form). You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description of the `report_off_grid_blocks` command. For a detailed description of the command, use the man command: `man report_off_grid_blocks`

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

report_seed_connections

```
report_seed_connections
[-help]
[-constraints_file filename]
[-exclude_nets_file filename]
[-out_file outfile]
```

Reports the number of connections between user-specified seeds.

Parameters

`-constraints_file` *filename*	Specifies the name of the input constraints file containing the seed definition. *Data_type*: string, optional

`-exclude_nets_file` *filename*	Specifies the name of the exclude net file to use during the calculation of seed connections. The exclude_nets_file format should be:
	`#any comment`
	`netName, netName,...`
	`netName, netName,...`
	Data_type: string, optional

`-out_file` *filename*	Specifies the name of the output report file in which the information about the number of connections between user-specified seeds is written. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `report_seed_connections` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_seed_connections`.

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

reset_fixed_module_size

```
  reset_fixed_module_size
[-help]
-modules
```

Specifies that during floorplan resizing, the size of the specified modules and/or blackboxes can change. Use this command to unset the fixed block size specified with the `set_module_size_fixed` command. You would use this command after setting the block size of modules and/or black boxes to fixed with the `set_module_size_fixed` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `reset_fixed_module_size` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_fixed_module_size`
`-modules`	Specifies that the size of the specified modules and/or blackboxes can change during floorplan resizing. Provide a space-separated list of instances. `*`: Specifies that the size of all the modules and/or blackboxes can change during floorplan resizing. *Data_type*: list, required

Example

The following command specifies that the size of instanceA and instanceB can change during floorplan resizing.

```
reset_fixed_module_size instanceA instanceB
```

Related Information

- `set_module_size_fixed`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

reset_macro_place_constraint

```
reset_macro_place_constraint
[-help]
[-align_group]
[-array]
[-avoid_abut_macro_edge_with_pins]
[-cell_obs]
[-cpg]
[-forbidden_space_to_core]
[-forbidden_space_to_macro]
[-honor_strict_spacing_constraint]
[-horizontal_stacking]
[-instance_orientation]
[-macro_corner_keepout]
[-max_io_pin_group_keep_out]
[-min_space_to_core]
[-min_space_to_macro]
[-parallel_run_length]
[-pg_resource_model]
[-same_length_site]
[-track_adjustment]
[-vertical_stacking]
```

Resets the macro constraints that are honored by the macro placer. To define the constraints of macros, use the `set_macro_place_constraint` command.

Parameters

`-align_group`	Deletes all the align_group constraints. *Data_type*: bool, optional
`-array`	Deletes all the array constraints. *Data_type*: bool, optional
`-avoid_abut_macro_edge_with_pins`	
	Specifies that macro edges with pins should not be abutted even when the macro distance is within the forbidden spacing setting. *Data_type*: bool, optional
`-cell_obs`	Deletes all the cell obstruction constraints. *Data_type*: bool, optional
`-cpg`	Deletes all the cpg constraints. *Data_type*: bool, optional
`-forbidden_space_to_core`	Resets the forbidden space to core. *Data_type*: bool, optional
`-forbidden_space_to_macro`	Resets the forbidden space to macro. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `reset_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man reset_macro_place_constraint`
`-honor_strict_spacing_constraint`	Specifies that forbidden spacing and minimum spacing constraints should be honored strictly. *Data_type*: bool, optional
`-horizontal_stacking`	Resets the maximum horizontal stack depth and the minimum horizontal spacing. *Data_type*: bool, optional

`-instance_orientation`	Deletes all the instance orientations. *Data_type*: bool, optional
`-macro_corner_keepout`	Resets the macro corner keepout constraints. *Data_type*: bool, optional
`-max_io_pin_group_keep_out`	Deletes the macro-only blockages which are automatically added to IO pins and resets the maximum height or width of macro-only blockages to 0. *Data_type*: bool, optional
`-min_space_to_core`	Resets the minimum space to core. *Data_type*: bool, optional
`-min_space_to_macro`	Resets the minimum space to macro. *Data_type*: bool, optional
`-parallel_run_length`	Resets the parallel run length to enable space checking. *Data_type*: bool, optional
`-pg_resource_model`	Deletes the pg resource model constraints. *Data_type*: bool, optional
`-same_length_site`	Resets the minimum difference site number. *Data_type*: bool, optional
`-track_adjustment`	Deletes all the track adjustment. *Data_type*: bool, optional
`-vertical_stacking`	Resets the maximum vertical stack depth and the minimum vertical spacing. *Data_type*: bool, optional

Example

The following command deletes all the pg resource model constraints:

```
reset_macro_place_constraint -pg_resource_model
```

Related Information

resize_floorplan

```
resize_floorplan
[-help]
[-x_size x_axis_size]
[-y_size y_axis_size]
[-x_ratio x_axis_ratio]
[-y_ratio y_axis_ratio]
[-undo]
[-push_core]
[-force_resize]
```

Resizes the floorplan while maintaining the relative locations of the existing floorplan. You can also set global parameters for the `resize_floorplan` command by using the resize_floorplan Category Attributes. The attributes that you specify are then used automatically whenever you run the `resize_floorplan` command or use the *Resize Floorplan* form. You can use this command after importing the design. When run on a block design, the `resize_floorplan` command keeps physical PG pins during resize and trims the PG pin geometries that fall out of the chip boundary after resize.

Note: You can use the `create_resize_blockage` command to add a size blockage object that controls the behavior of the resize line under a covered area.

Parameters

`-force_resize`	Resizes the floorplan even if the target size can not be met. However, the floorplan is resized as near as possible to the specified size. *Default*: If you do not specify this parameter, the floorplan is not resized if the target size can not be met. **Note**: This parameter can be used only when the `resize_floorplan_shift_based` attribute has been set to `true`. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `resize_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man resize_floorplan`
`-push_core`	Pushes the core when the design is I/O bound. *Data_type*: bool, optional
`-undo`	Revert to the floorplan that existed before the command was run. *Data_type*: bool, optional
`-x_ratio x_axis_ratio`	Specifies the percentage of how much the floorplan should be expanded or shrunk in the x direction. A positive value expands the floorplan and a negative value shrinks the floorplan. *Data_type*: float, optional
`-y_ratio y_axis_ratio`	Specifies the percentage of how much the floorplan should be expanded or shrunk in the y direction. A positive value expands the floorplan and a negative value shrinks the floorplan. *Data_type*: float, optional
`-x_size x_axis_size`	Specifies how much the floorplan should be expanded or shrunk in the x direction. A positive value expands the floorplan and a negative value shrinks the floorplan. This value is in microns. **Note**: If both `-x_size` and `-y_size` parameters are specified, the resize order is the same as the order of the parameters. *Data_type*: float, optional
`-y_size y_axis_size`	Specifies how much the floorplan should be expanded or shrunk in the y direction. A positive value expands the floorplan and a negative value shrinks the floorplan. This value is in microns. *Data_type*: float, optional

Example

The following command resizes the floorplan as follows: shrinks the floorplan in shift based mode by -50 microns in the x direction and -40 microns in the y direction.

```
resize_floorplan -x_size -50 -y_size -40
```

Related Information

  - Resizing the Floorplan

resize_floorplan_channel

```
resize_floorplan_channel
[-help]
[-channel_density value]
[-constraints constraint_file]
[-move_only]
[-report output_file]
[-report_only [-report_low_density_channels value]
  [-types {all fence_to_fence fen_to_core fence_to_macro macro_to_macro macro_to_core}]]
```

Automatically adjusts the channel width between objects to prevent potential routing congestion. You can use this command after importing the design, loading a completed floorplan, and then running the `place_design` and `route_early_global` commands.

Parameters

`-channel_density value`	
	Specifies the maximum utilization of routing tracks in a channel. *Data_type*: float, optional
`-constraints constraint_file`	
	Specifies the file that contains constraints for floorplan objects. A constraint file is a text file that can contain a list of seeds to use when generating fences and module guides, and basic relative, spacing and orientation constraints to follow during macro placement. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `resize_floorplan_channel` parameter. For a detailed description of the command and all of its parameters, use the man command: `man resize_floorplan_channel`
`-move_only`	Specifies that only move-only adjustment is allowed. *Data_type*: bool, optional
`-report output_file`	Generates a report that contains the channel congestion, targeted channel adjustment, and final real floorplan adjustment. *Default*: `topcell.channel` *Data_type*: string, optional
`-report_low_density_channels value`	
	Reports channel congestion whose track utilization is lower than the user-specified threshold value. *Minimum*: 0 *Maximum*: 1.0 *Data_type*: float, optional
`-report_only`	Generates a report of the channel congestion without adjusting the floorplan. *Data_type*: bool, optional
`-types {all fenceToFence fenceToCore fenceToMacro macroToMacro macroToCore}`	
	Reports channel congestion for specified type. You can specify more than one type at a time. *Default*: `all` *Data_type*: (enum)+, optional

Example

- The following command generates a report of only fence-to-fence congestion, without adjusting the floorplan:
  ```
  resize_floorplan_channel -report_only -types {fenceToFence}
  ```
- The following command generates a channel congestion report without adjusting the floorplan:
  ```
  resize_floorplan_channel -report_only -report reportfile
  ```

  The following report is generated:

  ```
  Channel (315.48 357.67 361.60 511.57)
  Left: CORE
  Right: DTMF_INST/PLLCLK_INST
  Congested utilization: 200/185 (108.1% V)
  Expected channel width increase: 6.48 um

  Channel (315.48 511.57 351.33 646.17)
  Left: CORE
  Right: DTMF_INST/RAM_128x16_TEST_INST/RAM_128x16_INST
  Congested utilization: 128/117 (109.4% V)
  Expected channel width increase: 5.51 um

  Channel (466.52 646.17 792.28 670.01)
  Bottom: DTMF_INST/RAM_128x16_TEST_INST/RAM_128x16_INST
  Top: DTMF_INST/ROM_512x16_0_INST
  Congested utilization: 52/42 (123.8% H)
  Expected channel height increase: 7.38 um
  ```

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

resize_floorplan Category Attributes

The root attributes in the `resize_floorpan` category are:

- resize_floorplan_cong_aware
- resize_floorplan_honor_halo
- resize_floorplan_io_fix
- resize_floorplan_io_move_with_edge
- resize_floorplan_io_relative
- resize_floorplan_maintain_resource_ratio
- resize_floorplan_relative
- resize_floorplan_shift_based
- resize_floorplan_shrink_fence
- resize_floorplan_snap_to_track

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the resize_floorpan category, use the following command:

```
get_db -category resize_floorpan
```

resize_floorplan_cong_aware

```
resize_floorplan_cong_aware {true | false}
```

Default: `false`

Data_type: bool, read/write

Resizes and shifts the floorplan objects by estimating the congestion for the floorplan and automatically deciding where to draw a resize line to avoid the congested area.

Related Commands

- `create_resize_blockage`
- `resize_floorplan`

resize_floorplan_honor_halo

```
resize_floorplan_honor_halo {true | false}
```

Default: `true`

Data_type: bool, read/write

Honors placement halo and preserves the space between macros held by halo after the floorplan resize. With this option set to true, if the original placement halo does not overlap with other macros or placement halo, after floorplan resize, it will not overlap with other macros or placement halo.

Related Commands

- `create_resize_blockage`
- `resize_floorplan`

resize_floorplan_io_fix

```
resize_floorplan_io_fix {true | false}
```

Default: `false`

Data_type: bool, read/write

Fixes I/Os at current location.

Related Commands

- `create_resize_blockage`
- `resize_floorplan`

resize_floorplan_io_move_with_edge

```
resize_floorplan_io_move_with_edge {true | false}
```

Default: `false`

Data_type: bool, read/write

Moves pins on the moved edge orthogonally to edge direction so pins stay on edge after movement. The pins on other edges are not touched.

Related Commands

- `create_resize_blockage`
- `resize_floorplan`

resize_floorplan_io_relative

```
resize_floorplan_io_relative {true | false}
```

Default: `true`

Data_type: bool, read/write

Resizes the space among I/Os proportionally. If you set this parameter to true, the I/Os are distributed proportional to the original I/O space. If you set this parameter to false, the I/Os are distributed evenly.

Note: By default, the overlapping I/Os are spaced proportionally.

Related Commands

- `create_resize_blockage`
- `resize_floorplan`

resize_floorplan_maintain_resource_ratio

```
resize_floorplan_maintain_resource_ratio {true | false}
```

Default: `false`

Data_type: bool, read/write

When enabled, it maintains the resource ratio after resizing the floorplan in shift-based mode.

Related Commands

- `create_resize_blockage`
- `resize_floorplan`

resize_floorplan_relative

```
resize_floorplan_relative {true | false}
```

Default: `false`

Data_type: bool, read/write

Resizes the space among floorplan objects proportionally.

Related Commands

- create_resize_blockage
- resize_floorplan

resize_floorplan_shift_based

```
resize_floorplan_shift_based {true | false}
```

Default: `true`

Data_type: bool, read/write

Shifts floorplan objects at appropriate location(s) without changing the proportional spacing. You can specify resize lines to control the areas of floorplan that will be expanded or shrunk. To set resize lines, use the `set_resize_line` command. If you do not specify resize line(s), the floorplan is resized automatically - that is, the resize lines are derived automatically based on the current floorplan and the specified resize values.

Related Commands

- create_resize_blockage
- resize_floorplan
- set_resize_line

resize_floorplan_shrink_fence

```
resize_floorplan_shrink_fence {true | false}
```

Default: `false`

Data_type: bool, read/write

Enables resized lines to go through fences and regions in floorplan. With this option enabled, during floorplan resize,the fences, regions, and guides inside the floorplan are automatically resized while maintaining their minimum size after the shrink.

Related Commands

- create_resize_blockage
- resize_floorplan

resize_floorplan_snap_to_track

```
resize_floorplan_snap_to_track {true | false}
```

Default: `false`

Data_type: bool, read/write

Snaps resize values (shrink/expand) of the floorplan to a multiple integer of the metal layer pitch. For example, if the horizontal metal pitch is 1.568 microns and you want to shrink the floorplan by 8 microns in y direction, the actual shrink value is 7.84 microns, the nearest multiple integer of the metal pitch. The x direction resize value snaps to the first vertical layer pitch and the y direction resize value snaps to the first horizontal layer pitch.

Related Commands

- create_resize_blockage
- resize_floorplan

resize_partition_to_abut

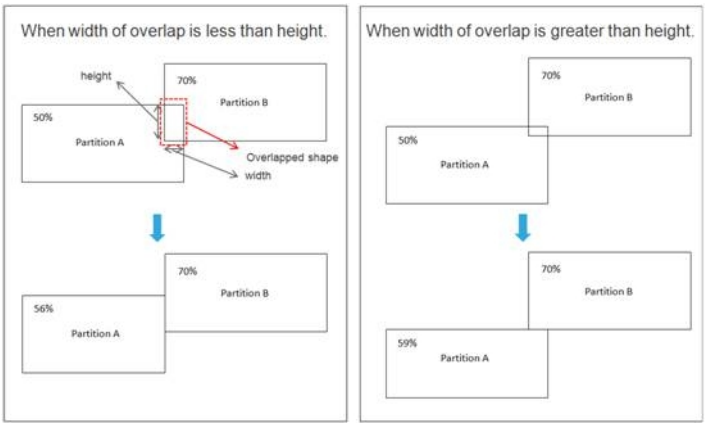
```
resize_partition_to_abut
[-help]
[-cut_to_fix_overlap]
[-honor_place_blockage blockage_name]
[-partition_to_core_gap distance]
[-partition_to_partition_gap distance]
{-hinsts hierarchical_instance_list | -selected | -all}
```

Creates an abutted floorplan from an existing floorplan by fixing gaps between:

- Partitions
- Partition and core boundary
- Partition and macro when there is no overlap between the partition and the macro

Note:

- The `resize_partition_to_abut` command honors place blockage when the blockage has no overlap with the partition. It does not honor doughnut and master/clone partitions.
- When you use the `resize_partition_to_abut` command, partitions grow. The order in which partitions grow is top edge,bottom edge,left edge,right edge. Also, some partitions shrink when the `-partiton_to_partiton_gap` option is used. The order in which partitions shrink is left edge, top edge, right edge, bottom edge.
- When there is an overlap between two partitions, if the width of the overlapped shape is less than the height, the partition with the lower TU shrinks horizontally. However, if the width of overlapped shape is bigger than the height, the partition with the lower TU shrinks vertically.

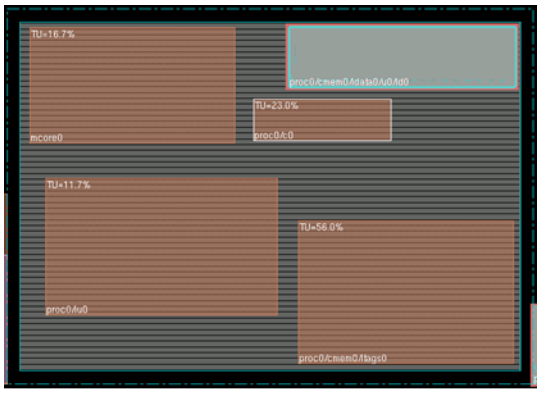


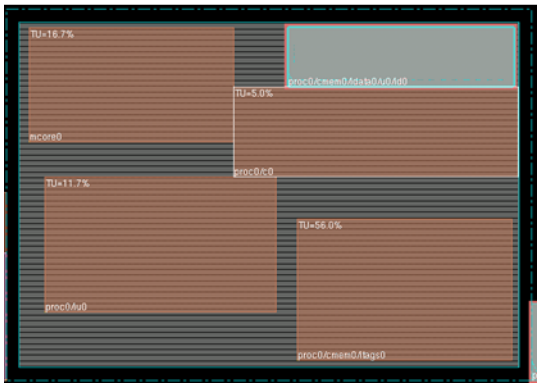
Parameters

`-help`	Outputs a brief description that includes the type and default information for each `resize_partition_to_abut` parameter. For a detailed description of the command and all of its parameters, use the man command: `man resize_partition_to_abut`
`-all`	Specifies to grow all partitions in the design. *Data_type*: bool, optional
`-cut_to_fix_overlap`	Cuts the overlapped partitions, if specified. Otherwise, the tool will shrink the partitions instead of cutting. *Data_type*: bool, optional
`-hinsts` *hierarchical_instance_list*	Specifies a list of hierarchical instances that will be modified. *Default*: All partitions in the design. *Data_type*: string, optional
`-honor_place_blockage` *blockage_name*	Specifies to fill gap upto the placement blockage boundary only. If a blockage name is specified, it honors only the specified blockage name. *Default*: Does not honor placement blockage. *Data_type*: string, optional
`-partition_to_core_gap` *distance*	Specifies the required distance (in micron) between a partition boundary and and a core boundary after growing the partition. *Default*: 0 micron *Data_type*: float, optional
`-partition_to_partition_gap` *distance*	Specifies the required distance (in micron) between the partitions after growing the partitions. *Default*: 0 micron *Data_type*: float, optional
`-selected`	Specifies to grow selected partitions. *Data_type*: bool, optional

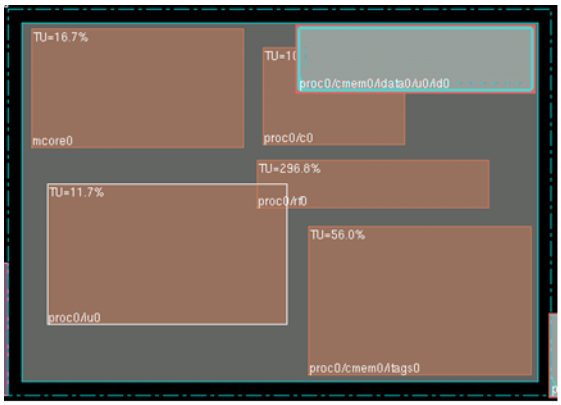
Examples

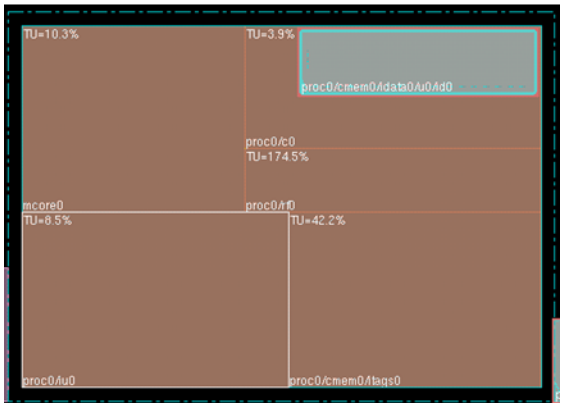
- The following command grows the selected partition
  ```
  resize_partition_to_abut -selected
  ```





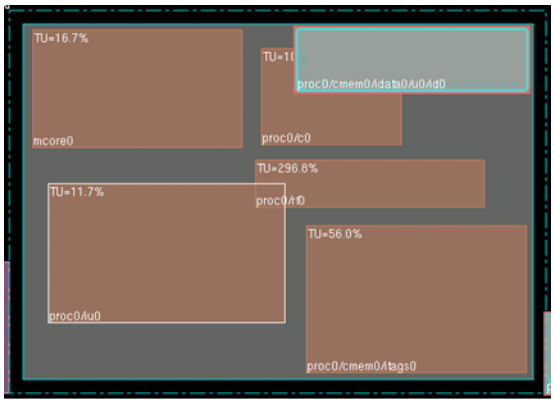
- If a partition overlaps another partition, the partition with higher target utilization keeps the original shape. The other partition shrinks to remove the overlap.
  The following command keeps the originals shape of proc0/rf0 and shrinks the other partitions to remove the overlap.
  ```
  resize_partition_to_abut -all
  ```

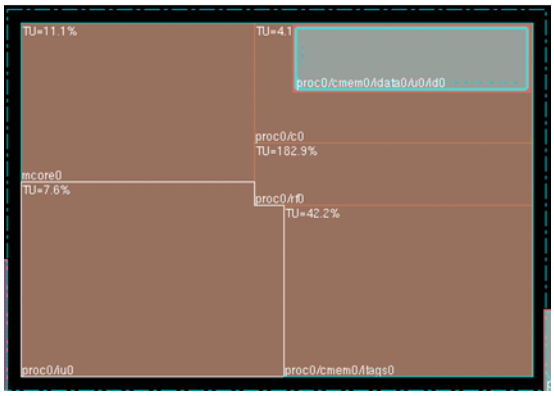




- The following command cuts the proc0/iu0 partition and keeps the original shape of the proc0/rf0 partition, which has higher utilization, to remove the overlap.

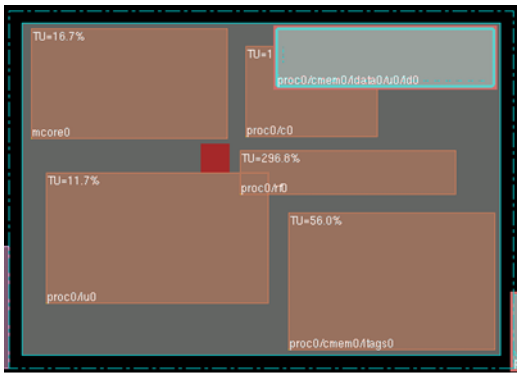
```
resize_partition_to_abut -cut_to_fix_overlap -all
```

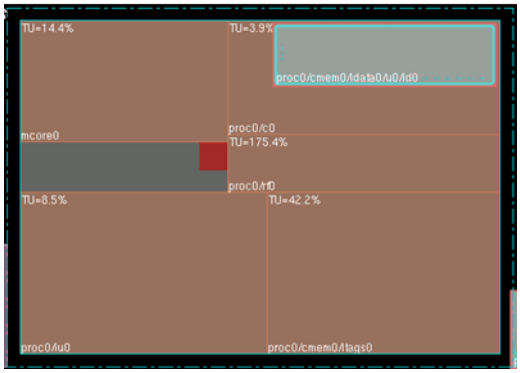




- The following command honors the place blockage which is not overlapping the partition by default.

```
resize_partition_to_abut -all -honor_place_blockage all
```





- The following command keeps the gap between two partitions, and between partitions and the core boundary after growing partition.

```
resize_partition_to_abut -partition_to_core_gap 5 -partition_to_partition_gap 5 -all -cut_to_fix_overlap
```

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

set_all_ios_to_fixed

```
set_all_ios_to_fixed
[-help]
[-pin_only | -cell_only | -area_io]
```

Changes the status of all I/O pins, I/O cells, or CLASS PAD AREAIO cells to a FIXED state to keep them from being reassigned. Use this command after importing the design.

Parameters

`-cell_only`	Changes the status of all I/O cells to a FIXED state. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `set_all_ios_to_fixed` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_all_ios_to_fixed`
`-area_io`	Changes the status of all CLASS PAD AREAIO cells to a FIXED state. *Data_type*: bool, optional
`-pin_only`	Changes the status of all I/O pins to a FIXED state. *Data_type*: bool, optional

Examples

- The following command changes the status of all I/O pins and I/O cells to a FIXED state:
  ```
  set_all_ios_to_fixed
  ```
  Note: This is the default functionality.
- The following command changes the status of all I/O pins to a FIXED state:
  ```
  set_all_ios_to_fixed -pin_only
  ```
- The following command changes the status of all I/O cells to a FIXED state:
  ```
  set_all_ios_to_fixed -cell_only
  ```
- The following command changes the status of all I/O pins, I/O cells, and all CLASS PAD AREAIO cells to a FIXED state:
  ```
  set_all_ios_to_fixed -area_io
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

set_bottom_io_pad_orient

```
set_bottom_io_pad_orient
[-help]
orient
```

Changes the orientation for the bottom pad (South side). Changing the bottom pad orientation changes the pad relationship of the East, North, and West side pads. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_bottom_io_pad_orient` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_bottom_io_pad_orient`
orient	Specifies the orientation. The possible orientation values are `r0`, `r90`, `r180`, and `r270`. *Data_type*: string, required

Example

The following command changes the orientation of the bottom I/O pad instances from r0 to r270 for the bottom pad (South side):

```
set_bottom_io_pad_orient r270
```

As a result, the respective orientation of the I/O pad instances change on the East (r270 to r180), North (r180 to r90), and West (r90 to r0) sides.

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

set_flipping

```
set_flipping
[-help]
flip_type
```

Specifies the orientation of the bottom row in the core area. The command recreates all the floorplan rows. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_flipping` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_flipping`
`flip_type`	Specifies the type of orientation. • `f`: Specifies that the first row flips from the bottom up. • `n`: Specifies no row flipping. • `s`: Specifies that the second row flips from the bottom up. **Tip:** To get the flipping value set by the `set_flipping` command, use the following: `get_db designs .row_flip` *Data_type*: string, required

Examples

- If the existing orientation of the bottom row is Mx and the second row from bottom is R0, then the following command changes the second row orientation to Mx and changes the orientation of the other rows accordingly (bottom row orientation will be R0).
  ```
  set_flipping s
  ```
- If the existing orientation of the bottom row is R0 and second row from bottom is Mx, then the following command changes the first row orientation to Mx and changes the orientation of the other rows accordingly (second from bottom row orientation will be R0):
  ```
  set_flipping f
  ```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

set_floorplan_row_spacing_and_type

```
set_floorplan_row_spacing_and_type
[-help]
spacing
type
```

Specifies the standard row spacing values and row pattern type. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_floorplan_row_spacing_and_type` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_floorplan_row_spacing_and_type`
`spacing`	Specifies the standard row spacing, in micrometers. This must be a positive value. *Default*: 0 *Data_type*: float, required
`type`	Specifies the row spacing type. Specify 1 for every row, or 2 for every other row to apply the spacing value. *Data_type*: int, required

Example

The following command specifies a row spacing value of 1.1 micrometers for every other row:

```
set_floorplan_row_spacing_and_type 1.1 2
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*
  - Standard Row Spacing

Data_type: float, required

set_inst_group_physical_hier

```
set_inst_group_physical_hier
[-help]
inst_group
```

Sets a pre-existing instance group into a physical hierarchy where you can generate a corresponding netlist. You can use this command after creating a group name.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_inst_group_physical_hier` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_inst_group_physical_hier`
`inst_group`	Specifies the name of the created group. *Data_type*: string, required

Example

The following commands create and set the instance group `adder1` as a physical hierarchy:

```
createInstGroup adder1
set_inst_group_physical_hier adder1
```

Related Information

- `create_group`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

set_instance_placement_status

```
set_instance_placement_status
[-help]
-status {unplaced | fixed | placed | cover | softfixed}
{-all_hard_macros | -all_partition_blocks |-all_black_boxes | -name instName(s)}
```

Changes the placement attributes status for all hard macros, all partition blocks, all blackboxes, or selected instances. This allows you to fix all blocks so they are not moved by `place_design`.

Parameters

`-all_hard_macros`	Applies the status option only to all hard macros. *Data_type*: bool, required
`-all_partition_blocks`	Applies the status option only to all partition blocks. *Data_type*: bool, required
`-all_black_boxes`	Applies the status option only to all blackboxes. *Data_type*: bool, required
`-help`	Outputs a brief description that includes type and default information for each `set_instance_placement_status` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_instance_placement_status`
`-name instName(s)`	Applies the status options to the specified instance(s). You can use a wildcard to specify multiple instances. *Data_type*: string, required
`-status {unplaced | fixed | placed | cover | softfixed}`	
	Specifies the change in placement status for instances. • `unplaced`: Specifies the change in placement status to be an *unplaced* status. The unplaced component does not have a location. • `fixed`: Specifies the change in placement status to a *fixed* status. The fixed component has a location and cannot be moved by automatic tools, but can be moved using interactive commands. • `placed`: Specifies the change in placement status to a *placed* status. The placed component has a location, and can be moved using automatic tools and interactive commands. • `cover`: Specifies the change in placement status to a *cover* status. The cover component has a location, but cannot be moved by automatic tools or interactive commands. • `softfixed`: Specifies the change in placement status to a *softFixed* status. The softFixed placement status means that instances cannot be moved by global placement and can only be moved by the legalization step of detail placement. Instances with this status can also be upsized by optimization. *Data_type*: enum, required

Example

The following commands set all hard macros and blackboxes to `fixed`. By setting this status, `place_design` can run without moving these fixed blocks.

```
set_instance_placement_status -all_hard_macros -status fixed
set_instance_placement_status -all_black_boxes -status fixed
```

set_io_constraints

```
set_io_constraints
[-help]
[-force_non_io_row]
[-io_order {clockwise | counterclockwise | default} | -row string]
[-spacing num | -remove_spacing]
[-end_space num | -remove_end_space]
[-first_cell_spacing float| -remove_first_cell_spacing]
[-remove_all]
```

Changes the constraints of an I/O row defined in the I/O constraint file. If you do not specify the name of the I/O row, the command modifies all the I/O rows. You can use this command to move a IO pad .

Parameters

`-end_space num`	Specifies the space, in µmeters, between the corner pad and the last I/O pad for the specified side of the row. *Default*: `0` *Data_type*: float, optional
`-first_cell_spacing float`	
	Specifies the distance, in µmeters, from the first cell to the beginning of the I/O row, based on the I/O order. *Data_type*: float, optional
`-force_non_io_row`	Forces the I/O constraints to run on a non I/O row flow. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `set_io_constraints` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_io_constraints.`
`-io_order {clockwise | counterclockwise | default}`	
	Changes the I/O placement order on all the rows. **Note:** This parameter is ignored if you specify a row name. *Default*: `default` *Data_type*: string, optional
`-remove_all`	Removes all the existing constraints on the I/O's. Evenly distributes all the I/O's in the rows. *Data_type*: bool, optional
`-remove_end_space`	Removes the end space of the row. *Data_type*: bool, optional
`-remove_first_cell_spacing`	
	Removes the spacing of the first cell. *Data_type*: bool, optional
`-remove_spacing`	Remove the spacing constraint from I/O cells on a row. *Data_type*: bool, optional
`-row string`	Specifies the name of the row to modify the I/O constraints. *Default*: 1 *Data_type*: string, optional
`-spacing num`	Specifies the global spacing, in µmeters, for all the I/O's on a row. **Note:** `set_io_constraints -io_order -spacing num` does not modify the spacing of corner I/O pads. *Default*: 0 *Data_type*: float, optional

Example

- The following command removes the spacing constraint from all I/O rows defined in the I/O constraint file:
  ```
  set_io_constraints  -remove_spacing
  ```

Related Information

  - Creating an I/O Assignment File

set_io_flow_flag

```
set_io_flow_flag
[-help]
{0 | 1}
```

Sets the flag to use I/O row flow for pad placement. To view the current flag setting, use the `get_io_flow_flag` command. You can use this command in the floorplanning stage. You can use this commands before creating I/O rows for I/O row based pad placement.

Parameters

`{0 | 1}`	Specify 1, to use the I/O row flow. Specify 0, to use the normal I/O flow. *Data_type*: int, required
`-help`	Outputs a brief description that includes type and default information for each `set_io_flow_flag` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_io_flow_flag.`

Example

- The following command enables you to start using the I/O row flow in Innovus:
  ```
  set_io_flow_flag  1
  ```

Related Information

- `create_io_row`
- `get_io_flow_flag`

set_io_row_margin

```
set_io_row_margin
[-help]
side
row
margin
```

Sets the distance from the die boundary edge to the I/O row starting edge location. You can use this command for multiple I/O rows.

Note: You can use the *Edit I/O Ring* form to specify I/O pad rings and row margins for multiple rows. Alternatively, to achieve the same using text commands, you must first use the `set_io_row_margin` command to set the distance from the die boundary edge to start of each row and then use the `place_pad_ios` command to place the I/O pads evenly between these rows.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_io_row_margin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_io_row_margin`
side	Specifies the side of the I/O row margin, where n is the North side, w is the West side, s is the South side, and e is the East side. *Data_type*: string, optional
margin	Specifies the distance between the die boundary edge to the I/O row edge, in microns. *Data_type*: float, optional

row	Specifies the I/O row number. This value can be up to 8 rows. You can also use this value in conjunction with the `place_pad_ios` and `place_peripheral_ios -opt_ios` commands to specify the number of rows for placing peripheral I/O cells for the CLASS PAD and CLASS PAD AREAIO flows respectively.
	• To create and optimize multiple I/O Rows in a CLASS PAD flow, use the following commands:
	`set_io_row_margin row`
	`place_pad_ios`
	• To create and optimize multiple I/O Rows in a CLASS PAD AREAIO flow, use the following commands:
	`set_io_row_margin rowNumber`
	`place_pad_ios -opt_ios`
	Maximum: 1000
	Minimum: 0
	Data_type: int, optional

Example

The following command sets the North side of the second I/O row starting edge value at 300 microns from the die boundary edge to the second I/O row edge:

```
set_io_row_margin n 2 300
```

Related Information

  - Edit I/O Ring

set_macro_place_constraint

```
set_macro_place_constraint
[-help]
[array_elements]
[-array array_name [-common_hier name] [-valid_group_orients {r0 mx my}] [-place_order {horizontal vertical}]]
[{-insts string | -all_macros } {-orientation string} [-common_hier name]]
[-cells string {-cell_obs string | -track_adjustment string}]
[-align_group string] [-cpg string]
[[-max_io_pin_group_keep_out {depth_value [side_value]}]
[-forbidden_space_to_core {unified_value | horizontal_value vertical_value}]
[-forbidden_space_to_macro {unified_value | horizontal_value vertical_value}]
[-min_space_to_core {unified_value | horizontal_value vertical_value}]
[-min_space_to_macro {unified_value | horizontal_value vertical_value}]
[-parallel_run_length float]
[-horizontal_stacking {max_macro_stack_length min_space_between_macro_stack max_space_between_macros}]
[-vertical_stacking {max_macro_stack_length min_space_between_macro_stack max_space_between_macros}]
[-honor_strict_spacing_constraint {true | false}]
[-avoid_abut_macro_edge_with_pins {true | false}]
[-same_length_site integer]
[-pg_resource_model {M1 value1 M2 value2 …}]
[-macro_corner_keepout {double_endcap_width double_endcap_height}]
[-halo_sharing {true | false}]]
```

Enables you to specify the constraints for placing the macros and standard cells concurrently. These constraints can be used to place macros in an array (or matrix) and define the relative placement of each macro. The whole array, treated like one macro, can be flipped or mirrored (R0, MX, MY, R180). You can use the new `set_macro_place_constraint` command to specify:

- Macro array constraints
- Group aligning constraints
- Macro-to-macro and macro-to-core boundary spacing constraints
- Macro orientation constraints
- Over macro power routing modeling
- Maximum stacking length
- Reserved space for pin routing
- I/O Pin Keep-out

Parameters

`-align_group string`	Specifies the macros that are to be aligned. *Data_type*: string, optional
`-all_macros`	Specifies that all macros should honor the constraints. *Data_type*: bool, optional
`array_elements`	Specifies the instance members information of a row or column of the array in the following format: *inst_name*:*orientation* [*spacing inst_name*:*orientation*] + **Note:** The `array_elements` should be specified with the `-array` parameter. *Data_type*: string, optional
`-array array_name`	Specifies the macro array name. *Data_type*: string, optional

`-avoid_abut_macro_edge_with_pins {true | false}`	When set to true, the `place_macro_detail` command avoids macro edge abutment even if the macro distance is within the forbidden space setting. When set to true, the `place_macro_detail` command abuts macros regardless of pins. *Default*: `true` *Data_type*: enum, optional
`-cell_obs {{Layer1_Name PowerStripeWidth SpacingBetweenStripes} {Layer2_Name ….}}`	

	Specifies the layer width and spacing to add cell obstruction on each macro to model power stripes . During the concurrent macro placement the power mesh does not exist. This parameter allows to mimic the number of routing tracks occupied by the real power mesh over the macros to make the congestion analysis more accurate during the concurrent macro placement.
	The format is:
	`cell_obs{{Layer1_Name PowerStripeWidth SpacingBetweenStripes} {Layer2_Name ….}}`
	Example:
	`set_macro_place_constraint -cells <cell_name> -cell_obs {{M5 0.24 1.251} {M8 0.64 8.409} {M9 1.2 7.49} }`
	Note: This setting is generated automatically by the `create_pg_model_for_macro_place` command. It is highly recommended to use this command to define the `-cell_obs` parameter.
	Data_type: string, optional

`-cells string`	Specifies the constraints for all instances of the specified cells. *Data_type*: string, optional
`-common_hier name`	Specifies the common logic hierarchy name for *inst_name* in *array_elements*, so the *inst_name* can be specified with short-hand format. *Data_type*: string, optional
`-cpg string`	Specifies the cpg guide of one instance. *Data_type*: string, optional
`-forbidden_space_to_core {unified_value | horizontal_value vertical_value}`	
	Specifies the value for forbidden spacing between macro to core boundary. If the space between the macro and core is smaller than this value, then the macros are abutted. Note: • If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing. • In case the `-min_space_to_core` parameter has been specified, then the value specified for the `-forbidden_space_to_core` parameter should be less than the value specified for the `-min_space_to_core` parameter. *Minimum=0* *Maximum=100000* *Data_type:* string, optional
`-forbidden_space_to_macro {unified_value | horizontal_value vertical_value}`	

	Specifies the value for forbidden spacing between a macro to macro. If the space between the macros is smaller than this value, then the macros are abutted. **Note:** • If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing. • In case the `-min_space_to_macro` parameter has been specified, then the value specified for the `-forbidden_space_to_macro` parameter should be less than the value specified for the `-min_space_to_macro` parameter. *Minimum=0* *Maximum=100000* *Data_type*: string, optional
`-halo_sharing {true | false}`	When enabled, abutted macros can share halos between them. **Note:** When the spacing between two macros is less than the forbidden-space-to-macro, the two macros are abutted. Since a single halo width instead of double width is enough to meet the physical rules, abutted macros can share halos between them using the new `-halo_sharing` parameter. **Note:** The halos of the abutted macros can overlap but macros cannot overlap with the halo of the other macro.  *Default:* `false` *Data_type*: enum, optional
`-help`	Outputs a brief description that includes the type and default information for each `set_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_macro_place_constraint`
`-honor_strict_spacing_constraint {true | false}`	
	When set to `true`, the `place_macro_detail` command strictly honors the forbidden spacing and minimum spacing constraints. When set to `false`, the `place_macro_detail` command treats forbidden spacing and min spacing setting as soft constraints to avoid large macro movements. *Default*: `false` *Data_type*: enum, optional
`-horizontal_stacking {max_macro_stack_length min_space_between_macro_stack max_space_between_macros}`	

	Specifies the maximum horizontal stack depth and the minimum horizontal spacing. • *max_macro_stack_length:* Specifies that the macro stacking length should not be more than the specified value. • *min_space_between_macro_stack:* Specifies the spacing between different macro stacks. • *max_space_between_macros:* Specifies the maximum space between macros. When the macro spacing is less than the specified value, the macros are counted in the stacking length. For example, if the max_space_between_macro value is 9 then the macros will be considered as packed if the space between the macros is between 0 and 9, however, if the real space is 10 then nothing will happened. *Data_type*: string, optional
`-insts string`	Specifies the macros on which the constraints are set. *Data_type*: string, optional
`-macro_corner_keepout {double_endcap_width double_endcap_height}`	
	Specifies the macro corner spacing constraints. It ensures that there is enough space between the macro corners for inserting the endcap cells properly. **Note:** The corner keepout area starts at the corner of the macro halo.  **Note:** The macro corner spacing constraints specified with this parameter are honored by the `place_macro_detail` and `check_macro_place_constraint` commands. However, if honoring the corner keepout constraint is difficult, corner abutting is allowed. **Note:** The tool reserves either the horizontal keepout larger than double corner cell width or vertical keepout larger than double corner cell height *Default*: {0,0} *Data_type*: string, optional

`-max_io_pin_group_keep_out {depth_value [side_value]}`	Specifies the maximum height and (optionally) side extension to automatically add macro-only blockages to IO pins.
	Note: The `-max_io_pin_group_keep_out` parameter automatically coordinates the size of the macro-only blockages based on the pin density and number for each group of IO pins.
	Note: Side value is optional. If you do not specify the side value, the `set_macro_place_constraint` command follows the default method to calculate the side (side = ¼ depth). If you specify the side value, the max IO group needs to follow the specified depth and side distance. The blockages of smaller IO groups will be derived automatically, keeping the same *depth/side* proportion (as described for the max IO group)
	Innovus supports the following formats:
	`set_macro_place_constraint -max_io_pin_group_keep_out depth_value`
	`set_macro_place_constraint -max_io_pin_group_keep_out {depth_value}`
	`set_macro_place_constraint -max_io_pin_group_keep_out {depth_value side_value}`
	Note: The depth and side values are specified in microns.
	Minimum=0
	Maximum=100000
	Data_type: string, optional

`-min_space_to_core {unified_value | horizontal_value vertical_value}`	
	Specifies the value for the minimum spacing between macro and core boundary. If the space between the macro and core is smaller than this value and larger than the forbidden space, then the macros are pushed away from the core to minimum space. **Note:** If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing. *Minimum=0* *Maximum=100000* *Default:* `0` *Data_type*: string, optional
`-min_space_to_macro {unified_value | horizontal_value vertical_value}`	

	Specifies the value for the minimum spacing between a macro to macro. If the space between the macros is less than this value, then the macros are aligned.
	Note: If only one unified value is specified, both horizontal and vertical spacings use the same value. If two values are specified, the first value is for the horizontal spacing, the second value is for the vertical spacing.
	For Example:
	• In the following command, both horizontal and vertical spacing use the same value.
	`set_macro_place_constraint -min_space_to_macro 10`
	• In the following command, the first value is for horizontal spacing, the second value is for vertical spacing.
	`set_macro_place_constraint -min_space_to_macro {10 20}`
	Minimum=0
	Maximum=100000
	Data_type: string, optional

`-orientation string`	Specifies the allowed orientation for the macros. **Note**: Specified orientation overwrites the previous definition. *Data_type*: string, optional

`-parallel_run_length` *float*	Specifies the parallel run length to enable space checking. **Note:** When the `-parallel_run_length` parameter is specified along with the `-horizontal_stacking` or `-vertical_stacking` parameters, only the macros with parallel run length >= the specified value will be counted in the stacking length. *Minimum=0* *Maximum=100000* *Data_type*: float, optional
`-pg_resource_model {`*M1 value1 M2 value2 …*`}`	
	Specifies the pg resource model for concurrent macro placement. During the concurrent macro placement the power mesh does not exist. This parameter allows you to mimic the number of routing tracks occupied by the real power mesh to make the congestion analysis more accurate during the concurrent macro placement. **Note:** This setting is generated automatically by the `create_pg_model_for_macro_place` command. It is highly recommended to use this command to define the `-pg_resource_model` parameter. *Data_type*: string, optional
`-place_order {horizontal | vertical}`	Specifies the place order in row (horizontal) or column (vertical) first for macro array. *Default*: `horizontal` *Data_type*: enum, optional
`-same_length_site` *integer*	Specifies the minimum number of sites between the vertical edge of two macros. *Minimum=0* *Maximum=100000* *Data_type*: int, optional
`-track_adjustment {{`*layer1 density1*`} {`*layer2 ….*`}}…`	Specifies the layer density to add track adjustment on each macro. For each routing layer and each macro, if the PG density over a macro is lower than the standard cell area then it increases the track resource in macro area to mimic the lower PG density. **Note:** This setting is generated automatically by the `create_pg_model_for_macro_place` command. It is highly recommended to use this command to define the `-cell_obs` parameter. *Data_type*: string, optional
`-valid_group_orients {r0 mx my}`	Specifies the valid orientations for the whole group. *Data_type*: (enum)+, optional
`-vertical_stacking {`*max_macro_stack_length min_space_between_macro_stack max_space_between_macros*`}`	
	Specifies the maximum vertical stack depth and the minimum vertical spacing. • *max_macro_stack_length:* Specifies that the macro stacking length should not be more than the specified value. • *min_space_between_macro_stack:* Specifies the spacing between different macro stacks. • *max_space_between_macros:* Specifies the maximum space between macros. When the macro spacing is less than the specified value, the macros are counted in the stacking length. For example, if the max_space_between_macro value is 9 then the macros will be considered as packed if the space between the macros is between 0 and 9, however, if the real space is 10 then nothing will happened. *Data_type*: string, optional

Example

The following command creates a macro array, ram_array, and defines it constraints.

```
set_macro_place_constraint -array ram_array {{ip1/dma/r0_irx:R0 4.66 ip1/dma/r1_irx:MY 8.0 ip1/dma/r2_irx:MY} 2.33 {ip1/dma/r3_irx:R0 4.66 ip1/dma/r_irx:MY}} -valid_group_orients {r0 my}
```

set_module_size_fixed

```
set_module_size_fixed
[-help]
-modules
```

Specifies that during floorplan resizing, the size of the specified modules and/or blackboxes should not change. Use this command before specifying the floorplan.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_module_size_fixed` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_module_size_fixed`
`-modules`	Specifies that the size of the *specified* modules and/or blackboxes should not change during floorplan resizing. Provide a space-separated list of instances. *: Specifies that the size of *all* the modules and/or blackboxes should not change during floorplan resizing. *Data_type*: list, required

Example

The following command specifies that the size of `instanceA` and `instanceB` should not change during floorplan resizing.

```
set_module_size_fixed instanceA instanceB
```

Related Information

- `reset_fixed_module_size`
- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

set_resize_line

```
set_resize_line
[-help]
-clear_all
[-direction {H|V}]
[{x y}]
[-width float]
```

Sets the resize lines for the `resize_floorplan_shift_based` attribute. The resize lines can be non-continuous though they must be orthogonal. If resize lines are specified, the floorplan will be resized between the area specified by the resize lines (for shift-based floorplan resize). To shrink or expand the floorplan in the horizontal direction, specify a vertical resize line. To shrink or expand the floorplan in the vertical direction, specify a horizontal resize line.

Each resize line can have multiple segments (for example, horizontal, vertical, and again horizontal) but it can only be applied to one direction. If you want to shrink or expand the floorplan in both directions, specify resize lines for each direction. You can create multiple resize lines. The resize lines are removed once the floorplan is resized. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_resize_line` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_resize_line.`
`-clear_all`	Clears all resize lines. *Data_type*: bool, optional
`-direction {H|V}`	Specifies whether the resize line is horizontal (H) or vertical (V). *Data_type*: string, optional
`{x y}`	Specifies the resize line point list. *Data_type*: pt list, optional
`-width float`	Specifies the width of the resize line in microns. A positive value expands the floorplan and a negative value shrinks the floorplan. *Data_type*: float, optional

Examples

- The following command sets a resize line with a width of 20 microns in the horizontal direction. As the width has a positive value, the floorplan will expand. The resize line is horizontal and will, therefore, expand the floorplan in a vertical direction.
  ```
  set_resize_line -direction H -width 20 (1924 3476) (3807 3476)
  ```
- The following command sets a resize line with a width of -20 microns in the horizontal direction. As the width has a negative value, the floorplan will shrink. The resize line is horizontal and will, therefore, shrink the floorplan in a vertical direction.
  ```
  set_resize_line -direction H -width -20 (1924 3476) (3807 3476)
  ```
- The following command sets a resize line with a width of 20 microns in the vertical direction. As the width has a positive value, the floorplan will expand. The resize line is vertical and will, therefore, expand the floorplan in a horizontal direction.
  ```
  set_resize_line -direction V -width 20 (2761 2215) (2761 3810)
  ```
- The following command sets a resize line with a width of -20 microns in the vertical direction. As the width has a negative value, the floorplan will shrink. The resize line is vertical and will, therefore, shrink the floorplan in a horizontal direction.
  ```
  set_resize_line -direction V -width -20 (2761 2215) (2761 3810)
  ```
- The following command sets a resize line with a width of -20 microns in the vertical direction. As a * has been specified for one of the coordinates, the value of that coordinate will be automatically derived.
  ```
  set_resize_line -direction V -width -20 (2761 *) (2761 3810)
  ```
- The following command creates a resize line with multiple segments.
  ```
  set_resize_line -direction V -width -20 (2643 1744) (2643 3411) (3382 3411)
  (3382 4117)
  ```

set_route_blockage_default_layer

```
set_route_blockage_default_layer
[-help]
{{[-layers layer_name | {layer_name_list} | all]
[-cut_layers layer_name | {layer_name_list} | all]
[-trim_metal_layers layer_name | {layer_name_list} | all]
[-drc_region_layers layer_name | {layer_name_list} | all]} | {-all_metal_cut }}
```

Specifies the default layers for routing blockages, for both metal layers and cut layers. The default layers set with this command are applicable for all routing blockages subsequently created using the GUI or the `create_route_blockage` command. Use this command before creating routing blockages.

Note: If any layers are specified with the `create_route_blockage` command, the layers specified with the `set_route_blockage_default_layer` command are ignored.

Parameters

`-all_metal_cut`	
	Specifies that default routing blockages will be created for all metal layers and all cut layers. *Data_type*: bool, required
`-cut_layers layer_name | {layer_name_list} | all`	
	• *layer_name:* Specifies that default routing blockages will be created for the specified cut layers. • `all:` Specifies that default routing blockages will be created for all cut layers. *Data_type*: list, optional
`-drc_region_layers layer_name | {layer_name_list} | all`	
	• *layer_name:* Specifies that default routing blockages will be created for the specified drc region layers. • `all:` Specifies that default routing blockages will be created for all drc region layers. *Data_type*: list, optional
`-help`	Outputs a brief description that includes the type and default information for each `set_route_blockage_default_layer` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_route_blockage_default_layer`
`-layers layer_name | {layer_name_list} | all`	
	• *layer_name*: Specifies that default routing blockages will be created for the specified metal layers. • `all:` Specifies that default routing blockages will be created for all metal layers. *Data_type*: list, optional
`-trim_metal_layers layer_name | {layer_name_list} | all`	
	• *layer_name*: Specifies that default routing blockages will be created for the specified trim metal layers. • `all:` Specifies that default routing blockages will be created for all trim metal layers. *Data_type*: list, optional

Example

The following command sets default routing blockages for the metal layers1, 2, and 3 and the cut layers 3 and 5.

```
set_route_blockage_default_layer -layers 1 2 3 -cut_layers 3 5
```

Related Information

- `create_route_blockage`

snap_floorplan

```
snap_floorplan
[-help]
{{-all} | {-selected} |
{[-guide][-block][-std_cell][-io_pad][-area_io][-partition_core][-pin_guide][-route_blockage][-place_blockage][-macro_pin][-pin][-
pin_blockage]}}
```

Snaps floorplan objects to the grid. You can use this command after importing the design.

Note: Innovus honors the FinFET grid and automatically checks for the FinFET definition. If it detects a FinFET definition, it enables support and sets the placement grid as FinFET grid by default. Since the height of all placeable objects must be a multiple of FinFET grid and the origin of these objects must be snapped to the FinFET grid. The snap_floorplan command is used to snap blocks, I/O pads, standard cells to the FinFET grid. It honors user specified snapping rule for x direction. For y direction, it honors the FinFET grid (when the FinFET grid is horizontal in regular horizontal row design).

Parameters

`-all`	Specifies the snapping of all supported object types. *Data_type*: bool, required
`-area_io`	Specifies the snapping of I/O cells. *Data_type*: bool, optional
`-block`	Specifies the snapping of floorplan blocks. *Data_type*: bool, optional
`-guide`	Specifies the snapping of floorplan guides, regions, and fences. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `snap_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man snap_floorplan`
`-io_pad`	Specifies the snapping of I/O pads. *Data_type*: bool, optional
`-macro_pin`	Specifies the snapping of macro pins to the correct color track. **Note:** The `snap_floorplan` command only snaps signal pins and places a macro with macro pins on color track. Innovus snaps the port on the lowest metal layer which is close to macro origin to the color track. *Data_type*: bool, optional
`-pin`	Specifies the snapping of pins. *Data_type*: bool, optional
`-pin_blockage`	Specifies the snapping of pin blockages. *Data_type*: bool, optional
`-pin_guide`	Specifies the snapping of pin guides. *Data_type*: bool, optional
`-place_blockage`	Specifies the snapping of placement blockages. *Data_type*: bool, optional
`-partition_core`	Specifies the snapping of the partition core. *Data_type*: bool, optional
`-route_blockage`	Specifies the snapping of routing blockages. *Data_type*: bool, optional
`-selected`	Specifies the snapping of all supported object types that are selected in the design display area. *Data_type*: bool, required
`-std_cell`	Specifies the snapping of standard cells. *Data_type*: bool, optional

snap_floorplan_io

```
snap_floorplan_io
[-help]
[-selected]
[-user_grid | -to_io_row [-overlap_row_only]]
```

Snaps I/O cells to a user-defined grid. Use this command after importing the design.

Note: You can specify the user-defined grid in the *Preferences - Floorplan* form in the View Menu of the Innovus GUI.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `snap_floorplan_io` parameter. For a detailed description of the command and all of its parameters, use the man command: `man snap_floorplan_io`
`-overlap_row_only`	Snaps the I/O cell only onto an overlapping I/O row. If an I/O row is not found, the command is not executed. *Data_type*: bool, optional
`-selected`	Applies to the selected I/Os only. *Default*: snaps to all I/O cells. *Data_type*: bool, optional
`-to_io_row`	Snaps the I/O cell onto an overlapping I/O row first. If an I/O row is not found, places the I/O cell in any row having the same site. *Data_type*: bool, optional
`-user_grid`	Specifies the snapping of I/O pads to user-defined grids. *Default*: snaps I/O to manufacture grid. *Data_type*: bool, optional

space_selected

```
  space_selected
[-help]
-fix_side {left | right | center | top | bottom | middle | dist_horizontal | dist_vertical}
[-honor_halo] [-space value [-is_space_lower_left_to_lower_left ] ]
```

Spaces objects (instances, modules, or blockages) horizontally or vertically by a specified distance value, and can evenly distribute the spacing horizontally or vertically between three or more objects. You can use this command after selecting two or more objects in the design display area.

Parameters

`-fix_side`	Specifies the vertical and horizontal object spacing. Choose one of the following: • `left`: Specifies that the left most object is fixed and all other objects are shifted horizontally to the right side of the fixed object, maintaining space defined in the `-space` option. • `right`: Specifies that the right most object is fixed and all other objects are shifted horizontally to the left side of the fixed object, maintaining space defined in the `-space` option. • `center`: Maintains the center point of the selected objects. It calculates the mid-point between the leftmost edge and rightmost edge of the selected objects and then spaces the blocks at the specified distance and centers them around this mid-point so that the left most edge and rightmost edge are at an equal distance from the mid-point. • `top`: Specifies that the top most object is fixed and all other objects are shifted vertically to the down side of the fixed object, maintaining space defined in the `-space` option. • `bottom`: Specifies that the bottom most object is fixed and all other objects are shifted vertically to the up side of the fixed object, maintaining space defined in the `-space` option. • `middle`: Maintains the center point of the selected objects. It calculates the mid-point between the top most edge and bottom most edge of the selected objects and then spaces the blocks at the specified distance and centers them around this mid-point so that the top most edge and bottom most edge are at an equal distance from the midpoint. • `dist_horizontal`: Specifies an even horizontal distribution. • `dist_vertical`: Specifies an even vertical distribution. *Data_type*: enum, required
`-help`	Outputs a brief description that includes the type and default information for each `space_selected` parameter. For a detailed description of the command and all of its parameters, use the man command: `man space_selected`
`-honor_halo`	Honors placement halo. With this option on, selected objects are spaced by a given value measured from the edge of the halo and not from the edge of the object. *Data_type*: bool, optional
`-is_space_lower_left_to_lower_left`	
	When specified it signifies that the spacing value denotes the distance from the Object A's lower left to Object B's lower left. By default, this parameter is false. This implies that the spacing value signifies the distance between the bounding of Object A and Object B. *Data_type*: bool, optional
`-space value`	Specifies the spacing value, in micrometers. *Data_type*: float, optional

Example

The following command fixes the bottom-most highlighted object and moves all the other objects vertically to the top, spacing the objects 5 micrometers apart from each other:

```
space_selected -fix_side bottom -space 5
```

split_rectilinear_inst

```
split_rectilinear_inst
[-help]
-inst inst_name
{{-ref_inst inst_name [-spacing_x value] [-spacing_y value]} |
{-cut_box {x1 y1 x2 y2}} | {-corner corner_name [-x value -y value]}}
[-push_out side_edge_name]
```

Cuts partition or black box boundaries to rectilinear instances that fit blocks in a given die, without modifying the existing block area. The command performs the rectilinear cut based on the following criteria that you specify:

- The name of a hierarchical instance.
- The name of a referenced instance.
- The name of corner where the cut is to be defined.
- The x and y offset values, in microns, from a specific corner or an overlapping area.
- The name of a side or edge that is to be pushed out, to maintain the existing block area.

You can use the command at any point in the design flow

Parameters

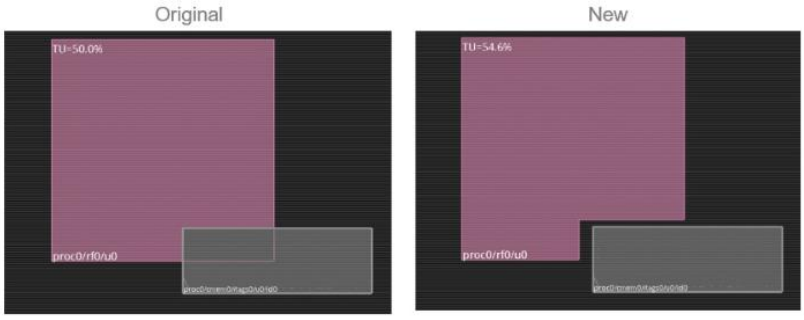
`-corner corner_name`	Specifies the name of a corner from where the cut is to be defined. This can be lx, ly, ux, uy coordinates, or edge number in case of a rectilinear corner. Edge numbers are counted clock-wise from the lower left corner starting with 0. *Data_type*: string, optional
`-cut_box {x1 y1 x2 y2}`	Specifies the rectilinear box that is to be cut. • `x1`: Specifies the lower left x coordinate of the cut area. • `y1`: Specifies the lower left y coordinate of the cut area. • `x2`: Specifies the upper right x coordinate of the cut area. • `y2`: Specifies the upper right y coordinate of the cut area. *Data_type*: rect, optional
`-help`	Outputs a brief description that includes the type and default information for each `split_rectilinear_inst` parameter. For a detailed description of the command and all of its parameters, use the man command: `man split_rectilinear_inst`
`-inst inst_name`	Specifies the name of a hierarchical instance. The instance can be a module, an uncommitted partition or a black box. *Data_type*: (inst|hinst|group)+, required
`-push_out side_edge_name`	Specifies the x offset value, in microns, from a specified corner. Corner numbers are counted clock-wise from the lower left corner starting with 0. This can be: • top • bottom • left • right • rectilinear edge number **Note**: If you do not specify a side or edge, the `split_rectilinear_inst` command will not maintain the existing area and all the sides or edges are modified by default. *Data_type*: string, optional
`-ref_inst inst_name`	Specifies the name of a reference instance. The instance can be a module, an uncommitted partition, a black box or a hard macro. *Data_type*: (inst|hinst|group)+, required

`-spacing_x value`	Specifies the x offset value, in microns, of the overlapping area between the specified block and the reference object. *Default*: 0  *Data_type*: float, optional
`-spacing_y value`	Specifies the y offset value, in microns, of the overlapping area between the specified block and the reference object. *Default*: 0 *Data_type*: float, optional
`-x value`	Specifies the x offset value, in microns, from a specified corner. Corner numbers are counted clock-wise from the lower left corner starting with 0. *Data_type*: float, optional
`-y value`	Specifies the y offset value, in microns, from a specified corner. *Data_type*: float, optional

Example

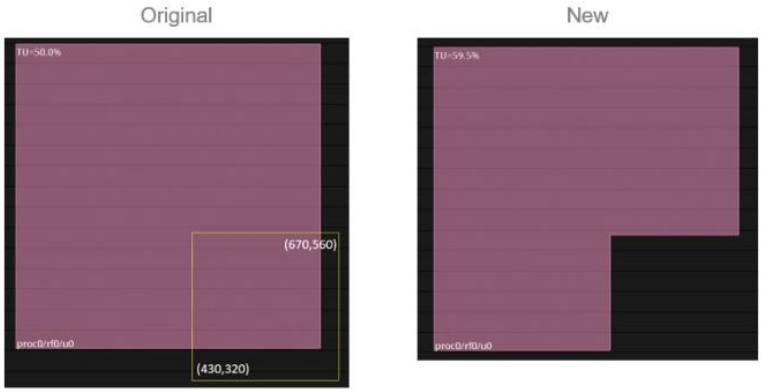
- The following command cuts away the area of proc0/rf0/u0 which overlaps proc0/cmem0/itags0/u0/id0, plus an additional 30um in the X-direction and 15um in the Y-direction resulting in the shape below:

```
split_rectilinear_inst -inst proc0/rf0/u0 -ref_inst proc0/cmem0/itags0/u0/id0 -spacing_x 30 -spacing_y 15
```



- The following command cuts away the intersection of the module and cut box resulting in the shape below:

```
split_rectilinear_inst -inst proc0/rf0/u0 -cut_box 430 320 670 560
```

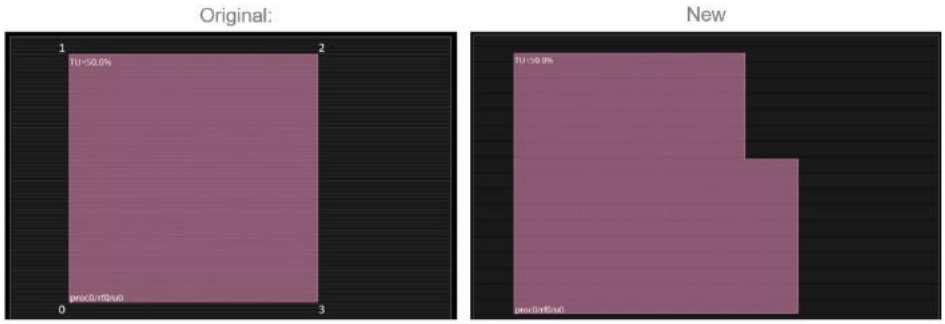


- The following command ccuts the module at corner number 2. The cut is 100um in the X-direction and 200um in the Y-direction:

```
split_rectilinear_inst -inst proc0/rf0/u0 -corner 2 -x 100 -y 200
```

- The command following cuts the module at corner number 2. The cut is 100um in the X-direction and 200um in the Y-direction. The area is maintained by pushing out the left edge (notice utilization of 50% is maintained):

```
split_rectilinear_inst -inst proc0/rf0/u0 -corner 2 -x 100 -y 200 -push_out left
```



Related Information

split_row

```
split_row
[-help]
[-area box | -row_id string | -selected | -from_io {left bottom right top}]
[-halo float| {-left_gap float| -right_gap float | -top_gap float | -bottom_gap float}]
[-site name]
[-keep_cell]
```

Cuts site rows within an area or that intersect with the selected object(s). Use this command after rows have been created. Only insts, hinsts, place blockages, route blockages, power domains, groups, or bumps can participate in row splitting.

Note: The default behavior is to cut rows that intersect with placement blockages and macros.

Parameters

`-area box`	Rows will be cut within the specified box. `box` is a tcl list containing 4 items. The items are, in order: `LLX, LLY, URX, URY.` **Note:** The `-halo` parameter cannot be applied `-area` used. *Data_type*: rect, optional
`-bottom_gap float`	Specifies the additional gap to be provided on the bottom side of the specified or selected object. *Data_type*: float, optional
`-from_io {left bottom right top}`	
	Cuts core rows the specified distance from I/O cells. `left` is the keep-away distance from IO cells on left side of die box, and so forth. *Data_type*: rect, optional
`-halo float`	Specifies additional space to be provided on the top, bottom, left, and right sides of the objects causing rows to be cut. Rows are cut to the expanded boundary. The same value is used for all sides. *Data_type*: float, optional
`-help`	Outputs a brief description that includes the type and default information for each `split_row` parameter. For a detailed description of the command and all of its parameters, use the man command: `man split_row`
`-keep_cell`	Specifies that all cells that are placed inside the cut row area will not be unplaced. *Default*: All cells inside the cut rows will be unplaced. *Data_type*: bool, optional
`-left_gap float`	Specifies the additional gap to be provided on the left side of the specified or selected object. *Data_type*: float, optional
`-right_gap float`	Specifies the additional gap to be provided on the right side of the specified or selected object. *Data_type*: float, optional
`-row_id string`	Specifies the name of an intersecting object. Rows that intersect this object are cut. Only one name may be specified. *Data_type*: bool, optional
`-selected`	Specifies that the rows that intersect with the selected object(s) will be cut. **Note:** Only supports inst, hinst, power domain, group, place blockage, route_blockage, and bump as selected object(s). *Data_type*: bool, optional
`-site name`	Rows containing site `name` will be cut. *Default*: All rows in the core box are cut. *Data_type*: string, optional
`-top_gap float`	Specifies the additional gap to be provided on the top side of the specified or selected object. *Data_type*: float, optional

Example

- The following command splits the rows containing sites of type `SITE_FE283001` in the specified area:
  ```
  split_row -site SITE_FE283001 -area 124.975 138.123 237.378 223.38
  ```
- The following command splits the rows intersecting with selected objects, with a 0.5 micron halo:
  ```
  split_row -selected -halo 0.5
  ```
- The following command splits the rows intersecting with the object named `fuu`, with additional bottom gap of 0.5 microns:
  ```
  split_row -row_id fuu -bottom_gap 0.5
  ```

stretch_rows

```
stretch_rows
[-help]
{-left | -right | -left -right}
[-to_core_edge]
```

Stretches selected rows. You can use this command after importing a design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `stretch_rows` parameter. For a detailed description of the command and all of its parameters, use the man command: `man stretch_rows`
`-left`	Specifies that the left edge of all selected rows should be aligned to the left-most edge among all selected rows. *Data_type*: bool, optional
`-right`	Specifies that the right edge of all selected rows should be aligned to the right-most edge among all selected rows. *Data_type*: bool, optional
`-to_core_edge`	Specifies that row edges should be aligned to the core boundary. *Data_type*: bool, optional

Example

The following command specifies that the left edge of all selected rows should be aligned to the left-most edge among all selected rows.

```
stretch_rows -left
```

swap_pins

```
swap_pins
[-help]
```

Switches the locations of two pins. You can use this command after selecting two pins in the same module in the design display area.

Parameters

`-help`	Outputs a brief description of the `swap_pins` command. For a detailed description of the command, use the man command: `man swap_pins`

Related Information

trace_obj_connectivity

```
trace_obj_connectivity
[-help]
[-clear_trace]
[-level level]
[-mode {netlist_based timing_based}]
[-out_file file_name]
[-insts string] | [-ports string] | [-selected ] | [-in_files file_name]
```

Traces the connections of specified macros, selected macros, or specified ports. You can also trace the connections based on netlist or timing. It supports different levels. You can also set global parameters for the `trace_obj_connectivity` by using the `trace_obj` Category Attributes. The attributes that you specify are then used automatically whenever you run the `trace_obj_connectivity` command or use the *Trace Macro* form. You can use this command after `proto_design`, `place_design`, or even after the whole design is completed.

Parameters

`-clear_trace`	Clears the existing trace result. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `trace_obj_connectivity` parameter. For a detailed description of the command and all of its parameters, use the man command: `man trace_obj_connectivity`
`-in_files file_name`	Specifies the name of the file from which saved trace macro result is loaded. *Data_type*: string, optional
`-insts string`	Specifies the macros to be traced. *Data_type*: string, optional
`-level level`	Specifies the trace level. *Maximum Level*: 10 *Minimum Level*: 1 *Default*: 1 *Data_type*: int, optional
`-mode {netlist_based timing_based}`	
	Specifies the trace mode to use: • `netlist_based`: Specifies that connection of the macro will be traced based on the netlist. • `timing_based`: Specifies that connection of the macro will be traced based on advanced timing tcl scripts command `all_fanin` and `all_fanout`. *Data_type*: enum, optional
`-out_file file_name`	Specifies the name of the file in which the trace macro results will be saved. *Default*: `<top_module_name>.tmcdb` *Data_type*: string, optional
`-ports string`	Specifies the names of the ports to be traced. *Data_type*: string, optional
`-selected`	Traces the selected macros or ports. *Data_type*: bool, optional

Example

The following command traces the connections for blk1 upto level 3:

```
trace_obj_connectivity -insts blk1 -level 3
```

Related Information

- `trace_obj` Category Attributes
- `gui_show_obj_connectivity`
- `all_fanin`

trace_obj Category Attributes

The root attributes in the `trace_obj` category are:

- trace_obj_macro_pins
- trace_obj_max_fanin_fanout
- trace_obj_register_inputs
- trace_obj_register_outputs

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `trace_obj` category, use the following command:

```
get_db -category trace_obj
```

trace_obj_macro_pins

`trace_obj_macro_pins` *list_of_pins*

Default: " "

Data_type: string, read/write

Specifies the macro pin name patterns.

Related Commands

- `trace_obj_connectivity`

trace_obj_max_fanin_fanout

`trace_obj_max_fanin_fanout` *number*

Default: 1000

Data_type: int, read/write

Specifies the maximum fanin/fanout number for a pin. While tracing the connectivity, a pin will be ignored if its fanin/fanout number is larger than the specified number.

Related Commands

- `trace_obj_connectivity`

trace_obj_register_inputs

`trace_obj_register_inputs` *list_of_pins*

Default: " "

Data_type: string, read/write

Specifies the register input pin names.

Related Commands

- `trace_obj_connectivity`

trace_obj_register_outputs

`trace_obj_register_outputs` *list_of_pins*

Default: " "

Data_type: string, read/write

Specifies the register output pin names.

Related Commands

- `trace_obj_connectivity`

unplace_obj

```
unplace_obj
[-help]
{-all  | -insts  | -blocks  | -groups  | -hinsts  | objNameList}
```

Unplaces objects. It clears the specified constraints (blocks, groups, guides, regions, and fences) from the floorplan. You can use this command after importing the design.

Parameters

`-all`	Unplaces all objects from the floorplan, including instances, blocks and groups. *Data_type*: bool, optional
`-blocks`	Unplaces all blocks from the floorplan. *Data_type*: bool, optional
`-groups`	Unplaces all the instance groups from the floorplan. This parameter will disable constraints, such as guides, fences, and regions. *Data_type*: bool, optional
`-help`	Outputs a brief description of the `unplace_obj` command. For a detailed description of the command, use the man command: `man unplace_obj`
`-hinsts`	Unplaces all the hierarchical instances from the floorplan. This parameter will disable constraints, such as guides, fences, and regions. *Data_type*: bool, optional
`-insts`	Unplaces all the standard cell instances from the floorplan. *Data_type*: bool, optional
objNameList	Specifies the object list. This can be a mixed list of instances, blocks, or groups, or their names. *Data_type*: string, optional

Examples

- The following command will unplace all the blocks.
  ```
  unplace_obj -blocks
  ```
- The following command will unplace the groups `group1` and `group2`.
  ```
  unplace_obj {group1 group2}
  ```

update_floorplan

```
update_floorplan
[-help]
[-no_snap_to_grid]
[[-core_to_left value][-core_to_bottom value][-core_to_right value][-core_to_top value] |
[-core_to_edge {left bottom right top}]]
```

Changes the distances between the core box and the die box on the sides you specified. Use this command after specifying the floorplan data or running an initial floorplan.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `update_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_floorplan`
`-core_to_bottom value`	Specifies the distance from the bottom of the core box to the bottom of the die box. *Data_type*: float, optional
`-core_to_edge {left bottom right top}`	
	Specifies the distances between the core box and die box on each side (left, bottom, right, and top). *Data_type*: rect, optional
`-core_to_left value`	Specifies the distance from the left of the core box to the left of the die box. *Data_type*: float, optional
`-core_to_right value`	Specifies the distance from the right of the core box to the right of the die box. *Data_type*: float, optional
`-core_to_top value`	Specifies the distance from the top of the core box to the top of the die box. *Data_type*: float, optional
`-no_snap_to_grid`	Specifies that the core box (or die box) boundary will not be snapped to the nearest metal pitch even if the specified die/ core box size is not an integer multiple of the smallest metal pitch. This prevents the input floorplan boxes from being changed. *Data_type*: bool, optional

Example

The following command changes the distance from the bottom of the core box to the bottom of the die box to 200:

```
update_floorplan -core_to_bottom 200
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

update_floorplan_for_macro_place

```
update_floorplan_for_macro_place
[-help]
[-init_rows]
[-keep_fixed_insts {inst1 inst2 ...}]
[-remove {all route_blockage place_blockage relative_floorplan power_domain insts_place wire boundary_constraint physical_inst drc PG_pin}]
```

Enables you to clean the floorplan before defining constraints for macros with the `set_macro_place_constraint` command.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `update_floorplan_for_macro_place` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_floorplan_for_macro_place`
`-init_rows`	Creates core rows. *Data_type*: bool, optional
`-keep_fixed_insts {inst1 inst2 ...}`	
	Keeps the specified instances in the floorplan. It sets the instances which are not unplaced. *Data_type*: string, optional
`-remove {all route_blockage place_blockage relative_floorplan power_domain insts_place wire boundary_constraint physical_inst drc PG_pin}`	
	Removes the specified objects from the floorplan. *Data_type*: (enum)+, optional

Example

- The following command initializes the core rows and deletes the placement blockages from the floorplan:

  ```
  update_floorplan_for_macro_place -init_rows -remove place_blockage
  ```

Related Information

update_floorplan_obj

```
update_floorplan_obj
[-help]
[-obj { hinst | inst| group | place_blockage | route_blockage | resize_blockage | bump | row | port | design}]
{-rects {{x1 y1} {x2 y2}...} | -polygon {{x1 y1} {x2 y2}...} | -move {x y}}
```

Updates the specified floorplan object by moving or reshaping. You can use this command after importing the design.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `update_floorplan_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_floorplan_obj`
`-move{x y}`	Moves the lower left corner of object to the specified point {x y}. *Data_type*: point, optional
`-polygon {{x1 y1} {x2 y2}...}`	Specifies the corner coordinates `{{x1 y1} {x2 y2}...}`, of the rectilinear object. The rectilinear object can take any shape depending on the number of x and y coordinates you specify. **Note:** The corner coordinates of a rectilinear object should be specified and this option only supports specifying one polygon shape. **Note:** For specifying a set of regions (disjoined) described in polygons, you must first use the `get_computed_shapes` command to get the equivalent in rects and then use the `-rects` parameter to specify the coordinates. *Data_type*: (point)+, optional
`-rects {{x1 y1} {x2 y2}...}`	Specifies one or more rects that must overlap to create one shape. The low left corner coordinate and the upper right corner coordinate of each rect should be specified. For example, `-rects {llx1 lly1 urx1 ury1 llx2 lly2 urx2 ury2 …}` **Note:** You can specify the coordinates of disjoint rects as well. *Data_type*: (rect)+, optional
`-obj { hinst | inst| group | place_blockage | route_blockage | resize_blockage | bump | row | port | design}`	
	Specifies a single pointer to the object that needs to be reshaped/moved. It must be one of the following types: • `hinst`, `group`, `place_blockage`, and `route_blockage` allow both reshape and move. • `inst`, `bump`, `row` and `port` only allow move. • `design` only allows reshape. **Note**: To get the db pointer for an object, you can select the object in GUI then use the `get_db selected` command. For example, `get_db selected` returns: `hinst:DTMF_CHIP/DTMF_INST/RAM_128x16_TEST_INST` *Data_type*: (hinst|inst|group|place_blockage|route_blockage|resize_blockage|bump|row|port|design), required

Example

- The following command gets the db pointer for the object to be updated and then updates it to the specified points:
  ```
  get_db selected
  ```
  returns: `hinst:DTMF_CHIP/DTMF_INST/RAM_128x16_TEST_INST`
  ```
  update_floorplan_obj -obj hinst:DTMF_CHIP/DTMF_INST/RAM_128x16_TEST_INST -rects {500 500 700 700}
  ```

Related Information

update_group

```
update_group
[-help]
{-name group_name {-add | -delete } -objs object_name}
```

Adds or deletes instances, hierarchical instances, or groups to/from a specified group. A group is a user-defined pseudo hierarchy and is created to contain instances, hierarchical instances and/or other groups. Use this command after creating a group using the `create_group` command.

Note:

- When you add a member to a group whose boundary constraint is a fence or a region, the size of the bounding box of the group does not change.
- If the group being added is also a power domain, a warning is displayed and the command is not executed.

Parameters

`-add`	When specified, it adds objects to the group. *Data_type*: bool, optional
`-delete`	When specified, it deletes objects to the group. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes the type and default information for each `update_group` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_group`
`-name group_name`	Specifies the name of the group to modify. *Data_type*: (group), required
`-objs object_name`	Specifies the name of the object, another group, hierarchical instance or leaf instance. **Note:** You can specify an instance names list in the { *inst_name_list* } format. The names list option is used for instances only and NOT for group or hierarchical instances. *Data_type*: (inst|hinst|group)+, required

Examples

- The following command adds hierarchical instance to group adder1:
  `update_group -name adder1 -add -objs SH28/I12/I44`
- The following command adds group subadder to group adder1:
  `update_group -name adder1 -add -objs subadder`
- The following command adds the instances inst_I1, inst_I2, and inst_I3 to group inst_group1:
  `update_group -name inst_group1 -add -objs {inst_I1 inst_I2 inst_I3}`
- The following command deletes the instances inst_I4 and inst_I5 from group inst_group1:
  `update_group -name inst_group1 -delete -objs {inst_I4 inst_I5}`

update_obj_floorplan_cut_box

```
update_obj_floorplan_cut_box
[-help]
-name name
-rects box_list
-type type
```

Specifies the rectilinear shape of floorplan objects by describing the cut out area. The floorplan objects include block top cell, module constraint (guide, region, fence), layershape, pin, net, group, and instance. The command creates a rectilinear cut box for an object. A rectilinear object is comprised of two or more boxes. To use this command, divide the required cut out area into one or more bounding boxes and specify the coordinates of each bounding box in the command. Once you run the command, the rectilinear cut area disappears from the object after a redraw. You can use the command at any point in the design flow.

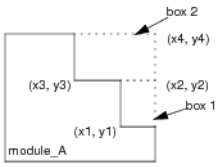
Parameters

`-help`	Outputs a brief description that includes the type and default information for each `update_obj_floorplan_cut_box` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_obj_floorplan_cut_box`
`-name name`	Specifies the name of the object for type. *Data_type*: string, required
`-rects box_list`	Specifies the rectilinear shape of an object. The box list must be specified in the following format: `{{x1 y1 x2 y2} ....}` *Data_type*: list, required
`-type type`	Specifies the type of object for name. This can be: • `Cell` • `Group` • `Instance` • `Layershape` • `Module` • `Net` • `Pin` *Data_type*: string, required

Example

The following example defines the rectilinear shape of the module module_A by specifying 2 rectilinear cut boxes defined by coordinates (x1, y1), (x2, y2), (x3, y3), and (x4, y4).

```
update_obj_floorplan_cut_box -name module_A -type Module -rects {{x1 y1 x2 y2} {x3 y3 x4 y4}}
```



Related Information

update_origin

```
update_origin
[-help]
{-center | -lower_left | -location x y | -delta x y}
```

Moves the entire design to a new location. All objects that are recorded in DEF are moved to a new location. No change is made to the other attributes of objects except the location. All properties and characters such as orientation and placement status remain the same after the move.

Parameters

`-center`	Moves the origin point of the entire design to the center point of the current floorplan box. Example: `update_origin -center` Before:  After:  *Data_type*: bool, optional

`-delta x y`	Moves the origin point of the entire design by the specified distance, *deltaX* and *deltaY.* Example: `update_origin -delta 500 500` Before:  After:  *Data_type*: point, optional
`-help`	Outputs a brief description that includes the type and default information for each `update_origin` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_origin`

`-location` *x y*	Moves the origin point of the entire design to the specified location, *x y*. Example: `update_origin -location 300 300` Before:  After:  *Data_type*: point, optional

`-lower_left`	Moves the origin point of the entire design to the lower left point of the current floorplan box. Example: update_origin `-lowerLeft` Before:  After:  *Data_type*: bool, optional

Example

The following command moves the origin point to the center point of the current floorplan box:

```
update_origin -center
```

Related Information

- Floorplanning the Design chapter in the *Innovus Stylus Common UI User Guide*

update_partition_to_stairway

```
update_partition_to_stairway
[-help]
-dx value
-dy value
[-grow_neighbor_partition_direction {x y}]
-partition partition_name
-step number_of_steps
{-corner {ll lr ul ur} | -vertex number_of_vertex}
```

Creates small stairway rectilinear edges at a specified partition corner to improve congestion.

Note: This command does not support master/clones.

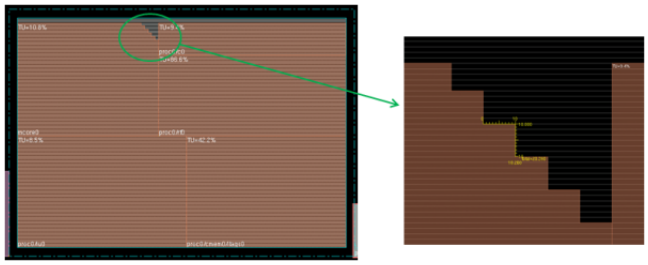
Note: The `-dx`, `-dy`, `-ptn`, `-step`, and `-corner/-vertex` options should be set by default. The partition will snap to the row automatically.

Parameters

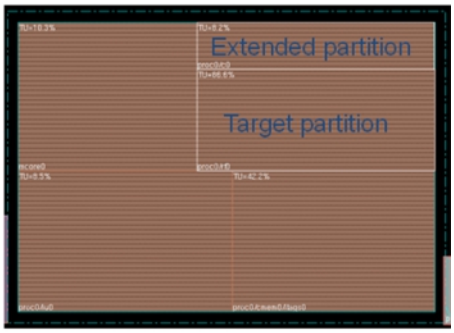
`-help`	Outputs a brief description that includes the type and default information for each `update_partition_to_stairway` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_partition_to_stairway`
`-corner {ll lr ul ur}`	Specifies partition corner where a stairway will be created. • `ul`: Upper left • `ll`: Lower left • `lr`: Lower right • `ur`: Upper right *Data_type*: enum, optional
`-dx value`	Specifies step width. *Data_type*: float, required
`-dy value`	Specifies step height. *Data_type*: float, required
`-grow_neighbor_partition_direction {x y}`	
	Specifies the direction of the target partition in which the neighbor partition will grow to fill the stairway gap between the target partition and the neighbor partition. If this option is not specified, no abutted partition will grow. *Data_type*: enum, optional
`-partition partition_name`	Specifies the name of the target partition. *Data_type*: string, required
-step *number_of_steps*	Specifies the number of steps to be created in stairway. *Data_type*: int, required
`-vertex number_of_vertex`	Specifies partition vertex where stairway will be created. Vertex starts from the lower-left corner of the partition clockwise. The first vertex is 0. A vertex can be negative, and for a negative vertex, corner numbering starts at 0 from the lower-left corner of a partition counter clockwise.  *Data_type*: int, optional

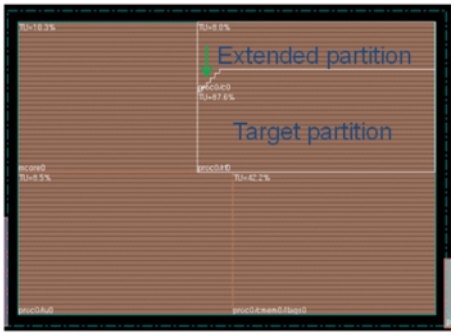
Examples

- The following command creates five-stairway rectilinear edges. The width and height of steps are 10.
  `update_partition_to_stairway -dx 10 -dy 10 -partition mcore -step 5 -corner ur`

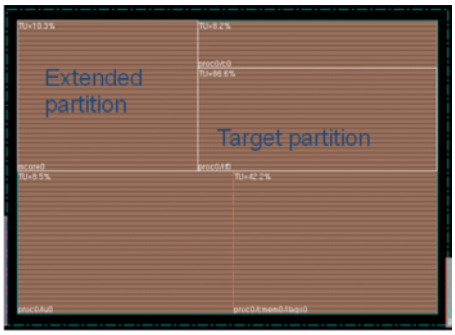


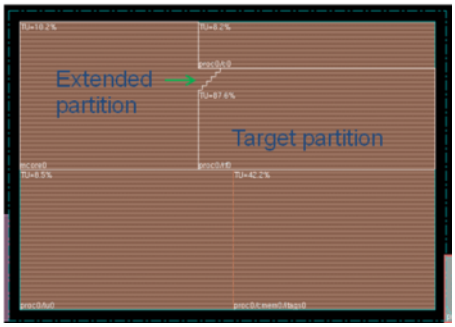
- The following command sets `-grow_neighbor_partition_direction y`, and the partition next to the target partition in the Y direction extends.
  `update_partition_to_stairway -dx 10 -dy 10 -partition regfile_iu_rftype2_abits8_dbits32_words136 -step 5 -corner ul -grow_neighbor_partition_direction y`





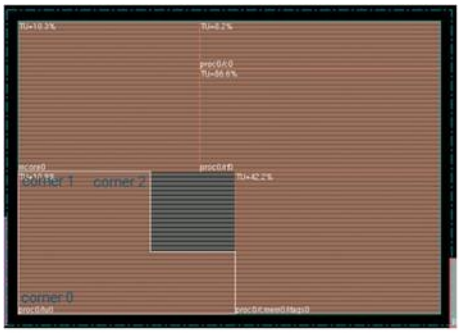
- The following command sets `-grow_neighbor_partition_direction x`, and the partition next to the target partition in the X direction extends.
  `update_partition_to_stairway -dx 10 -dy 10 -partition regfile_iu_rftype2_abits8_dbits32_words136 -step 5 -corner ul -grow_neighbor_partition_direction x`

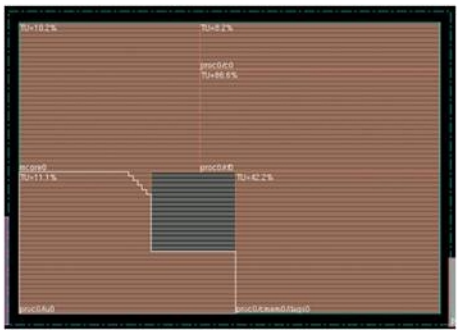




- The following command changes the vertex 2 to a stairway.

```
update_partition_to_stairway -dx 10 -dy 10 -partition iu  -step 5 -vertex 2 -grow_neighbor_partition_direction y
```





Related Information

update_route_rule

```
update_route_rule
[-help]
[-add_via {via_name1 via_name2 ...}]
[-generate_via]
[-hard_spacing {0|1}]
[-min_cut {layer1[:layer2] min_cut ...}]
-name ruleName
[-spacing {layer1[:layer2] spacing ...}]
[-use_via_cut_class {layer cut_class [nr_row nr_col] ...}]
[-via {via_name1 via_name2 ...}]
[-width {layer1[:layer2] width ...}]
```

Modifies a non-default rule created by the `create_route_rule` command, or coming in from DEF or the OpenAccess design data.

Note: Any NONDEFAULTRULE defined in LEF or the OA techfile cannot be modified by this command. You must modify the LEF or OA techfile directly if you need to change them.

This command should normally be used before any routing exists in the design. If there is any existing routing using this NDR, then the changes may cause new DRC violations. In some cases ecoRoute may be able to repair the routing (for example just changing the vias can often be repaired, and just adding new via choices should not need any repair), but in many cases you will need to reroute the entire design (e.g. when changing the width or spacing) to get good results.

If `add_route_vias_auto` attribute is set to `true`, then vias are automatically generated for the modified NDR. See the add_route_vias Category Attributes chapter for more details.

Parameters

`-help`	Prints a brief description that includes type and default information for each `update_route_rule` parameter. For a detailed description of the command and all of its parameters, use the man command: `man update_route_rule`
`-add_via {`*`via_name1 via_name2 ...`*`}`	
	Specifies a list of vias to add to the existing NDR via list. You can use this parameter to add DFM vias or other custom vias. *Data_type*: string, optional
`-generate_via`	Auto-generates vias with the generateVias command. This is intended for debugging, and not used generally as it only adds vias for the current session. If you save, and later restore the design in a new session, the added vias are not added to the NDR via list any longer. You can use this option to do experiments in the current session, or write out a LEF or DEF file to put the modified NDR into the LEF or OA techfile. **Note**: If the `add_route_vias_auto` attribute is set to `true`, then vias are always auto-generated even when `-generate_via` is not given. This is the normal usage behavior if you want to use the auto-generated vias for the rest of the flow (For example, after save, and then restoring the design in a new session.) *Data_type*: enum, optional
`-hard_spacing {0|1}`	Sets the non-default rule as HARDSPACING. *Data_type*: int, optional
`-min_cut {`*`layer1`*`[:`*`layer2`*`] `*`min_cut ...`*`}`	
	Specifies the minimum cut limit for via layers. *Data_type*: string, optional
`-name `*`ruleName`*	Specifies the name of the non-default rule to be modified. *Data_type*: string, required
`-spacing {`*`layer1`*`[:`*`layer2`*`] `*`spacing ...`*`}`	
	Specifies the spacing for the routing layers. *Data_type*: string, optional
`-use_via_cut_class {`*`layer cut_class [nr_row nr_col] ...`*`}`	
	Resets the layer `cut_class` list. *Data_type*: string, optional
`-via {`*`via_name1 via_name2 ...`*`}`	
	Resets the via list to empty, and then adds the list of named vias to the NDR via list. *Data_type*: string, optional
`-width {`*`layer1`*`[:`*`layer2`*`] `*`width ...`*`}`	
	Specifies the width for the routing layers. *Data_type*: string, optional

Example

- The following command creates a rule that requires double width and double spacing. All other values are the same as the default rule. add_ndr is like update_route_rule for via generation. If the `add_route_vias_auto` attribute is set to `true`, then vias are automatically generated that match the different layer widths. If not, the vias from the default rule are used, which is not correct for wires that are twice the default width.
  add_ndr -name NDR_2w2s -spacing {metal1:metal4 0.2 metal5:metal6 0.4 metal7 0.6} -width {metal1:metal4 0.2 metal5:metal6 0.4 metal7 0.6}

- The following command modifies the width and spacing values in non-default rule NDR_2w2s created by the command. above. If the `add_route_vias_auto` attribute is set to `true`, vias are automatically generated with matching widths and added to the NDR via-list. If not, then the original vias are not changed, which can be wrong for different widths.
  update_route_rule -name NDR_2w2s -spacing {metal1:metal4 0.4 metal5:metal6 0.8 metal7 0.9} -width {metal1:metal4 0.4 metal5:metal6 0.8 metal7 0.9}
- The following command auto-generates vias for rule NDR_2w2s with the generateVias command to get vias that match the wider wire widths, even if `add_route_vias_auto` attribute is set to false. This is only useful for debugging in the current session, or to write a LEF file with the NDR to add back into the LEF or OA techfile. If you want to use the auto-generated vias for the rest of the flow, you should set `add_route_vias_auto` attribute to `true`.
  update_route_rule -name NDR_2w2s -generate_vias
- The following command modifies existing rule NDR_2w2s to specify MINCUTS to 2 for the Vx layers (via1 to via3).
  update_route_rule -name NDR_2w2s -min_cut {via1:via3 2}

write_floorplan

```
write_floorplan
file
[-help]
[-no_name]
[-sections {macro | pin | bndry | special_route | pin_constraint}]
[-xml]
```

Saves the floorplan information to a file. The command saves all the floorplan blocks that are placed/fixed/covered, in the floorplan file. When you save a floorplan, the Innovus software saves all objects which can be saved and any specific properties which are affected if the data is saved. By default, the floorplan information is saved as a Version 8 floorplan file. After you save a floorplan, the Innovus software creates the following files:

- A general floorplanning file with the extension .fp
- A power route data file with the extension .fp.spr
  Note: If there is an entry in the IO Cell Libraries field in the Design Import form, a third file is created with the extension `.fp.areaio`.

Note:

- The `write_floorplan` command honors the blackbox min/max aspect ratio information in the floorplan information file.
- The `write_floorplan` command saves net attributes including non-default attributes of a net, like weight, bottomPreferredRoutingLayer, or detour. You can use this command after importing the design.
- The `write_floorplan` command saves the user-specified seed information by default.
- The `write_floorplan` command saves the information related to blockages, tracks, and pin shapes into the *.fp file.
- The `write_floorplan` command saves feedthrou-bumps into the .fp.areaio file. The format is as below:
  `Bump: [BumpName] [BumpCellName] [x coord] [y coord] [BumpPin_1] [PinName_1] [BumpPin_2] [PinName_2]`

Parameters

file	Specifies the name of floorplan file to be saved. *Data_type*: string, required
-help	Outputs a brief description that includes type and default information for each `write_floorplan` parameter. For a detailed description of the command and all of its parameters, use the man command: `man write_floorplan`.
-no_name	Specifies that floorplan object names are not output to the floorplan file when you save the floorplan. *Data_type*: bool, optional
-sections {macro | pin | bndry | special_route | pin_constraint}	
	Specifies the objects section in the floorplan file that will be updated. The sections can be: • `macro` • `pin` • `bndry` • `special_route` • `pin_constraint` **Note:** The `write_floorplan` command supports routing blockages on master slice layers. *Data_type*: string, optional
-xml	Saves the floorplan information in the XML format floorplan file. *Data_type*: bool, optional

Example

The following command writes the current floorplan information to the file `myFloorPlan.fp`:

```
write_floorplan myFloorPlan.fp
```

Related Information

- `create_floorplan`
- `check_floorplan`
- `floorplan` Category Attributes
- `read_floorplan`
- `write_floorplan_script`
- The following section in the Floorplanning the Design chapter of the *Innovus Stylus Common UI User Guide*
  - Saving and Loading Floorplan Data

write_floorplan_script

```
write_floorplan_script
[-help]
out_file
[-append_to_file]
[-compact_row]
[-no_snap_to_grid]
[-selected | -sections {boundary row place_blockages route_blockages pin_blockages groups constraints pins iopad areaio bump partitions
blocks global_net_connect bus_sink_groups black_boxes net_group_and_bus_guide relative_fplan pin_groups pin_guides custom_shape cover_cell}]
```

Allows you to write out the specified floorplan sections and source the output file after `init_design`. With this command the tool would write a file that you can examine, edit, and then source to selectively (or completely) define your floorplan. You can specify the floorplan section to write out. The `write_floorplan_script` command writes out a file with Tcl commands to recreate the floorplan. It can optionally write out specific floorplan sections listed with option -sections. The file includes commands to delete any existing data for each section if any exists.

Note: Unlike `write_floorplan`, the `write_floorplan_script` command does not include special-routing like P/G routing. You should use `write_def_by_section -special_net_routing` for that purpose.

Note: The `create_bus_guide -type {hard | soft}` command supports soft/hard constraints to guide Innovus routers. With the hard constraint type, after running Early Global Route (eGR), NanoRoute (NR), or NanoRoute High Frequency Router (NRHF), the route obeys the path of the bus guide but with soft constraints the bus guide only guides the route path. The tool can route the net out of the bus guide. The `write_floorplan_script` command writes out these constraints types to the output file.

Parameters

`-append_to_file`	Appends new data to the file, by default it will write out to the file specified by out_file. *Data_type*: bool, optional
`-compact_row`	When specified, it enables the `write_floorplan_script` command to write out the row-creation commands in a simple and compact way. *Data_type*: bool, optional
out_file	Writes the floorplan Tcl commands to the specified file. *Data_type*: string, required
`-help`	Outputs a brief description that includes the type and default information for each `write_floorplan_script` parameter. For a detailed description of the command and all of its parameters, use the man command: `man write_floorplan_script`
`-no_snap_to_grid`	Specifies that the object should not be snapped to the specified grid and keep the location of object the same before and after loading the dumped script. *Data_type*: bool, optional
`-sections {boundary row place_blockages route_blockages pin_blockages groups constraints pins iopad areaio bump partitions blocks global_net_connect bus_sink_groups black_boxes net_group_and_bus_guide relative_fplan pin_groups pin_guides custom_shape cover_cell}`	

	Specifies one or more specific floorplan sections to write out to the file. • `areaio`: Writes out areaio information. • `black_boxes`: Writes out location, shape, and orientation of black box instances. • `blocks`: Writes out placement and orientation of all blocks. • `boundary`: Writes out the floorplan boundary, including the boundary to IO and core box spacing, and the global row parameters required by the `floorPlan` command to regenerate the rows automatically. **Note**:The `floorPlan` command will auto-generate the rows also, unless "rows" is included with `-sections` to override them with the current rows. • `bump`: Write out all the bumps. • `bus_sink_groups`: Writes bus sink group information. • `constraints`: Writes out any region, fence, and guide constraints for groups or hinsts. • `cover_cell`: Writes out cover cell information. • `custom_shape`: Writes out custom shape information. • `global_net_connect`: Writes out all the global net connections. • `groups`: Writes out any group definitions (group names and list of instances). It also writes out the groups belonging to power domains. • `iopad`: Writes out all the IO pads. • `net_group_and_bus_guide`: Writes out all the net groups and bus guides. • `partitions`: Writes out all the partitions. • `pin_blockages`: Writes out all the pin blockages. • `pin_groups`: Writes out all the pin groups. • `pin_guides`: Writes out all the pin guides. • `pins`: Writes out all the external IO pins. • `place_blockages`: Writes out placement/density blockages. • `relative_fplan`: Writes out relative floorplan constraints and all the placement relationship of floorplan objects independently from the actual coordinates in a floorplan. **Note**: You can use `write_floorplan_script -sections relative_fplan` to save relative floorplan info. • `route_blockages`: Writes out routing blockages. • `row`: Writes out all the core and IO rows. *Data_type*: (enum)+, optional
`-selected`	Specifies the floorplan object to write out. **Note:** The tool does not support to write out standard cells. *Data_type*: bool, optional

Example

- The following command writes out the user specified (row) section to the `write_floorplan_script.tcl` file.

```
write_floorplan_script -sections {row} out_file write_floorplan_script.tcl
```

In write_floorplan_script.tcl, something like the following will be written out:

```
# Standard Cell Row
delete_row -all
set_db current_design .row_spacing_type 2
set_db current_design .row_spacing 0
create_row -site tsm3site -area 335.280 335.440 1119.360 340.483 -flip_first_row -no_check
create_row -site tsm3site -area 335.280 340.483 1119.360 345.526 -no_check
create_row -site tsm3site -area 335.280 345.526 1119.360 350.569 -flip_first_row -no_check
create_row -site tsm3site -area 335.280 350.569 1119.360 355.612 -no_check
```

- The following command by default writes out all the sections to the `write_floorplan_script.tcl` file

  ```
  write_floorplan_script out_file write_floorplan_script.tcl
  ```

  In `write_floorplan_script.tcl`, something like the following will be written out:

  ```
  # floorplan boundary
  set ret [catch {create_floorplan -no_resize -no_snap_to_grid -box_size 0.000 0.000 1454.740 1447.062
  235.000 235.000 1219.740 1212.062 335.280 335.440 1119.740 1112.062}]
  if {$ret != 0} {
  create_floorplan -no_snap_to_grid -box_size 0.000 0.000 1454.740 1447.062 235.000 235.000 1219.740
  1212.062 335.280 335.440 1119.740 1112.062}
  # Standard Cell Row
  delete_row -all
  set_db current_design .row_spacing_type 2
  set_db current_design .row_spacing 0
  create_row -site tsm3site -area 335.280 335.440 1119.360 340.483 -flip_first_row -no_check
  create_row -site tsm3site -area 335.280 340.483 1119.360 345.526 -no_check
  create_row -site tsm3site -area 335.280 345.526 1119.360 350.569 -flip_first_row -no_check
  create_row -site tsm3site -area 335.280 350.569 1119.360 355.612 -no_check
  # netGroupAndBusGuide
  # Global Net Connection
  delete_global_net_connections
  commit_global_net_rules
  # partition
  # Placement obstruction
  delete_obj [get_db place_blockages -if { .name == *** | .type == *** } ]
  # Routing obstruction
  delete_route_blockages -all
  # Pin blockage
  delete_route_blockages -all
  # Instance group
  # Hierarchical Instance's constraint(Fence, Region or Guide)
  # Pin
  # IO pad
  set inst [get_db insts IOPADS_INST/Pibiasip]
  set_db $inst  .location 0 548.16
  set_db $inst  .orient  R270
  set_db $inst  .place_status placedset_db [get_db insts IOPADS_INST/Pibiasip ] .place_status fixed
  # Area IO
  # Bump
  ```

- The following command writes out the user specified (custom_shape) section to the `write_floorplan_script.tcl` file

  ```
  write_floorplan_script -sections {custom_shape} out_file write_floorplan_script.tcl
  ```

  In `write_floorplan_script.tcl`, something like the following will be written out:

  ```
  # custom shapes
  delete_gui_object -shape
  add_gui_shape -layer <layer>  -line {x1 y1 x2 y2}
  add_gui_shape -layer <layer>  -polygon {x1 y1 x2 y2 …}
  ```

Related Information

- `write_floorplan`

write_io_file

```
write_io_file
[-help]
[-version_2]
[-locations | -by_order]
[-include_cell_name]
[-only_selected_bump]
[-template [-io_order {default | clockwise | counterclockwise}]]
[-relative_orient]
out_file
```

Saves the current I/O information to a Version: 3 file by default. It also provides you the option to save the I/O information in a Version: 2 file for 6.2 and previous release of the software. The saved file can be used to specify the I/O Assignment File in the Design Import form. This is used to save the I/O pin or pad order to a file after assigning pins or pads by loading a floorplan file or DEF data. This I/O Assignment file is rule-based, and the keyword in the I/O file is Version: 3. You can use this command after floorplanning the design.

Note: The `write_io_file` command saves the bump connect target information in the I/O file by default.

Note: The `write_io_file` command will write all the information of I/O pins and I/O pads if the design has both IO pins and IO pads.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `write_io_file` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man write_io_file`
`-by_order`	Specifies the order of the I/O pad placement locations in the I/O file. *Data_type*: bool, optional
`-include_cell_name`	Specifies that the cell name of the I/O instance must be included in the I/O file. *Data_type*: bool, optional
`-io_order {default | clockwise | counterclockwise}`	
	Specifies the order of placing the I/O pins in the I/O template file. You can choose one of the following: • `default`: Specifies the default pin order. For a vertical edge, the default pin order is from the bottom to the top. For a horizontal edge, the default pin order is from the left of the right. • `clockwise`: Specifies the pin order in the clockwise direction. • `counterclockwise`: Specifies the pin order in the clockwise direction. **Note:** For I/O cells, the write_io_file command will write out only the default I/O order. *Data_type*: string, optional
out_file	Specifies the name of the pin order file to be written to. *Data_type*: string, required
`-locations`	Generates an I/O file that has placement locations rather than a sequence or order of the I/O pads. Placement co-ordinates are relative to the design boundary and are not absolute locations. *Default:* If you do not specify this parameter, it generates an order file. *Data_type*: bool, optional
`-only_selected_bump`	Saves only the selected bumps to the IO file. By default, `write_io_file` dumps out embedded bumps to the IO file. When the `-only_selected_bump` option is specified, only selected bumps are dumped out and embedded bumps are ignored. *Data_type*: bool, optional
`-relative_orient`	Specifies an I/O orientation relative to the bottom (south) side. *Data_type*: bool, optional
`-template`	Performs initial I/O placement by randomly distributing the I/Os evenly. Writes out an I/O template file with evenly spaced I/O pins, after design import. Once the I/O template file is generated, you can modify the I/O file manually and reload the file in Innovus. *Data_type*: bool, optional
`-version_2`	Saves the current I/O information to a Version: 2 file for 6.2 and previous release of the software. If you specify this parameter for saving an I/O file consisting of rectilinear design for I/O pads, Innovus displays an error message. This is because the rectilinear design for I/O pads is supported only in the current release version of Innovus. *Default*: If you do not specify this parameter, the I/O information is saved in a Version: 3 file. *Data_type*: bool, optional

Example

- The following command writes the current I/O pad and pin information to Version: 3 file:
  ```
  write_io_file myIoPlan.io
  ```
- The following command writes the current I/O pad and pin information to a Version: 2 file and specifies the clockwise placement of the I/O pins in the I/O template file:
  ```
  write_io_file -version_2 -io_order clockwise -templatelate myIoPlan.io
  ```

write_macro_place_constraint

```
write_macro_place_constraint
[-help]
[-cpg_scope {selected macro_only all}]
-out_file string
[-sections {array basic cpg pg_model_over_macros pg_resource_model}]
```

Enables you to write constraints into a TCL format file from the database.

Parameters

`-cpg_scope {selected macro_only all}`	
	Specifies the instances that are to be written in the CPG guide section. *Data_type*: enum, optional
`-help`	Outputs a brief description that includes the type and default information for each `write_macro_place_constraint` parameter. For a detailed description of the command and all of its parameters, use the man command: `man write_macro_place_constraint`
`-out_file string`	Specifies the name of the file to which the macro place constraints are written. *Data_type*: string, required
`-sections {array basic cpg pg_model_over_macros pg_resource_model}`	
	Specifies the constraint sections to be written. • `array`: Writes macro array constraints. • `basic`: Writes non-default macro place constraints set by the `set_macro_place_constraint` command. • `cpg`: Writes out the guide file for initializing the orientation of the instances and placing them close to the specified location. • `pg_model_over_macros`: Writes PG modeling for macros. • `pg_resource_model`: Writes PG resource modeling for standard cell areas. **Note**: This option is used to model PG over the whole design if the `-pg_model_over_macros` option is not specified. **Note:** Only the basic constraints are dumped out if the -sections option is not specified. *Data_type*: (enum)+, optional

Example

- The following command writes the basic macro place constraints to the xyz file:
  ```
  write_macro_place_constraint -cpg_score all -out_file xyz
  ```

write_route_rule

```
write_route_rule
[-help]
ndr_rule_name
{-def_file def_file_name | -lef_file lef_file_name}
```

Exports/saves the new rule that was created with the `add_ndr` command into a LEF/DEF file. You can use this command after creating a non-default rule.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `write_route_rule` parameter. For a detailed description of the command and all of its parameters, use the man command: `man write_route_rule`
ndr_rule_name	Specifies the name of a non-default rule. *Data_type*: string, required
`-def_file` *def_file_name*	
	Specifies the name of a DEF file, to which the non-default rule is exported. *Data_type*: string, required
`-lef_file` *lef_file_name*	
	Specifies the name of a LEF file, to which the non-default rule is exported. *Data_type*: string, required

Example

The following command exports the non-default rule, testndr to the LEF file, all.lef.

```
write_route_rule testndr -lef_file all.lef
```

Flowkit Commands and Attributes

- check_flow
- create_flow
- create_flow_step
- define_feature
- delete_flow_config
- edit_flow
- end_flow
- flow Category Attributes
- flowtool Category Attributes
- get_feature
- get_flow_config
- init_flow
- is_feature
- is_flow
- read_flow
- report_flow
- reset_flow
- run_flow
- schedule_flow
- set_feature
- set_flow_config
- set_flowkit_read_db_args
- set_flowkit_write_db_args
- write_flow
- write_flow_template

check_flow

```
check_flow
[-help]
[-fail string]
[-flow string]
[-from string]
[-proc string]
[-step string]
[-to string]
```

Creates a single flow_step object and fills-in the required, and some optional attributes. Further modifications of the step can be performed using the `set_db` command. If you try to define a step with the same name as an existing step, it results in error. To redefine a flow step, you must use the `set_db` command to modify the attributes, or delete and recreate it.

Note: Unlike Tcl procedures, flow steps do not take arguments and refer to attributes instead. The use of attributes requires that the data on which a step relies, is stored in the database and may be examined later.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `check_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man check_flow`
`-fail` *string*	Reports a problem. this is not used for analysis. It can only be used from Tcl called as part of static checking. Calling from outside static checking results in error. *Data_type*: string, optional
`-flow` *string*	Runs the specified flow. the `from`/`to` values are based on the flow steps. *Default:* `flow_step_order` *Data_type*: string, optional
`-from` *string*	Specifies the name of the step to start the flow from. By default, the flow starts from the first step that has not been run, or the first step if all steps have been run previously. **Note:** This must be a step in the flow. *Data_type*: string, optional
`-proc` *string*	Checks the specified procedure instead of analyzing a flow step. *Data_type*: string, optional
`-step` *string*	Runs just the specified step. This takes priority over `from`/`to` options. *Data_type*: string, optional
`-to` *string*	Specifies the name of the step to run to (inclusive; in other words, the named step is executed). By default, runs to the end of the last step in the flow. Must be a step in the flow, later than the `-from` step (if any). *Data_type*: string, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

create_flow

```
create_flow
[-help]
[steps]
-name name
[-owner string]
[-skip_metric]
[-tool tool]
[-tool_options options]
```

Creates a new, named flow object. `run_flow` then allows the execution of a named flow (in addition to its existing functionality).

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man create_flow`
`[steps]`	Specifies a list of flow step names in the order they must be executed. **Note:** This is an optional parameter. You can either provide `[steps]` or use the `-tool` parameter. *Data_type*: string, optional
`-name name`	The name of the flow object to create. *Data_type*: string, required
`-owner string`	Specifies the owner of the flow. *Data_type*: string, optional
`-skip_metric`	Restricts the tool from capturing the flow's metric snapshot. *Data_type*: bool, optional
`-tool tool`	Specifies the name of the tool with which to run this flow. This parameter allows you to create flows for other tools than the one currently running. If not specified, default is the current tool. *Data_type*: string, optional
`-tool_options options`	Specifies options for use when launching this flow. *Data_type*: string, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

create_flow_step

```
create_flow_step
[-help]
body
[-categories string]
[-check checkTcl]
[-description string]
[-exclude_time_metric]
-name name
[-owner string]
[-write_db]
[-skip_metric]
```

Creates a single `flow_step` object and fills-in the required, and some optional attributes. Further modifications of the step can be performed using the `set_db` command. If you try to define a step with the same name as an existing step, it results in error. To redefine a flow step, you must use the `set_db` command to modify the attributes, or delete and recreate it.

Note: Unlike Tcl procedures, flow steps do not take arguments and refer to attributes instead. The use of attributes requires that the data on which a step relies, is stored in the database and may be examined later.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `create_flow_step` parameter. For a detailed description of the command and all its parameters, use the man command: `man create_flow_step`
`body`	Specifies a block of Tcl that is run as the main action of the step. *Data_type*: string, required
`-categories` *`string`*	Defines the metric categories to calculate the flow step. This parameter is equivalent to `create_snapshot -categories`. It indicates the metrics system to calculate and collect extra metrics above those already collected as part of the `create_snapshot` call. The possible values of this parameter include `all`, `*`, `flow`, `design`, `setup`, `power`, `check`, `clock`, `hold`, and `route`. Specify multiple categories in a list to calculate the requested set. The `all` and `*` values are default and aliases of each other. They cause the `create_snapshot` command to get the current state of the design using `[get_db [get_db current_design] .state]` and then look in `[get_db metric_category_status_map]` to assess the metric categories, which would calculate metrics. This is so that the metric category code would not try and calculate the clock category, when the design is only floor planned (for instance). *Data_type*: string, optional
`-check` *`checkTcl`*	Specifies a block of Tcl to run step-specific static checks. *Data_type*: string, optional
`-description` *`string`*	Describes the purpose for the current flow step. *Data_type*: string, optional
`-exclude_time_metric`	Ensures that the CPU and wall time of the corresponding step is not included in any parent steps. This parameter is equivalent to executing `create_snapshot -exclude_time_metric`. It indicates that the metrics system should not consider the snapshot CPU and wall time when calculating the total steps. Use it while reporting the flows so that the time spent in it is not added to the overall flow time. *Data_type*: bool, optional
`-name` *`name`*	Specifies the name of the Tcl of the step. This can consist of alphanumeric characters and underscore only, and may not start with a digit. The following names have special meanings and may not be used for steps: • next • end *Data_type*: string, required
`-owner` *`string`*	Specifies the owner of the flow. *Data_type*: string, optional
`-skip_metric`	Skips generating metrics when the step is complete. By default, every step saves updated metrics values when completed. So this parameter alters the `run_flow` command to not create a snapshot (by running the `create_snapshot` command) for that step. *Data_type*: bool, optional
`-write_db`	Automatically saves a database when the flow step is complete. *Data_type*: bool, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

define_feature

```
define_feature
[-help]
feature
[-default string]
[-description string]
[-group string]
[-obj string]
[-possible_values string]
[-required]
[-type {bool string enum}]
```

Defines the feature for a flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `define_feature` parameter. For a detailed description of the command and all its parameters, use the man command: `man define_feature`
feature	Specifies the name of the feature. *Data_type*: string, required
`-default` *string*	Specifies the default value of the feature. *Data_type*: string, optional
`-description` *string*	Specifies the detailed description of the flow feature. If it matches multiple features, then these features are listed along with a short description for each. If it matches exactly one feature, a full description of this feature is printed. Matching no features results in an error. *Data_type*: string, optional
`-group` *string*	Outputs the exclusive group that contains features. *Data_type*: string, optional
`-obj` *string*	Specifies the flow or flow_step for a flow specific feature. The features can be limited to a flow/step, or be global and usable in all the flows/steps. *Data_type*: string, optional
`-possible_values` *string*	Specifies the list of values that are valid for the features. *Data_type*: string, optional
`-required`	Specifies that the mentioned feature is mandatory. *Data_type*: bool, optional
`-type {bool string enum}`	Specifies the type of feature value. *Data_type*: enum, optional

Related Information

Flowkit chapter of the *Stylus Common UI Migration Guide* document.

delete_flow_config

```
delete_flow_config
[-help]
key ...
```

Deletes the configuration value at the specified key, allowing the user to change the type of a `setup.yaml` key by first deleting it.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `delete_flow_config` parameter. For a detailed description of the command and all its parameters, use the man command: `man delete_flow_config`
key ...	Specifies the key to delete the configuration value. *Data_type*: string, required

Related information

- `set_flow_config`
- The Flowkit chapter of the *Stylus Common UI Migration Guide* document.

edit_flow

```
edit_flow
[-help]
[-after string]
[-append string]
[-before string]
[-enabled_feature string]
[-owner string]
[-prepend string]
[-reset]
[-unique]
```

Allows you to insert flow steps into an existing flow without redefining the flow itself. This command is very useful for flow customization.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `edit_flow` parameter.
`-after string`	Adds the specified `flow` and/or `flow_step` objects after the flow supporting a full canonical path to a flow step object. *Data_type*: string, optional
`-append string`	Appends the specified `flow` and/or `flow_step` objects before or after the flow. *Data_type*: string, optional
`-before string`	Adds the specified `flow` and/or `flow_step` objects before the flow supporting a full canonical path to a flow step object. *Data_type*: string, optional
`-enabled_feature string`	Executes the `edit_flow` command only if the specified user-defined features are enabled. *Data_type*: string, optional
`-owner string`	Specifies the owner of the flow being edited. *Data_type*: string, optional
`-prepend string`	Adds the specified `flow` and/or `flow_step` objects before or after the flow. *Data_type*: string, optional
`-reset`	Resets the customization for the specified `flow` and/or `flow_step` objects before or after the flow. *Data_type*: bool, optional
`-unique`	Prevents the addition of the flow and/or `flow_step` objects, if those are already provided. This avoids duplication of the flow defined in the YAML file and the `edit_flow` statements scripted in the `tech_flow_steps` file. **Note:** This parameter prevents the specified `flow_step` from getting added to the same flow twice, irrespective of the values provided to the `-after` or `-before` parameters. For example, if `edit_flow -append bob -unique` is called twice to insert different `flow_steps` in the floorplan flow, it will add `bob` only once. *Data_type*: bool, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

Examples

- Following is an example of customizing the reference flow process using the `flow_config.template` file:

```
create_flow_step -name write_sdf {
write_sdf [get_db flow_report_directory]/[get_db local_flow].sdf
}
edit_flow -after flow_step:innovus_report_late_timing -append flow_step:write_sdf
```

- Following is an example of inserting an additional `step_2` step after the `step_1` step:

```
set file_dir [file dirname [ dict get [ info frame [ info frame ] ] file ] ]
source ${file_dir}/scripts/run_flow.tcl
create_flow_step -name step_2 {
}
edit_flow -append step_2 -after step_1
```

- Following is an example of adding flow customization to the `flow_config.tcl` file:

```
create_flow_step -name output_files {
set design_name [get_db current_design .name]
write_netlist [get_db flow_report_directory]/${design_name}.v
write_def [get_db flow_report_directory]/${design_name}.def
}
edit_flow -append flow_step:output_files -after flow_step:block_finish
```

- The following commands will promote the `edit_flow` statements to the parent edited flow just before or after the specified anchor:

```
edit_flow -unique -after init_floorplan -append add_tracks_n7
edit_flow -unique -after init_floorplan -append add_endcaps_n7
edit_flow -unique -after init_innovus_user -append init_innovus_n7
```

end_flow

```
end_flow
[-help]
flow_or_step
```

Ends the specified flow or step. This command accepts a single string argument, which is a flow or step name. The specified string must match a flow or step in the path for the current step. Else, a Tcl error occurs. Flowkit/flowtool then skips all the contiguous steps to match the given flow or step name in the hierarchy.

Note: Calling `end_flow` outside `flow_step` or inside `run_flow` (for example, `init_flow plugin`, `flow_header_tcl` or as a plain command) will produce an error.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `end_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man end_flow`
`flow_or_step`	Specifies the flow or step to be ended and skipped. *Data_type*: string, required

Related Information

flow Category Attributes

The root attributes in the `flow` category are:

- flow_branch
- flow_caller_data
- flow_db_directory
- flow_error_errorinfo
- flow_error_message
- flow_error_write_db
- flow_exclude_time_for_init_flow
- flow_exit_when_done
- flow_feature_values
- flow_features
- flow_footer_tcl
- flow_header_tcl
- flow_hier_path
- flow_history
- flow_log_directory
- flow_log_prefix_generator
- flow_mail_on_error
- flow_mail_to
- flow_metrics_file
- flow_metrics_snapshot_parent_uuid
- flow_metrics_snapshot_uuid
- flow_overwrite_db

- flow_plugin_names
- flow_plugin_steps
- flow_post_db_overwrite
- flow_remark
- flow_report_directory
- flow_run_tag
- flow_schedule
- flow_starting_db
- flow_startup_directory
- flow_status_file
- flow_step_canonical_current
- flow_step_check_tcl
- flow_step_current
- flow_step_last
- flow_step_last_msg
- flow_step_last_status
- flow_step_next
- flow_summary_tcl
- flow_template_feature_definition
- flow_template_tools
- flow_template_type
- flow_template_version
- flow_user_templates
- flow_top
- flow_verbose
- flow_working_directory
- flow_yamllint_exec

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `flow` category, use the following command:

```
get_db -category flow
```

flow_branch

`flow_branch string`

Default: ""

Data_type: string, read/write

Specifies the branch being run for a hierarchical flow.

flow_caller_data

`flow_caller_data string`

Default: ""

Data_type: string, read/write

Specifies the data used by the caller of the tool for identifying the flow.

flow_db_directory

`flow_db_directory` *`string`*

Default: `flow.database`

Data_type: string, read/write

Specifies the flow directory where results databases are stored.

flow_error_errorinfo

`flow_error_errorinfo` *`string`*

Default: ""

Data_type: string, read/write

Specifies the TCL error stack in the error database.

flow_error_message

`flow_error_message` *`string`*

Default: ""

Data_type: string, read/write

Specifies the TCL error message in the error database.

flow_error_write_db

`flow_error_write_db {true | false}`

Default: `true`

Data_type: bool, read/write

Runs the database when an error occurs in a flow step.

flow_exclude_time_for_init_flow

`flow_exclude_time_for_init_flow {true | false}`

Default: `false`

Data_type: bool, read/write

Marks all those snapshots as `exclude_time_metric`, which were created after running the `init_flow` command. This marking adds user steps to the `init_flow` internal plugin locations.

flow_exit_when_done

`flow_exit_when_done {true | false}`

Default: `false`

Data_type: bool, read/write

Exits the flow after running the final step.

flow_feature_values

`flow_feature_values` *`string`*

Default: ""

Data_type: string, read/write

Specifies the global feature settings.

flow_features

`flow_features` *string*

Default: ""

Data_type: string, read/write

Specifies the global feature definitions.

flow_footer_tcl

`flow_footer_tcl` *string*

Default: ""

Data_type: string, read/write

Specifies the TCL script to run when a flow ends.

flow_header_tcl

`flow_header_tcl` *string*

Default: ""

Data_type: string, read/write

Specifies the TCL script to run when a flow starts.

flow_hier_path

`flow_hier_path` *string*

Default: ""

Data_type: string, read/write

Displays the path of the current flow within the flow hierarchy.

flow_history

`flow_history` *string*

Default: ""

Data_type: string, read/write

Displays the complete flow run history.

flow_log_directory

`flow_log_directory` *string*

Default: `flow.log`

Data_type: string, read/write

Specifies the flow directory where log files are stored.

flow_log_prefix_generator

`flow_log_prefix_generator` *string*

Default: `{`

```
set logPrefix ""
# Work out the subset of steps we are running
```

```
set startPath [split $start_step "."]

set endPath [split $end_step "."]
for {set i 0} {$i < [llength $startPath]} {incr i} {
if {[lindex $startPath $i]
ne [lindex $endPath $i]} {
if {$subflow_start_step && $subflow_end_step} {
set logPrefix [join [lrange
$startPath 0 [expr $i - 1]] "."]
} else {
set logPrefix $start_step
if {$i < [llength
$endPath]} {
set logPrefix "${logPrefix}-[join [lrange $endPath $i end] "."]"
}
}

break
}
}
# Add the branch name
if {$branch ne {}} {
if {$logPrefix eq {}} {
set
logPrefix $branch
} else {
set logPrefix "$branch.$logPrefix"
}
}
# Add the top-level flow
to the prefix
if {$logPrefix eq {}} {
set logPrefix [string range $flow 5 end]
} else {
set logPrefix
"[string range $flow 5 end].$logPrefix"
}
# Fall back to tool name
if {$logPrefix eq {}} {
set
logPrefix $tool
}
# Add the flow log directory
set logPrefix [file join $flow_log_directory $logPrefix]

return $logPrefix
}
```

Data_type: string, read/write

Specifies the TCL script to create log filenames in flowtool.

flow_mail_on_error

```
flow_mail_on_error {true | false}
```

Default: `false`

Data_type: bool, read/write

Sends an email to 'flow_mail_to', if an error is detected.

flow_mail_to

```
flow_mail_to string
```

Default: ""

Data_type: string, read/write

Specifies the email address where results are sent.

flow_metrics_file

`flow_metrics_file` *string*

Default: ""

Data_type: string, read/write

Specifies the flow metrics file for reporting results.

flow_metrics_snapshot_parent_uuid

`flow_metrics_snapshot_parent_uuid` *string*

Default: ""

Data_type: string, read/write

Specifies the snapshot uuid to which the results from this flow will be appended.

flow_metrics_snapshot_uuid

`flow_metrics_snapshot_uuid` *string*

Default: ""

Data_type: string, read/write

Specifies the snapshot uuid of the most recent flow step executed.

flow_overwrite_db

`flow_overwrite_db {true | false}`

Default: `false`

Data_type: bool, read/write

Enables overwriting databases while saving.

flow_plugin_names

`flow_plugin_names` *string*

Default: *list*

Data_type: string, read/write

Displays the names of all the internal plugin points.

flow_plugin_steps

`flow_plugin_steps` *string*

Default: *""*

Data_type: string, read/write

Displays the list of plugin steps that have been added through `edit_flow`.

flow_post_db_overwrite

`flow_post_db_overwrite` *string*

Default: *""*

Data_type: string, read/write

When this attribute is set within `skip_db flow_step`, you can identify the name and type of database from the current to future flows as `flow_starting_db`.

flow_remark

`flow_remark` *`string`*

Default: *`""`*

Data_type: string, read/write

Displays the remarks from the last loaded `flow.yaml` file.

flow_report_directory

`flow_report_directory` *`string`*

Default: `flow.report`

Data_type: string, read/write

Specifies the flow directory where reports are written.

flow_run_tag

`flow_run_tag` *`string`*

Default: ""

Data_type: string, read/write

Specifies the tags for the particular flow run.

flow_schedule

`flow_schedule` *`string`*

Default: ""

Data_type: string, read/write

Specifies the set of flows to execute after the current flow completes.

flow_starting_db

`flow_starting_db` *`string`*

Default: ""

Data_type: string, read/write

Specifies the starting database for the flow run.

flow_startup_directory

`flow_startup_directory` *`string`*

Default: `/home/user_id`

Data_type: string, read/write

Specifies the directory from where the software was run.

flow_status_file

`flow_status_file` *`string`*

Default: ""

Data_type: string, read/write

Specifies the file for flow status.

flow_step_canonical_current

`flow_step_canonical_current` *string*

Default: ""

Data_type: string, read/write

Specifies the currently running canonical flow step.

flow_step_check_tcl

`flow_step_check_tcl` *string*

Default: ""

Data_type: string, read/write

Specifies the procedure to check the steps.

flow_step_current

`flow_step_current` *string*

Default: ""

Data_type: string, read/write

Specifies the currently running flow step.

flow_step_last

`flow_step_last` *string*

Default: ""

Data_type: string, read/write

Specifies the last flow step to be completed.

flow_step_last_msg

`flow_step_last_msg` *string*

Default: ""

Data_type: string, read/write

Specifies the message provided for the last step that was run.

flow_step_last_status

`flow_step_last_status` *string*

Default: `not_run`

Data_type: string, read/write

Specifies the status for the last flow step run.

flow_step_next

`flow_step_next` *string*

Default: ""

Data_type: string, read/write

Specifies the next step to run in the flow.

flow_summary_tcl

`flow_summary_tcl` *string*

Default: `{puts [report_metric -format text]}`

Data_type: string, read/write

Specifies the Tcl script to run at the end of flowtool.

flow_template_feature_definition

`flow_template_feature_definition` *string*

Default: ""

Data_type: string, read/write

Features list and status for the current template.

flow_template_tools

`flow_template_tools` *string*

Default: ""

Data_type: string, read/write

Specifies the list of tools included in the flow templates being run.

flow_template_type

`flow_template_type` *string*

Default: ""

Data_type: string, read/write

Specifies the type of template being run.

flow_template_version

`flow_template_version` *string*

Default: ""

Data_type: string, read/write

Specifies the version of the template being run.

flow_user_templates

`flow_user_templates` *string*

Default: ""

Data_type: string, read/write

Specifies the flow user template definitions.

flow_top

`flow_top` *string*

Default: ""

Data_type: string, read/write

Specifies the flow to be executed by default.

flow_verbose

```
flow_verbose {true | false}
```

Default: `true`

Data_type: bool, read/write

When set to `true`, each Tcl command inside a flow script will be logged. For example, the command executed inside the flow script will be prefixed with `@flow`:

```
@flow 1: set_db design_process_node 28
```

flow_working_directory

```
flow_working_directory string
```

Default: "."

Data_type: string, read/write

Specifies the flow directory where the flow is being run.

flow_yamllint_exec

```
flow_yamllint_exec string
```

Default: `yamllint`

Data_type: string, read/write

Specifies where `yamllint` can be found to check the `yaml` syntax.

flowtool Category Attributes

The root attributes in the `flowtool` category are:

- flowtool_exit_timeout
- flowtool_extra_arguments
- flowtool_metrics_qor_html
- flowtool_metrics_qor_excel
- flowtool_metrics_qor_text
- flowtool_metrics_qor_vivid
- flowtool_predict_full_names
- flowtool_summary_tcl

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `flowtool` category, use the following command:

```
get_db -category flowtool
```

flowtool_exit_timeout

`flowtool_exit_timeout` *int*

Default: `30`

Data_type: int, read/write

Specifies the maximum time (in seconds) for which flowtool will wait to complete post exiting from the tool.

flowtool_extra_arguments

`flowtool_extra_arguments` *string*

Default: `""`

Data_type: string, read/write

Specifies the extra arguments passed to flowtool when running in the tool mode..

flowtool_metrics_qor_html

`flowtool_metrics_qor_html` *string*

Default: ""

Data_type: string, read/write

Specifies the metrics file in the HTML format to write after tool's exit.

flowtool_metrics_qor_excel

`flowtool_metrics_qor_excel` *string*

Default: ""

Data_type: string, read/write

Specifies the metrics file in the Excel format to write after tool's exit.

flowtool_metrics_qor_text

`flowtool_metrics_qor_text` *`string`*

Default: ""

Data_type: string, read/write

Specifies the metrics file in the txt format to write after tool's exit.

flowtool_metrics_qor_vivid

`flowtool_metrics_qor_vivid` *`string`*

Default: ""

Data_type: string, read/write

Specifies the metrics file to write after the tool's exit.

flowtool_predict_full_names

`flowtool_predict_full_names {true | false}`

Default: `false`

Data_type: bool, read/write

Shows the `skip_metric` flow name in prediction.

flowtool_summary_tcl

`flowtool_summary_tcl` *`string`*

Default: ""

Data_type: string, read/write

Specifies the TCL script to run during run_flow summary.

get_feature

```
get_feature
[-help]
[feature]
[-obj string]
```

Returns the feature for a flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_feature` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_feature`
`feature`	Specifies the name of the feature. *Data_type*: string, optional
`-obj` *`string`*	Specifies the `flow` or `flow_step` to be returned. *Data_type*: string, optional

Related Information

Flowkit chapter of the *Stylus Common UI Migration Guide* document.

get_flow_config

```
get_flow_config
[-help]
key ...
[-quiet]
```

Returns the feature configuration for a flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `get_flow_config` parameter. For a detailed description of the command and all its parameters, use the man command: `man get_flow_config`
`key ...`	Specifies the key to get configuration value. *Data_type*: string, required
`-quiet`	Suppresses errors in case the key does not exist. *Data_type*: bool, optional

Examples

The below example presents the specification of a flow config key and use of the `get_flow_config` command to retrieve the configuration value:

In `setup.yaml`:

```
design_name: dtmf_recvr_core
```

Use the following command to access the content from tool prompt or script:

```
innovus> get_flow_config design_name
dtmf_recvr_core
```

Some `design_yaml` values can be hierarchical in nature. To retrieve such nested values, specify the keys as a sequence, as mentioned below:

In `setup.yaml`:

```
library_sets:
fast:
library_files:
- /path/to/library/data/timing/pllclk_fast.ldb
- /path/to/library/data/timing/ram_fast.ldb
- /path/to/library/data/timing/rom_fast.ldb
```

Use the following command to access the content from tool prompt or script:

```
innovus > get_flow_config library_sets fast
/path/to/library/data /timing/pllclk_fast.ldb /path/to/library/data]/timing/ram_fast.ldb /path/to/library/data /timing/rom_fast.ldb
```

This command can also be used to set particular values based on other defined entries. This requires proper quoting in the YAML files, since the “[]” characters are native operators. See the commands below for understanding:

In `setup.yaml`:

```
lib_dir: /path/to/library/data
```

```
library_sets:
fast:
library_files:
- '[get_db lib_dir]/timing/pllclk_fast.ldb'
- '[get_db lib_dir]/timing/ram_fast.ldb'
- '[get_db lib_dir]/timing/rom_fast.ldb'
```

Use the `-quiet` parameter to check if a key exists and to prevent the following message:

```
innovus > get_flow_config my_var
Flow setup value does not exist: my_var
```

```
innovus > get_flow_config -quiet my_var
```

Related Information

Flowkit chapter of the *Stylus Common UI Migration Guide* document.

init_flow

```
init_flow
[-help]
```

The command processes flow information provided by flowtool to setup and run a provided flow sequence. It outputs the affected flow root attributes, such as:

- init_flow summary
- Flow script: /grid/tfo/vol102/tiqa/flow/demo_dtmf/scripts/run_flow.tcl
- Flow: flow:block
- From: prects.block_start
- To: prects.block_finish
- Working directory: /grid/tfo/vol102/tiqa/flow/demo_dtmf
- Starting database: /grid/tfo/vol102/tiqa/flow/demo_dtmf/dbs/block.fplan.block_finish.enc
- Run tag:
- Branch name:
- Metrics file: /grid/tfo/vol102/tiqa/flow/demo_dtmf/flow.metrics
- Status file: /grid/tfo/vol102/tiqa/flow/demo_dtmf/flow.status

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `init_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man init_flow`

Related Information:

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

is_feature

```
is_feature
[-help]
[feature_name]
[-obj string]
```

Tests if the specified flow feature is defined. The format of this command is similar to that of the `get_feature` command.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `is_feature` parameter. For a detailed description of the command and all of its parameters, use the man command: `man is_feature`
feature_name	Specifies the name of the feature to be tested. *Data_type*: string, optional
`-obj` *string*	Specifies if the `flow` or `flow_step` will be returned. *Data_type*: string, optional

Related Information:

- get_feature
- Flowkit chapter of the *Stylus Common UI Migration Guide* document.

is_flow

```
is_flow
[-help]
[-after string]
[-before string]
[-hierarchical]
[-inside string]
[-quiet]
```

Allows you to query during the execution of a flow for further action.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `is_flow` parameter.
`-after string`	Specifies the current execution after the `flow` or `flow_step` object. *Data_type*: string, optional
`-before string`	Specifies the current execution before the `flow` or `flow_step` object. *Data_type*: string, optional
`-hierarchical`	Displays all parent flows. *Data_type*: bool, optional
`-inside string`	Specifies the current execution within the `flow` object. *Data_type*: string, optional
`-quiet`	Ensures that errors are not reported for missing `flow` or `flow_step` objects. *Data_type*: bool, optional

Related Information:

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

read_flow

```
read_flow
[-help]
filename
[-no_check]
```

Loads the content for the current flow and debugs the flow in the tool. The command accepts single argument as the name of the files that describe the `flow` and `flow_step` objects, as shown below:

```
read_flow scripts/run_flow.tcl
```

```
read_flow scripts/flow.yaml
```

This command should not be used for YAML or TCL files, in general. For example, the following command should not be used, in which the `setup.yaml` file is used by the flow, but does not contain flow information:

```
read_flow scripts/setup.yaml
```

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `read_flow` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man read_flow`
`filename`	Specifies the flow script to read. *Data_type*: string, required
`-no_check`	Skips running the `yamllint` and `check_tcl` flow checks. *Data_type*: bool, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

report_flow

```
report_flow
[-help]
```

Generates a report with the following information:

- The flow type, section list and generation date of the templates
- The flow step order
- One line for every item in flow_history , indicating the success of that item and the configuration of optional flow features, and any error message

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `report_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man report_flow`

Example

```
Flow Features: low_power
   (optional): prefer_area ccopt
Flow Generated: 2013-05-14 14:40 GMT
Flow Step Order:
  init place prects cts postcts postcts_hold signoff

Step       Status     prefer_area    ccopt    Message
-------------------------------------------------------------------------------
init       success    on             off
place      success    on             off
prects     success    on             off
cts        error      on             off      "Prefer_area" doesn't allow CTS.
cts        success    off            off
```

This report indicates:

- The flow was generated with the `low_power` feature enabled, and the `prefer_area` and `ccopt` features optional.
- The init, place and prects steps were run with `prefer_area` enabled, ccopt disabled, and succeeded.
- The cts step was then run with `prefer_area` enabled, `ccopt` disabled, and it failed.
- The cts step was then run with both `prefer_area` and `ccopt` disabled, and it succeeded.

There is some overlap between `report_flow` and the summary printed at the end of `run_flow` commands. The difference is that `report_flow` reports information about the entire flow history (since the last `run_flow -reset`, if any), whereas the summary at the end of `run_flow` only includes data about the steps run by that command.

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

reset_flow

```
reset_flow
[-help]
[-all]
[-edits]
[-features]
[-flows]
[-history]
[-steps]
```

Resets the content for the current flow in the software by clearing any existing flows, steps, or features. The functionality of the `-history` parameter of this command is equivalent to `run_flow -reset`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `reset_flow` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man reset_flow`
`-all`	Resets all the flows, steps, features, edits, and history set in the software. *Data_type*: bool, optional
`-edits`	Resets all the flow edits appended through the `edit_flow` command. *Data_type*: bool, optional
`-features`	Resets all the flow features and associated values. *Data_type*: bool, optional
`-flows`	Resets all the flow objects. *Data_type*: bool, optional
`-history`	Resets the flow history and state of all the attributes (such as `flow_step_canonical_current`, `flow_history`, and `flow_top`). *Data_type*: bool, optional
`-steps`	Resets all the `flow_step` objects. *Data_type*: bool, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

run_flow

```
run_flow
[-help]
[-directory string]
[-flow string]
[-from string]
[-no_check]
[-no_summary]
[-predict {summary | tcl}]
[-reset]
[-step string]
[-to string]
[-yaml string]
```

The command runs one or more flow steps by default, in the order specified in a single flow.

If more than one flow is defined, the `run_flow` command must be run with `-flow`. However, if `-step` is used, that step does not have to be part of a flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `run_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man run_flow`
`-directory string`	Specifies the working directory in which to run the flow. If a directory is not specified, the current directory is used. **Note:** Any relative paths in attributes such as *flow_report_directory* are relative to this directory. *Data_type*: string, optional
`-flow string`	Runs the specified flow (created with the `create_flow` command). `from`/`to` options are based on the flow steps. *Default:* `flow_step_order` *Data_type*: string, optional
`-from string`	Specifies the name of the step to start from accepting a full dotted canonical path to a flow step object. By default, flow starts from the step immediately after the last successfully run step (determined by examining the value of *flow_history*), or the first step if that attribute is not set. *Data_type*: string, optional
`-no_check`	Skips the error checks prior to running. By default, the checks are run. *Data_type*: bool, optional
`-no_summary`	Skips the full summary from printing. By default, summary is printed and emailed if `flow_mail_to` is set. *Data_type*: bool, optional
`-predict {summary | tcl}`	Displays the projected future steps to run honoring the `-step`, `-flow`, `-from`, and `-to` parameters. *Data_type*: enum, optional
`-reset`	Before running, clears the flow history. After this, the flow starts from the first step if no explicit `-from` step is specified. *Data_type*: bool, optional
`-step string`	Runs just the specified step. This takes priority over `from`/`to` options. *Data_type*: string, optional
`-to string`	Specifies the name of the step to run to (inclusive; in other words, the named step is executed) accepting a full dotted canonical path to a flow step object. By default, runs to the end of the last step in the flow. Must be a step in the flow, later than the `-from` step (if any). *Data_type*: string, optional
`-yaml string`	Specifies the yaml file to source before running the flow. *Data_type*: string, optional

Examples

- The following command prints the hierarchical list of steps to be run post the specified run:

  ```
  run_flow -from cts.block_start -to cts.schedule_report_cts -predict
  ```

  Following is the output of the above command:

  ```
  Flow steps which would run
  --------------------------
  cts.block_start
  cts.init_innovus
  cts.init_innovus.extra_settings
  cts.add_clock_spec
  cts.add_clock_tree
  cts.add_tieoffs
  cts.block_finish
  cts.schedule_report_cts
  ```

- The following command prints the list of steps as DPO names to be run post the specified run:

  ```
  run_flow -from cts.block_start -to cts.schedule_report_cts -predict -tcl
  ```

  Following is the output of the above command:

  ```
  flow_step:block_start flow_step:init_innovus flow_step:extra_settings flow_step:add_clock_spec flow_step:add_clock_tree
  flow_step:add_tieoffs flow_step:block_finish flow_step:schedule_report_cts
  ```

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

schedule_flow

```
schedule_flow
[-help]
[-branch string]
[-db string]
[-defer]
[-directory string]
[-flow string]
[-include_in_metrics]
[-no_db]
[-sync | -no_sync]
```

Schedules a flow to be run after the current flow. The details of scheduled flows are stored in the `flow_schedule` attribute.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `schedule_flow` parameter. For a detailed description of the command and all its parameters, use the man command: `man schedule_flow`
`-branch string`	Specifies the branch for the new flow. *Data_type*: string, optional
`-db string`	Specifies the starting database of the flow. If not supplied, the final database of the preceding flow (the one currently running) is used. *Data_type*: string, optional
`-defer`	Prevents the scheduled flow from running, until requested. *Data_type*: bool, optional
`-directory string`	Specifies the working directory to use for the flow. By default, the current directory is used. *Data_type*: string, optional
`-flow string`	Specifies the flow to be scheduled. *Data_type*: string, optional
`-include_in_metrics`	Includes the flow in the current metric snapshot. *Data_type*: bool, optional
`-no_db`	When specified, flowtool does not use the database saved at the end of the step as the starting database for this flow. *Data_type*: bool, optional
`-no_sync`	When specified, flowtool does not wait for this flow to complete before continuing. *Data_type*: bool, optional
`-sync`	When specified, flowtool waits for all flows in the current branch to complete before starting. *Data_type*: bool, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

set_feature

```
set_feature
[-help]
[feature]
[-obj string]
-value string
```

Saves the feature for a flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_feature` parameter. For a detailed description of the command and all its parameters, use the man command: `man set_feature`
feature	Specifies the name of the feature. *Data_type*: string, optional
`-obj` *string*	Specifies the `flow` or `flow_step` to be saved. *Data_type*: string, optional
`-value` *string*	Specifies the value to set the feature. *Data_type*: string, required

Related Information

Flowkit chapter of the *Stylus Common UI Migration Guide* document.

set_flow_config

```
set_flow_config
[-help]
key
value ...
```

Saves the feature configuration for a flow.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_flow_config` parameter. For a detailed description of the command and all its parameters, use the man command: `man set_flow_config`
`key`	Specifies the key to set configuration value. *Data_type*: string, required
`value ...`	Specifies the value to set configuration value. *Data_type*: string, required

Related Information

- Flowkit chapter of the *Stylus Common UI Migration Guide* document.
- delete_flow_config

set_flowkit_read_db_args

```
set_flowkit_read_db_args
[-help]
[-dynamic_view analysis_view]
[-hold_views hold_views]
[-leakage_view analysis_view]
[-lef_files list_of_files]
[-setup_views setup_views]
[{-oa_lib_cell_view {libname cellname viewname}}] [{-no_timing}] [{-no_timing_graph}] [{-mmmc_file fileName}]
```

Controls the run-time options used by `read_db` when a flow script is loading `flow_starting_db` specified by `flowtool` or used by `schedule_db`.

Note: This command supports all the parameters supported by `read_db`.

Parameters

`-help`	Prints a brief description that includes the type and default information for each `set_flowkit_read_db_args` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man set_flowkit_read_db_args`
`-dynamic_view` *analysis_view*	Specifies the analysis view for the dynamic power analysis. *Data_type*: string, optional
`-hold_views` *hold_views*	Specifies the hold views for loading rather than the active hold views. *Data_type*: string, optional
`-leakage_view` *analysis_view*	Specifies the analysis view for the leakage power analysis. *Data_type*:
`-lef_files` *list_of_files*	Specifies the list of LEF files for loading. Use this option if you want to override the existing LEF files in the design being restored and load different LEF files instead. • This option is intended to allow upgrading to new versions of LEF files that are compatible with the old versions. The list of all LEF files used by this design must be provided. • If any pin locations, cell boundaries, or OBS shapes are changed for used cells, new DRC violations may occur. • If pins are added or removed from used cells, or used cells are removed, fatal errors may occur while loading the netlist. • If the removed pins and cells are unused in the design, warnings or errors may still occur, if any library-specific data was stored for those cells or pins during the design flow (such as `dont_touch` data). *Data_type*: string, optional
`-mmmc_file` *fileName*	Specifies the path name to a Multi-Mode/Multi-Corner (MMMC) configuration file (for example, the same file format used by `read_mmmc`) to replace the MMMC file saved by `write_db` (and all the corresponding .lib files, .sdc files, etc. referenced by the MMMC file). *Data_type*: string, optional

`-no_timing`	Skips reading of the MMMC file, timing libraries and timing constraints. **Note:** • Most designs that use LEF rely on the .lib information to define the bus order for MACROs that have bus bit terminals. Therefore, using the -`no_timing` parameter can result in the connectivity to bus ports of leaf level instances being reversed. When `.lib` information is not available, the default is for bus ports to be treated as descending (for example, [7:0]). While using Verilog modules or OpenAccess abstract views to define the bus order, the connectivity will still be correct even when `-no_timing` is specified. • Timing libraries cannot be loaded in the same session after a design is read using the `-no_timing` option. You must use the `set_flowkit_read_db_args` command without the `-no_timing` parameter in a new session to load the design with timing libraries and constraints. • If you save a design after `set_flowkit_read_db_args -no_timing`, it will not save timing information unless you use `set_flowkit_write_db_args -add_ignored_timing`. *Data_type*: bool, optional
`-no_timing_graph`	Skips reading the timing graph even if it was saved to the disk by `set_flowkit_write_db_args`. *Data_type*: bool, optional
`-oa_lib_cell_view {`*`libname cellname viewname`*`}`	Specifies the library name, cell name, and view name for reading an OpenAccess DB design. *Data_type*: string, optional
`-setup_views` *`setup_views`*	Specifies the setup views for loading rather than the setup views active during `set_flowkit_write_db_args`. *Data_type*: string, optional

Related Information

- Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.
- read_db

set_flowkit_write_db_args

```
set_flowkit_write_db_args
[-help]
[-add_ignored_timing]
[-def]
[-lib]
[-no_constraint]
[-no_fill]
[-no_pvs_fill]
[-no_wait string]
[-sdc]
[-user_path]
[-verilog]
[{-rc_extract}] [{-timing_graph}] [{-oa_lib_cell_view string}] [{-oa_view string}] [{-lib_to_ldb}]
```

Allows you to save databases through flowkit in the Open Access format and specify the library/cell/view information. The `set_flowkit_write_db_args` command can be used to extend the options used to save a design on flow-steps, which are marked with `skip_db false`. This command needs to be placed inside the `flowstep body_tcl` of interest since it only affects that `flowstep` and resets back to default state when that step completes. The format of this command is similar to what would be used for `write_design`:

```
create_flow_step -name save {set_flowkit_write_db_args -rc -lib2ldb}
```

This saves a database named `save`, which uses the `-rc` and `-lib2ldb` options for `write_db`. Previous and subsequent flowsteps use default `write_design` options unless overridden using the `set_flowkit_write_db_args` command.

Note: This command supports all the parameters supported by `write_db`.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `set_flowkit_write_db_args` parameter.

`-add_ignored_timing`	Copies the old timing data when loaded in physical-only mode. If you use `set_flowkit_read_db_args -no_timing` to read the DB, the timing data is not loaded. This option allows you to copy the ignored timing data from the original `read_db` location and add it back during `set_flowkit_write_db_args` like this:
	`set_flowkit_read_db_args -no_timing test1`
	`<physical editing commands ...>`
	`set_flowkit_write_db_args -add_ignored_timing test2`
	This usage model is intended to allow faster physical-only editing, like DRC fixing, where the netlist is not modified. If you change the netlist, unpredictable results may occur when reading the `test2` DB using timing data copied from `test1`.
	Data_type: bool, optional

`-def`	Saves a DEF file, in addition to the normal DB files in the DB directory. This parameter is normally not used for flat or block flows and is not used by `set_flowkit_read_db_args`. It can be useful in a hierarchical flow, where you want to use `assemble_design` to read only the netlist and the DEF files without opening up each design DB and writing out the Verilog and DEF files separately (see `-verilog`). *Data_type*: bool, optional
`-lib`	Resolves symbolic links of the timing lib files and side files. Normally external file references, such as to the LEF, .lib, SDC, files are saved using full path-name, symbolic links to the original files inside a libs sub-directory inside the DB directory. This parameter forces copies of the files rather than symbolic links in the libs sub-directory so there are no external file references. That makes the DB directory much larger, and makes it suitable for sending to a different network where the library and external data files are not available. An OA DB will still have OA library references using the normal cds.lib methodology, but any other external file references will be copied inside the cellview directory. *Data_type*: bool, optional

`-lib_to_ldb`	Converts the `.lib` timing libraries referenced in the MMMC file to the `.ldb` format and writes them in a libs sub-directory inside the output design directory. References to the original .lib files in the MMMC file are changed to the corresponding `.ldb` files inside the libs sub-directory. This makes the design directory much larger because it has all the timing library data inside it and is not recommended for normal flows. Normally, you should setup `.ldb` files in an external library directory and have the MMMC files use them directly to avoid this overhead. Using `.ldb` files will make `set_flowkit_read_db_args` faster when it reads the library data, so this option is useful for doing "throw-away" debugging experiments that require repeated sessions at the cost of a one-time conversion, and carrying the library data with the design. *Data_type*: bool, optional
`-no_constraint`	Saves the timing graph data without the SDC constraints data. This parameter requires the `-timing_graph` parameter and is useful in reducing the disk size, and speeding up `set_flowkit_read_db_args` and `set_flowkit_write_db_args`. However, the timing-graph data cannot be loaded by any other release version. Additionally, the timing constraints would be lost without the SDC files, if loaded by a different release version. **Note:** You can still load the timing-graph with the current release version, and then use `set_flowkit_write_db_args` without the `-no_constraint` parameter to regenerate the SDC files from the timing-graph and then use `set_flowkit_read_db_args` with a later release. *Data_type*: bool, optional
`-no_fill`	Prevents writing of any metal or via fill shapes inside the database. This is useful during the ECO routing, since the fill data is regenerated anyway. This way, it is not worth saving the current fill data. All the fill data that would go to DEF FILLS section (floating fill data), or the DEF SPECIALNETS section with + SHAPE FILLWIRE or FILLWIREOPC will be ignored and not written. *Data_type*: bool, optional
`-no_pvs_fill`	Prevents saving the PVS fill data file. In some PVS flows, a stream (GDS) file from PVS is saved inside the software DB directory. During `set_flowkit_read_db_args`, this file is not read, but can be optionally loaded or used later in the flow. By default, if the PVS fill file exists, `set_flowkit_write_db_args` will copy it from the `set_flowkit_read_db_args` location to the new DB directory. If ECO changes to the current design have made the PVS fill file invalid, use this parameter to stop it from being copied. *Data_type*: bool, optional
`-no_wait` *string*	Writes the design in a separate process. You can continue executing new commands simultaneously while the design is being saved. This is useful when you want to save intermediate results without waiting for the save to complete. *Data_type*: string, optional
`-oa_lib_cell_view` *string*	Saves the database to an Open Access library cell view. *Data_type*: string, optional
`-oa_view`	Specifies the Open Access view name. *Data_type*: string, optional
`-rc_extract`	Writes RC extraction data, including data for incremental extraction. By default, the software does not automatically save RC extraction data to save disk space and run-time. The `-rc_extract` parameter does not save RC extraction data if the design is not extracted or if extract_rc_engine = pre_route. *Data_type*: bool, optional
`-sdc`	Saves the timing constraint file even if it is not modified. *Data_type*: bool, optional
`-timing_graph`	Saves the timing graph data. *Data_type*: bool, optional
`-user_path`	Saves external file references exactly same as the user entered it. *Data_type*: bool, optional

`-verilog`	Saves a Verilog file inside the DB directory, in addition to the normal DB files. This parameter is not normally used for flat or block flows. It can be used in a hierarchical flow, where you want to use `assemble_design` to read only the Verilog and the DEF files without opening up each design DB and writing out the Verilog and DEF files separately. *Data_type*: bool, optional

Related Information

write_flow

```
write_flow
[-help]
[-directory string]
-out_file string
[-flow_tcl]
[-flow_yaml]
[-include_state]
[-setup_yaml]
```

Generates a Tcl script that may be sourced to reproduce the current flow. The script includes commands to:

- Set the value of all top-level attributes with non-default values to their current values
- Recreate all flow step objects with their current attributes, aside from those relating to run history (specifically, `run_count` and `status`).

Sourcing this script reproduces (but not runs) the current flow in a fresh session, and forms a user readable and editable record of the flow (compared to the flow data saved in the DB, which should not be read or edited directly). The command also supports writing a YAML file version of the memory flow. This is an outline of the content, and may not exactly match what the `write_flow_template` command produces.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `write_flow` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man write_flow`
`-directory string`	Specifies the directory is which all the files need to be written. *Data_type*: string, optional
`-flow_tcl`	Writes only the `flow.tcl` file in the directory. *Data_type*: bool, optional
`-flow_yaml`	Writes only the `flow.yaml` file in the directory. *Data_type*: bool, optional
`-include_state`	Writes out the current flow state. This can be used to restore the flow. *Data_type*: bool, optional
`-out_file string`	Specifies the name of the output file to generate. *Data_type*: string, optional
`-setup_yaml`	Writes only the `setup.yaml` file in the directory. *Data_type*: bool, optional

Related Information

write_flow_template

```
write_flow_template
[-help]
[-describe string]
[-directory string]
[-enable_feature string]
[-ip_steps string]
[-list]
[-optional_feature string]
[-tech_steps string]
[-template_file string]
[-tools]
[-type string]
[-user_steps string]
[-version string]
```

Creates a set of template TCL files to be used as the basis for a flow. This command is used at the beginning after which, you can manage the generated and modified files. When invoking the command, you will select the type of flow required (implying a subset of template scripts to include) and the arrangement of sections across generated files.

On completion, a message is given to indicate creation of the flow template in the specified directory.

Parameters

`-help`	Outputs a brief description that includes the type and default information for each `write_flow_template` parameter. For a detailed description of the command and all its parameters, use the `man` command: `man write_flow_template`
`-describe string`	Outputs a detailed description of available flow features for flow types matching the provided string. A features table includes names and description for each flow (refer to the Examples section). Matching no flow types results in an error. *Data_type*: string, optional
`-directory string`	Specifies the name of the directory for saving the generated files. If no directory is specified, the command uses the name *flow*. If required, the tool appends "_" and an integer to the directory name to avoid overwriting an existing directory. For example, `flow_1` and `flow_2`). Default: `scripts` *Data_type: string, optional*
`-enable_feature string`	Specifies a list of flow features that are unconditionally incorporated into the generated scripts. *Data_type*: string, optional
`-ip_steps string`	Overlays the contents of the generated `flow.yaml` file and inserts the specified scripts under the `ip_flow_steps` flow. *Data_type*: string, optional
`-list`	Lists the available flow templates. *Data_type*: bool, optional
`-optional_feature string`	Specifies a list of flow features that are conditionally incorporated into the generated scripts. Both the enabled and disabled code are included, with conditionals based on a new attribute. *Data_type*: string, optional
`-tech_steps string`	Overlays the contents of the file(s) generated by running the `write_flow_template` command. The file(s) provided with this parameter are copied into the `scripts` directory inside a `tech` sub-folder and appear in `tech_flow_steps` for the stylus flows. *Data_type*: string, optional
`-template_file string`	Specifies the flow template file. *Data_type*: string, optional
`-tools`	Returns the list of tools whose scripts should be included in the flow. *Data_type*: string, optional
`-type string`	Specifies the type of flow to be used. *Data_type*: string, optional
`-user_steps string`	Overlays the contents of the generated `flow.yaml` file and inserts the specified scripts under the `user_flow_steps` flow. *Data_type*: string, optional
`-version string`	Specifies the version of the flow to be used. *Data_type*: string, optional

Related Information

Flowkit chapter of the *Innovus Stylus Common UI Migration Guide* document.

Examples

- Following is an example of fetching the detailed description of the available flow features for the `block` flow sequence using this parameter:

```
innovus> write_flow_template -describe block
Features for flow templates matching 'block'
```

```
Template block
--------------
Provider : tool
Max version : 1
Description : Standard block flow
This is the default template
+--------------------------+-------------------------------------------------------------------------+
| Feature | Description |
+--------------------------+-------------------------------------------------------------------------+
| clock_design | Run discrete clock expansion |
| dft_compressor | Add flow support for scan chains with compression insertion |
| dft_simple | Add flow support for scan chain insertion |
| express | Enable express synthesis and implementation flow |
| opt_early_cts | Implement early clock tree for use during prects optimization |
| opt_eco | Run opt_design during eco flow |
| opt_postcts_hold_disable | Disable postcts hold fixing |
| opt_postcts_split | Run postcts opt_design for setup and hold as separate steps |
| opt_postroute_split | Run postroute opt_design for setup and hold as separate steps | | opt_signoff_area | Run signoff base area
optimization as part implementation flow|
| opt_signoff_drv | Run signoff base drv optimization as part implementation flow | enabled |
| opt_signoff_dynamic | Run signoff base dynamic optimization as part implementation flow | disabled |
| opt_signoff_hold | Run signoff base hold optimization as part implementation flow | disabled |
| opt_signoff_leakage | Run signoff base leakage optimization as part implementation flow | enabled |
| opt_signoff_setup | Run signoff base setup optimization as part implementation flow |
| report_inline | Run report generation as part of parent flow versus schedule_flow |
| route_track_opt | Adds track based optimization to route_design |
| synth_physical | Full physically aware synthesis flow |
| synth_spatial | Physically aware synthesis flow with spatial final optimization |

+--------------------------+-------------------------------------------------------------------------+
```

- When one or more of these features are enabled, a new `opt_signoff` flow is added to the `block` flow sequence. Each of these features corresponds to calling the `opt_signoff` command. For example, on enabling all the `opt_signoff` features, the following flow sequence is displayed:

```
flow:block
flow:opt_signoff
flow_step:run_opt_signoff_area
opt_signoff -area
flow_step:run_opt_signoff_drv
opt_signoff -drv
flow_step:run_opt_signoff_setup
opt_signoff -setup
flow_step:run_opt_signoff_hold
opt_signoff -hold
flow_step:run_opt_signoff_leakage
opt_signoff -leakage
flow_step:run_opt_signoff_dynamic
opt_signoff -dynamic
```

- Following is an example of viewing available flow types using the `-list` parameter:

```
innovus> write_flow_template -list
tool provided templates:
+-----------+---------+--------------------------------+
| Name | Version | Description |
+-----------+---------+--------------------------------+
| block | 1 | Standard block flow (default) |
| hier | 1 | Hierarchical flow |
+-----------+---------+--------------------------------+
```

- Following is an example of generating template of `block` type in the `scripts` directory using the `-enable_feature` parameter:

```
innovus> write_flow_template \
+ -enable_feature dft_simple \
+ -tools "genus"
##FLOW_KIT: generating tool provided flow type 'block'
Flowkit template writing file scripts/run_flow.tcl
Flowkit template writing file scripts/common_steps.tcl
Flowkit template writing file scripts/genus_config.template
Flowkit template writing file scripts/design_config.template
Flowkit template writing file scripts/mmmc_config.template
```

```
Flowkit template writing file scripts/flow_config.template
Flowkit template writing file scripts/genus_steps.tcl
FLOWKIT MSG: 200 Completed template generation of type 'block' in directory 'scripts'.
```

- Following is an example of generating template of `block` type in the `scripts` directory using the `-optional_feature` parameter:

```
innovus> write_flow_template \
+ -optional_feature synth_physical \
+ -tools "genus"
##FLOW_KIT: generating tool provided flow type 'block'
Flowkit template writing file scripts/run_flow.tcl
Flowkit template writing file scripts/common_steps.tcl
Flowkit template writing file scripts/genus_config.template
Flowkit template writing file scripts/innovus_config.template
Flowkit template writing file scripts/design_config.template
Flowkit template writing file scripts/mmmc_config.template
Flowkit template writing file scripts/flow_config.template
Flowkit template writing file scripts/genus_steps.tcl
FLOWKIT MSG: 200 Completed template generation of type 'block' in directory 'scripts'.
```

alias

```
alias
[-help]
new_cmd
old_cmd
[-args {{new old} ...}]
```

Create command aliases for any Tcl command. It is a wrapper around the built-in Tcl “interp alias” command. All command aliases are public, so partial command matching and using <tab> to

complete a typed in command work on them. It also supports argument name aliases for procedures that use `define_proc_arguments`, `parse_proc_arguments`, or `define_proc` for parsing the arguments, and for application commands. The argument aliases do not work for built-in Tcl commands. The argument aliases are private, so they are not shown by `-help`, and do not support partial-option completion or matching.

You can use this command to migrate an existing Tcl script when some of the commands or argument names have changed, but are otherwise compatible.

Parameters

`-help`	Prints a brief description that includes type and default information for each `alias` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man alias`
`new_cmd`	Specifies the new command name that is an alias for the existing *`old_cmd`* name. It can be the same name as the *`old_cmd`* if you only want to create new `-arg` aliases, and do not need a new command alias. *Data_type*: string, required
`old_cmd`	Specifies the existing old command name. *Data_type*: string, required
`-args {{`*`new old`*`} …}`	Specifies a list of new and old argument names to create aliases. You can give multiple *`new`* names for the same *`old`* name. The new aliases are private, and do not show up with `-help`. You can create more than one alias for the same *`old`* name. *Data_type*: string, optional

Example

The following command adds a new command name alias `new_read_sdf` and some argument name aliases for `read_sdf`:

```
>alias new_read_sdf read_sdf -args {
```

```
    {-ignore_error -continue_on_error}
    {-summary -report_summary}
    {-sum -report_summary}
}
```

Then, the following commands

```
>new_read_sdf in.sdf -ignore_error -summary
>new_read_sdf in.sdf -ignore_error -sum
>new_read_s in.sdf -ignore_error -sum
```

would behave the same as

```
>read_sdf in.sdf -continue_on_error -report_summary
```

Note: Tcl partial command matching works if the partial command is unique as shown in the above example, but the alias argument names are private, and will not support partial option matching, or appear in the `-help` output.

Related Information

- `define_proc_arguments`
- `parse_proc_arguments`
- `define_proc`

check_ccr

```
check_ccr
[-help]
ccr_number
```

Enables users to check if a CCR (Cadence Change Request) created on their behalf is checked into the current release or not.

The command returns 1 if the specified CCR is integrated into this build and 0 if it is not.

- It includes all integrated CCRs that have the `Checked_In` or `Validated` status at the time of the build.
- It only includes master CCRs. Duplicate CCRs are not included.
- It currently lists all CCRs fixed in the current release stream or previous release. For example, checking in release version 16.22, will find all CCRs integrated into 16.10 through 16.22 that are in the current 16.22 release.

Parameters

`-help`	Prints a brief description that includes type and default information for each `check_ccr` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_ccr`
`ccr_number`	Specifies the CCR number to check. *Data_type*: string, required

Examples

- The following example checks if the CCR 123456 is checked into the Innovus release 18.13-s088_1.

```
innovus 1> getversion
18.13-s088_1

innovus 2> check_ccr 123456
1
```

check_netlist

```
check_netlist
[-help]
-out_file filename
[-sub_module_ports]
```

Performs several checks on the design netlist and creates a report, named `checknetlist.rpt`. This report shows the following information:

- Design Summary
- Design Statistics
- I/O Pad Summary
- Design Rule Checking
- Submodule Port Definition Checking (optional)

You can use this command after the design netlist is imported.

Parameters

`-help`	Prints a brief description that includes type and default information for each `check_netlist` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_netlist`
`-out_file` *filename*	Specifies the name of the file where the report will be written. If no name is specified, the default filename is `checknetlist.rpt`. *Data_type*: string, optional
`-sub_module_ports`	If this option is included, `check_netlist` checks the port definitions for any submodules. *Data_type*: bool, optional

Example

Error conditions are indicated by an asterisk (*) preceding the reported statistic, such as

```
Number of Ports Connect to Core Cells *: 57

Number of Ports Connect to multiple Pads *: 0

Number of Floating Ports *: 0
```

Warnings, or possible errors are indicated by a question mark in front of the statistic, such as

```
Number of undefined Floating Pins ?: 0
```

The following example shows the information contained in the generated by `check_netlist` report.

```
Design: TOPModule

------ Design Summary:

Total Standard Cell Number (cells) : 5908

Total Block Cell Number (cells) : 4

Total I/O Pad Cell Number (cells) : 0

Total Standard Cell Area ( um^2) : 133864.32

Total Block Cell Area ( um^2) : 366346.56

Total I/O Pad Cell Area ( um^2) : 0.00

------ Design Statistics:

Number of Instances : 5912

Number of Nets : 6217

Average number of Pins per Net : 3.69

Maximum number of Pins in Net : 541

------ I/O Pad summary

Number of Primary I/O Ports : 57

Number of Input Ports : 28

Number of Output Ports : 29
```

```
Number of Bidirectional Ports : 0

Number of Power/Ground Ports : 0

Number of Ports Connect to Core Cells *: 57

Number of Ports Connect to multiple Pads *: 0

Number of Floating Ports *: 0

------ Design Rule Checking:

Number of Output Pins connect to Power/Ground *: 0

Number of Input Floating Pins *: 1

Number of Output Floating Pins : 245

Number of InOut Floating Pins : 0

Number of UniPort Floating Pins : 0

Number of undefined Floating Pins ?: 0

Number of Multiple Driving Nets *: 1

Number of Parallel Driving Nets : 1

Number of Tristate Driving Nets : 0

Number of Input Floating Nets(No FanIn) *: 0

Number of Output Floating Nets(No FanOut) : 1

Number of Hign Fanout Nets (>50) : 3

------ Sub Module Port Definition Checking

* module arb has 3 port define error

* module accum_stat has 1 port define error

* module tdsp_core_glue has 128 port define error
```

- write_netlist

check_syntax

```
check_syntax
[-help]
[file1.tcl file2.tcl ...]
[nagelfar.tcl options]
[-options]
[-out_file fileName]
```

Does the “lint type” checking of Innovus Tcl script files.

It finds many common Tcl errors, such as misspelled commands, using a Tcl variable before setting it.

The `check_syntax` command is a wrapper around the public-domain Tcl linter named nagelfar. Nagelfar automatically loads the Innovus syntax and plugin files and is therefore aware of Innovus commands and options. Nagelfar is available from http://sourceforge.net/projects/nagelfar. A recent version of nagelfar is included in the installation hierarchy at: `<install_dir>/share/nagelfar`.

You can check the nagelfar documentation in the installation directory for details about its options, the checks it performs, and the steps to turn on or off various checks.

To run this command, you should have tclsh in your search path.

Parameters

`-help`	Prints a brief description that includes type and default information for each check_syntax parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man check_syntax`
`file1.tcl` *`file2.tcl`*	Specifies the Tcl files to be checked.
`nagelfar.tcl options`	Specifies the native nagelfar.tcl options. See the nagelfar docs in the installation directory for details.
`-options`	Calls “nagelfar.tcl –help” to list out all the legal nagelfar options. This option cannot be used with any other options. *Data_type*: bool, optional
`-out_file` *`fileName`*	Sends the output to the specified file, rather than the default of stdout. *Data_type*: string, optional

compare_release

```
compare_release
[-help]
[-out_file file_name]
{-base_version release_version | -base_file file_name}
[-target_version release_version | -target_file file_name]
```

Compares the two different releases and reports all the added, deleted, or modified commands, arguments, and root attributes. It also reports any data-type changes for argument values or root attributes and any enum value changes.

Parameters

`-help`	Prints a brief description that includes type and default information for each `compare_release` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man compare_release`
`-base_file` *file_name*	Specifies the `.info` file of the older base release. *Data_type*: string, optional
`-base_version` *release_version*	Specifies the older base release, such as 16.10-p001_1, from `<install>/share/innovus/version_info`. *Data_type*: string, optional
`-out_file` *file_name*	Specifie the output report file. *Default*: `stdout` *Data_type*: string, optional
`-target_file` *file_name*	Specifies the target release .info file to be compared with the older base release .info file. *Data_type*: string, optional

`-target_version` *release_version*	Specifies the version, such as 16.20-p002_1, which is compared to the older base release. Looks in `<install>/share/innouvs/version_info` for the correct `.info` file. *Default*: Current version *Data_type*: string, optional

Example

- The following command compares two releases by first finding the install directories, and the correct .info files to compare.

  ```
  >which innovus

  /tools/innovus18.11/bin/innovus
  ```

  The install directory above is /tools/innovus18.11 (for examples, the 18.1 ISR release).

  Suppose you also have the 18.1 production release in /tools/innovus.18.10. Find the .info files to compare:

  ```
  >ls /tools/innovus18.10/share/innovus/version_info

  innovus.18.10-p006_1.cui.info  innovus.18.10-p006_1.info

  >ls /tools/innovus18.11/share/innovus/version_info

  innovus.18.11-s080_1.cui.info  innovus.18.11-s080_1.info
  ```

  Then, run the `compare_release` command to compare either the legacy (.info.) or Common UI versions (.cui.info):

  ```
  innovus> compare_release \

  -base_file /tools/innovus18.10/share/innovus/version_info/innovus.18.10-
  p006_1.cui.info \

  -target_file /tools/innovus18.11/share/innovus/version_info/innovus.18.11-
  s080_1.cui.info \

  -out_file 18.11.diff
  ```

  The output file will show all the differences between the two releases.

Related Information

- innovus

convert_legacy_to_common_ui

```
convert_legacy_to_common_ui
[-help]
<in_dir_or_file>
<out_dir_or_file>
```

Allows usage of legacy scripts to be used in Stylus Common UI.

Parameters

`-help`	Prints out the command usage.
`<in_dir_or_file>`	Specifies the name of the legacy script or script directory name. *Data_type*: string, required
`<out_dir_or_file>`	Specifies the Stylus Common UI script or script directory name. *Data_type*: string, required

decrypt

```
decrypt
[-help]
file_name
```

Decrypts and evaluates a Tcl file that was encrypted with the encrypt command.

Parameters

`-help`	Prints out the command usage.
file_name	Specifies the name of the Tcl file to be decrypted and evaluated. *Data_type*: string, required

Related Topics

- encrypt

define_proc

```
define_proc
[-help]
proc_name
arg_list
proc_body
[-description proc_help]
[-hidden]
[-extended_help help_description]
```

This command defines a Tcl proc that uses an extended argument syntax to check for legal argument names and legal values. It is a super-set of the functionality supported by define_proc_arguments, and parse_proc_arguments and easier to use.

The arguments are parsed, and if any errors occur, an error message is written, and a TCL_ERROR is returned, so the *proc_body* is not executed. If the arguments are parsed successfully the Tcl vars are set accordingly, and the *proc_body* is executed.

It supports simple types like int, string, etc., built-in types like point, rect, and objects like inst, net, pin.

Commands defined with define_proc also have the same support as other Innovus commands, including:

- help support (e.g. "cmd -help" to see the options, and "help c*" would find the command named cmd, etc.)
- tab-completion of partial command or option names (e.g. "cmd<tab>" or "cmd -opt<tab>")
- partial argument name matching is allowed (e.g. "cmd -opt" will work if -opt only matches one option name prefix like -opt_test)
- redirect output to files or Tcl vars using > or >> (e.g. "cmd > my_file", or "cmd > &my_tcl_var")

Parameters

arg_list	Defines the argument list of the Tcl procedure in the following format for each argument: `{var default arg_name data_type flags help}` *Data_type*: string, required For example

```
{report_file report.out {-out_file file_name}
string optional {The output file for the report}
}
```

In this format:

- *var* is the local Tcl variable to assign, such as report_file in the example above. The value for the argument is assigned to this variable before the body of `define_proc` is invoked.
- *default* is the default value, such as report.out in the example above. If the argument is not given, then *var* will be assigned the *default* value. Note, unlike an argument value passed to the command, the type of the default value is not checked.
  For example, the following command would set int_var to "no_value" if -my_int is not given. Normally the default value should be a legal int value, but you can use this to check if the argument was given for an optional argument when there is no good default value.

  ```
  {int_var no_value {-my_int int} int optional {int
  value help description}}
  ```

  The default value is ignored if the argument is a required argument (see *flags* below).
- *arg_name* is the argument name with optional value help. Both named {-opt value} and unnamed {value} arguments are supported.

  If the first word starts with a dash, it is a named argument with optional help string. For example, `{-out_file file_name}` will appear in the help output as: -out_file <file_name>.

  If no help string is given like this: `{-out_file}`

  The help output will include the data_type like: -out_file <string>.

If the first word does not start with a dash, it is an unnamed argument and the first word is used as the help string. For example, `{out_file}` will appear in the help output as: `<out_file>`.

- *`data_type`* is the argument data type. Many types are supported including simple types, bool type, enum type, built-in types, and object types.
  - These simple types are supported: **int, float, double, string.** They all require an argument value that matches the type (e.g. -my_int 23, or -my_string "my test string"). **float** and **double** are both allowed, and mean the same thing. For example

    ```
    {int_var 0 {-my_int int} int optional {int value help description}}
    ```

    Note that a integer passed to a float or double type will get a .0 added to the end so it can be passed to expr and forced to use floating point arthimetic.
  - The **bool** type supports an argument with or without a value. If the *arg_name* definition has a value help string, then a bool value is required, otherwise a value is not allowed. So, a switch that takes no value would look like:

    ```
    {switch_var false -my_switch bool optional "-my_switch help description"}
    ```

    and would be used like this with no value

    ```
    -my_switch
    ```

    The switch_var will be set to true if -my_switch is given, and set to the default value of false if not given.

    A bool with a value required, would look like this

    ```
    {bool_var false {-my_bool bool} bool optional "bool with value help description"}
    ```

    and would be used like this

    ```
    -my_bool true
    ```

Any Tcl allowed bool value can be used for the input value (e.g. true, false, 1, 0, on, off, etc.) but the bool_var will always have either true, false or the *default* value if the argument is not given.

- These built-in types are supported: **point, rect.**
  - **point** is exactly two doubles. The input can be either a single list or list of lists style, so both {1.0 2.0} or {{1.0 2.0}} are allowed as input. The point_var will always be assigned as a simple list of two values for either type of input. An integer value gets a .0 added, so it can be used in a Tcl expr and forced to be treated as a double. So an input like {1 2} will be assigned to the point_var as {1.0 2.0}.
  - **rect** is exactly four doubles. It can be in a single list or list of lists style, so {0 1 2 3}, {{0 1} {2 3}} or {{0 1 2 3}} are allowed. The rect_var will always be assigned as a simple list of four values.
- An **enum** type must include the list of legal enum values like this {**enum** val1 val2 ...}. It supports an optional list_type of * (a list of 0 or more) or **+** (a list of 1 or more) as the last enum value. It allows an optional {**hidden** val1 val2 ...} list for hidden enum values. The enum value inputs are case-insensitive, but the return value assigned to *var* is always forced to be all lower-case characters.
  For example,

  ```
  {sort_var name {-sort} {enum name age {hidden city state} +} optional {help description}}
  ```

  would allow `-sort age`, or `-sort "name CITY"`, but would give errors for `-sort ""`, or `-sort abc`.
  The help string will show the enum values but not the hidden enum values like this:

  ```
  -sort {name age} # help description (enum+, optional)
  ```

- An **object** type allows object names and pointers to be passed in as values like this {**object** *obj_type1 [obj_type2 ...]* [*list_type*]}. It supports an optional *list_type* of * (a list of 0 or more) or **+** (a list of 1 or more) as the last value. If *list_type* is not given, exactly one value is required for input. For example,

  ```
  {driver_var {} {-drivers} {object pin port *} optional {help description}}
  ```

  would allow a list of 0 or more pin or port objects for input. The input could be a list of pin or port pointers, or a name-pattern like "i1/p*" that allows * and ? pattern matching. *driver_var* will be assigned a list of pointers of the correct type (or types). So both of these uses would have the same result:

  ```
  -drivers [concat [get_db pins i1/p*] [get_db ports i1/p*]]
  ```

  ```
  -drivers i1/p*
  ```

  In both cases, all the pins and ports that match i1/p* would be returned as a list of objects and assigned to *driver_var*.

  If any objects are passed in that are not pin or port objects, an error will occur during parsing.

  If at least one pointer is required (e.g. list_type **+** or no list_type), and none are matched by the name pattern, an error will occur during parsing.

  Design objects like **hinst, inst, hnet, net, hpin, pin**, **port**, etc and library objects like **base_cell, base_pin, lib_cell, lib_pin**, etc, and technology objects like **layer**, **route_rule**, etc. are supported, but only objects that have a .name attribute can use a name-pattern in addition to pointers (e.g. a wire object has no .name so it cannot be looked up with a name-pattern). See the Stylus Common UI Database Reference for a list of all the obj_types.

- *flags* is list of flags that may be an empty list. The supported flags are
  - **optional** means the argument is optional. If the argument is not given, *var* will be set to the *default* value. Arguments are **optional** by default, so this is mostly to make it easy to see it in the definition. It cannot be combined with **required**.
  - **required** means the argument is required. It is an error to not have the argument.
  - **multiple** means the argument can appear multiple times and *var* will be set to a list of all the values.
  - **hidden** means the argument is not shown in the help output, partial argument name matching will not match it, and <tab> complete will not show it. **hidden** must be optional, so it cannot be combined with **required**, **required_group,** or **exclusive_required_group** flags.
  - **obsolete** means the argument still works but is considered obsolete. It will give a warning message if it is used that the user should stop using this argument to be compatible with future releases. An **obsolete** argument will automatically be **hidden** and cannot be a required argument. See **alias** if you just want to change the *arg_name* to a new *arg_name*.
  - {**exclusive_group** *group_name*} means only one of the arguments can be given from the same *group_name*. For example, if they are both optional, but only one of -my_int or -my_int2 is allowed:

    ```
    {int_var 0 {-my_int int} int {{exclusive_group
    group1}} {help for -my_int}}
    {int_var2 0 {-my_int2 int} int
    {{exclusive_group group1}} {help for -
    my_int2}}
    which would show up in the help usage as [-
    ```

```
my_int <int> | -my_int2 <int>]
```

- {**exclusive_required_group** *group_name*} means exactly one of the arguments must be given from the same *group_name.* For example, if exactly one of -my_int or -my_int2 is required:

  ```
  {int_var 0 {-my_int int} int
  {{exclusive_required_group group1}} {help for
  -my_int}}
  {int_var2 0 {-my_int2 int} int
  {{exclusive_required_group group1}} {help for
  -my_int2}}
  which would show up in the help usage as {-
  my_int <int> | -my_int2 <int>}
  ```

- {**required_group** *group_name*} means one or more of the arguments must be given from the same *group_name.*

- {**requires** *arg_name1* [*arg_name2* ...]} means this argument requires all the other arguments in the list. For example both -arg1 and -arg2 are required if -my_int is given.

  ```
  {int_var 0 {-my_int int} int {optional
  {requires -arg1 -arg2}} {help for -my_int}}
  ```

- {**alias** *obsolete_name [***warn***]*} means an alias of *obsolete_name* to the *arg_name* will be added. If **warn** is given, a warning message will be given if the *obsolete_name* is used telling the user to change to *arg_name,* otherwise *obsolete_name* will behave just like *arg_name*. The *obsolete_name* is not shown in help output. This can be used to migrate users to new argument names, but keep the old name for backward compatibility. For example, to migrate from `-old_my_int` to `-new_my_int` you would use this:

  ```
  {int_var 0 {-new_my_int int} int {{alias -
  old_my_int}} {help for -new_my_int}}
  ```

	• *help* is a help string for the argument, such as *"a file name to read"*.
-description *proc_help*	Specifies the help description for the defined procedure, shown by "help cmd" or "cmd -help". *Data_type*: string, optional
-extended_help *help_description*	Provides the extended help description for a procedure. It is printed after -description and arg_list; shown by help cmd or cmd -help. *Data_type*: string, optional
-help	Outputs the command usage and a brief description about the command parameters.
-hidden	Makes the procedure hidden and not public. That means <tab> complete will not return this proc name, and "info commands *" will not return this proc name. But if you type the full name like "info commands full_cmd_name" it will return the command, or "full_cmd_name -help" will return help for it. *Data_type*: bool, optional
proc_body	Defines the Tcl procedure body that uses var names from *arg_list*. *Data_type*: string, required
proc_name	Specifies the name of the Tcl procedure. *Data_type*: string, required

Example

Here is an example of some common usage:

```
define_proc test –description “An example of the extended argument syntax” {
   {out_file "default.out" out_file string optional "The output file name"}
   {my_count 0 {-count num_inputs} int required "The number of inputs"}
   {verbose false -verbose bool optional "Verbose output"}
```

```
  {check_err not_set {-check_err bool} bool optional "Override global check setting"}
  {effort low -effort {enum low medium high} optional "How much effort to use"}
  {my_insts {} {-insts} {object inst +} optional "One or more insts"}
}{
# Proc body goes here
  ...
}
```

The above procedure generates the following help output:

```
> test -help
```

An example of the extended argument syntax

```
Usage: test [-help] [<out_file>] [-check_err <bool>] -count <num_inputs> [-effort {low
medium high}] [-verbose]

-help                       # Prints out the command usage
<out_file>                  # The output file name (string, optional)
-check_err <bool>           # Override global check setting (bool, optional)
-count <num_inputs>         # The number of inputs (int, required)
-effort {low medium high}   # How much effort to use (enum, optional)
-insts <inst>+              # One or more insts (Iinst)+, optional)
-verbose                    # Verbose output (bool, optional)
```

Related Information

- define_proc_arguments
- parse_proc_arguments

define_proc_arguments

```
define_proc_arguments
command_name
[-info string]
[-define_args string]
[-hide]
```

Defines the arguments and attributes of a Tcl procedure. The arguments and attributes are displayed when you view the help associated with the procedure.

The `define_proc_arguments` command, when used with the `parse_proc_arguments` command, enables you to validate command usage. For invalid commands, appropriate error messages are displayed.

Parameters

proc_name	Specifies the name of an existing Tcl procedure. *Data_type*: string, required
-info *string*	Provides help information for the procedure. *Data_type*: string, optional
-define_args *string*	Defines all possible arguments of the Tcl procedure. It can also be used to define the help text and constraints for individual arguments of the procedure and generates the help for command options. The variable *arg_defs* is a list of lists where each list element defines one argument. Each element in the list has the following format: `"arg_name" "option_help" "value_help" "data_type" "attributes"` *Data_type*: string, optional
	`arg_name`: Specifies the name of the argument.
	`option_help`: Provides a short description of the argument.
	`value_help`: Specifies the help information for the associated option values.

	data_type: (Optional) Used for validation of options. Supported data types are `string`, `list`, `boolean`, `int`, `integer`, `float`, or `one_of_string`. *Default:* `string`
	attributes: (Optional) Used for validation of options. The attributes can be: • `required`: This argument must be specified . This is mutually exclusive with `optional` and `internal`. • `optional`: Specifying this argument is optional. This is mutually exclusive with `required`. • `internal`: Disables the display of help information for the option in the procedure help. This argument is mutually exclusive with `required`. • `value_help`: Indicates that the valid values for `one_of_string` argument should be listed whenever argument help is shown. • `values {`*`allowable_values`*`}`: This argument must be used with the `one_of_string` data type. • `merge_duplicates` : Ensures that when the option appears more than once in a command, its values are concatenated into a list of values. The default behavior is that the right-most value specified for the option is used. • `bind_option` *`other_arg_name`*: Binds the current option with the option specified as the *`other_arg_name`* variable. • `mutual_exclusive_group` *`group_name`*: Defines a group name and includes the current option in the *`group_name`* group. All options in the same group are treated as mutually exclusive. • *Default:* `optional`
`-hide`	Hides the procedure and its body. *Data_type*: bool, optional

Examples

The following Tcl procedure uses the `define_proc_arguments` command for defining arguments and attributes, and for validating the command usage.

```
proc cmdProc {args} {

parse_proc_arguments -args $args results

foreach argname [array names results] {

puts "$argname = $results($argname)"

}

}

define_proc_arguments cmdProc -info "Command Description" \

-define_args \

{{-string "String help" "string_val" string optional}

{-integer "Int help" "int_value" int optional}

{-list "List help" "list_value" list {optional bind_option -boolean_a}}

{-boolean_a "BoolA help" "" boolean {optional mutual_exclusive_group

g0}}

{-boolean_b "BoolB help" "" boolean {optional mutual_exclusive_group

g0}}

{-float_num "Float help" "float_value" float}

{-oosa "One of StringA help" "one_of_str_value" one_of_string

{optional value_help {values {v1 v2}}}}

{-oosb "One of StringB help" "one_of_str_value" one_of_string

{optional {values {v4 v5}}}}

}
```

Now, if the `cmdProc` procedure is invoked with the `-help` option at the command prompt, the following help information is displayed.

```
cmdProc -help

Usage: cmdProc # Command Description
```

```
[-string string_val] (String help)

[-integer int_value] (Int help)

[-list list_value] (List help, Bind_Option=-Bool)

[-boolean_a ] (BoolA help, Mutual_Exclusive_Group=g0)

[-boolean_b ] (BoolB help, Mutual_Exclusive_Group=g0)

[-float_num float_value] (Float help)

[-oosa one_of_str_value] (One of StringA help, Values={v1 v2 })

[-oosb one_of_str_value] (One of StringB help)
```

Related Information

- define_proc
- parse_proc_arguments

define_variables

```
define_variables
[-help]
name_list
[-transient  | -delete ]
```

Creates Tcl variables in the global namespace if they do not already exist, and adds them to a save list to be saved by `write_db` and restored by `read_db`. The variables will be saved even if the root attribute `write_db_auto_save_user_globals` is false. It can also remove Tcl globals that would be automatically saved if `write_db_auto_save_user_globals` is true. It is intended for Tcl global variables, but it also supports namespace variables.

During `read_db`, the Tcl variables are created if they do not already exist and the value is set. If a namespace variable is given, it will also create the namespace if it does not already exist.

Parameters

`-delete`	Deletes the Tcl variables and removes them from the save and transient lists. It returns an error if the Tcl variables do not exist. *Data_type*: bool, optional
`-help`	Outputs a brief description that includes type and default information for each `define_variables` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man define_variables`
`name_list`	Specifies a list of Tcl variable names. If the specified Tcl variable does not already exist, it is created and added to a save list of variables to be saved by `write_db`. *Data_type*: string, required
`-transient`	Adds the Tcl variables to a transient list used by `write_db` (and removes them from the save list if they are there). The transient list will override the automatic save list created if the root attribute `write_db_auto_save_user_globals` is `true`, so the variables will not be saved. *Data_type*: bool, optional

Examples

The following command saves the variables `global1` and `namespace1::var1` with `write_db`:

```
>define_variables {global1 namespace1::var1}
```

Related Topics:

delete_floating_constants

```
delete_floating_constants
-help
```

Deletes dangling 1'b1s or 1'b0s from the Verilog. They are either dangling nets assigned 1'b1 or 1'b0 or 1'b1/1'b0 connections that are not hierarchically connected to a leaf instance.

Parameters

None

Example

In the code below only BUFX2 is a leaf.

```
//
// Original Verilog
module hier4 (A,B);
input A;
input B;

BUFX2 u0 (.A(A));
BUFX2 u1 (.A(1'b1));
endmodule

module hier3 ();

hier4 u0 (.A(1'b1),.B(1'b0));
hier4 u1 (.A(1'b0),.B(1'b1));
endmodule

module hier2 ();

hier3 u0 ();
endmodule

module top ();

// Internal wires
wire a;
wire b;
wire c;
wire d;
```

```
assign a = 1'b1 ;
assign b = 1'b1 ;
assign c = 1'b0 ;
assign d = 1'b0 ;

hier2 u0 ();
BUFX2 u1 (.A(a));
BUFX2 u2 (.A(c));
endmodule

//
// Verilog after delete_floating_constants is issued

module hier4 ( A, B);
input A;
input B;

BUFX2 u0 (.A(A));
BUFX2 u1 (.A(1'b1));
endmodule

module hier3 ();

hier4 u0 (.A(1'b1));
hier4 u1 (.A(1'b0));
endmodule

module hier2 ();

hier3 u0 ();
endmodule

module top ();

// Internal wires
wire a;
wire c;

assign a = 1'b1 ;
assign c = 1'b0 ;

hier2 u0 ();
BUFX2 u1 (.A(a));
BUFX2 u2 (.A(c));
endmodule
```

delete_dangling_ports

```
delete_dangling_ports
-help
-partition
```

Deletes ports that are disconnected from both the inside and outside of a module, and ports that are connected within the module but disconnected outside the module.

Parameters

`-help`	Prints a brief description that includes type and default information for each `delete_dangling_ports` parameter. For a detailed description of the command and all of its parameters, use the man command: `man delete_dangling_ports`
`-partition`	Specifies the partition only flag of the type boolean. *Data_type*: bool, optional

Related Information

- `delete_empty_hinsts`
- `disconnect_dangling_port`

deselect_obj

```
deselect_obj
[-help]
{[-all ] | [obj_list]}
```

Deselects the object or the list of objects from a set. The object type can be any object type drawn on GUI such as instance wire, via instance...

Parameters

`-help`	Prints a brief description that includes type and default information for each `deselect_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man deselect_obj`
`-all`	Deselects all selected objects. *Data_type*: bool, optional
obj_list	Specifies the list of objects to be deselected. *Data_type*: (any_object)+, optional

Example

The following command deselects the instance name i1.

```
deselect_obj [get_db insts i1]
```

Related Information

- `delete_obj`
- `report_obj`
- `select_obj`

encrypt

```
encrypt
[-help]
input_file_name
[-pragma]
[> file]
[-tcl  | -verilog ]
```

Encrypts a file in an nc-protect compatible format.

Parameters

`-help`	Prints out the command usage.
input_file_name	Specifies the file to be encrypted. *Data_type*: string, required
> file	Specifies the name of the encrypted file. By default, the encrypted file is printed to standard out (stdout). *Data_type*: redirect_operator, optional
`-pragma`	Specifies to only encrypt the text between the protect begin and protect end NC Protect pragmas. Encryption block must start with pragma protect comment. *Data_type*: bool, optional
`-tcl`	Specifies that the file to be encrypted is a Tcl file. This is the default option. *Data_type*: bool, optional
`-verilog`	Uses Verilog style comments for NC Protect pragmas. *Data_type*: bool, optional

Related Topics

- decrypt

eval_legacy

```
eval_legacy
[-help]
script
```

Runs a legacy command in the legacy Tcl interpreter. This command is not required in normal usage. However, it may be needed in cases where some legacy usage is not yet available in the Stylus Common UI. This command is intended as a temporary workaround as users transition to the Stylus Common UI and will be removed in a future release.

You should first check if there is a Stylus Common UI equivalent command before using this command by using the `get_common_ui_map` command:

```
>get_common_ui_map <legacyCommand>
```

Most legacy commands are available, but legacy commands that have behavior changes in the Stylus Common UI will not work properly (`saveDesign`, `restoreDesign`, `init_design`, `report_timing` etc.).

The legacy commands run in a separate Tcl interpreter, so Tcl variables in the current interpreter are not available. That means the *script* should normally be inside " " rather than { } so Tcl variable substitution occurs in the current interpreter before passing the script to the legacy Tcl interpreter.

Note: You can use `1` as an abbreviation for the `eval_legacy` command. To use `eval_legacy` in Stylus, you can simply write `1` and then the legacy command name. It also enables the command line tab completion for legacy commands after `eval_legacy`. The following type of input is supported:

```
> l{legacyCmd<tab> -option<tab>}
```

You can also use `eval_legacy {restoreDesign/ saveDesign}` to run legacy `restoreDesign` and `saveDesign` commands.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `eval_legacy` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man eval_legacy`
`script`	Specifies one or more legacy Tcl commands to run in the legacy Tcl interpreter. *Data_type*: string, required

Example

- The following command run `setFillerMode` and `addFiller` commands in the legacy Tcl interpreter.

  ```
  set my_prefix fill eval_legacy "setFillerMode -corePrefix $my_prefix"
  eval_legacy "addFiller ..."
  ```

  You can have more than one legacy command inside a single eval_legacy like this:

  ```
  set my_prefix fill
  eval_legacy
           "setFillerMode -corePrefix $my_prefix
            addFiller ..."
  ```

- The following uses a TCL variable defined in the current interpreter and passes it to a legacy command

  ```
  set inst CTS_ccl_BUF_clk_G0_L2_245
  eval_legacy “dbGet top.insts.name $inst”
  ```

- The following uses `get_db` to find a particular instance and then passes that object's name to legacy `dbGet`. The argument is inside “”, so both of the `[get_db.. ]` proc substitutions, and the `$inst` are evaluated inside the CUI interpreter first, before passing the result to the `dbGet` command in the legacy interpreter.

  ```
  eval_legacy "dbGet -p1 top.insts.name  [get_db [get_db insts $inst] .name]"
  ```

Related Information

- get_common_ui_map
- convert_legacy_to_common_ui

get_all_layers

```
get_all_layers
[-help]
[{object display multiple_color internal module metal color custom oa_layout}]
```

Returns a complete list of all layers and floorplan object settings. If you specify type, the software returns all the layers of the specified type. This command can be used at any stage in the design flow.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_all_layers` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_all_layers`
`{object display multiple_color internal module metal color custom oa_layout}`	Specifies the type of the layer. Innovus supports nine types of layers, which can be specified as follows: • `object`: Returns object layers, which represent db objects, such as instances, modules, pins, and so on. • `display`: Returns display-only or view-only layers, including flightlines, rulers, and congestion. • `multiple_color`: Returns multiple color layers, such as congestion and yield maps. • `internal`: Returns internal layers, such as bump layers, structured data path layers, etc. • `module`: Returns module layers, which are layers associated with hinsts. • `metal`: Returns wire/via layers, including metal/via, pin, and blockage. • `color`: Returns color layers. • `custom`: Returns custom layers, which are used to represent custom objects and GDSII data. • `oa_layout`: Returns OA layout layers. *Data_type*: enum, optional

Example

Returns all metal layer names:

```
get_all_layers metal
```

get_common_ui_map

```
get_common_ui_map
-help
legacy_name
```

Provides the mapping of a legacy command and its options or the dbget chain in Stylus Common UI.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_common_ui_map` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_common_ui_map`
`legacy_name`	Specifies the legacy command name, the UDM name, or the dbget chain. *Data_type*: string, required

Examples

- The following command gets the mapping of the `assembleDesign` command in Stylus Common UI:

  ```
  >get_common_ui_map assembleDesign
  ```

  Output:

  ```
  assembleDesign                    assemble_design
  -allTimingBlocks                  -all_timing_blocks
  -block                            -oa_block
  -blockCell                        -block_cell
  -blockData                        -block_data
  -blockDir                         -block_dir
  -cpfFile                          -cpf_file
  -exceptBlocks                     -ignore_timing_blocks
  ```

-fe	-encounter_format
-fplan	-floorplan_only
-keepPGPinGeometry	-keep_pg_pin_geometry
-keepPinGeometry	-keep_pin_geometry
-mmmcFile	-mmmc_file
-noDefMerge	-no_def_merge
-skipCells	-skip_cells
-skipComponents	-skip_components
-skipNets	-skip_nets
-skipSpecialNets	-skip_special_nets
-topDesign	-top_design
-topDir	-top_dir

- The following command gets the mapping of the dbget chain (`dbget top.nets.vWires.objType`) in Stylus Common UI:

```
> get_common_ui_map "dbGet top.nets.vWires.objType"                    #
support dbGet and strict legacy db attribute name
Output:
dbGet top.nets.vWires.objType   get_db nets .virtual_wires.obj_type
```

Related Information

- `get_ccopt_property_common_ui_map`

get_compress_level

`get_compress_level`

Displays the current compression speed level used for compressing large data files. Compression speed is controlled with the `set_compress_level` command.

Related Information

- `set_compress_level`

get_layer_preference

```
get_layer_preference
[-help]
layer_name
{-is_visible | -is_selectable | -color | -line_width | -stipple | -stipple_data}
```

Provides information about a single preference for a single object.

See `set_layer_preference` for descriptions of how to set layer preferences.

Parameters

`-help`	Prints a brief description that includes type and default information for each `get_layer_preference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man get_layer_preference`
`-color`	Provides information about the color of the object. A color name or a numeric RGB value is returned. *Data_type*: bool, optional
`-is_selectable`	Provides information about whether the object is selectable. If a value of `1` is returned, the object is selectable. If a value of `0` is returned, the object is not selectable. *Data_type*: bool, optional
`-is_visible`	Provides information about whether the object is visible. If a value of `1` is returned, the object is visible. If a value of `0` is returned, the object is not visible. *Data_type*: bool, optional
`layer_name`	Provides the name of the layer or the object type. *Data_type*: string, required
`-line_width`	Provides information about the number of pixels in the border of the specified object. An integer value is returned. *Data_type*: bool, optional
`-stipple`	Provides information about the stipple pattern of the object. A stipple name is returned. *Data_type*: bool, optional
`-stipple_data`	Provides information about the width and height of the stipple pattern. This information is in x-window bitmap format. *Data_type*: bool, optional

Example

Returns the color for `M1` objects:

```
get_layer_preference M1 -color
```

Related Information

- `set_layer_preference`

get_legacy

```
get_legacy
-help
common_ui_cmd_attr_name
```

Returns the legacy command, legacy Tcl global, or legacy `setXXXMode -option` that corresponds to the specified Stylus Common UI command or root attribute.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_legacy_command` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_legacy`
`common_ui_cmd_attr_name`	Specifies the Stylus Common UI command name or attribute name. *Data_type*: string, required

Examples

- The following command returns the legacy command that corresponds to the Stylus Common UI command `place_design`:

  ```
  @innovus 1> get_legacy place_design
  Command: place_design
  ```

- The following command returns the `setFillerMode` option that corresponds to the Stylus Common UI attribute `add_fillers_prefix`:

  ```
  @innovus 2> get_legacy add_fillers_prefix
  Mode option: setFillerMode -corePrefix
  ```

- The following command returns the legacy Tcl global that corresponds to the Stylus Common UI attribute `init_lef_files`:

  ```
  @innovus 3> get_legacy init_lef_files
  Tcl global: init_lef_file
  ```

get_message

```
get_message
-help
-id msgID
[-severity | -limit | -suppress | -count | -short | -long | -on_error  | -
stop_script_limit | -detail ]
```

Gets the limit, severity, or suppression for a message.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `get_message` parameter. For a detailed description of the command and all of its parameters, use the man command: `man get_message`
`-count`	Returns the number of times this message has been issued this session.
`-detail`	Returns the message of specified id.
`-id` *msgID*	Specifies a single message ID, in the form "ENCFOO-123".
`-limit`	Returns the limit for the specified message as an integer. -1 is unlimited. 0 is suppressed.
`-long`	Returns the long message description, as used for the Description section in "`man` *msgID*"
`-on_error`	Returns the error action for the specified message.
`-severity`	Returns the severity, `error`, `warn`, `info`, or `default`, of the specified message as a string.
`-short`	Returns the short message description. Equivalent to "`help` *msgID*" .
`-stop_script_limit`	Returns the message limit allowed for every public command. Message limit set as -1 means unlimited.
`-suppress`	Returns `1` if the message is suppressed, `0` if not suppressed.

Related Information

- `set_message`

get_preference

```
get_preference
[-help]
preference_name
```

Returns the current preference settings.

Parameters

`-help`	Prints out the command usage
preference_name	Specifies the name of a preference. *Data_type*: string, required

Related Information

- set_preference

gui_bind_key

```
gui_bind_key
[-help]
key
-cmd cmdOrProcName
[-is_public]
```

Enables you to create keyboard shortcuts.

You can use this command at any time after starting Innovus.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_bind_key` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_bind_key`

key	Specifies the key to be used as the shortcut. You can specify a: • Single key-Specify any one of the following keys: ◦ `a-z` ◦ Function keys: Use `F1-F12` ◦ Arrow keys: Use `Up Down Left Right` ◦ Number keys ◦ Unshifted punctuation keys: `. , / - =` ◦ Other keys: Use `Space`, `Delete`, `Backspace`, or `Esc` keys • Combination-Specify `Shift` as the first key followed by '-' followed by: ◦ `A - Z` ◦ One of the 'shifted' punctuation chars: `~@#$%^&*()_+` ◦ Function keys: use `F1 - F12` ◦ Arrow keys: use `Up Down Left Right` ◦ Other keys: use `Space`, `Delete`, `Backspace`, or `Esc` • Ctrl/Alt Key Combination-Specify `Ctrl` or `Alt` as the first key followed by '+' followed by any of the single keys above *Data_type*: string, optional
`-cmd` *cmdOrProcName*	Specifies the command or proc to be executed - no parameters allowed. *Data_type*: string, optional
-is_public	Specifies the bindkey as user defined. *Data_type*: string, optional

Example

Runs the `gui_fit` command when you press `f` on your keyboard:

```
gui_bind_key f "gui_fit"
```

gui_bind_key

gui_get_record_obj_by_info

```
gui_get_record_obj_by_info
[-help]
[-layer layer_value]
[-name object_name]
-obj_type {viainst sviainst swire wire pwire pblkg}
-rect {x1 y1 x2 y2}
```

Returns the point of an object based on specific layer/name/area.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `gui_get_record_obj_by_info` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_get_record_obj_by_info`.
`-layer layer_value`	Specifies the layer value or layer range. *Data_type*: string, optional
`-name object_name`	Specifies the object name of net name for wire/swire/pwire/viainst/sviainst. *Data_type*: string, optional
`-obj_type {viainst sviainst swire wire pwire pblkg}`	Specifies the object type. *Data_type*: enum, required
`-rect {x1 y1 x2 y2}`	Specifies the coordinates of the object bounding-box. *Data_type*: rect, required

Example

The following command returns the point of wire which area is `{365.83 989.66 384.59 989.94}`, layer value is `3`, net name is `DTMF_INST/TDSP_CORE_INST/MPY_32_INST/ab_b[6]`.

```
uiGetRecordObjByInfo -objType wire -rect {365.83 989.66 384.59 989.94} -layer 3 -name
{DTMF_INST/TDSP_CORE_INST/MPY_32_INST/ab_b[6]}
```

gui_move_cursor

```
gui_move_cursor
[-help]
x y
```

Places the cursor at the specified location in the main window.

You can specify this command at any time after starting the Innovus software.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_move_cursor` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_move_cursor`
x	Specifies the x coordinate of the cursor location. *Data_type*: float, required
y	Specifies the y coordinate of the cursor location. *Data_type*: float, required

Example

The following command places the cursor at the coordinates (`133`, `277`).

```
gui_move_cursor 133 277
```

help

```
help
[-help]
pattern1
[pattern2]
[-category category]
[-detail  | -summary ]
[-command  | -attribute  | -obj  | -message ]
```

Displays help information related to a command, object, attribute or message based on the specified arguments.

By default, only commands, objects and attributes are searched for help.

Parameters

`-attribute`	Searches attributes only. *Data_type*: bool, optional
`-category` *category*	Returns only those attributes that are in the given category. *Data_type*: string, optional
`-command`	Searches commands only. *Data_type*: bool, optional
`-detail`	Provides detailed help, even when multiple help strings are returned. By default, a short help description is returned if more than one items are matched. *Data_type*: bool, optional
`-message`	Searches messages only. Note, By default messages are not searched. This option is required to see the message help. *Data_type*: bool, optional
`-obj`	Searches objects only. *Data_type*: bool, optional
pattern1	Searches for any command, object, or attribute that matches pattern1. Pattern matching with * and ? is allowed. If the pattern ends in : (e.g. inst:) only objects will be matched. If the pattern starts with . (e.g. .place*) then only attributes will be matched. *Data_type*: string, required
pattern2	Returns help only for those attributes that match pattern2 for the objects matching pattern1. For example, the following command will return all attributes that match `place*` on the `inst` object. `help inst place*` *Data_type*: string, optional
`-summary`	Provides a short description even for a single match. By default, if only a single item is matched, the full help description is returned. *Data_type*: bool, optional

Examples

- The following command prints the help for any command, object, or attribute that matches "port*". For attributes, the owning object is shown in (), followed by a summary of the data_type, read/write status, default value, allowed `get_db -index` values, and a description:

```
innovus> help port*
Objects:
port: External logical ports of the design. See pg_ports for power/ground ports

Attributes:
port(bump) # port, read-only, default={}, indices={}
# The port the bump is assigned to.
ports(design) # port*, read-only, default={}, indices={}
# ports of design. Does not include pg_ports, unless PG port is explicitly in the
# Verilog netlist.
ports(root) # port*, read-only, default={}, indices={}
# Short-cut for [get_db current_design .ports]
```

- The following command shows the help output for the attribute `.base_cell` on the object `inst:`. The : and . chars in `inst:` and `.base_cell` are optional as they restrict the search to objects and attributes, respectively.

```
innovus> help inst: .base_cell
Attribute: base_cell (on obj_type: inst)
Description: The base_cell of the inst.
category:
default:
is_computed: false
is_settable: true
is_user_defined: false
skip_in_db: true
type: base_cell
```

- The following output shows the help for a single command:

```
innovus 14> help write_metric
Command: write_metric:

Usage: write_metric [-help] [<pattern>] [-format <string>] [-id <string>] [-merge]
[-names <string>] {-file <string> | -inline }

-help      # Prints out the command usage
<pattern>   # List of patterns to match metrics (string, optional)
-file <string> # Filename to write (string, optional)
-format <string> # Data format for the return value (string, optional)
```

```
-id <string> # Database ID to output (string, optional)
-inline # Return the result instead of writing it to a file (bool, optional)
-merge # Merge the results into an existing file (bool, optional)
-names <string> # List of patterns to match snapshot names (string, optional)
```

- The following command shows the help output for a message.

```
innovus 14> help -message IMPTCM-48
Error/Warning message: IMPTCM-48: "%s" is not a legal option for command "%s".
Either the current option or an option prior to it is not specified correctly.
```

is_common_ui_mode

```
is_common_ui_mode
[-help]
```

Checks if the Stylus Common UI mode is enabled. This command is helpful if you are using both Common UI and Legacy UI, and you want to source their respective script based on the value returned by `is_common_ui_mode`. In such scripts. if `is_common_ui_mode` returns 1, Stylus Common UI commands will be sourced, and if it returns `0`, Legacy commands will be sourced.

For example, you can write a script, which can be sourced irrespective of UI, as below.

```
if {[is_common_ui_mode]}

{
<common UI commands>
}

else

{
<Legacy UI commands>
}
```

Parameters

None

Example

The following example checks it on the Innovus prompt:

```
@innovus> is_common_ui_mode

1

innovus> is_common_ui_mode

0
```

Return value `1` indicates that the Stylus Common UI mode is enabled.

lminus

```
lminus
[-exact]
list1
list2
```

Subtracts the specified elements in the second list (*list2*) from the first specified list (*list1*) .

Parameters

-exact	Searches for an exact match.
list1	Specifies the list from which elements must be removed.
list2	Specifies the list of elements to be subtracted.

Examples

- The following command subtracts the elements from list l2 from list l1.

```
innovus> set l1 {a a* ab2 b1 b2 c}
innovus> set l2 {a c}
innovus> lminus $l1 $l2
a* ab2 b1 b2
```

- The following command subtracts a list consisting of a* and c from the list of elements of l1.

```
innovus> lminus $l1 {a* c}
b1 b2
```

- The following command uses an exact search.

```
innovus> lminus -exact $l1 {a* c}
a ab2 b1 b2
```

man

```
man
command_name | msg_id
```

This command is a Tcl wrapper that calls the Linux ‘man’ command, so you can see man pages for Innovus commands, Innovus root attributes, or other Linux commands. The man-page directories inside the Innovus installation are automatically added to the beginning of the Linux environment variable MANPATH so you will see Innovus man-pages before any other man-pages in your MANPATH.

The only exception is if the argument matches the msg_id format (e.g. several letters with a dash followed by an integer like ‘ABC-123’)., the Tcl wrapper directly returns the msg_id message you would see in the log file, along with any extended help description if it is available for that msg_id. These msg_id ‘man-pages’ are not included in the man-page directories, but are only available inside Innovus.

For all other arguments, it just calls the Linux ‘man’ command with the proper MANPATH, so you can use any Linux ‘man’ options as described in the Linux man-page for ‘man’.

For information on setting up MANPATH for Stylus Common UI commands directly from Linux, see Setting Up the Run-Time Environment in the *Getting Started* chapter of the *Innovus Stylus Common UI User Guide*.

Parameter

command_name	Indicates the name of the text command (or root attributes) for which the manual information is required.
msg_id	Specifies a message ID in the format like ‘ABC-123’. The output will show the log file message and any extended help description that can include likely causes, possible fixes, and possible workarounds for this msg_id.

Example

- The following command returns the manual description of the command `report_timing`:

  ```
  man report_timing
  ```

- The following command returns the manual description of the `SOCSYC-139` message ID:

  ```
  man SOCSYC-139
  ```

Related Information

- Setting Up the Run-Time Environment in the *Getting Started* chapter of the *Innovus Stylus Common UI User Guide*.

parse_proc_arguments

```
parse_proc_arguments
[-help]
result_array
[forced_proc]
-args string
```

Supports argument validation within a Tcl procedure and enables the use of the `-help` option to view the help information associated with the procedure.

Procedures using the `parse_proc_arguments` command will validate the arguments. If the required arguments are missing or have invalid values, the `parse_proc_arguments` command generates a Tcl error and the calling procedure terminates.

The `parse_proc_arguments` command must be the first command called in the procedure. This command cannot be used outside of a procedure.

Parameters

`-help`	Prints out the command usage.
`-args string`	Specifies the list of arguments passed to the Tcl procedure. *Data_type*: string, required
result_array	Specifies the result array into which the parsed arguments are to be stored. *Data_type*: string, required
forced_proc	Specifies the name of the invoking procedure. *Data_type*: string, optional

Examples

The following Tcl procedure uses the `parse_proc_arguments` command for argument validation.

```
proc cmdProc {args} {

parse_proc_arguments -args $args results

foreach argname [array names results] {
```

```
puts "$argname = $results($argname)"

}

}

define_proc_arguments cmdProc -info "Command Description" \

-define_args \

{{-string "String help" "string_val" string optional}

{-integer "Int help" "int_value" int optional}

{-list "List help" "list_value" list {optional bind_option -Bool}}

{-boolean_a "BoolA help" "" boolean {optional mutual_exclusive_group g0}}

{-boolean_b "BoolB help" "" boolean {optional mutual_exclusive_group g0}}

{-float_num "Float help" "float_value" float}

{-oosa "One of StringA help" "one_of_str_value" one_of_string {optional value_help
{values {v1 v2}}}}

{-oosb "One of StringB help" "one_of_str_value" one_of_string {optional {values {v4
v5}}}}

}
```

Now, if the cmdProc procedure is invoked using the following command at the command prompt, argument validation takes place and the following errors are reported.

```
innovus> cmdProc -boolean_a -boolean_b

**ERROR: Options '-boolean_a -boolean_b' are mutually exclusive for 'cmdProc'.

Usage: cmdProc [-string string_val] [-integer int_value] [-list list_value] [-boolean_a
]

[-boolean_b ] [-float_num float_value] [-oosa one_of_str_value {v1 v2 }] [-oosb
one_of_str_value]]

**ERROR: Errors in 'cmdProc'.
```

The following command to invoke the cmdProc procedure will also return the errors shown below.

```
innovus> cmdProc -oosa v5

**ERROR:  The arguments specified (v5) in cmdProc -oosa are not valid. Refer to the
documentation for valid arguments.
```

```
Usage: cmdProc [-string string_val] [-integer int_value] [-list list_value] [-boolean_a
]

[-boolean_b ] [-float_num float_value] [-oosa one_of_str_value {v1 v2 }] [-oosb
one_of_str_value]]

**ERROR: Errors in 'cmdProc'.
```

print_message

```
print_message
-help
formatString
[args]
[-error]
[-warning]
```

Generates a message that is included in the `report_messages` output if the message is designated as an error or a warning.

Parameters

args	Specifies the format argument value to print. *Data_type*: string, optional
-error	Specifies the message is an error. A prefix will be added. *Data_type*: bool, optional
formatString	Specify the format specifier like sprintf or Tcl's format command. *Data_type*: string, required
-help	Prints a brief description that includes the type and default information for each `print_message` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man print_message`.
-warning	Specifies that the message is a warning. A prefix will be added. *Data_type*: bool, optional

Examples

The following commands generate an error and a message, which are included in the report_message output:

```
[DEV]innovus 3> print_message -error "A test %s." "from the user"
ERROR: (user): A test from the user.

[DEV]innovus 4> print_message -warning "A test %s." "from the user"
WARN: (user): A test from the user.

[DEV]innovus 5> print_message "A test %s." "from the user"
A test from the user.

[DEV]innovus 6> report_messages
*** Summary of all messages that are not suppressed in this session:
Severity      ID       Count          Summary
ERROR       no_id       1            A test %s.
ERROR       user        1            A test %s.
WARN        user        1            A test %s.
*** Message Summary: 1 warning(s), 2 error(s)
```

Related Information

- report_messages

program Category Attributes

The root attributes in the program category are:

- cmd_file
- log_file
- logv_file
- program_major_version
- program_name
- program_short_name
- program_version
- selected

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `program` category, use the following command:

```
get_db -category program
```

cmd_file

`cmd_file` *fileName*

Default: ""

Data_type: string, read/write

Specifies the cmd log file name of the program.

The `.cmd` file captures just the Tcl commands executed without extra formatting so they can be cut-and-pasted for reuse. The names of the files default to the program name, extension, and extra number if there is a file name collision (e.g. innovus.log2, innovus.logv2, innovus.cmd2). These names can be overridden, or the files suppressed with the Linux command line options `-log`, `-no_cmd`, and `-no_logv` (see 'man innovus' for details).

The `cmd_file` root attribute is writable. You can change where the output is logged for any of them

during the run.

log_file

`log_file` *`fileName`*

Default: ""

Data_type: string, read/write

Specifies the log file name of the program. It will default to `innovus.log<N>` where `<N>` is a unique integer to avoid file name collisions. It can be set from the Innovus Linux command line, and it can be changed in Tcl during the run to direct the log output to different files. If it is changed, the new file is opened for write (not append), so any previous contents are lost.

The `log_file` root attribute is writable. You can change where the output is logged for any of them during the run.

logv_file

`logv_file` *`fileName`*

Default: ""

Data_type: string, read/write

Specifies the verbose log file name of the program.

The `.logv` file captures all output to the xterm and has more detailed verbose output that is not normally needed. However, it can be useful when debugging problems. Every output line has a time-stamp, and complex commands like `opt_design` will write out much more detailed internal information to help debug issues.

The `logv_file` root attribute is writable. You can change where the output is logged for any of them during the run.

program_major_version

`program_major_version`

Default: ""

Data_type: double, read-only

Returns the major version and one digit after the decimal point.

For example, the following command gives the major version of the software:

```
@innovus 1> get_db program_major_version
20.1
```

program_name

```
program_name
```

Default: ""

Data_type: string, read-only

Specifies the name of the program.

For example, the following command gives the name of the software:

```
@[DEV]innovus> get_db program_name
Innovus Implementation System
```

program_short_name

```
program_short_name
```

Default: ""

Data_type: string, read-only

Specifies the short name of the program.

For example, the following command gives the short name of the software:

```
@[DEV]innovus> get_db program_short_name
innovus
```

program_version

```
program_version
```

Default: ""

Data_type: string, read-only

Specifies the version of the program.

For example, the following command returns the software version:

```
@innovus 1> get_db program_version
20.10-d255_1
```

selected

`selected` *`list`*

Default: ""

Data_type: string, read/write

Specifies the list of currently selected objects. It can be set to a list of objects as long as they are selectable.

puts

`puts`
`[-help]`
`[-nonewline]`
`[-logv]`
`[`*`channel`*`]`
`string`

Outputs information to the screen (stdout) and Innovus log files (.log/.logv).

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `puts` command: `man puts`
`channel`	Specifies a channel id returned by `open` or `socket`. *Data_type*: string, optional
`-logv`	Specifies to write string to the .logv file only. This option cannot be used with *`channel`*. *Data_type*: bool, optional
`-nonewline`	Suppresses the new-line that is normally added after the *`string`* value. *Data_type*: bool, optional
`string`	Specifies a string value to write out. *Data_type*: string, optional

redirect

```
redirect
[-help]
[file_or_var_name]
[command]
[-tee]
[-stdin | -append]
[-stdin | -variable]
[-variable]
[-stderr | -stdin]
```

Redirects the output to a file or variable. You can also directly use redirect characters without explicit use of the redirect command for Innovus commands.

Any Tcl return value from *command* is returned by redirect. If redirect is used at the prompt, any echoing of the Tcl return at the prompt is not redirected.

You can also use the `redirect` command to write the contents directly to a gzip compressed file by ending the file name with .gz.

Parameters

`-help`	Prints a brief description that includes type and default information for each `redirect` parameter.
`file_or_var_name`	File or variable name for output to go. *Data_type*: string, optional
`command`	Command to be executed. *Data_type*: string, optional
`-append`	Appends stdout/stderr to file or variable. *Data_type*: bool, optional
`-stderr`	Redirects stderr. *Data_type*: bool, optional
`-stdin`	Redirects stdin. *Data_type*: bool, optional
`-tee`	Redirects output to both screen and file or variable. *Data_type*: bool, optional
`-variable`	Redirects to a Tcl variable. *Data_type*: bool, optional

It is also possible to use redirect characters similar to Unix usage, for Innovus commands, but not for built-in Tcl commands. This usage works for any Innovus command that does not explicitly register > or >> as options (if > or >> are visible in the man page or -help output for the command, it is explicitly registered). Note that the "source" command is overlaid by Innovus to add various verbose options, so it also supports these characters.

The table below shows the usage of redirect characters, and how to use & to indicate a Tcl var name.

Redirect Characters	Meaning
> <name>	redirect stdout to the file <name>

>> <name>	redirect stdout and append to the file <name>
> &<name>	redirect stdout to the Tcl var <name>
>> &<name>	redirect stdout and append to the Tcl var <name>

Examples

- Redirects the output to a new file timing.txt.
  ```
  redirect timing.txt "time_design -post_route"
  ```
- Appends the output to the file test.out.gz in compressed gzip format.
  ```
  redirect test.out.gz "source test.tcl" -append
  ```
- Redirects the output to both screen and a file.
  ```
  redirect timing.txt "time_design -post_route" -append -tee
  ```
- Redirects to the file a.log in compressed gzip format
  ```
  source test.out > a.log.gz
  ```
- Redirects and appends to the file a.log
  ```
  report_area >> a.log
  ```
- Redirects to the Tcl var a
  ```
  report_area > &a
  ```
- Redirects and appends to the Tcl var a
  ```
  report_area >> &a
  ```
- The `get_db` and `get_property` commands return their values as TCL_RESULTS. To redirect the output to any file, you can use any of the following methods:
  a. You can redirect output of `get_db` and `get_property` using the following commands:
  ```
  redirect {puts "[get_db insts .name]"} > inst_name.rpt
  redirect {puts "[get_property [get_lib_cells SDFFHQX1] area]"} > property.rpt
  ```
  b. You can get the value of output stored in a variable using the following commands:
  ```
  redirect a {puts "[get_db insts .name]”} -variable
  redirect b {puts "[get_property [get_lib_cells F1] area]"} -variable
  ```

rename_obj

```
  rename_obj
[-help]
[-escape_ok]
[-flexible]
object
new_name
```

Renames the `base_name` of a single design object, which could only be a `inst`, `hinst`, `design`, `module`, `port`, `hport`, or `hnet`. This command changes only the `base_name` of the specified objects, and cannot move those across the netlist hierarchy. This command also returns the new name of the renamed object.

The names used for SDC timing constraints can only be modified using this command, if they have been loaded into the memory. So, ensure that all the timing views are loaded using the `set_analysis_view` command before running the `rename_obj` command so that the SDC constraints are updated properly. The modified SDC files can be retrieved after renaming the objects.

The `rename_obj` command cannot update the names used inside a CPF `power_intent` file. This is because the CPF usage assumes that the CPF file is golden and should not be modified. To change the names used inside a CPF file, first update the CPF file manually, and then use the updated CPF file to run the `rename_obj` command.

An IEEE1801 `power_intent` file is allowed to be changed during the design flow. So, changing names using the `rename_obj` command will automatically update the IEEE1801 object names. You can use the `rename_obj` command to write out the new IEEE1801 file with the updated names.

Note: To update the inst, net, phys_insts, port, module, and design object names, use the `update_names` command.

Parameters

`-help`	Provides a brief description of the command that includes the type and default information for its parameters. For a detailed description of the command and all its parameters, use the man command: `man rename_obj`

-escape_ok	Allows `new_name` to have either the hierarchy chars '`/`' or the bus-bit chars '`[]`' in it, which will automatically be escaped. If this parameter is not specified, any set of '`/`' or '`[]`' chars in `new_name` will cause an error and the object will not be renamed. *Data_type*: bool, optional
`-flexible`	If `new_name` coincides with an existing name, this parameter appends a suffix (such as `_1` and `_2`) to differentiate it. If this parameter is not specified, a name collision in such a scenario causes an error, and the specified object is not renamed. *Data_type*: bool, optional
object	Specifies the object to be renamed. The object here must be an `inst`, `hinst`, design, `module`, `port`, `hport`, or `hnet`. If *object* is a `port` or `hport`, any `hnet` connected to it with the same `base_name` is also renamed to keep it matched (for example, renaming `hport:top/i1/clkin` also renames `hnet:top/i1/clkin`). If *object* is an `hnet` that is connected to a `port` or `hport` with the same `base_name`, an error occurs. In such a case, you must change the `port` or `hport` name to proceed. If an `hnet` name matches with its associated `net` name (for example, `get_db $my_hnet .net`), then the net name is also renamed on using the `rename_obj` command. For example, renaming `hnet:top/net1` also renames `net:top/net1`. Therefore, to rename a `net`, you need to rename the `hnet` with the same name. This command does not allow renaming a bus-bit object. So any `port`, `hport`, or `hnet` that has a `.base_name` like `busA[0]` (a bus-bit object), cannot be renamed, While a `.base_name` with a scalar name (like `busA\[0\]`) can be changed. *Data_type*: (`inst | hInst | vCell | topCell | term | hTerm | hNet`), required

new_name	Specifies the new `base_name` for the specified object. *Data_type*: string, optional

Examples

- The following command renames an `inst base_name` to `i2_new`:
```
rename_obj inst:top/i1/i2 i2_new
inst:top/i1/i2_new                #returned object with new name
```
- The following command renames an `inst base_name i2\/i3` with escaped hierarchy:
```
rename_obj {inst:top/i1/i2\/i3} i2/i3_new -escape_ok
inst:top/i1/i2\/i3_new            #returned inst object, no hierarchy change
```
- The following command renames a scalar `hport` name to remove escaped bus-bit chars:
```
rename_obj {hport:top/i1/busA\[0\]} busA_0
hport:top/i1/busA_0               #returned hport object
```
Note: `hnet:top/i1/busA\[0\]` is also renamed to `hnet:top/i1/busA_0`.
- The following command renames a `port` name:
```
rename_obj port:top/clkin clkin_new
port:top/i1/clkin_new             #returned port object
```
Note: Both `hnet:top/i1/clkin` and `net:top/i1/clkin` are renamed.

`update_names`

report_area

```
  report_area
[-help]
[-detail]
[-hierarchical_instance hinst_name]
[-include_physical]
[-min_area area_per_module]
[-min_count instance_count]
[-out_file filename]
[-show_leaf_cells]
[-show_msv_cells]
[-sort_by {name count area}]
[-table_style {horizontal vertical}]
[-summary | -depth depth_of_hierarchy]
```

Reports the combined standard cell area in each of the hierarchy modules and the top-level design. Also reports the cell area based on different cell types if the `-detail` option is specified. The command provides breakdown based on the cell type (such as .is_* attributes). The report represents the design hierarchy, and therefore, provides better readability.

Note: The units used in the report depend on the units used in the library. The area for each module is calculated from all the standard cells within each module using the LEF information.

Parameters

`-help`	Prints a brief description that includes type and default information for each `report_area` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_area`
`-depth depth_of_hierarchy`	Specifies the depth of hierarchy, all levels if not specified; the top of the hierarchy (design) is 1. *Data_type*: int, optional

`-detail`	Report the area in different cell type (buffer, inverter, combinational, flop, latch, clock_gate, macro, physical). *Data_type*: bool, optional
`-hierarchical_instance` *hinst_name*	Reports the area of the leaf instances in the specified hierarchical instance. You can use the -depth option to control the analysis depth of the specified hierarchical instance. *Data_type*: (hinst), optional
`-include_physical`	Specifies to include physical cells in the area calculation and report. By default, it reports only logical cells. *Data_type*: bool, optional
`-min_count` *instance_count*	Specifies the min instance count per module. The generated output will report the area of hinsts with number of instances greater than the specified `min_count value`. *Default*: `0` *Data_type*: int, optional
`-` `min_area` *area_per_module*	Specifies the min area per module. The generated output will report the area of hinsts with area greater than the specified min_area lib_units. *Default*: `0` *Data_type*: float, optional
`-out_file` *filename*	Specifies the name of the output file. *Data_type*: string, optional

`-show_leaf_cells`	Specifies to include the leaf cells at the design level and each hinst level. These are the instances whose parent is the hinst display. *Default*: `0` (Shows the hinst children in the report) *Data_type*: bool, optional
`-show_msv_cells`	Includes multiple supply voltage cells in the report. This option works with "-table_style vertical". *Data_type*: bool, optional
`-sort_by {name count area}`	Specifies the order of hinst names. *Default*: `name` *Data_type*: enum, optional
`-summary`	Prints the area summary for the design. It is equivalent "`-depth 0`". *Data_type*: bool, optional
`-table_style {horizontal vertical}`	Specifies whether the base report should be expanded in the vertical or horizontal direction. *Default*: `horizontal` *Data_type*: enum, optional

Examples

The following command shows the standard cell area in different base classes.

```
report_area -detail
```

(Macro)		0	0.00	

report_dangling_ports

```
report_dangling_ports
-help
-partition
-out_file fileName
```

Reports ports that are disconnected from both the inside and outside of a module, and ports that are connected within the module but disconnected outside the module.

Note: If the design has some dangling or unconnected ports, Innovus will add `FE_UNCONNECTED_*` nets for these dangling or unconnected ports in the design during optimization. You can report these dangling ports using the `report_dangling_ports` command.

Parameters

`-help`	Prints a brief description that includes type and default information for each `report_dangling_ports` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_dangling_ports`
`-out_file`	Specifies the name of the report generated by this command. *Data_type*: string, required
`-partition`	The option a partition only flag of the type boolean. This is an optional. *Data_type*: bool, optional

Examples

The following command writes information on dangling reports to file `myreport`:

```
report_dangling_ports -out_file myreport
```

Related Information

- delete_dangling_ports
- disconnect_dangling_port

report_gate_count

```
report_gate_count
[-help]
[-hinst hinst_name]
[-level level]
[-limit gateCount]
[-std_cell_only]
[-out_file fileName]
```

Reports the size of the imported design, measured in gate counts.

The software calculates the gate count for a module using the following equation:

```
gateCount = moduleArea / gateSize
```

Where:

- `moduleArea` is the area of the module. By default, this is the sum of the areas of all instances inside of the module, including standard cells, blocks, and I/O cells. If you specify the `-std_cell_only` parameter, `moduleArea` is the sum of the areas of the standard cells inside the module only.
- `gateSize` is calculated as follows:

  ```
  gateSize = dbgStdCellHgt x dbgDBUPerIGU x dbgSitesPerGate
  ```

  Where:

  - `dbgStdCellHgt` is the standard cell row height.
  - `dbgDBUPerIGU` is the *M2* layer pitch.
  - `dbgSitesPerGate` is a user-defined global variable that determines the gate size the software assumes when calculating the gate count. For example, the default value of `3` means the assumed the gate size is equal to 1 standard cell row height and 3 *M2* layer pitch widths. You can change this value to adjust the assumed gate size for each specific design.

You can use the `report_gate_count` command after importing the design.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_gate_count` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_gate_count`.
`-level` *level*	Expands the module to the specified level. For example, if you specify `1`, CTS expands the specified module by one level. The gate counts of all "children" modules of the module that satisfy the `-limit` parameter are included in the gate count report. If you specify `2`, CTS expands the module by two levels. The gate counts of all "children" and "grandchildren" modules of the module are included in the gate count report. *Default*: Module is not expanded, and CTS reports only the gate count of the module itself. (This is equivalent to specifying a level of `0`.) *Data_type*: int, optional
`-limit` *gateCount*	Instructs CTS to ignore modules with gate counts below the specified limit. Such modules are ignored during expansion and reporting. *Default*: CTS ignores modules with 1000 or fewer gates during expansion and reporting. *Data_type*: int, optional
`-hinst` *hinst_name*	Specifies the hierarchical instance for which to generate a gate count report. *Default*: Generates a gate count report for the hierarchical instance corresponding to the top cell of the design. *Data_type*: string, optional
`-out_file` *fileName*	Writes out the gate count report to the specified file name. The default file extension is `.gateCount`. *Default*: Displays the gate count report *only* in the Innovus console. *Data_type*: string, optional

`-std_cell_only`	Calculates gate count based only on standard cells within the specified module. Blocks and I/O cells within the module are ignored. *Data_type*: bool, optional

report_hidden_usage

`report_hidden_usage`
`in_files`

Reports a summary of all the hidden application Tcl globals and mode options in the specified files. Hidden globals and mode options are normally used for temporary fixes or early access, and often disappear or change in a new release. This command will help to find out the hidden settings used in existing scripts that might not be needed in the new release.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_hidden_usage` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_hidden_usage`
`in_files`	Specifies input files to search for hidden usage. *Data_type*: string, required

Examples

- The following command reports the hidden settings in the floorplan.tcl and place.tcl files.

```
>report_hidden_usage {floorplan.tcl cts.tcl} > hidden.rpt

################################################################################
#  Generated by:    Cadence Innovus 18.10-a072_1
#  OS:              Linux x86_64(Host ID sjfib146)
#  Generated on:    Tue Apr 17 22:47:31 2018

report_messages

```
report_messages
[-help]
[[{-errors | -warnings | -all } [-count ]] | -suppressed ]
[[-prefix prefix [-detail ] [-summary ]] ] [-detail | -count | -suppressed ] [-summary
| -count | -suppressed ]
```

Reports the messages that have been issued since the tool was launched. When you run `report_messages` without any argument, it prints a summary table and returns no Tcl value. However, when you provide an argument, it returns a list a of message IDs and does not print a table.

Parameters

`-help`	Prints a brief description that includes type and default information for each `report_messages` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man report_messages`
`-all`	Returns a list of all issued message IDs as a Tcl result. The result does not include suppressed message IDs. *Data_type*: bool, optional
`-count`	Returns the count of every message when `-errors`, `-warnings`, or `-all` is specified. For example, if an error appeared 20 times, command will return: `{<Error ID> 20}` *Data_type*: bool, optional
`-detail`	Returns a list of detail message of the specified prefix. *Data_type*: bool, optional
`-errors`	Returns a list of issued error message IDs as a Tcl result. *Data_type*: bool, optional
`-prefix` *prefix*	Returns a list of issued error message IDs matched with `-prefix` specified as a Tcl result. *Data_type*: string, optional
`-summary`	Returns the summary of the message that has the specified prefix. *Data_type*: bool, optional
`-suppressed`	Returns a list of suppressed message IDs as a Tcl result. *Data_type*: bool, optional
`-warnings`	Returns a list of issued warning message IDs as a Tcl result. *Data_type*: bool, optional

Examples

- The following command prints a summary table and returns no Tcl value.

```
report_messages
```

Output:

```

report_netlist_statistics

```
report_netlist_statistics
```

Reports statistical data of the design netlist such as number of cells, number of nets (including tri-nets and degen nets), number of pins, and number of IOs in the design and number nets with different number of terms. The primitives used in the design are also listed.

Example

```
*** Statistics for net list DTMF_CHIP ***
Number of cells      = 4263
Number of nets       = 4551
Number of tri-nets   = 0
Number of degen nets = 21
Number of pins       = 16490
Number of i/os       = 57

Number of nets with    1 terms = 21 (0.5%)
Number of nets with    2 terms = 2510 (55.2%)
Number of nets with    3 terms = 771 (16.9%)
Number of nets with    4 terms = 510 (11.2%)
Number of nets with    5 terms = 223 (4.9%)
Number of nets with    6 terms = 108 (2.4%)
Number of nets with    7 terms = 76 (1.7%)
Number of nets with    8 terms = 46 (1.0%)
Number of nets with    9 terms = 30 (0.7%)
Number of nets with >=10 terms = 256 (5.6%)

*** 72 Primitives used:

Primitive AOI21X1 (282 insts)
```

report_obj

```
report_obj
[start [pattern] | [-selected ]
[-categories list_of_categories]
[-file fileName]
[-index index_name index_value ...]
[-computed ] [-all ]
[-set_by_user | -read_only]
[-tcl | -verbose ]
```

Creates a report about the attributes for a given pattern/category/object. This command is mainly intended for root attributes but can be used for any object.

It shows the non-default, settable, persistent, not computed, and public attributes of objects.

You can also add more attributes or filter out some attributes using various parameters below.

Parameters

`-help`	Prints a brief description that includes the type and default information for each system root attribute.
`-all`	Reports all non-computed attributes and their current value which could be default or not. *Data_type*: bool, optional
`-categories` *list_of_categories*	Reports only those attributes that are in the given categories. Wildcards * and ? are allowed. Attributes that do not have a category are assigned the reserved category name `NULL`. The report puts all the attributes in a category together. *Data_type*: string, optional
`-computed`	Includes all attributes that are marked as is_computed in the data model. This parameter can be used with `-all`. *Data_type*: bool, optional
`-file` *fileName*	Specifies the output file name. *Data_type*: string, optional

`-index` *`index_name index_value ...`*	Specifies the list of indices in a form of object pointers or pairs of *`obj_type object_name`*, for example. '-index {view view1}' or '-index $obj'. *Data_type*: tcl_obj, optional
`pattern`	Returns all the attribute names that match the specified *`pattern`* using the * and ? wildcards. The *`start`* value is required before the *`pattern`* value. *Default:* * *Data_type*: string, optional
`-read_only`	Reports attributes with `.is_settable = false`. *Data_type*: bool, optional
`start`	Returns attributes for the objects in the *`start`* list. *Default:* `root` *Data_type*: string, optional
`-selected`	Reports attributes for only selected objects. This parameter cannot be used with `-all`. *Data_type*: bool, optional

`-set_by_user`	Reports the root attributes set by the user. In the legacy system, the `setXXXMode` options (e.g. `setPlaceMode`, `setRouteMode`) tracked if the user set them or not independently from the value, while the legacy Tcl globals (e.g. timing_xxx) do not track this. For the root attributes derived from `setXXXMode` options, the `set_by_user` flag can be checked and the root attribute value returned even if the value equals the default value (use `reset_db` to clear the `set_by_user` flag). For root attributes derived from legacy Tcl globals, there is no `set_by_user` flag, so only the root attributes that have a value different from the default value are returned. **Note**: If `-categories` is used along with `-set_by_user`, the attributes in the given categories, as well as all unmapped attributes will be printed. *Data_type*: bool, optional
`-tcl`	Returns the objects and their values in a TCL style list, which is a list of keyword-value pairs. *Data_type*: bool, optional
`-verbose`	Returns the object's data type and default value. This parameter cannot be used with the `-tcl` parameter. *Data_type*: bool, optional

Examples

- The following command displays the root attributes for the `timing` category that are not computed, and do not match the default value with their current values:

```
report_obj -categories timing -all

********************************************************************************** Object:
root:**********************************************************************************

wire_capacitance_min_rise                                             0.0410037
```

report_obj Category Attributes

The root attributes in the report_obj category are:

- report_obj_display_limit

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `program` category, use the following command:

```
get_db -category program
```

report_obj_display_limit

```
report_obj_display_limit displayLimit
```

Default: `1000`

Data_type: int, read/write

Controls the number of objects that will be displayed when using `report_obj`. If the value is `10`, 'report_obj insts' will only display 10 instance objects with all their non-default attributes.

report_summary

```
report_summary
[-help]
[-out_dir directoryName]
[-no_text | -no_html]
[-out_file fileName | -no_text]
[-no_html | -browser] [-exclude_base_cells_for_density base_cell+ | -
exclude_inst_prefix list_of_prefixes]
```

Reports statistics for the entire design, or a selected object in the design. A report on the entire design includes statistics for the following categories:

- General design information
- General library information

- Netlist information
- Timing information
- Floorplan/Placement information

To display information about a selected object in the design, you must select the object first before using `report_summary`. The information contained in the report varies depending on the object you select. You can select a module, an instance, or a net.

You can use this command at any time after importing a design.

Parameters

`-browser`	Opens a browser and displays the HTML version of the report. *Data_type*: bool, optional
`-exclude_base_cells_for_density` *base_cell+*	Specifies the list of cells to be excluded from the density report. Any instances of these cells are ignored from fixing ((libCell/ptnCell)+. *Data_type*: (base_cell)+, optional
`-exclude_inst_prefix` *list_of_prefixes*	Specifies the list of prefixes to map all instance names to be excluded from the density report. *Data_type*: string, optional
`-no_html`	Generates only a text version of the report. **Note:** If you specify `-no_html`, you cannot specify `-no_text`. *Default:* The report is generated in both HTML and text format. *Data_type*: bool, optional

`-no_text`	Generates only an HTML version of the report. Some statistics in the sections on the main HTML report page include links to more detailed HTML report pages. For example, if you click on the *# Layers* link under the *General Library Information* section of the HTML report, the software displays a detailed HTML report on the layers in the design. **Note:** If you specify `-no_text`, you cannot specify `-no_html`. *Default:* The report is generated in both HTML and text format. *Data_type*: bool, optional
`-out_dir` *directoryName*	Specifies the directory in which the HTML and text reports are saved. If `-no_text` is specified, saves only the HTML version of the report to the specified directory. The `-out_dir` parameter cannot be used with `-no_html`. *Default:* `report_summary` *Data_type*: string, optional
`-out_file` *fileName*	Writes the text version of the report to the specified file. **Note:** You can specify this option only if you specify `-no_html`. *Default:* If you specify `-no_html` and do not specify `-out_file`, the software writes the text version of the report to a file named *design_name*`.main.htm.ascii` in the `report_summary` folder. *Data_type*: string, optional

Examples

Examples

- The following command reports statics for the entire design and generates a text version of the results called `report_summary.rpt`:

  ```
  report_summary -no_html -out_file report_summary.rpt
  ```

  The following is a sample of the resulting text report:

  ```

- The following command also reports statics for the entire design, but creates both a text version and an HTML version of the results. Both versions of the report are saved in the `myReport` directory. The text version is named `dtmf_chip.main.htm.ascii` whereas the HTML report is saved as *`design_name`*`.main.htm`.

  ```
  report_summary -out_dir myReport
  ```

Related Information

- For an example of an HTML report, see "HTML Summary Report" in the File Menu chapter of the *Innovus Stylus Common UI Menu Reference*.

resume

```
resume [-help]
```

Resumes a suspended script from the point where it had stopped.

Use the `suspend` and `resume` commands to debug your scripts interactively. The `suspend` command stops a script and restores access to the Innovus prompt. You can then type any command required for debugging. Whenever you want to resume the suspended script, type `resume` at the Innovus prompt.

Parameters

`-help`	Prints the usage of the `resume` command. For a detailed description of the command, use the `man` command: `man resume`.

Related Topics

- `suspend`
- "Interrupting the Software" section of the Getting Started chapter in the *Innovus Stylus Common UI User Guide*.

select_obj

```
select_obj
[-help]
any_object+
```

Selects the object or the list of objects for putting into a set. The object type can be any object type selectable on the GUI such as inst and net.

You can add a new selection to an already selected object using the following command:

```
select_obj [concat [get_db selected.] new_object_dbo_name]
```

Parameters

`-help`	Prints a brief description that includes type and default information for each `select_obj` parameter. For a detailed description of the command and all of its parameters, use the man command: `man select_obj`
`any_object+`	Specifies the list of objects. **Note:** If the list contains the objects that cannot be selected, such as `head`, `layer`, and `ptn`, `select_obj` will not select them. The objects that cannot be selected are `root`, `layer`, `partition`, `bus`, `clock`, `module`, `via_def`, `via_def_rule`, `layer_rule`, `gcell_grid`, `foreign_cell`, `hnet`, `site`, `shape`, `density_shape`, and `track_pattern`. *Data_type*: (any_object)+, required

Example

```
select_obj [get_db insts i1/*]
```

- `deselect_obj`
- Design Implementation Flow chapter in the *Innovus Stylus Common UI User Guide*

set_compress_level

`set_compress_level` *`compression_level`*

Specifies the compression level to use when compressing large data files. A higher compression level creates a more compressed file, but at the cost of speed. A lower compression level creates a less compressed file, but speeds up the process. By default, the software uses the `gzip` default value, that is 6, which results in high compression at the cost of speed.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_compress_level` parameter. For a detailed description of the command and all of its parameters, use the man command: man `set_compress_level`
`compression_level`	Specifies the compression level to use when compressing files. You can specify -1 or values between 1 and 9, where: `1` Creates the least compressed files at the highest speed. `9` Creates the most compressed files at the lowest speed. -1 Returns to the `gzip` default value, that is 6 (`Z_DEFAULT_COMPRESSION`). *Data_type*: int, required

Examples

- The following command sets the highest compression level and results in the most compressed data:
  ```
  set_compress_level 9
  ```
- The following command resets the compression level to the gzip default, that is 6.
  ```
  set_compress_level -1
  ```

Related Commands

- get_compress_level

set_current_design

`set_current_design` *`cell_name`*

Switches the design to the partition specified by the `top` *`cell_name`*.

Note: Cadence recommends that you use the same name for the top cell and the partition.

You can use this command only after you commit the partition.

Parameters

`cell_name`	The name of the top cell that indicates a different partition. *Data_type*: string, required

Related Topics

- Hierarchical Flow Capabilities chapter in the Innovus User Guide
  - Partitioning the Design - Restoring the Top-Level Floorplan with Partition Data

set_layer_preference

```
set_layer_preference
[-help]
layer_name
[-is_visible {1 | 0}]
[-is_selectable {1 | 0}]
[-color {color_name | color_value}]
[-line_width {lw}]
[-stipple stipple_name | -stipple_data width height "stipple_data"]
```

Sets a new preference for the specified object or layer.

See `get_layer_preference` for descriptions of how to display layer preferences.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_layer_preference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_layer_preference`
`-color {color_name | color_value}`	Specifies a color for the object. Specify either a color name or a numeric RGB value. *Data_type*: string, optional
`-is_selectable {1 | 0}`	Specifies whether the object is selectable. Specify `1` to make the object selectable. Specify `0` to make the object non-selectable. *Data_type*: enum, optional

`-is_visible {1 | 0}`	Specifies whether the object is visible. Specify `1` to make the object visible. Specify `0` to make the object invisible.
	Examples
	• You can turn off the visibility of all custom layers by using the following command:
	`set_layer_preference customLayers -is_visible 0`
	• You can turn off display of flightlines by using the following command:
	`set_layer_preference flightLine -is_visible 0`
	Data_type: enum, optional

layer_name	Specifies the name of the layer or the object type. The valid layer names are `M#`, where `#` is `0` through `1`, and `M#AVio`, `M#Cont`, `M#ContPin`, `M#ContRB`, `M#Pin`, `M#RB`, `M#RTrk`, and `M#Vio`. The valid object types are `blackBox`, `block`, `blockHalo`, `bump`, `bump1`, `bump2`, `bump3`, `cellBlkgObj`, `channel`, `clkTree`, `congest`, `congestH`, `congestObj`, `congestV`, `datapath`, `fence`, `gcellOvflow`, `guide`, `hinst`, `inst`, `ioSlot`, `ioRow`, `macroSitePattern`, `metalFill`, `mGrid`, `net`, `netRect`, `nonPrefTrackObj`, `obstruct`, `pinObj`, `pinText`, `power`, `powerNet`, `ptnFeed`, `ptnPinBlk`, `pwrdm`, `pwrdm1`, `pwrdm2`, `pwrdm3`, `layerBlk`, `region`, `routeGuide`, `ruler`, `screen`, `select`, `sitePattern`, `stdRow`, `term`, `text`, `trackObj`, `userGrid`, and `violation`. *Data_type*: string, required
`-line_width` *lw*	Specifies the number of pixels in the border of the specified object. Specify this value as integer. *Data_type*: int, optional

`-stipple` *stipple_name*	Specifies information about the stipple pattern of the object. The valid stipple names are `None`, `Horizontal`, `Vertical`, `Grid`, `Slash`, `Backslash`, `Cross`, and `Brick`. *Data_type*: string, optional
`-stipple_data` *width height "stipple_data"*	Specifies the stipple information for the object. Specify this information in x-window bitmap format. *Data_type*: string, optional

Example

The following command sets a layer preference for the module object in green with dotted stipple pattern (8 by 4 bitmap with dot at every 4 pixels):

```
set_layer_preference hinst -color green -stipple_data 8 4 "0x00 0x11 0x00 0x00"
```

set_license_check

```
set_license_check
[-help]
[-option_list {license1 license2 …}]
[-wait time_in_minutes]
[-default]
[-check_out license]
[-status]
[-exists_on_server]
```

Manages licenses for product options. Specifies licenses to check out, license wait time, and the status of all product option licenses.

Note: This command does not manage multi-CPU licenses. For information on the commands that manage multi-CPU licenses, see the "Multiple-CPU Processing Commands" chapter.

Parameters

`-check_out` *license*	Checks out the licenses for the specified product options when this command runs. *Data_type*: string, optional
`-default`	Restores the default. values for this command. *Data_type*: bool, optional
`-exists_on_server`	Outputs a table that provides the following information for each of the licenses that exist on the license server. • License name • Product number • Product name • License string • Version *Data_type*: bool, optional

`-help`	Outputs a brief description that includes type and default information for each `set_license_check` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_license_check`.
`-option_list` *license1 license2 …*	Specifies licenses to check out dynamically. Dynamic licenses are not checked out until they are needed. If you specify a license that is not allowed with your base license, or a license that is not available, the software does not check out that license and instead issues a warning message. If you specify more than one license, begin and end the option list with double quotation marks or braces. *Data_type*: string, optional
`-status`	Outputs the following information: • The name of the base license that is checked out • The current wait time • A list of the allowed license options • A list of the available license options • A list of the currently checked-out license options. *Data_type*: bool, optional
`-wait` *time_in_minutes*	Specifies the amount of time the system waits for a license to become available. If the license is available in less than the specified wait time, the system checks out the next needed license without waiting. *Default:* `0` (no wait time) *Value range:* `0` to `10,000` *Data_type*: int, optional

Examples

- The following command outputs a table that provides information about the licenses that exist on the license server:

  ```
  set_license_check -exists_on_server
  ```

  The system outputs the following information:

  ```
  Name         Prod #    Product Name  License string                          Version
  invs_hier    INVS40    Innovus Hierarchical Design Option Innovus_Hier_Opt  15.1
  invs_ms      INVS30    Innovus Mixed Signal Option Innovus_MS_Opt           15.1
  invs_3d_ic   INVS60    Innovus 3D-IC Option Innovus_3D_IC_Opt               15.1
  invs_20nm    INVS20    Innovus 20nm Option Innovus_20nm_Opt                 15.1
  invs_10nm    INVS10    Innovus 10nm Option Innovus_10nm_Opt                 15.1
  invs_i20nm   INVSI20   Innovus I20nm Option Innovus_I20nm_Opt               15.1
  invs_i10nm   INVSI10   Innovus I10nm Option Innovus_I10nm_Opt               15.1
  ................................................
  ................................................
  ................................................
  ```

- The following command specifies that licenses for Tempus-L and Tempus-XL may be checked out. Tempus-L licenses are checked out before Tempus-XL licenses.

  ```
  set_license_check -option_list {tpsl tpsxl}
  ```

- The following command sets the wait time to 5 minutes:

  ```
  set_license_check -wait 5
  ```

set_limited_access_feature

```
set_limited_access_feature
[-help]
featureName 1 | 0
```

Enables or disables a limited access feature.

Innovus includes certain limited access features that showcase advanced technology integrated in the software. These features have been internally qualified at Cadence but have had only limited customer testing.

> Limited access features are enabled by a variable specified through the `set_limited_access_feature` command. To use these limited access features, contact your Cadence representative to qualify your usage and to make sure it meets your needs before deploying it widely.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_limited_access_feature` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_limited_access_feature`
`featureName`	Specifies the name of the limited access feature. *Data_type*: string, required
*`1	0`*	Specifies the name of the variable that enables the feature. Specifying a value of `1` enables the feature. Specifying a value of `0` disables the feature. *Data_type*: bool, required

set_log_post_cmd

```
set_log_post_cmd
[-help]
[-disable command_list]
[-enable command_list]
[-report]
```

Turns on/off logging specific commands inside a source file that would be logged in the post-expansion mode (suc as source_verbose = true and log_verbose_type = post). It can be used to suppress commands, such as ‘set’ and ‘get_db’ to reduce clutter in a large post-expansion log file.

Note: This command does not affect pre-expansion logging.

Parameters

`-help`	Prints a brief description that includes type and default information for each `set_log_post_cmd` parameter. For a detailed description of the command and all of its parameters, use the man command: `man set_log_post_cmd`
`-disable` *command_list*	Specifies a a list of command names to not log. *Data_type*: string, optional
`-enable` *command_list*	Specifies a a list of command names to be logged. *Data_type*: string, optional
`-report`	Writes out each disabled commands to stdout. One command is written per line. *Data_type*: bool, optional

Related Information

- `get_db`

set_message

```
  set_message
-help
-id list_of_msgIDs
[-severity {warn error info} | -limit <number> | -no_limit | -suppress | -unsuppress |
-on_error {msg_only exit stop_script} | -stop_script_limit limitNumber]
```

Specifies to change the message severity levels, `INFO, WARNING` or `ERROR`, at the beginning of the message. This command allows you to control the messages that are displayed for a particular design. For example, if there are some warnings that are critical for the design, you can change the message severity to `ERROR`. Similarly, if there are messages that you want to ignore, you can change the message severity to `INFO`.

An example of an ERROR message is:

**ERROR: (GLOBAL-105): Unknown global 'timing_enable_socv_analysis' specified.

All ERROR and WARN message begin with a header like:

**ERROR: (<msg_id>):

**WARN: (<msg_id>):

The <msg_id> format is: <prefix>-<num> ("GLOBAL" is the prefix, and "105" is the num in the example above).

You can use the msg_id to change how that specific message is handled using the options below.

Parameters

-help	Outputs a brief description that includes type and default information for each `set_message` parameter. For a detailed description of the command and all of its parameters, use the man command: man `set_message`.
`-id` *list_of_msgIDs*	Specifies the list of message IDs that require a change in the message severity level. If you do not specify a message ID, the change in severity level is applied to all message IDs. *Data_type*: string, optional

`-limit` *`number`*	Sets the message limit to *`number`* per every public command. The default limit is 20, so any specific message will be written out 20 times for one command and then further output of that message will be disabled (along with an additional message saying the message limit has been exceeded). If the number is set to 0, the message will be completely suppressed for the next public command that triggers the message. You can unsuppress the message by setting the number greater than 0. *Data_type*: int, optional
`-no_limit`	Removes any existing limit on the selected messages. **Note:** Suppressed messages remain suppressed until the `-unsuppress` option is applied. *Data_type*: bool, optional
`-on_error {msg_only exit stop_script}`	Specifies an extra action for error messages (not for warn or info messages). If no message is specified, the action applies to all error messages. • `msg_only`: Prints error message only, and the command proceeds as it normally would. This is the default. • `exit`: Exits immediately and returns to Linux. • `stop_script`: Waits for the current Tcl command to finish, then stops executing any Tcl script, and returns to the interactive Tcl prompt. Note, if a message severity is changed from error to either warn or info, it will no longer trigger this extra action. *Data_type*: enum, optional
`-severity {warn error info reset}`	Specifies the new severity level for the message ID being modified. The `reset` argument sets the message severity back to its original state. *Data_type*: enum, optional

`-stop_script_limit` *limitNumber*	Sets the message limit for a public command. If you set `-stop_script_limit` for a command as `10` and message for the command is triggered for the 10th time, the tool will wait for the current Tcl command to finish, then stop executing any Tcl script, and return to the interactive Tcl prompt. The default value of `-stop_script_limit` is `-1`, which is unlimited.
`-suppress`	Suppresses the message. *Data_type*: bool, optional
`-unsuppress`	Unsuppresses the message. *Data_type*: bool, optional

Examples

- The following command changes the message IMPLF-81 from `ERROR` to `WARN`:
  ```
  set_message -id IMPLF-81 -severity warn
  ```
- The following command returns all messages to their original severity:
  ```
  set_message -severity reset
  ```
- The following command resets the specified message to its original severity:
  ```
  set_message -id ENCLF-18  -severity reset
  ```

Related Information

- `get_message`

set_preference

```
set_preference
[-help]
preference_name
value
```

Defines preferences, such as, commands issued during a session can be logged to a log or the screen.

When writing to a log and screen, the commands are preceded by <CMD>.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_preference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_preference`.
`preference_name`	The name of the preference variable you want to set. To see a list of preferences, select ***View - Set Preference*** from the menu, then click *Save*. In the Save Preferences form, select the required save option and click *OK*. If you select the default *Save to Home Directory* option, the list of preferences and their values are saved in `.enc` file in your home directory. *Data_type*: string, required
`value`	The value for the preference. *Data_type*: string, required

Preference Variables

The following table lists the preference variables you can set using the `set_preference` command and their GUI equivalent in the Preferences form:

Note: The following table might not be readable when viewed with the Unix man command. Check the `set_preference` command description in the *Innovus Text Command Reference* to view the table.

Variable Name	GUI Equivalent in Preferences Form	
	Tab Name	Option Name
DesignName	***Design***	*Design Name*
DesignHierChar		*Design Hierarchical Character*
DEFHierChar		*DEF Hierarchical Character*
PDEFBusDelim		*PDEF Bus Delimiter*
LogTypeInCmd		*Log Type-In Command*
logviewer		*Invoke viewLog at Start Up*
MouseGestures		*Enable Mouse Gestures*
ShowFPObjInPlace	***Display***	*Show Floorplan Objects in Physical View*
ShowAllFence		*Show All Constraint*
DisplayPtnPin		*Display Partition Pin*
ShowAttrPopup		*Show Attributes Popup*
ShowUnplacInnovusnst		*Display Unplaced Instances*
ShowRectilinearPad		*Show Rectilinear Pad Cell*
DisplayCellPin		*Display Instance Pin*
ShowLefLayerName		*Show Lef Layer Name*
AutoRedraw		*Auto-redraw after Layer Change*
EnlargeLogicalPin		*Enlarge Logical Pin In Fit View*
InstDisplayThreshold		*Instance Display Threshold*
WirInnovussplayThreshold		*Wire Display Threshold*
WirInnovussplayCheck2D		*Apply Threshold in 2D*
percentageOfPan		*Percentage of Window to Pan*

`scaleOfZoom`		*Scale of Zoom In/Out*
`zoomPrevCount`		*Number of Previous Zoom Saved*
`MinFPModuleSize`		*Min. Floorplan Module Size*
`ShowParentModule`		*Show Parent Module With Level*
`ShowChildPartition`		*Show Child Partition With Level*
`ShowParentPartition`		*Show Parent Partition With Level*
`AutoDetailDisplay`		*Automatic Detail Display for Large Design* ◦ Special Wire ◦ Regular Wire
`DetailDisplayFactor`		*Factor*
`DisplayRelFPlan`	***Innovus***	*Honor Relative Floorplan Constraints*
`SingleLayerMode`		*Single Layer Mode For Routing Blockage, Ptn Pin Blockage and Ptn Feed*
`ShowDelBox`		*Show Delete Confirmation Box*
`StrecthRestriction`		*Box Stretch Restrictions* ◦ *No Restriction* ◦ *Maintain Area* ◦ *Maintain Aspect Ratio*
`StretchRectilinear`		*Rectilinear Stretch Restrictions* ◦ *No Restriction* ◦ *Maintain Area*
`MoveRestriction`		*Move Restrictions* ◦ *No Restrictions* ◦ *Orthogonal*

clone_row_orientation_snapping		*Clones snapping to same master row orientation*
SelectByArea	***Selection***	*Select by Area* ◦ *Enclosed by Box* ◦ *Intersecting Box*
SelectByLine		*Select by Line*
SelectStickyMode		*Sticky Mode*
SelectNetWhenSelectPin		*Hilite Net When Selecting a Pin*
HiliteNetWhenQueryObj		*Hilite Nets When Querying an Instance*
HiliteShapeWhenSelectNet		*Hilite Pin Shapes When Selecting a Net*

QuerySkipInst		*Skip Objects by Auto Query* ◦ *Cell*
QuerySkipInstObs		◦ *Obs in Cell*
QuerySkipInstPin		◦ *Pin in Cell*
QuerySkipRegular		◦ *Regular Wire*
QuerySkipSpecial		◦ *Special Wire*
WinSelectMargin		*Window Select Margin*
HighlightColorNumber		*Number of Highlight Color*
MinFlightLineWidth	***Flightline***	*Minimum Flightline Width*
MaxFlightLineNetTerms		*Maximum Flightline Net Terms*
DisplayPlaceFlightLine		*Show Flightline In Physical View*
ShowNumberBlockConnection		*Show Number of Connections For Block*

FlightLineInMove	*Draw Flightline When Moving Instance(s)*
ShowConnectionInOutNumber	*Show Input/Output Connection Number*
ShowFlightLineTermMark	*Show Pin's Input/Output Mark*
ShowBothInputConnection	*Show Both Input Pins Connection*
ShowNetWeightConnection	*Show Connection With Netweight 0*
ShowFlightLineThruPtnPin	*Show Flightlines Through Partition Pins*
noInsideMacro	*Don't Show Flightline to Inside Macro*
SkipBufferFlightline	*Skip Buffer/Invert Cell*
NoClockFlightline	*Don't Show Clock Net*
OnlyClockFlightline	*Show Clock Net Only*
DrawFlightlineLast	*Draw Flightline on Top of Selection*
OnlyBundleNetFlight	*Only Show Net Bundle Flight Line*
ExclusiveFlight	*Show Connection Only Between Selected Objects*
ConnectionColorType	*Single Color* *Different Color by Type of Connections* *Different Color by Number of Connections*
InputConnectionColor	• *Different Color by Type of Connections: Input* • *Different Color by Number of Connections: Small*
OutputConnectionColor	• *Different Color by Type of Connections: Output* • *Different Color by Number of Connections: Medium*

`InoutConnectionColor`	• *Different Color by Type of Connections: Inout* • *Different Color by Number of Connections: Large*
`MixtureConnectionColor`	• *Single Color: <color>* • *Different Color by Type of Connections: Inout*
`ShowConnectionWithWidth`	*Different Width by Number of Connections*
`FLWidthThresholdLow`	*Number of Connections* ◦ *Small* - Fewer than specified low threshold
`FLWidthThresholdHigh`	◦ *MInnovusum* - Equal to or between than specified low and high thresholds ◦ *Large* - Greater than specified high threshold
`NoInstFlightLine`	*Don't Show Connection to Unselected Object* ◦ *Instance*
`NoBlockFlightLine`	◦ *Block*
`NoModuleFlightLine`	◦ *Module*
`NoBlackBlobFlightLine`	◦ *Black Blob*
`NoBlackBoxFlightLine`	◦ *Black Box*

InstanceText	***Text***	*Instance Text* ◦ *Instance Name* ◦ *Master Name*
ShowNetFullName		*Show Full Net Name*
ShowNetNameWithLayerColor		*Show Net Name With Layer Color*
ShowModuleText		*Object Text Display* ◦ *Module*
ShowAmoebaModuleText		◦ *Module in Amoeba*
ShowRowSiteText		◦ *Row Site*
ShowIoPadText		◦ *IO Pad*
ShowInstanceText		◦ *Instance*
ShowInstancePinText		◦ *Instance Pin*
ShowBlackBlobText		◦ *Black Blob*
ShowIoPinText		◦ *IO Pin*
ShowGroupText		◦ *Group*
ShowBumpText		◦ *Bump*
ShowClockTreeText		◦ *Clock Tree*
ShowChannelText		◦ *Channel*
ShowLefPortNumText		◦ *Lef Port Num*

ShowMacroSitePtnText		◦ *Macro Site Ptn*
ShowSIPFingerText		◦ *SIP Finger*
ShowNetText		◦ *Net*
TextDisplaySize		*Text Display Size* ◦ Small ◦ MInnovusum ◦ Large ◦ Auto
TermCrossPix		*Term Cross Symbol Size*

Note: Options on the ***Windows*** tab of the Preferences form map to the `set_window_preference` command instead of the `set_preference` command.

The following table lists the preference variables you can set using the `set_preference` command and their type, range/default/sample value.

Note: The following table might not be readable when viewed with the Unix man command. Check the `set_preference` command description in the *Innovus Text Command Reference* to view the table.

Related Topics

For more information on setting preferences from the GUI, see:

- get_preference
- Set Preference form in the View Menu chapter in the *Innovus Stylus Common UI Menu Reference*.

set_proc_verbose

```
set_proc_verbose
[-help]
{[procedure_name [-quiet ]] | [-report ]}
```

Makes a procedure verbose, when the procedure is called for execution.

Enables verbose logging of the commands inside a specific Tcl procedure. For example, if you make ‘proc test’ verbose, and type ‘test’ at the command line, you would see something like:

```
@innovus 1> test

#@ Begin verbose proc (pre): test

@proc 1: set a 1

@proc 2: puts "inside test with $a"

inside test with 1

#@ End verbose proc: test
```

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_proc_verbose` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_proc_verbose`.
`procedure_name`	Specifies the name of the procedure to be made verbose. *Data_type*: string, required
`-quiet`	Changes the procedure back to not being verbose. *Data_type*: bool, optional
`-report`	Reports procedures that are verbose. *Data_type*: bool, optional

Examples

- The following commands show the usage of the `set_proc_verbose` command and its options for the `fplan_boxes` procedure.

  The code within the `fplan_boxes` procedure is given below:

  ```
  @innovus 1> proc fplan_boxes {} {

  + puts "Floor Plan Boxes:"

  + puts [get_db current_design .boundary]

  + }
  ```

  The following command executes the `fplan_boxes` procedure. Please note that the execution result simply shows the coordinates of the floor plan boxes.

  ```
  @innovus 2> fplan_boxes

  Floor Plan Boxes:

  {{93.818 -645.458} {93.818 -639.731} {102.843 -639.731} {102.843 -645.458}}
  ```

  The following command makes the `fplan_boxes` procedure verbose:

  ```
  @innovus 3> set_proc_verbose fplan_boxes

  fplan_boxes
  ```

  After the `fplan_boxes` procedure is made verbose and is executed, the code of the `fplan_boxes` procedure is displayed:

  ```
  @innovus 4> fplan_boxes

  #@ Begin verbose proc fplan_boxes
  @proc(fplan_boxes) 1: puts "Floor Plan Boxes:"
  Floor Plan Boxes:
  @proc(fplan_boxes) 2: get_db current_design .boundary
  @proc(fplan_boxes) 3: puts [get_db current_design .boundary]
  {{93.818 -645.458} {93.818 -639.731} {102.843 -639.731} {102.843 -645.458}}
  #@ End verbose proc fplan_boxes
  ```

  You can use the `-report` option to see the verbose procedures:

  ```
  @innovus 6> set_proc_verbose -report
  fplan_boxes
  ```

  If you have made your procedure verbose and now you want to make it non-verbose, you can use the `-quite` option. The command below makes the `fplan_boxes` procedure non-verbose:

  ```
  @innovus 6> set_proc_verbose fplan_boxes -quiet
  ```

```
fplan_boxes
```

set_window_preference

```
set_window_preference
[-help]
-window_name
{on | off}
```

Enables or disables windows (panels) from the Innovus main display. You can save these window settings in the .enc file in your home directory. The settings are automatically loaded when invoking the Innovus main window.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `set_window_preference` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man set_window_preference`.
`-window_name`	Specifies the name of the window you want to turn on or off in the Innovus main display. You can select from the following: • `properties` -- Controls the Attribute Viewer panel. • `status` -- Controls the message bar display, which shows object identifier or coordinate information. • `toolbox` -- Controls the tool widget display. • `viewColor` -- Controls the visibility, selectability, and color display of various attributes. • `world` -- Controls the satellite window display. *Data_type*: string, required
`{on | off}`	Specifies whether window should be turned on or off. *Data_type*: string, required

Example

The following command turns on the tool widget display:

```
set_window_preference toolbox on
```

source

```
source
[-help]
filename
[-quiet | verbose]
[-quiet  | -echo ]
```

Reads a file and executes the commands in the file (scripts).

Parameters

`-help`	Describes the command usage.
`-echo`	Enables verbose source. *Data_type*: bool, optional
`filename`	Specifies the name of the file to source. *Data_type*: string, required
`-quiet`	Forces source to be normal Tcl source command. *Data_type*: bool, optional
`-verbose`	Enable verbose source. *Data_type*: bool, optional

With no `-quiet, -verbose, -echo` argument, file is sourced according to the `source_verbose` attribute.

Note that the setting of `-quiet, -verbose, -echo` argument only affects the verbosity of sourcing the outermost file. If that file contains nested `source` commands, the verbosity of those nested commands is controlled by their associated `[-quiet | -verbose | -echo]` arguments or the `source_verbose` attribute if no arguments.

suspend

```
suspend [-help]
```

Suspends your script and returns to the Innovus prompt.

The `suspend` command gives you more flexibility in managing and debugging your scripts. You can insert multiple `suspend` commands in a script. The `suspend` command can also be used in nested scripts. When the script reaches a point where you have inserted the `suspend` command, it stops and restores access to the Innovus prompt. You can then type any command required for debugging.

Whenever you want to resume your script, just type `resume` at the Innovus prompt.

Parameters

`-help`	Prints the usage of the `suspend` command. For a detailed description of the command, use the `man` command: `man suspend`.

Related Information

- `resume`

system Category Attributes

The root attributes in the system category are:

- auto_file_dir
- auto_file_prefix
- distributed_mmmc_disable_reports_auto_redirection
- gui_verbose
- layer_name_no_abbreviation
- log_verbose_type
- print_full_message_summary
- read_db_directory
- read_db_file_check
- read_db_stop_at_design_in_memory
- read_db_tool_name
- read_db_version
- script_search_path
- source_echo_filename
- set_db_verbose
- soft_stack_size_limit
- source_verbose
- source_continue_on_error
- log_verbose_style
- source_verbose_line_length_limit
- tcl_error_info
- tcl_partial_cmd_argument_matching
- tcl_return_display_length_limit
- ui_precision

- ui_precision_capacitance
- ui_precision_derating
- ui_precision_power
- ui_precision_sensitivities
- ui_precision_timing
- write_db_auto_save_user_globals
- write_db_cmd_file_limit

To set the value of any root attribute, use the `set_db` command:

```
set_db attribute_name value
```

To get the current value of any root attribute, use the `get_db` command:

```
get_db attribute_name
```

To get the current value of all attributes in the `system` category, use the following command:

```
get_db -category system
```

auto_file_dir

`auto_file_dir` *directoryName*

Default: ./

Data_type: string, read/write

Specifies the directory to store files/sub-directories 'auto-generated' by the tool. This includes report files or other output files with default names that are automatically created by some commands in the current run directory. Default names that have been overridden with a name chosen by the user, are not affected. This allows multiple simultaneous runs from the same run directory to direct output files to different result directories to avoid collisions.

auto_file_prefix

`auto_file_dir` *fileName*

Default: ""

Data_type: string, read/write

Specifies a prefix to be applied to all files 'auto-generated' by the tool. This includes report files or other output files with default names that are automatically created by some commands in the current run directory. So a default name like "cmd.report" will become "<prefix>cmd.report". Default names that have been overridden with a name chosen by the user, are not affected. This allows multiple simultaneous runs from the same run directory to direct default output files to different locations to avoid collisions.

distributed_mmmc_disable_reports_auto_redirection

`distributed_mmmc_disable_reports_auto_redirection {true| false}`

Default: `false`

Data_type: string, read/write

Allows reports to be generated in the specified location.

When set to `true`, the software does not allow the reports for different views to get overwritten. When set to `false`, the reports are generated automatically in the DMMMC view directory structure.

gui_verbose

`gui_verbose {all db none}`

Default: `db`

Data_type: enum {all db none}, read/write

Controls which GUI actions are logged. You can select:

- `all`: Logs all GUI actions.
- `db`: Logs the GUI actions that affect the DB, such as `gui_select`, but does not capture display-only actions such as `gui_dim_foreground`.
- `none`: Does not log any GUI actions. So, the .log and .cmd files are incomplete.

layer_name_no_abbreviation

`layer_name_no_abbreviation {true | false}`

Default: `true`

Data_type: bool, read/write

By default the value of this attribute is true, and most command `-layer <layer>` options require a LEF/OA layer name, or a routing-layer index value (for example, 1 for the first routing layer, 2 for the second) for input. If this attribute is `false`, an older style abbreviation is also allowed (for example, M1 for the first routing layer, M2 for the second routing layer).

Note: This layer abbreviation style is not recommended, and is only allowed for backward compatibility to migrate older scripts. Eventually this attribute will be removed. You should modify your scripts to use LEF/OA layer names, or routing-layer index values for -layer options to avoid problems in the future.

log_verbose_type

```
log_verbose_type {pre post both}
```

Default: `pre`

Data_type: enum {pre post both}, read/write

When verbose logging is enabled, the log can be pre-Tcl expansion, post-Tcl expansion, or both. You can switch between these settings in the middle of a script.

- `pre`: Logs commands pre-Tcl expansion. For example:

  ```
  @file 1: set lef_files $files
  ```

- `post`: In some cases it is helpful to see commands post-Tcl expansion (such as after $files is replaced by its Tcl value). This can result in very long lines, so you should normally set `source_verbose_line_length_limit` if you do this. The example above would look like:

  ```
  @file 1: set lef_files {a.lef b.lef}
  ```

- `both`: You can even log both pre-Tcl and post-Tcl expansion when doing detailed debugging, so you would see each command line repeated like this:

  ```
  @file 1: set lef_files $files
  @file 1: set lef_files {a.lef b.lef}
  ```

Related topics

- `source_verbose` attribute
- `flow_verbose` attribute in the `flow` category
- `set_proc_verbose`

print_full_message_summary

```
print_full_message_summary {true | false}
```

Default: `false`

Data_type: bool, read/write

Controls the format of the message summary. If `true`, prints full message, otherwise prints truncated message.

read_db_directory

```
read_db_directory directory_name
```

Default: ""

Data_type: string, read/write

Specifies the directory of the current loaded database.

read_db_file_check

```
read_db_file_check {true | false}
```

Default: `true`

Data_type: bool, read/write

By default, `read_db` will check all the files inside the saved DB directory. If any file is edited, renamed, or deleted, the tool will give an error. However, read_db will not perform this check if `read_db_file_check` is set to `false`.

read_db_stop_at_design_in_memory

```
read_db_stop_at_design_in_memory {true | false}
```

Default: `true`

Data_type: bool, read/write

By default, tool gives error and stops if you call `read_db` more than once in the same Innovus session unless `read_db_stop_at_design_in_memory` is set to `false`. Using `read_db` twice in one Innovus session is not recommended as settings from the first database may not be cleaned up

properly and can cause problems in the second database.

read_db_tool_name

`read_db_tool_name`

Default: ""

Data_type: string, read/write

Indicates the tool name of the tool that created the restored db on the disk database.

read_db_version

`read_db_version`

Default: ""

Data_type: string, read/write

Indicates the version of the tool that generates an on-disk database.

script_search_path

`script_search_path` *`search_directory_path`*

Default: "."

Data_type: string, read/write

Provides a set of directories for the software to search for files that are sourced using the Tcl `source` command. The software will search in each search path directory for the specified file.

source_echo_filename

`source_echo_filename {true | false}`

Default: `false`

Data_type: bool, read/write

If true, echoes the post-Tcl expansion file name from a source command. This is useful to see “Sourcing a.tcl” that shows the actual ‘a.tcl’ file name rather than a Tcl variable like “source $file”.

set_db_verbose

```
set_db_verbose {true | false}
```

Default: `false`

Data_type: bool, read/write

When true, additional messages are displayed describing every object modified by `set_db` or `reset_db` commands.

Refer to the following example:

```
set_db set_db_verbose true
set_db [get_db hinsts */D*] .dont_touch true
Setting attribute of hinst 'DATA_BUS_MACH_INST': 'dont_touch' = true
Setting attribute of hinst 'DECODE_INST': 'dont_touch' = true
2 true
set_db set_db_verbose false
Setting attribute of root '/': 'set_db_verbose' = false
1 false
set_db [get_db hinsts */D*] .dont_touch true
2 true
```

soft_stack_size_limit

```
soft_stack_size_limit size_limit
```

Default: `10`

Data_type: string, read/write

Specifies the soft stack size limit in mbytes. When the tool is launched, the the soft stack size limit is auto-enlarged to 0.2% RAM. If 0.2%RAM is larger than the hard limit, the tool sets it to the hard limit.

source_verbose

```
source_verbose {true| false}
```

Default: `true`

Data_type: bool, read/write

If true, each command inside a “source file.tcl” script is also logged. For example, the command

executed inside the file will be prefixed with `@file`:

```
@file 1: set_db design_process_node 28
```

All commands have an '@' prefix in the log. If the command is an application command like init_design, or place_design and not a built-in Tcl command like 'set', it would be prefixed with @@. This makes it easy to grep for '@' to see all commands, or '@@' to see just the application commands.

```
@@file 1: init_design
```

When Innovus starts, this attribute is set as `true`. So, commands inside initialization files, such as ./innovus_startup, that are automatically loaded at startup will also be logged. See `man Innovus` for the list of startup files. You can force the startup value to false by setting the following envar before starting Innovus:

```
setenv CDS_STYLUS_SOURCE_VERBOSE 0
```

If you set this attribute to `false`, files are sourced in quiet mode. This is equivalent to source filename -quiet.

source_continue_on_error

```
source_continue_on_error {true| false}
```

Default: `false`

Data_type: bool, read/write

Enable or disables `source` to continue the script on TCL_ERROR. If `true`, the `source` command will ignore Tcl errors, and continue processing the script files. If `false`, a Tcl error will halt the script.

Example

In the following example, there is Tcl File (test.tcl). If `source_continue_on_error` is set to `true`, and incorrect pin is specified for the `get_clock_tree_capacitance` command , the script will continue and source other commands mentioned after `get_clock_tree_capacitance`.

```
@innovus 1> set_db source_continue_on_error true

1 true

@innovus 2> source test.tcl

#@ Begin verbose source test.tcl
```

```
@file(test.tcl) 1: puts "Testing Script for Errors"

Testing Script for Errors

@file(test.tcl) 2: get_clock_tree_capacitance -pin a/b

**ERROR: (IMPTCM-162):  "a/b" does not match any object in design for specified type
"pin port " object in command "get_clock_tree_capacitance".

Usage: get_clock_tree_capacitance [-help] [-edge {rise fall both}] -pin <pin> [ -
delay_corner <delay_corner> ] [ -load | -wire ] [ -delay_type <type> ]

**ERROR: (IMPTCM-4):    The value "a/b" specified for the object type of argument "-
pin" is not a valid object. Review the command specification and remove the argument
or specify a legal value.

**ERROR: (IMPSE-110):   File 'test.tcl' line 2: errors out.

@file(test.tcl) 3: puts "End Testing Script for errors"

End Testing Script for errors

#@ End verbose source test.tcl
```

If `source_continue_on_error` is set to `false`, and incorrect pin is specified for the `get_clock_tree_capacitance` command, the script will end and will not source other commands mentioned after `get_clock_tree_capacitance`.

```
@innovus 3> set_db source_continue_on_error false

1 false

@innovus 4> source test.tcl

#@ Begin verbose source test.tcl

@file(test.tcl) 1: puts "Testing Script for Errors"

Testing Script for Errors

@file(test.tcl) 2: get_clock_tree_capacitance -pin a/b

**ERROR: (IMPTCM-162):  "a/b" does not match any object in design for specified type
"pin port " object in command "get_clock_tree_capacitance".
```

```
Usage: get_clock_tree_capacitance [-help] [-edge {rise fall both}] -pin <pin> [ -
delay_corner <delay_corner> ] [ -load | -wire ] [ -delay_type <type> ]

**ERROR: (IMPTCM-4):    The value "a/b" specified for the object type of argument "-
pin" is not a valid object. Review the command specification and remove the argument
or specify a legal value.

**ERROR: (IMPSE-110):   File 'test.tcl' line 2: errors out.

#@ End verbose source test.tcl
```

log_verbose_style

`log_verbose_style { debug | echo | echo_comments}`

Default: `echo`

Data_type: `enum {debug echo echo_comments}, read/write`

When verbose logging is enabled, the logging style for each command is controllable. It is sometimes helpful to include file name and comments for script debugging and at other times this is too much information. You can switch between settings in the middle of a script.

The values mean:

- `debug`: Will output the file name, line numbers, commands, comments, and empty lines. For example:

  ```
  @file(a.tcl) 1: #comment
  @file(a.tcl) 2: set a $b
  ```

- `echo`: Will output only the line numbers and commands. For example:

  ```
  @file 2: set a $b
  ```

- `echo_comments`: Will output line numbers, commands, comments, and empty lines. For example:

  ```
  @file 1: #comment
  @file 2: set a $b
  ```

Related Topics

- `source_verbose`
- `flow_verbose`
- `set_proc_verbose`

source_verbose_line_length_limit

`source_verbose_line_length_limit` *`value`*

Default: `-1`

Data_type: int, read/write

Limits the length of the verbose source Tcl commands that are logged. -1 means there is no limit. If you use the default pre-Tcl expansion logging, then -1 is generally the best. If you turn on post-Tcl expansion logging (see), a command such as “set a [get_db insts]” will by expanded by Tcl into “set a inst:top/i1 inst:top/i2 …”, and log a list of every inst that will often make the log file too big to be useful. You can limit the length of the longest command line to avoid that. This is different than the Tcl output length limit which only affects the length of the output echoed by Tcl when typing at the prompt.

Related Topics

- `log_verbose_type`
- `tcl_return_display_length_limit`

tcl_error_info

`tcl_error_info {true| false}`

Default: `false`

Data_type: bool, read/write

When set to `true`, the `tcl_error_info` prints the error information if there is an issue in the Tcl script.

tcl_partial_cmd_argument_matching

`tcl_partial_cmd_argument_matching {error | warn | quiet}`

Default: `quiet`

Data_type: enum {quiet warn error}, read/write

Controls argument name and enum name partial matching. An argument name, such as -opt will be accepted for -option if no other argument name begins with -opt.

- `quiet`: Silently allow partial-matching
- `warn`: Gives a warning message but still runs.
- `error`: Disables partial-matching, gives an error, and the command fails.

Related Command

- `get_computed_shapes`

tcl_return_display_length_limit

`tcl_return_display_length_limit`

Default: 10000

Data_type: int, read/write

Limits the number of characters displayed on the xterm window (stdout) and the .log file. The Tcl return value itself is not truncated. A value of `-1` indicates that there is no display limit. Some commands that are likely to have longer Tcl return values are `get_computed_shapes` and `history`. `tcl_return_display_length_limit` is useful to limit the Tcl return output for commands that may have long lists as input. For example, if you type `set a [get_db insts]`, the `set` command will return the value of `$a` to Tcl, and the Tcl interpreter will echo all the insts to stdout and the .log file.

Example

- In the example below, the tcl return values of `get_metric` command options are not truncated. However, the remaining part is truncated to 3 characters.

```
innovus 1> set_db tcl_return_display_length_limit 3
1 3
innovus 2> get_metric *
```

```
flo... truncated to 3 characters (use the tcl_return_display_length_limit
attribute to control the length before truncation).
```

- In the example below, the value of `tcl_return_display_length_limit` is set to `-1`. As a result, there is no display limit.

```
innovus 3> set_db tcl_return_display_length_limit -1
1 -1
innovus 4> get_metric *
flow.cputime 0 flow.cputime.not_child 0 flow.cputime.total 0 flow.cputime.user 0
flow.cputime.user.not_child 0 flow.cputime.user.total 0 flow.realtime 0
flow.realtime.not_child 0 flow.realtime.total 0 metric.version 1
```

ui_precision

`ui_precision` *`number`*

Default: `3`

Data_type: int, read/write

Specifies the number of significant digits to be displayed in the absence of an explicit precision for that type.

ui_precision_capacitance

`ui_precision_capacitance` *`number`*

Default: 3

Data_type: int, read/write

Specifies the number of significant digits to be displayed for quantities of type capacitance.

ui_precision_derating

`ui_precision_derating` *`number`*

Default: 3

Data_type: int, read/write

Specifies the number of significant digits to be displayed for derating factors such as those specified via set_timing_derate constraints or AOCV derating libraries.

ui_precision_power

`ui_precision_power` *number*

Default: 3

Data_type: int, read/write

Specifies the number of significant digits to be displayed for quantities of type power.

ui_precision_sensitivities

`ui_precision_sensitivities` *number*

Default: `3`

Data_type: int, read/write

Specifies the number of significant digits to be displayed for statistical sensitivity values and SOCV sigma values.

ui_precision_timing

`ui_precision_timing` *number*

Default: `3`

Data_type: int, read/write

Specifies the number of significant digits to be displayed for delay type values including cell and net delays, transitions, arrival and required times, and slacks.

write_db_auto_save_user_globals

`write_db_auto_save_user_globals {true| false}`

Default: `false`

Data_type: bool, read/write

If `true`, `write_db` automatically saves the Tcl global variables created by the user. User globals are defined as any “info globals” names that do not exist at startup (such as created by the user executed code).

You can use the `define_variables` command to add or delete specific Tcl variables from the

automatic save list.

write_db_cmd_file_limit

`write_db_cmd_file_limit` *number*

Default: 10

Data_type: int, read/write

The write_db command saves the complete .cmd history across multiple sessions.
The write_db_cmd_file_limit attribute specifies the file length limit (in units of Mb) that is saved in the inn.cmd.gz file inside the save directory. If it is set to 0, no history is saved at all.

uniquify_filename

```
uniquify_filename
[-help]
filename
```

Uniquifies a file.

Parameters

filename	Specifies the name of the file to uniquify. *Data_type*: string, required
-help	Prints a brief description that includes type and default information for each `uniquify_filename` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man uniquify_filename`

update_names

```
update_names
[-help]
[-allowed chars]
[-change_modules hinsts_modules [-local]]
[-design]
[-first_restricted chars]
[-honor_dont_touch]
[-hport]
[-inst]
[-last_restricted chars]
[-log_file string [-append_log]]
[-map {{from to}...}]
[-max_length integer]
[-module]
[-net]
[-no_verbose]
[-nocase]
[-phys_inst]
[-port]
[-prefix string [-name_collision]]
[-random [-random_map_dir out_dir]]
[-regexp]
[-replace_string string]
[-reserved_words string]
[-restricted string]
[-suffix string [-name_collision]]
[-system_verilog]
[-verilog]
[-vhdl]
```

Updates the inst, net, phys_insts, port, module, and design names at each level of hierarchy. The inst and net names are local to only one level of hierarchy, as seen by Verilog inside a module.

If a net or port name is a part of a bus definition, then only the base bus name is updated, and the bus-bits are not modified. So for example, a net named 'busA[0]' specifies that the base bus name is 'busA', which can be changed to 'busB[0]'. However, the '[0]' part will not be changed.

If a net or port name is an escaped scalar name, then all the characters can be modified. So in such a case, an escaped Verilog name like '\busA[0] ' can be changed to 'busA_0_' using various matching options available as shown in the Examples section below.

You can restrict the changes to just one name type using parameters, such as `-inst`, `-net`, `-port`, `-module`, or `-design`. Otherwise, the requested change is applied to all the name types.

By default, there is no restriction on the length of the new names (see `-max_length`).

Each name is checked, and the characters or strings are removed, replaced, or added according to the parameters explained below. Then the final name is checked for collisions with any existing names. If the new name collides with an existing name, a suffix such as _1 and _2 is appended until it is unique.

The old and new names for each modified name are reported.

Note: Names used for SDC timing constraints can only be modified if they are loaded into memory. So you must make sure all the timing views are loaded with `set_analysis_view` before running this command.

Note: There is a limitation that names used inside a CPF `power_intent` file cannot be updated. CPF usage assumes that the CPF file is golden and should not be modified. If you need to change names used inside a CPF file, you need to update the CPF file manually and then read in the new CPF file after running `update_names`. In contrast, an IEEE1801 `power_intent` file is allowed to change during the design flow, so changing any pin, instance or net names with `update_names` will automatically update the IEEE 1801 names. You can write out the new IEEE1801 file with the updated names.

Note: To rename a specific object, use the `rename_obj` command.

Parameters

`-help`	Prints the command usage.
`-allowed` *chars*	Specifies the characters that are allowed in the names. Any characters that are not in the allowed list will be removed in the final name. The minimum specification is 10 characters. To allow all the letters from a to z in capital and lower case letters, you must specify all of them. Use `-regexp` to allow dash "-" as a character range indicator. *Data_type*: string, optional

`-append_log`	Appends the report to `<out_file>` specified with the `-log_file` option. If you omit this option, `<out_file>` is overwritten. You can specify this option only if you have specified the `-log_file` option. *Data_type*: bool, optional
`-change_modules` *hinsts_modules*	Limits the name changes to the objects inside the specified list of modules or modules of the `hinsts`. The changes are applied recursively down the hierarchy below each module, unless the `-local` parameter is specified. The current design is used by default, if this parameter is not used. *Data_type*: `hinst|module|design)+`, optional
`-design`	Changes only the design module name. *Data_type*: bool, optional
`-first_restricted` *chars*	Specifies the characters that cannot be used in the beginning of the name. Those will be removed, including repeated characters. So `-first_restricted {_#%$}` will change _$abc to just abc. *Data_type*: string, optional
`-honor_dont_touch`	Prevents renaming of the objects, for which the `dont_touch` attribute is set.
`-hport`	Changes the port names (e.g. Verilog input, output, or inout names) of the intermediate modules for all hinsts, including bus port names. It also modifies the same implicit net name connected to the port to match the new port name. It does not modify the port names of library cells or the top-level design. *Data_type*: bool, optional
`-inst`	Changes only the Verilog instance names at each level of hierarchy. *Data_type*: bool, optional

`-last_restricted` *chars*	Specifies the characters that cannot be used at the ending of a name. Those will be removed, including repeated chars. *Data_type*: string, optional
`-local`	Turns off the recursive descent, so that changes become local to the module or design. The objects defined in the design/module can be modified (for example, design/module, `port`/`hport`, `inst`, or `net` names), but sub-module names and `hport` names of sub-modules cannot be modified. *Data_type*: bool, optional
`-log_file` *out_file*	Specifies a log file for the output report that shows the old name and the new name for any name changes. *Data_type*: string, optional
`-map {{`*from to*`}...}`	Takes a list of string pairs and maps the first string to the second string in each pair. You need to enclose each pair in braces. To be compatible with Genus usage, double quotes are optionally allowed around the strings. For example, both `-map {{"from" "to"} {"AND" "and"}}` and `-map {{from to} {AND and}}` will result in the same output. *Data_type*: string, optional
`-max_length` *int*	Limits the length of the changed name to the specified number of characters. If the name exceeds the limit, the additional characters will be truncated from the end. If the new name is not unique, the original name is further trimmed back to allow the name with a suffix, such as 1, 2, etc. to make it unique and within the specified length limit. Note, the truncation happens after all other changes. This means the truncated names may now collide with -vhdl, -verilog, or -system_verilog reserved names, or end with a char from the -last_restricted set. If that happens, you will have to rerun the command with the same options and either a longer -max_length or no -max_length. *Data_type*: int, optional

`-module`	Changes all module names other than the design module name. *Data_type*: bool, optional
`-name_collision`	Adds only the `-prefix` or `-suffix` values, if a name change collides with an existing name. This parameter can be used only when either the `-prefix` or `-suffix` parameter is used. *Data_type*: bool, optional
`-net`	Changes the Verilog net names at each level of hierarchy (e.g. Verilog wire names). This will not modify net names that correspond to Verilog port definitions (e.g. Verilog input, output or inout names). If you want to modify those net names, use the -port option. *Data_type*: bool, optional
`-no_verbose`	Suppresses the output generated from `update_names`. *Data_type*: bool, optional
`-nocase`	Changes names that collide if the case is ignored. For example, if both net1 and Net1 exist, one of them will be changed to resolve the collision by appending a suffix, such as _1 or _2. *Data_type*: bool, optional
`-phys_inst`	Changes only those physical inst names (like filler cells) that do not appear normally in the Verilog output. When this parameter is specified, the module-scoping parameters (like `-change_modules`) are ignored, so all the physical inst names are checked. Type: bool, optional

`-port`	Changes the port names (e.g. Verilog input, output, or inout names) of the top-level module for the design, including bus port names. It also modifies the same implicit net name connected to the port to match the new port name. It does not modify the port names of library cells or intermediate modules. *Data_type*: bool, optional
`-prefix` *string*	Adds a prefix to the names that are changed. *Data_type*: string, optional
`-random`	Makes all the modified names random. It obfuscates the design names so that the test cases can be shared without exposing the real netlist names. This parameter cannot be used with any other parameter that affects names. It can be used with `-inst`, `-net`, `-hport`, `-design`, and `-port` to limit the types of names to be modified. *Data_type*: bool, optional

`-random_map_dir` *out_dir*	Specifies the `out_dir` (output directory) for the map-file of the old and new random names to be written for each name type that is modified inside the output directory. This parameter requires the `-random` parameter. It is useful in the cases when there are side files that have names to be mapped and are not supported by `update_names`. The following files are written:
	`inst.map for inst and hinst names`
	`net.map for net and hnet names`
	`pin.map for hport and pin names`
	`port.map for top-level port names`
	`module.map for module names`
	The format is *old_name new_name* on each line for every name. For example, `inst.map` may look like:
	`blockA/blockB/regC i1/i2/i3`
	`blockA/regD i1/i3`
	…
	Data_type: string, optional

`-regexp`	Allows specifying character ranges with a dash "-" in the `-allowed` option. This is similar to regexp single character matching usage. For example, to allow all alphanumerical characters, along with _ and $ as legal chars, use: -allowed {a-zA-Z0-9_$} *Data_type*: bool, optional
`-replace_string` *string*	Specifies the replacement string for `-restricted` or `-reserved_words` strings. The default value for this option is "_". *Data_type*: string, optional
`-reserved_words` *string*	Specifies a list of words to be avoided (reserved words), like 'begin end'. If a complete name exactly matches one of the reserved words (not just a sub-string of the name), then by default, the name will be changed with the addition of an `_1`, `_2`, etc. suffix. If you also specify the `-replace_string` *rep_str* parameter, then the reserved words will be replaced by *rep_str* instead, and the `_1`, `_2`, etc. will be appended, if there are any collisions. *Data_type*: string, optional
`-restricted` *string*	Specifies a list of strings that cannot be used inside a name. Each string is replaced with the `-replace_string` string. For example, `-restricted {ab bc}` will replace all the `ab` and `bc` strings inside the names. *Data_type*: string, optional
`-suffix` *string*	Adds a suffix to the names that are changed. **Note:** If the length of `-suffix` exceeds the `-max_length` value, the suffix is truncated.
`-system_verilog`	Replaces SystemVerilog reserved words. If a complete name exactly matches one of the reserved words (not just a sub-string of the name), then the name will be changed. *Data_type*: bool, optional

`-verilog`	Replaces Verilog reserved words. If a complete name exactly matches with one of the SystemVerilog reserved words (not only a sub-string of the name), then the name will be changed. *Data_type*: bool, optional
`-vhdl`	Fixes names to meet VHDL identifier requirements. It replaces VHDL reserved words. If a complete name exactly matches one of the VHDL reserved words (not only a sub-string of the name), then the name will be changed. It also implicitly uses –first_restricted “_0123456789” to remove any leading _ or digit chars, and –last_restricted “_” to remove any trailing _ chars, so you cannot use –vhdl together with –first_restricted or –last_restricted. Finally, this option will remove any repeated _ chars in the middle of any name, and replace it with a single _ char because VHDL does not allow repeated _ chars. *Data_type*: bool, optional

Examples

- The following command replaces the `p1` inst name with the `prefix_p1` prefix without updating all the `p1` sub-strings (for example, without changing `insts` named `p12` or `op1`):
  ```
  update_names -inst -reserved_words {p1} -replace_string {prefix_p1}
  ```
- The following example replaces sub-string "no" with "NO", and all brackets "[" and "]" with underscore "_" in all net names:
  ```
  innovus 1> update_names -net -map {{no NO} {[ _} {] _}}
  ```
  Optional double-quotes are ignored, so this has the same result:
  ```
  innovus 1> update_names -net -map {{"no" "NO"} {"[" "_"} {"]" "_"}}
  ```
  So, a Verilog net name that requires escaping like:
  `\test[0]nox` would change to `test_0_NOx`
  Note, neither the Verilog or DEF name requires escaping anymore, so no \ would be written to Verilog or DEF for these names. A “real” bus name like
  `no[0]` would just be changed to `NO[0]`
  because the `[0]` are bus-bit chars and values that are never changed.

- The following example replaces any sub-strings that match ab, bc, or ca with "@" in all object names:
  ```
  innovus 1> update_names -restricted "ab bc ca" -replace_string "@"
  ```
- The following command changes the brackets "[" and "]" in all names to "_". It does not change real bus-bit chars for nets.
  ```
  innovus 1> update_names -restricted {[ ]} -replace_string "_"
  ```
  Note: You should use {} to protect the [] from being interpreted by Tcl.
- The following example specifies the maximum length of all module names to be 12 characters.
  ```
  innovus 1> update_names -max_length 12 -module
  ```
- The following example fixes case-insensitive collisions. Suppose you have two insts named inst73 and INST73. This command renames one of the insts by appending _<num> to one of the names for avoiding a naming conflict, when casing is ignored.
  ```
  innovus 1> update_names -inst -nocase
  ```
- The following example allows all capital and lower case letters, numbers, underscores, backslash, and brackets. Any other character will be removed.
  ```
  innovus 1> update_names -allowed
  {ABCDEFGHIJKLMNOPQRSTUVWXYZabcdefghijklmnopqrstuvwxyz0123456789_\[]}
  ```
  If you want to use character ranges, you can use `-regexp`:
  ```
  innovus 1> update_names -regexp -allowed {a-zA-Z0-9_\[]}
  ```
- If you want to change names that collide with reserved Verilog words, then use the following command:
  ```
  innovus 1> update_names -verilog
  ```
  Names that exactly match a Verilog reserved words, like "input" will be replaced with "input_1". This does not replace sub-strings in names that match "input", so "my_input" would not be modified.

Related Topics

`rename_obj`

view_log

```
view_log
[-help]
[file_name logFileName]
```

Opens up a log file in a separate console window for viewing within the Innovus.

The log file viewer within the Innovus opens the current log file by default, and updates it in real time. If you specify a log file name, the software opens up the specified log file.

The log file displayed contains `[+]` and `[-]` markers that expand and collapse command information, so that you can control how much detail you want to read. Log messages are color coded for easier identification: blue messages are warnings, red messages are errors.

You can access documentation for commands in the log file that are underlined. Click on the command in the file, and the software opens an HTML window displaying the *Innovus Text Command Reference* documentation for that command.

You also can access the log file viewer from the *Tools Menu- Log Viewer*.

Note: You can specify `view_log` more than once to view multiple log files in separate console windows simultaneously. However, you cannot open multiple versions of the current log file.

Parameters

`file_name` *`logFileName`*	Specifies the name of the log file to open. *Data_type*: string, optional
`-help`	Outputs a brief description that includes type and default information for each `view_log` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man view_log`.

Related Information

- Tools Menu- *Log Viewer*.

gui_get_legend

```
gui_get_legend
[-help]
-type {inst_density pin_density metal_density route_congestion}
[-display_range | -value_range | -show_legend_on_layout | -legend_location | -
enable_min_value | -enable_max_value]
```

Gets the current legend setting.

You can use the `gui_set_legend` and `gui_get_legend` commands to get the snapshot of different density for analysis.

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `man` command: `man gui_get_legend`
`-display_range`	Gets the display range
`-enable_min_value`	Gets the state of the min value of display range.
`-enable_max_value`	Gets the state of the max value of display range.
`-legend_location`	Gets the location of legend.
`-show_legend_on_layout`	Gets the state of legend on layout.
`-type {inst_density pin_density metal_density route_congestion}`	Gets the setting for the specified legend type.
`-value_range`	Gets the value range.

Example

The following command sets the legend for the inst_density legend type:

```
> gui_set_legend -type inst_density -display_range {1 0.9} -show_legend_on_layout true
```

The following command gets the current legend setting for the `inst_density` legend type.

```
> gui_get_legend -type inst_density
{display_range {0.9 0.9}} {legend_location ne} {show_legend_on_layout true}
{value_range {0.75 1}}
```

Related Information

- `gui_set_legend`

gui_set_legend

```
gui_set_legend
[-help]
[-display_range {x y}]
[-enable_max_value {true false}]
[-enable_min_value {true false}]
[-legend_location {ne nw se sw}]
[-reset -display_range|-value_range|-show_legend_on_layout|-enable_min_value|-
enable_max_value]
[-show_legend_on_layout {true false}]
-type {inst_density pin_density metal_density route_congestion}
[-value_range {x y}]
```

Specifies the legend setting.

You can use the `gui_set_legend` and `gui_get_legend` commands to get the snapshot of different density for analysis.

Parameters

`-help`	Prints a brief description of the command. For a detailed description of the command, use the `man` command: `man gui_set_legend`
`-display_range {x y}`	Specifies the display range in the {min max} format
`-enable_max_value {true false}`	Enables the max value of the display range.
`-enable_min_value {true false}`	Enables the min value of the display range.
`-legend_location {ne nw se sw}`	Specifies the location of legend.
`-reset` *`-display_range|-value_range|-show_legend_on_layout|-enable_min_value|-enable_max_value`*	Resets the settings of the specified option, `-reset -display_range|-value_range|-show_legend_on_layout |-enable_min_value|-enable_max_value`. You can reset all options by using `-reset all`.
`-show_legend_on_layout {true false}`	Specifies to show the legend on layout.
`-type {inst_density pin_density metal_density route_congestion}`	Specifies the setting for the specified legend type.
`-value_range {x y}`	Specifies the value range in the {min max} format.

Example

The following command sets the legend for the inst_density legend type:

```
> gui_set_legend -type inst_density -display_range {1 0.9} -show_legend_on_layout true
```

The following command gets the current legend setting for the `inst_density` legend type.

```
> gui_get_legend -type inst_density
{display_range {0.9 0.9}} {legend_location ne} {show_legend_on_layout true}
```

```
{value_range {0.75 1}}
```

Related Information

read_taf

```
read_taf
[-help]
[filename [-quiet]
```

Applies additional attribute data from Genus for the user-managed exchanges. It is not needed for managed exchanges after iSpatial (syn_opt -spatial) from Genus to Innovus or when using common-DB between Genus and Innovus. The 'taf' format is a private format between Genus and Innovus.

Parameters

`-help`	Prints a brief description that includes type and default information for each `read_taf` parameter.
filename	Specifies the name of file to read. *Data_type*: string, required
`-quiet`	When `-quite` is specified, the tool does not give a summary. *Data_type*: bool, optional

report_disk

```
report_disk
[-help]
[-dir directory_name]
```

Reports the disk metrics of the current working directory and the /tmp directory. The output of this command allows you to investigate Mb/sec throughput of the disk and disk I/O requirements.

This command also reports the used and free disk space for the directory specified by the `-dir` parameter (default is /tmp).

Parameters

`-help`	Outputs a brief description that includes type and default information for each `report_disk` parameter. For a detailed description of the command and all of its parameters, use the man command: `man report_disk`.
`-dir` *`directory_name`*	Specifies the name of the directory in which disk metric information is written. The default directory is `/tmp`.

Examples

- The following is a sample output for `report_disk`:

```
>report_disk

DISK_INFO : 206.66 Mb/S   381G total   1.1G used   359G free   /env(TMPDIR)

{206.66 381G 1.1G 359G}
```

- The following command shows the usage of `report_disk -dir`:

```
>report_disk -dir .

DISK_INFO : 98.51 Mb/S   9.6T total   9.3T used   395G free   .

{98.51 9.6T 9.3T 395G}
```

time_info

```
time_info
[-help]
[stage_name]
[-current]
[-report]
[-stamp]
[-table metric_table_id]
```

Reports and tracks runtime and memory performance.

Parameters

`-help`	Outputs a brief description that includes type and default information for each `time_info` parameter. For a detailed description of the command and all of its parameters, use the man command: `man time_info`.
stage_name	Specifies the name of the stage.
`-current`	Reports the current stage.
`-report`	Reports all stages up to this point
`-stamp`	Creates a time stamp.
`-table` *metric_table_id*	Specifies metrics table ID to support multiple tables. *Default*: 'default'

Examples

- The following command shows the usage of the `-current` parameter:

```
[DEV]innovus 4> time_info -current
=========================================================
CPU Runtime: 0:00:52.5
Wall Runtime: 0:03:41
Memory Usage: 1387.4 MBytes
Peak Memory Usage: 1505.3 MBytes
Current Time: 12:17:13 (Jul07)
=========================================================
```

- The following command shows the suage of -report:

```
@[DEV]innovus 6> time_info -report
Total Wall | Stage Wall | Wall % | Date - Time     | Memory   | Stage
----------------+----------------+------------+-------------------+------------+--
--------------------
0:00:00    | 0:00:00    | 0.0%   | 8:27:08 (Jul07) | 824.3 MB | init
----------------+----------------+------------+-------------------+------------+--
--------------------
Number of threads: 1 * 1 (id: default)
```

clear_all_rulers

```
clear_all_rulers -help
```

Removes all ruler lines from the main window. You can also clear the ruler lines with the *Clear All Rulers* icon on the toolbar in the main window.

Parameters

`-help`	Prints a brief description that includes type and default information for each `clear_all_rulers` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man clear_all_rulers`

Related Information

create_gui_shape

```
create_gui_shape
[-help]
[-layer layerName]
[-name guiShapeName]
[-width width]
{-rect {x1 y1 x2 y2} | -line {x1 y1 x2 y2 ...} | -polygon {x1 y1 x2 y2 ...}}
[ -line {x1 y1 x2 y2 ...} [-arrow ] ]
```

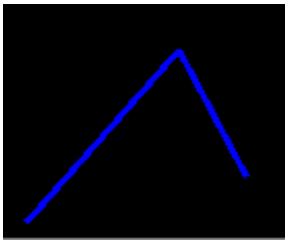
Adds a shape to the default or specified custom layer. You can use the `create_gui_shape` command at any point in the design flow. The shapes added by the command annotate comment shapes and do not show up in a DEF output.

Note: In OpenAccess flows, the shapes added with the `create_gui_shape` command are stored in the OpenAccess cellview. However, the shapes are stored in a private structure that is accessible only to Innovus. To create shapes that are visible in Virtuoso as well, use the `create_shape` command instead.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_gui_shape` parameter. For a detailed description of the command and all of its parameters, use the man command: `man create_gui_shape`
`-arrow`	Draws an arrow in the middle of the line segment to indicate the start to end direction. This parameter can only be used with `-line`. *Data_type*: bool, required
`-layer` *layerName*	Specifies the GUI layer name to use or create for the shape. If the specified layer does not exist, it is created automatically. If a layer is not specified, the tool automatically creates a layer with the name `defaultLayer` and adds the shape to it. *Data_type*: string, optional
`-line {`*x1 y1 x2 y2 ...*`}`	Creates a line, with *x1 y1 x2 y2 ...* specifying the coordinates for the line segments. The values are specified in microns. *Data_type*: (point)+, optional
`-name` *guiShapeName*	Specifies the name of the GUI shape. *Data_type*: string, optional
`-polygon {`*x1 y1 x2 y2 ...*`}`	Creates a polygon shape, with *x1 y1 x2 y2 ...* specifying the coordinates for the polygon segments. The values are specified in microns. *Data_type*: (point)+, optional
`-rect {`*x1 y1 x2 y2*`}`	Specifies the coordinates of the lower-left and upper-right points of the rectangle. The values are specified in microns. *Data_type*: rect, optional
`-width` *width*	Specifies the width of the shape border in pixels. The minimum (default) value is `1` and the maximum is `7`. *Data_type*: int, optional

Examples

- The following command adds a triangular shape in layer `1`:
  ```
  create_gui_shape -layer 1 -polygon {95.841 -645 96.592 -644.147 96.926 -644.777}
  ```
  - The following command adds a line shape with two segments:
  ```
  create_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777}
  ```
  - The following command adds a line shape with two segments and direction arrows:
  ```
  create_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777} -
  arrow
  ```
  - The following command adds a line shape of 3-pixel width:
  ```
  create_gui_shape -layer 1 -line {95.841 -645 96.592 -644.147 96.926 -644.777} -
  width 3
  ```
  


Related Information

- create_gui_text

create_gui_text

```
create_gui_text
[-help]
-label text
-layer layerName
{-box {x1 y1 x2 y2} | {{-height height | -fixed_height fixHeight} -pt {x y} [-
orient direction]}}
[-box {x1 y1 x2 y2} [-no_bbox]]
```

Adds text (annotation) to the specified custom layer. You can use the `create_gui_text` command at any point in the design flow. The text added by the command annotates comment text and does not show up in a DEF output.

Note: In OpenAccess flows, any text added with the `create_gui_text` command is stored in the OpenAccess cellview. However, the text is stored in a private structure that is accessible only to Innovus. To create text that is visible in Virtuoso as well, use the create_text command instead.

Parameters

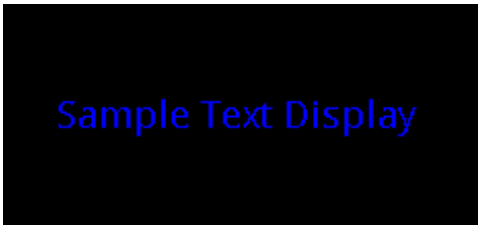
`-help`	Prints a brief description that includes type and default information for each `create_gui_text` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_gui_text`
`-box {x1 y1 x2 y2}`	Specifies the coordinates of the lower-left and upper-right points of the rectangle in which text will be added. The coordinate values are specified in microns. When this parameter is used, the tool figures out the correct size and orientation to be used to fit the text into the box. The text is center justified in the box. Use this parameter to control the text orientation and size. *Data_type*: rect, optional
`-fixed_height fixHeight`	Specifies the height in pixels. `fixHeight` should be an integer value. *Data_type*: int, optional

`-height` *height*	Specifies the height of the text in microns. *Data_type*: float, optional
`-label` *text*	Specifies the text that you want to add. *Data_type*: string, required
`-layer` *layerName*	Specifies the GUI layer name to use or create for the text. If the specified layer does not exist, it will be automatically created. *Data_type*: string, required
`-no_bbox`	Specifies that bounding box should not be drawn when text is displayed at the specified box coordinates. This parameter can be used only when `-box` is specified. *Data_type*: bool, optional
`-orient` *direction*	Specifies the orientation of the text. Possible values are: `mx mx90 my my90 r0 r90 r180 r270` This option cannot be used with `-box`.
`-pt {`*x y*`}`	Specifies the origin coordinate of the text in microns. *Data_type*: point, optional

Examples

- The following command adds the text label `Sample Text Display` with size of 18 pixels on layer `1` at the specified point coordinates:

  ```
  create_gui_text -layer 1 -label "Sample Text Display" -fixed_height 18 -pt {0 250}
  ```

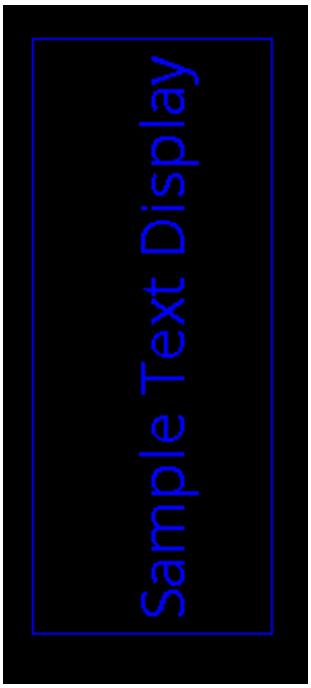
  


- The following command adds the text label `Sample Text Display` on layer `1` in a box with the specified coordinates. As the length of the box is more than the width, the text is displayed horizontally:

```
create_gui_text -layer 1 -box {0 250 500 450} -label "Sample Text Display"
```

- The following command adds the text label `Sample Text Display` on layer `1` in a box with the specified coordinates. As the height of the box is more than the width, the text is displayed vertically:

  ```
  create_gui_text -layer 1 -box {0 250 200 750} -label "Sample Text Display"
  ```



- The following command adds the text label `Sample Text` Display on layer `1` at the specified box coordinates. However, the bounding box is not displayed:

  ```
  create_gui_text -layer 1 -box {0 250 500 450} -no_bbox -label "Sample Text
  Display"
  ```

create_ruler

```
create_ruler
[-help] {{-center {x y} -radius value} | -coords {x1 y1 x2 y2 ...}}
```

Adds a ruler. For an orthogonal ruler, use `-coordinates` to specify ruler segments. For a circular ruler, use `-center` and `-radius`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `create_ruler` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man create_ruler`
`-center {x y}`	Specifies the coordinates for the center of a circular ruler. *Data_type*: point, optional
`-coords {x1 y1 x2 y2 ...}`	Specifies the beginning and ending coordinates for the ruler line segments. The values are in microns. *Data_type*: (point)+, optional
`-radius value`	Specifies the radius of a circular ruler. *Data_type*: double, optional

Example

- The following command creates a circular ruler of radius 500 with the center at `{0 0}`:

  ```
  create_ruler -center {0 0} -radius 500
  ```

delete_workspace

```
delete_workspace
[-help]
[-dir directory]
-name workspaceName
```

Deletes the specified workspace. Use this command at any stage in the design flow to remove a workspace that you do not need any longer.

Parameters

`-help`	Prints a brief description that includes type and default information for each `delete_workspace` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man delete_workspace`
`-dir` *`directory`*	Specifies the directory from which the workspace is to be deleted. The default search order to access directories for deleting workspaces is as below: • Current working directory • User home directory *Data_type*: string, optional
`-name` *`workspaceName`*	Specifies the name of the workspace to be deleted. *Data_type*: string, required

Example

The following example deletes the `Test` workspace from the current working directory.

```
delete_workspace -name Test
```

Related Information

- `read_workspace`
- `write_workspace`
- `set_default_workspace`

edit_copy

```
edit_copy
[-help]
[-orientation {r0 r90 r180 r270 mx mx90 my my90}]
[-net net_name | -net_group string| -keep_net_name]
[-rotate_point {x y} | -times integer]
[-rotate_point {x y} | [dx dy ]]
```

Copies selected or specified objects to the specified location. In the current release, the command supports copying of regular wires and vias, special wires and vias, as well as patch wires. When `set_db edit_wire_snap_objects_to_track regular` (or `special` or `patch`) is specified before using `edit_copy`, copied wires of that type are snapped to track.

Note: Use the `copy_obj` and `paste_obj` commands to copy placement and routing blockages.

Parameters

`-help`	Prints a brief description that includes type and default information for each `edit_copy` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man edit_copy`
dx	Specifies the dx distance to move the object copy in microns. *Data_type*: float, required
dy	Specifies the dy distance to move the object copy in microns. *Data_type*: float, required
`-keep_net_name`	Specifies that the net name from the original object should be retained after copying. *Data_type*: bool, optional

`-net` *net_name*	Specifies net to which the copied object should be assigned. If neither `-net` nor `-keep_net_name` is specified and: • The copied wire connects to a single wire, the tool assigns the single wire's net to the copied wire. • The copied wire connects to multiple wires on the same net, the tool assigns the net to the copied wire. • The copied wire connects to multiple wires on different nets, the tool assigns `_NULL` to the copied wire and displays the following message: `**WARN: (IMPSPR-304): One target route connects to more than one routes on different nets, net for the target route might not be correctly assigned. Undo and try again to pick a proper location.` *Data_type*: (net), optional
`-net_group` *string*	Assigns the specified net group name to the new copy of the bus guide. You can specify only one net group name with the `-net_group` parameter. If the net group name you specify does not exist, the tool does not copy the bus guide and issues an error message. If you copy a bus guide without the `-net_group` parameter, the new bus guide retains the net group name of the original bus guide. Note that the `-net_group` parameter cannot be used for wires or vias. If you use it for copying a wire or via, the tool ignores the setting but continues the copy operation with a warning. Similarly, the `-net` and `-keep_net_name` parameters do not work for bus guides. If you copy a bus guide with `-net` or `-keep_net_name`, the tool ignores the settings, issues a warning, and copies the bus guide with the original net group name. *Data_type*: string, optional
`-orientation {r0 r90 r180 r270 mx mx90 my my90}`	
	Specifies the orientation of object copy after pasting. Use this parameter to rotate the selected wire or via during copy/paste. For values `r0`, `r90`, `r180`, and `r270`, the wire or via is rotated by specified degrees around the lower left point. For values `mx`, `mx90`, `my`, and `my90`, the bounding box is mirrored. *Data_type*: enum, optional

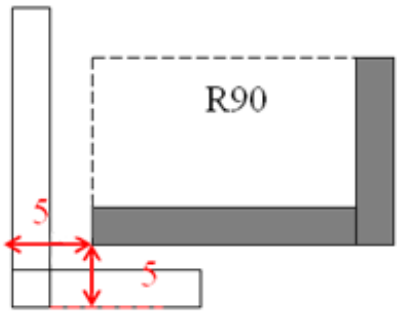
`-rotate_point {x y}`	
	Rotates the copied wire(s) around the specified point `{x y}`, when specified along with the `-orientation` parameter. If the `-rotate_point` parameter is not specified, the copied wires are rotated by default around the lower-left corner of the bounding box of the original wires. If you specify the `-rotate_point` parameter without the `-orientation` parameter, the tool copies the object at the same location. This is the same as specifying the `-orientation {R0}` option. **Note**: The `-rotate_point` parameter cannot be used with the `-times` parameter.

`-times` *integer*	Specifies the number of times the object is to be copied. For example, if you specify 3, the selected wire is copied thrice. The distance between different copies of the wire is equal to the distance between the original wire and the first copy. If you move the first copy, the other copies are moved by the same distance:  **Note**: If DRC checking is turned on with `setEditMode -drc_on true`, all copied wires obey the DRC rules. *Data_type*: int, optional

Example

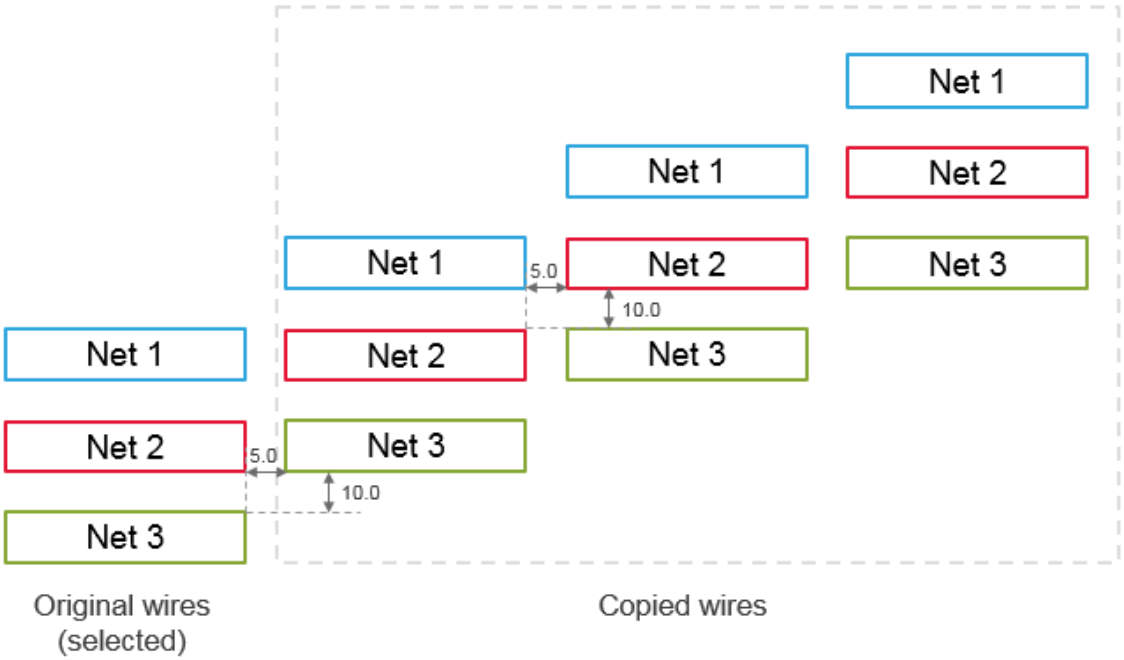
- The following command copies the selected wire 5 microns up and to the right of the original and rotates the wire by 90 degrees around the lower left corner:

```
edit_copy 5 5 -orientation r90
```



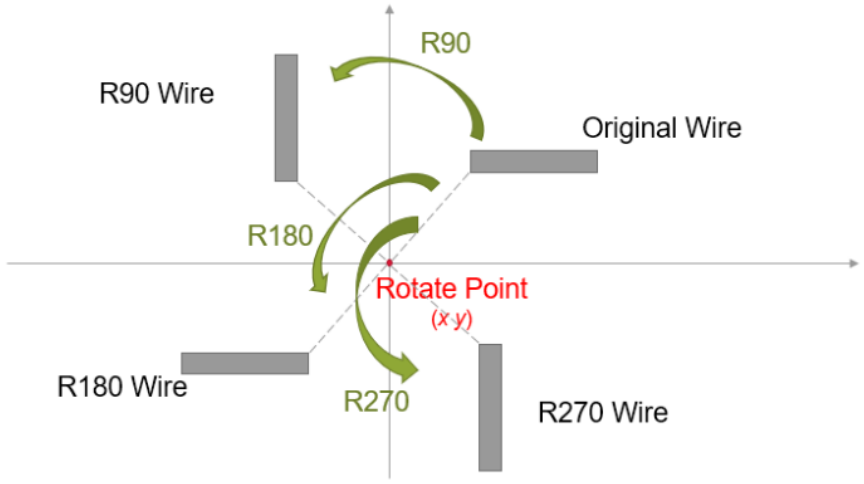
- The following command copies the selected wires 3 times and the distance between each copy set is as specified:

```
edit_copy 5.0 10.0 -times 3 -keep_net_name
```



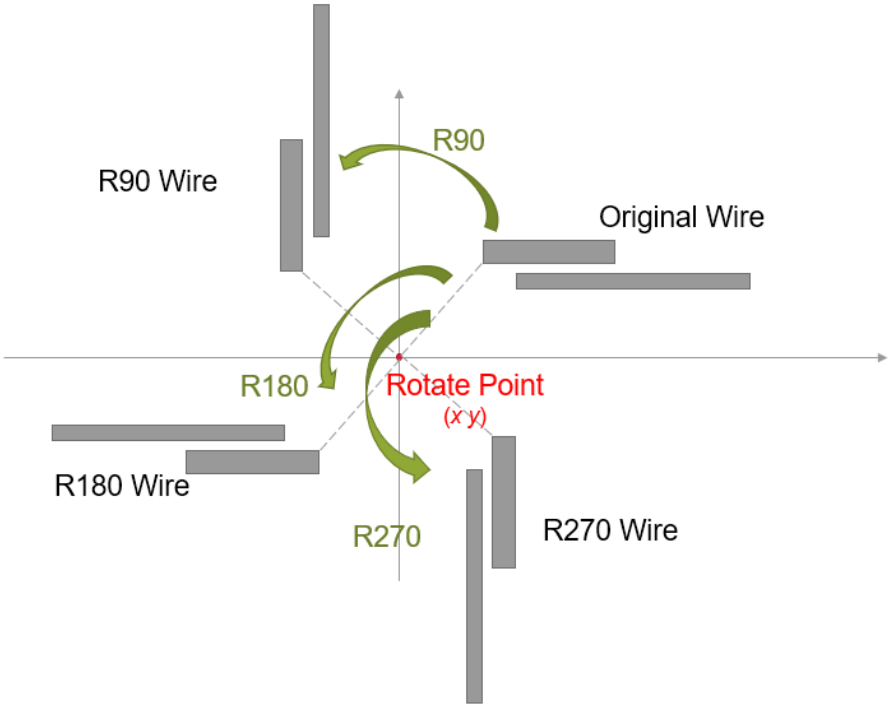
- The following commands rotate the new copy of the selected wire by 90, 180, and 270 degrees, respectively, around the specified rotation point, *x y*:

```
edit_copy -orientation r90 -rotate_point x y
edit_copy -orientation r180 -rotate_point x y
edit_copy -orientation r270 -rotate_point x y
```



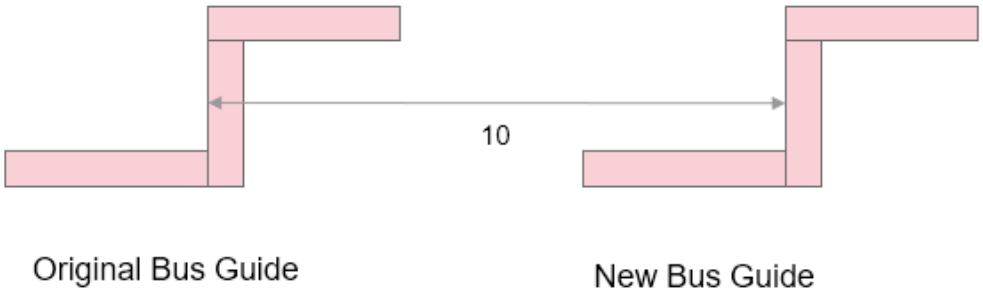
- The following commands rotate the new copy of the selected group of wires by 90, 180, and 270 degrees, respectively, around the specified rotation point, *x y*:

```
edit_copy -orientation r90 -rotate_point x y
edit_copy -orientation r180 -rotate_point x y
edit_copy -orientation r270 -rotate_point x y
```



- The following command copies the selected bus guide 10 microns to the right of the original:

```
edit_copy 10 0
```



- The following command copies the selected bus guide 10 microns to the right of the original and assigns the net group `B` to the copy:

```
edit_copy 10 0 -net_group B
```

gui_add_marker

```
gui_add_marker
[-help]
-color <string>
-name <string>
-point {x y}
-type {x tick star}
```

Places a marker to indicate location on the design layout.

Parameters

`-help`	Outputs the command usage and a brief description about the command parameters.
`-color <string>`	Specifies the color of the marker. You can specify 16 colors for the marker. These are: `red blue green yellow magenta cyan pink orange brown purple violet teal olive gold maroon wheat` *Data_type*: string, required
`-name <string>`	Specifies the name of the marker. *Data_type*: string, required
`-point {x y}`	Specifies the location `{x y}` at which the marker will be placed on the design layout. *Data_type*: point, required
`-type {x tick star}`	Specifies the shape of the marker. There are three shapes for the markers: `x`, `tick`, and `star`. *Data_type*: enum, required

Example

- The following command shows that a X type marker of color RED has been placed at the location {100 100}.
  ```
  gui_add_marker -name aa -color red -point {100 100} -type x
  ```

Related Information

gui_add_ui

```
gui_add_ui
[-help]
name
[-before name]
[-checked {true | false}]
[-command string]
[-disabled {true | false}]
[-enable_variable string]
[-foreground string]
[-icon filename]
[-in name]
[-label string]
[-movable {true | false}]
[-newline {true | false}]
[-shortcut string]
[-tooltip string]
-type {menu | toolbar | submenu | command | check | radio | separator | toolbutton}
[-underline integer]
[-value string ]
[-variable string]
[-visible_variable string]
```

Adds a new interface element with the specified name of the specified type. Use this command to customize the Innovus graphical interface by adding menus, toolbars, status bar, and other interface elements, as required.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_add_ui` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_add_ui`

name	Specifies as a string the internal name of the interface element you want to add. **Note:** Choose the internal name of the element carefully as this is what is used internally by the software to identify the element for any further manipulation. *Data_type*: string, required
-before *name*	When specified, adds the new element before the element identified by *name*. *Data_type*: string, optional
-checked {true | false}	Specifies whether or not the check box or radio button you are adding should be checked. **Note:** You can use the `-checked` parameter only if you are adding elements of type `check` or `radio`. *Default*: `false` *Data_type*: bool, optional
-command *string*	Specifies the Tcl command to be executed when the element you are adding is invoked. **Note:** You can use the `-command` parameter only if you are adding elements of type `command, check, radio` or `toolbutton`. *Data_type*: string, optional
-disabled {true | false}	Specifies the state of the interface element you are adding. **Note:** You can use the `-disabled` parameter only if you are adding elements of type `menu, submenu, command, check, radio` or `toolbutton`. The parameter is NOT applicable for elements of type `toolbar` and `separator`. *Default*: `false` *Data_type*: bool, optional
-enable_variable *string*	Represents the Tcl global variable for Enable status. *Data_type*: string, optional

`-foreground` *`string`*	Specifies foreground color of the icon. **Note:** You can use the `-foreground` parameter only if you are adding an element of type `toolbutton`. *Data_type*: string, optional
`-icon` *`filename`*	When adding a toolbutton, specifies the file name of the toolbutton icon. *`filename`* can be the full path of the icon file or an icon name supported by Innovus. The icon names used in Innovus can be queried using the `gui_get_ui` command. For list of supported image formats for the icon file, see the "Supported Image Formats" section of the Customizing the User Interface chapter in the *User Guide*. **Note:** The `-icon` parameter is applicable only for elements of type `toolbutton`. *Data_type*: string, optional
`-in` *`name`*	Specifies the name of the parent element. Use this parameter along with `-before` to specify the location of the element you are adding. By default, `-in` adds the element to the end of the parent element. Use `-before` to add the element at a specific location within the parent element. **Note:** If `-in` is not specified, the new element is created but is not added to any location. *Data_type*: string, optional
`-label` *`string`*	Specifies the label to be displayed on the new element. **Note:** This parameter is NOT applicable for elements of type `separator`. *Data_type*: string, optional
`-movable {true | false}`	When adding a toolbar, specifies whether or not it will be movable. *Data_type*: bool, optional

`-newline {true | false}`	When adding a toolbar, specifies whether or not the toolbar should be added as a new row. **Note:** The `-newline` parameter is applicable only for elements of type `toolbar`. *Default*: `false` *Data_type*: bool, optional
`-shortcut` *string*	Specifies the shortcut key for a command, check box, radio button, or toolbutton. **Note:** You can use the `-shortcut` parameter only if you are adding elements of type `command`, `check`, `radio`, or `toolbutton`. *Data_type*: string, optional
`-tooltip` *string*	Specifies the tooltip text for the toolbar or toolbutton you are adding. **Note:** The `-tooltip` parameter is applicable only for elements of type `toolbar` and `toolbutton`. *Data_type*: string, optional
`-type {menu | toolbar | submenu | command | check | radio | separator | toolbutton}`	
	Specifies the type of the interface element you want to add. Currently, elements of type `main` and `statusbar` are not supported. *Data_type*: enum, required
`-underline` *integer*	Specifies the integer index of the character to be underlined in the element label. The index begins with `0` and should have a value less than or equal to the length of the element label. For instance, if you want the second letter of the element label to appear underlined, specify *integer* as `1`. **Note:** The `-underline` parameter is NOT applicable for elements of type `toolbar, separator,` and `toolbutton`. **Note:** This parameter can be used only if the `-label` parameter is also specified. *Data_type*: int, optional

`-value` *`stringValue`*	When adding a radio button, specifies the value to be stored in the associated variable when the radio button is selected. **Note:** The `-value` parameter is applicable only for elements of type `radio`. *Data_type*: string, optional
`-variable` *`string`*	When adding a check box or radio button, specifies the Tcl global variable for the item. *Data_type*: string, optional
`-visible_variable` *`string`*	Represents the Tcl global variable for Visible status *Data_type*: string, optional

Examples

- The following command will add a new menu labeled *ExampleMenu* in the main window:
  ```
  gui_add_ui exmpMenu -type menu -label ExampleMenu -in main
  ```
- The following command will add a new menu item labeled *ExampleCommand* in *ExampleMenu*:
  ```
  gui_add_ui exmpCommand -type command -label ExampleCommand -in exmpMenu -command [list puts Example Command]
  ```
- The following command adds a new, unmovable toolbar to the layout window:
  ```
  gui_add_ui newTB -type toolbar -in main.layout -movable false
  ```

gui_attach_to_cursor

```
gui_attach_to_cursor
[-help]
[ -selected  | objects ]
```

Attaches selected or specified objects to the cursor. The use model is as follows:

1. Select the object(s) to be moved by using the `gui_attach_to_cursor` command.
2. Zoom into the location where you want to place the object(s).
3. Click at the required location to place the selected object(s) there.

This command is useful during floorplanning when you may need to move multiple objects into the same zoomed in area.

Parameters

`-help`	Prints a brief description of the `gui_attach_to_cursor` command. For a detailed description of the command, use the `man` command: `man gui_attach_to_cursor`.
`objects`	Specifies the object pointer list. *Data_type*: (any_object)+, required
`-selected`	Attaches the selected objects to the cursor. *Data_type*: bool, required

Example

The following command attaches objects `A` and `B` to the cursor:

```
gui_attach_to_cursor {A B}
```

Now, move the cursor to the layout and click at the desired location to place objects `A` and `B` there.

Related Information

- gui_zoom

gui_browse_db

```
gui_browse_db
[-help]
start
```

Launches the database browser (DB Browser). The DB browser returns information about one of the following:

- Specified object list
- Top cell of the design
- Selected object

Parameters

`-help`	Prints a brief description that includes type and default information for each `browse_db` parameter. For a detailed description of the command and all of its parameters, use the man command: `man browse_db`
start	Specifies the objects whose attributes need to be displayed in the browser. If you specify an object list, the DB browser displays the attributes of the specified objects in the browser. Use the *Show next object in list* and the *Show last object in list* buttons in the browser to traverse through the list. Alternatively, you can specify one of the following values: • `top`: Displays attributes of the top cell of the design in the browser • `selected`: Displays attributes of the objects you have selected in the main window. Use the *Show next object in list* button in the DB Browser to move to the next object in the sequence. *Data_type*: string, required

Examples

- The following command launches the DB Browser and returns attributes of the top cell of the design.

```
gui_browse_db top
```

    - DB Browser

gui_clear_highlight

```
gui_clear_highlight
[-help]
[ -all | obj_list |  -select | -original | -index indexValue]
```

Removes highlights from the highlighted objects at any stage of the design flow. You can choose to clear highlight from all objects, specified objects, selected objects, objects highlighted with original color, or objects with specified index values. If no parameter is specified, all highlights are removed.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_clear_highlight` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_clear_highlight`
`-all`	Specifies that highlight will be cleared from all objects. This is the default option. *Data_type*: bool, optional
`-index` *`indexValue`*	Specifies that highlight will be cleared from the objects highlighted with the specified index value. The index value is the value of the Highlight Set as specified through the *View - Highlight Selected* menu or through the `gui_highlight` command. For example, if you specify a value of 3 for index, highlights will be cleared from from all objects that are highlighted as Highlighted Set 3. *Data_type*: int, optional, min=1, max=1024
`obj_list`	Specifies the object pointer list for clearing highlight. *Data_type*: (any_object)+, optional
`-original`	Specifies that highlight should be cleared from the objects highlighted with original color. *Data_type*: bool, optional
`-select`	Specifies that highlight should be cleared from all selected objects. *Data_type*: bool, optional

Examples

- The following command clears highlight from all highlighted objects.
  `gui_clear_highlight`
- The following command clears highlight from all objects that have been highlighted as Highlight Set 4 through the *View - Highlight Selected* menu or through the `gui_highlight`

command.

```
gui_clear_highlight -index 4
```

- The following command clears highlight from all highlighted objects that are currently selected in the display window.

```
gui_clear_highlight -select
```

gui_clear_hinst_colors

```
gui_clear_hinst_colors
[-help]
[-color_id colorID [-hinst hInstName]]
```

Resets the color ID for all or the specified hierarchical instances.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_clear_hinst_colors` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_clear_hinst_colors`.
`-color_id` *colorID*	Specifies the color ID to which all hierarchical instances or the specified hierarchical instance will be reset. The valid values of color ID are from 0 to 29. The color value for the color ID is the same as specified in the Module Color Preference form (accessed by clicking *Floorplan - Edit Floorplan - Color Module*). *Default*: If no color ID and no instance name is specified, all hierarchical instances are displayed with the color ID `0`. This is the same behavior as the *Reset* button on the Module Color Preference form. *Data_type*: int, optional, min=0, max=29
`-hinst` *hInstName*	Specifies the name of hierarchical instance that should be displayed in the color corresponding to the specified color ID. *Default*: If no instance is specified, the color ID for all hierarchical instances is reset. *Data_type*: string, optional

Example

- The following command resets the color ID for all hierarchical instances and their descendants to `3`:

  ```
  gui_clear_hinst_colors -color_id 3
  ```

- The following command resets the color ID for the hierarchical instance *DTMF_INST* and all its descendants to the color ID 3:

```
gui_clear_hinst_colors -color_id 3 -hinst DTMF_INST
```

gui_clear_trace_flightline

`gui_clear_trace_flightline [-help]`

Clears all flightlines traced through the `gui_trace_flightline` command.

Parameters

`-help`	Prints a brief description of the `gui_clear_trace_flightline` command. For a detailed description of the command, use the `man` command: `man gui_clear_trace_flightline`.

Related Information

- `gui_report_trace_flightline`
- `gui_trace_flightline`
- `gui_write_flightline`

gui_close_cell_view

```
gui_close_cell_view [-help]
```

Closes the Cell Viewer.

If the Cell Viewer is open at any stage of the design flow, you can use the `gui_close_cell_view` command to close it.

Parameters

`-help`	Prints a brief description of the `gui_close_cell_view` command. For a detailed description of the command, use the `man` command: `man gui_close_cell_view`.

Related Information

- `gui_open_cell_view`
- Tools Menu chapter of the *Menu Reference*
  - *Cell Viewer*

gui_create_floorplan_snapshot

```
gui_create_floorplan_snapshot
[-help]
-dir string
-name string
[-overwrite]
```

Creates snapshots of the design for all three views (Floorplan, Amoeba, and Placement) at any stage of the design flow. The command creates GIF images, for all the design views, on the same scale as can be seen in Innovus. It can also save QoR parameters like WNS,TNS, Placement Overlap, and Congestion at any stage of the design flow. Once the snapshot is created, you can view it using `gui_show_floorplan_snapshot`.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_create_floorplan_snapshot` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_create_floorplan_snapshot`.
`-dir string`	Specifies the directory in which you want to save the snapshot. *Data_type*: string, required
`-name string`	Specifies the name of snapshot and the files will be created, like `ss_string_view.gif` for all three views. *Data_type*: string, required
`-overwrite`	Overwrites the existing snapshot with new one. *Data_type*: bool, optional

Note: This command will not work in the `-nowin` mode.

Examples

- The following command will create a design snapshot in the directory `/work/user1`. Before creating the snapshot, it will create the following files:

    - `ss_cts.fplan.gif` for floorplan view
    - `ss_cts.amoeba.gif` for amoeba view
    - `ss_cts.place.gif` for place view

    ```
    gui_create_floorplan_snapshot -dir /work/user1 -name cts
    ```

- The following command will create a snapshot under the name `cts`. If there exists a snapshot under this name in the directory `/work/user1`, it will overwrite it.

  ```
  gui_create_floorplan_snapshot -dir /work/user1 -name cts -overwrite
  ```

gui_create_user_bundle_net

```
gui_create_user_bundle_net
[-help]
name
-end {inst|hinst|port|base_pin|group}
-nets net_list
-start {inst|hinst|port|base_pin|group}
```

Creates a bundle of specified nets that can be displayed as flightlines. Bundled nets help you with data flow analysis before and after layout. Net bundles can be created and viewed in floorplan and amoeba views. Each custom net bundle displays the number of nets in it and works for macros, blobs, and giudes.

Using `gui_create_user_bundle_net`, you can create custom bundled nets that allow you to define your own net bundles as per your requirements. This is useful while debugging physical properties of interconnects within a complicated hierarchical design because you can define start and end points of a net bundle. As a result, you can create and display only relevant flightlines, instead of looking at all the flightlines of specified nets.

Note: One net can be part of multiple net bundles simultaneously.

You can display flightline net bundles using the `gui_show_user_bundle_nets` command and delete them using the `gui_delete_user_bundle_net` command.

Note: You can choose to display flightlines for only bundled nets by using the *Show Net Bundle FlightLine Only* option in the Preferences form. If this option is not selected, the net bundle flightlines are displayed along with other selection-based flightlines by default.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_create_user_bundle_net` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_create_user_bundle_net`
`-end {inst|hinst|port|base_pin|group}`	
	Specifies the name of object which is the end point of the nets. The object type includes inst, hinst, port, base_pin, and group. *Data_type*: (inst|hinst|port|base_pin|group), required
name	Specifies the name of the custom net bundle. *Data_type*: string, required
`-nets` *net_list*	Specifies the list of nets to be included in the net bundle. You can use patterns with wildcards to specify net names. All the nets that match the specified pattern are put in the same bundle. *Data_type*: (net)+, required
`-start {inst|hinst|port|base_pin|group}`	
	Specifies the name of object which is the start point of the nets. The object type includes inst, hinst, port, base_pin, and group. *Data_type*: (inst|hinst|port|base_pin|group), required

Examples

- The following command creates a bundle called `bundle_1`, which contains flightlines of nets `net_1` and `net_2`:

  ```
  gui_create_user_bundle_net bundle_1 -nets {net_1 net_2} -start Module1 -end
  Module2
  ```

  You can then use the gui_show_user_bundle_nets command to display `bundle_1` flightlines as follows:

  ```
  gui_show_user_bundle_nets -net_bundle bundle_1
  ```

Related Information

- `gui_delete_user_bundle_net`

- View Menu chapter of the *Menu Reference*
  - *Preferences - Flightline*

gui_delete_objs

```
gui_delete_objs
[-help]
[-shape | -text | -marker | -all | -selected ]
```

Deletes specified or selected GUI objects.

Parameters

`-help`	Prints out the command usage. For a detailed description of the command, use the `man` command: `man gui_delete_objs`
`-all`	Deletes all GUI objects. *Data_type*: bool, optional
`-marker`	Deletes GUI markers. *Data_type*: bool, optional
`-selected`	Deletes selected GUI objects. *Data_type*: bool, optional
`-shape`	Deletes GUI shapes. *Data_type*: bool, optional
`-text`	Deletes GUI texts. *Data_type*: bool, optional

Related Information

- `create_gui_shape`
- `create_gui_text`
- `gui_add_marker`

gui_delete_ui

`gui_delete_ui [-help] name`

Deletes an existing interface element with the specified name. If multiple interface elements are found with the same name, the first matched element is deleted. Use this command to customize the Innovus graphical interface by removing menus, menu items, and other interface elements that you do not require any longer.

Parameters

`-help`	Prints a brief description that includes type and default information for each `gui_delete_ui` parameter. For a detailed description of the command and all of its parameters, use the `man` command: `man gui_delete_ui`
`name`	Specifies the internal name of the interface element as a string. An error is returned if an interface element with the specified name does not exist. **Note:** Here, *`name`* represents the internal name assigned to the element when it was added to the interface and not the label that is displayed on the interface. If you specify the label instead of the name, the software will return an error. *Data_type*: string, required

Example

- The following command will delete an interface element with the internal name *`Menu1`*:

  ```
  gui_delete_ui Menu1
  ```
