

# ENG-411

## Concurrent Engineering of Space Missions

Source: ESA

### Lecture 3 - Subsystems and COMET

**Marnix Verkammen**

[marnix.verkammen@epfl.ch](mailto:marnix.verkammen@epfl.ch)

# Session's goal

- Subsystems presentation
  - Resources
  - Calculation sheets
- COMET Tutorial
  - Introduction
  - Roles & domains
  - Model
  - Ownership & subscription
  - Three switch mechanism
  - Excel add-in
- Questions?

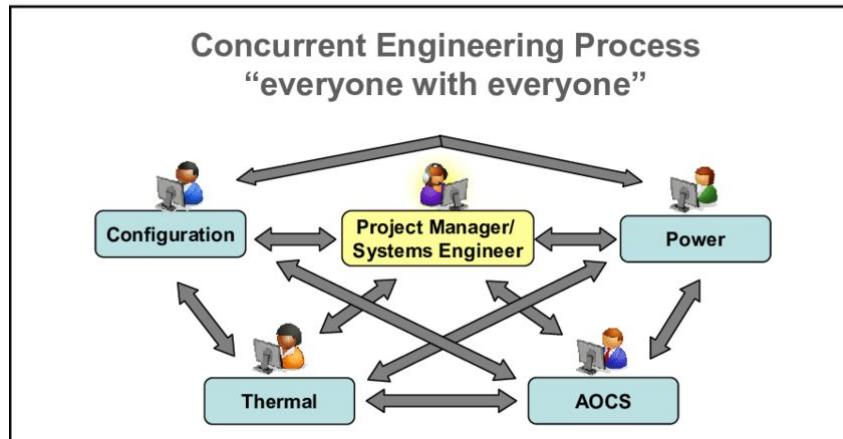

# Data exchange

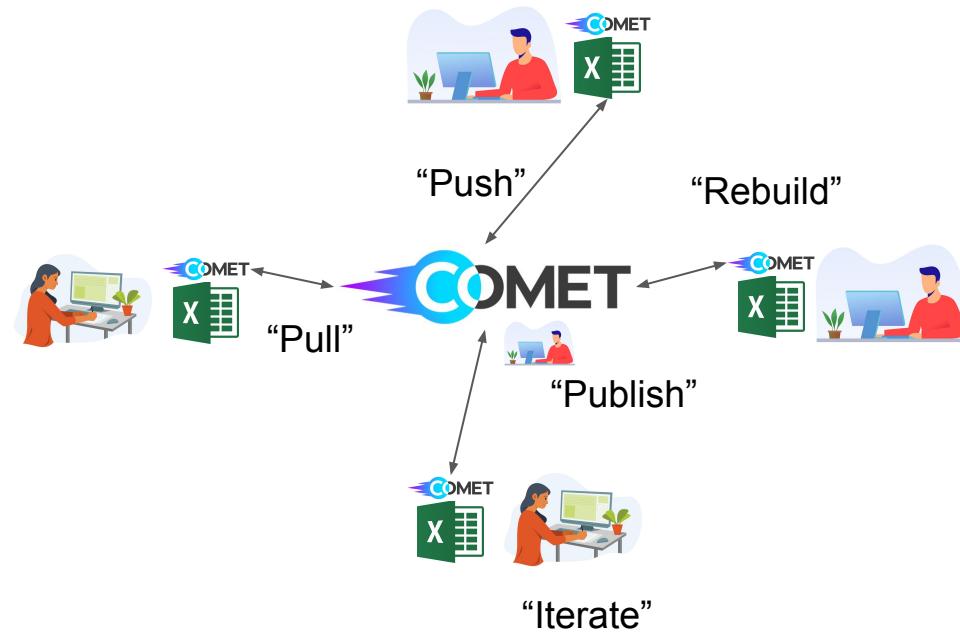

## History at ESA:

- < 2006: Integrated Design Model (IDM) in MS Excel
- < 2022: Open Concurrent Design Tool (OCDT)
- Now: **COMET** Integrated Modelling Environment (IME)

Others: eg. Valispace, and many more

Source: Volker Maiwald et al. (2010) "DLR Feasibility Study SolmeX - CE Study Report"

# Subsystems

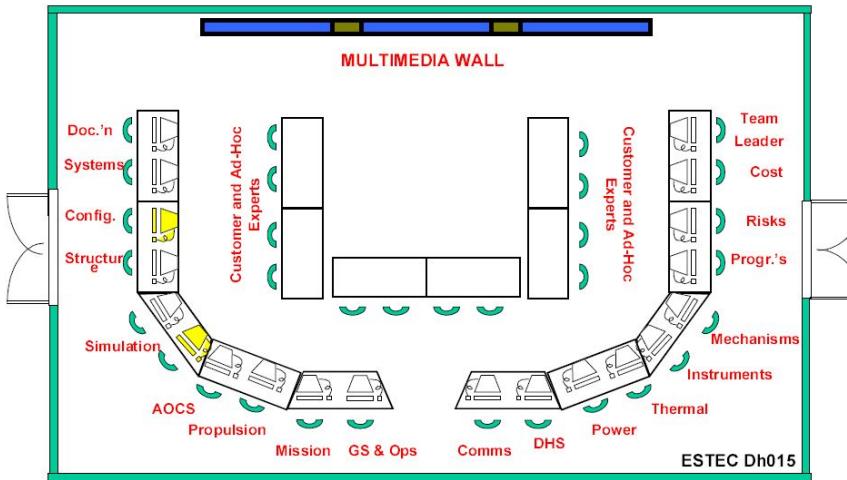

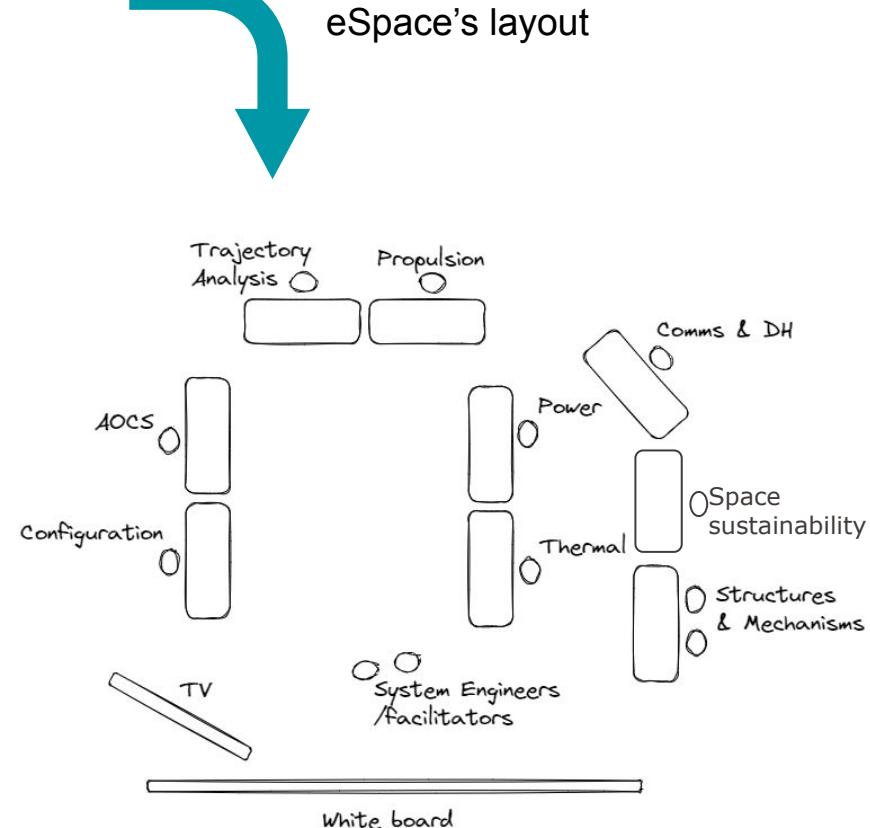

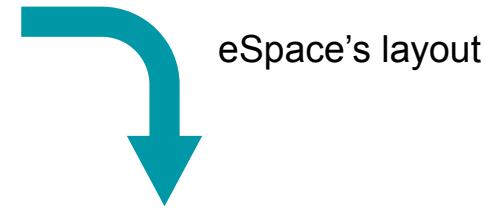

Figure 3 - The ESA/ESTEC Concurrent Design Facility Layout  
 M. Bandecci et alii, "The ESA/ESTEC Concurrent Design Facility", proceedings of EuSEC 2000

ESA's Concurrent Design Facility in LEGO (see official instructions [here](#))

# Expected results per sub-systems

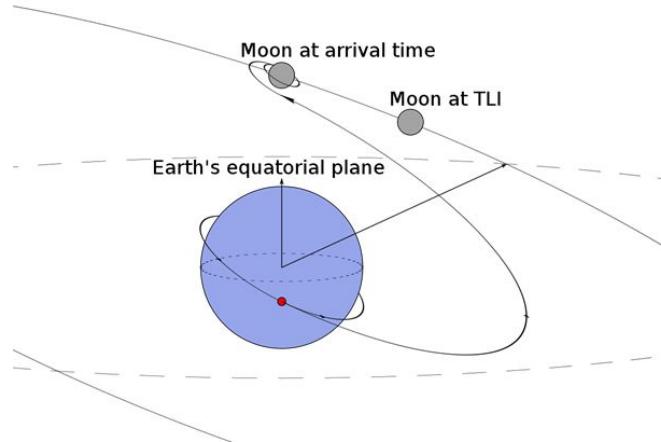

## Trajectory / Mission analysis

- Define and update the orbit and transfers of the spacecraft
- Define DeltaV over lifetime, DeltaV budget to be refined with systems team
- Calculate ground station contact time
- Calculate eclipse duration
- End of life management, support debris risks
- Support payload choice

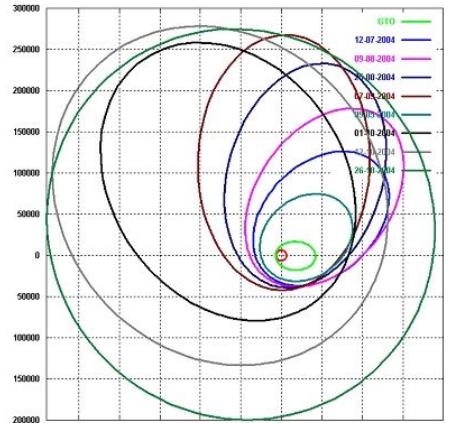

[General Mission Analysis Tool \(GMAT\)](#).  
Use case [here](#).

Or [SPICE](#) tool with its [python wrapper](#)

[Example of a trans-lunar injection](#)

[SMART-1 OSCULATING ORBIT](#)

# Expected results per sub-systems

## Structures & Mechanisms

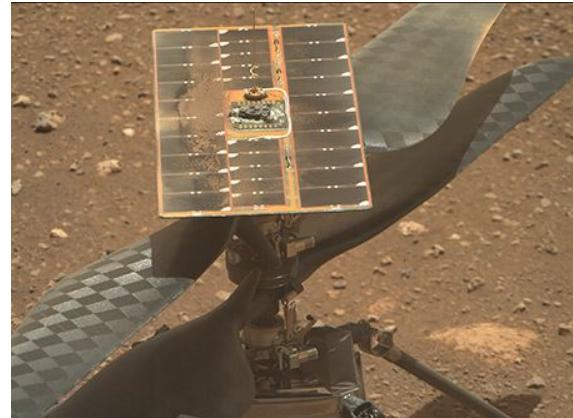

- Define the structure depending on the configuration
- Estimate the structural mass and the loads
- Separation mechanisms for companion spacecraft(s)
- Solar Array drive mechanisms
- Identify possible need for other mechanisms
- Mechanism design
- Mass budget of the subsystem

[D\\_Orbit's Ion satellite carrier](#)

[Beyond Gravity, platform mechatronics](#)

[Maxon's motor for the Ingenuity mars helicopter](#)

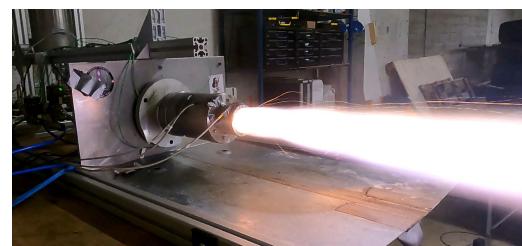

# Expected results per sub-systems

## Propulsion

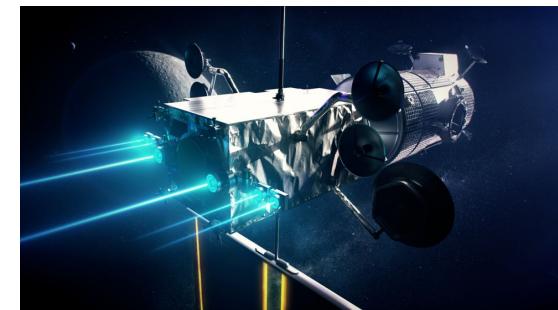

- Based on the DeltaV necessary for the mission, define the propulsion system:
  - Propulsion type (Chemical vs. electrical?)
  - Propellant type ("Green" propellant?)
  - Type of thrusters, sizing
  - Type of tanks, materials, sizing
  - Pipes (passivation?)
- Compute and update subsystem mass (also considering wet/dry mass)
- Subsystem power budget

"Green" satellite fuel - ESA

Credit: EPFL Rocket Team

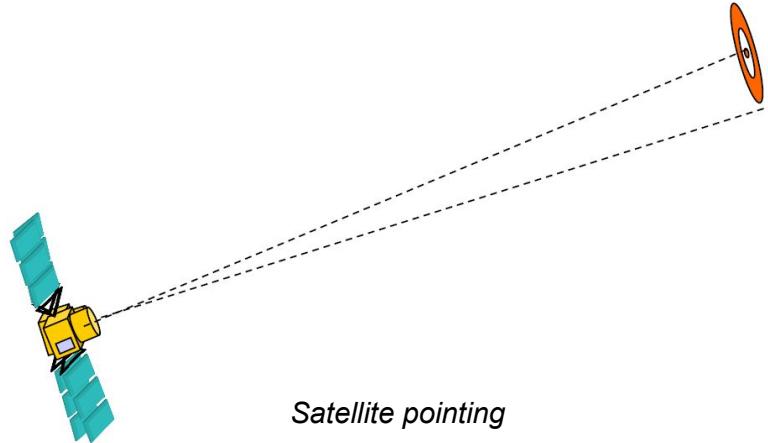

[Electrical Propulsion blog article - NASA](#)

# Expected results per sub-systems

## Attitude and Orbit Control System (AOCS)

Select equipment based on pointing requirements and attitude control requirements

- Sensors
  - Star Trackers
  - Sun sensor
  - Gyrometer
  - Navigation camera
  - ...
- Actuators:
  - Reaction wheels
  - Control moment gyroscopes
  - Thrusters
  - Solar sailing
  - ...
- Subsystem mass and power budget

[Star tracker - SODERN](#)

[CubeSat Magnetorquer](#)

[Reaction Wheel - Gomspace](#)

# Expected results per sub-systems

## CDHS (Communication and Data Handling Systems)

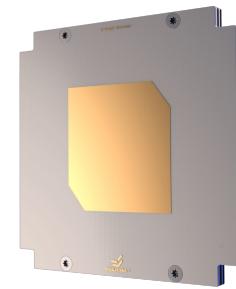

- Define the equipment needed based on the data rates needed for ground station contact and ISL (also considering the redundancies)
  - Antenna(s)
    - S band
    - P band
    - Inter satellite link
  - Mass Memory
  - Define the OBDH hardware
- Define the link budget
- Define mass and power budgets

[GOMspace NanoMind A3200](#)

[Bunny-1 On Board Computer - EPFL Spacecraft Team](#)

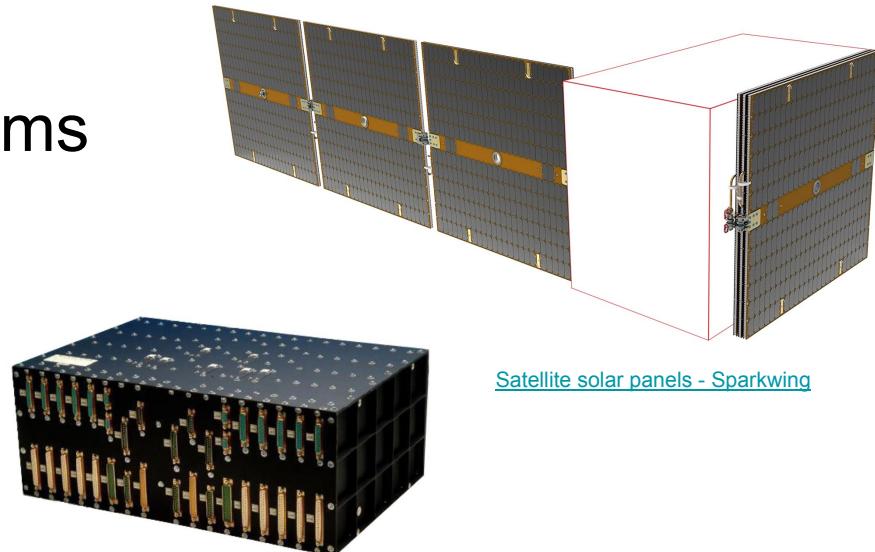

[S band patch antenna - EnduroSat](#)

# Expected results per sub-systems

## Power

- Design equipment based on the total power budget in the satellite
  - Solar array design and sizing
  - Battery (primary, secondary)
  - PCDU
  - Cable harness
- Power budget for the different modes to be made with systems team and experts
- Electrical passivation of the spacecraft
- Output and update the sub-system mass, communicate it with the systems team

Power Conditioning and Distribution Unit, copernicus satellite

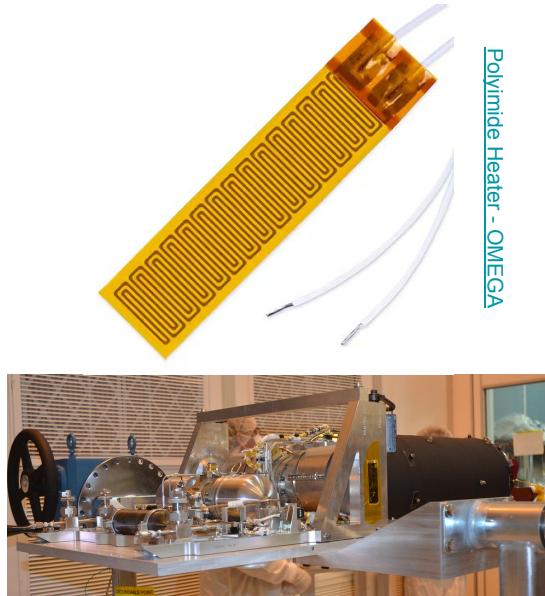

[Inside the right wall of Mars Express](#). Credit: ESA

# Expected results per sub-systems

## Thermal

- Compute the thermal balance
- Help configuration with the placement of equipment with difficult thermal requirement
- Define the thermal equipment
  - MLI
  - Paint
  - Heat pipes
  - Radiators
  - Heaters
  - Coolers
  - ....
- Define and update sub-system power and mass budget

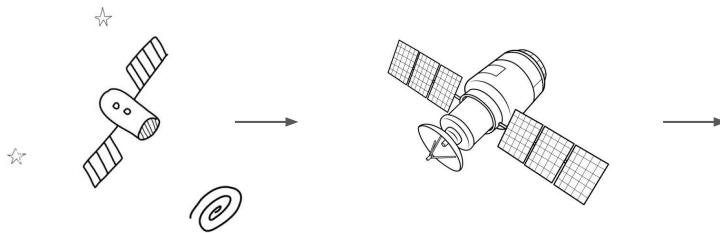

[Cryocooler for James Webb Space Telescope - NASA](#)

Multi-Layer Insulation (MLI)

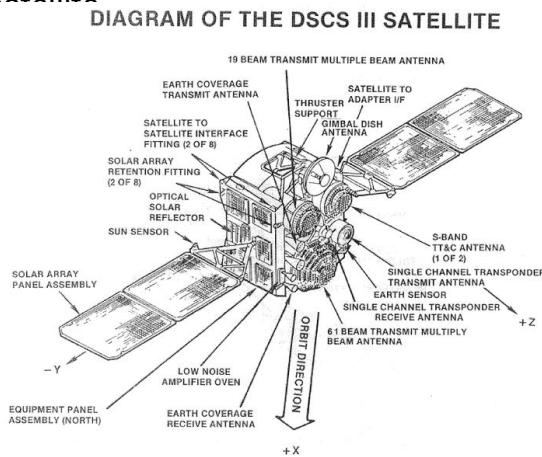

## Expected results per sub-systems

## Configuration

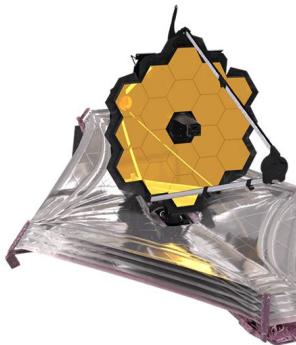

- Close to systems engineering
- Create the configurations of the spacecraft
- Define the location of the equipment in the
- Determine the MoI and CoG
- Verify external interfaces

<https://www.istockphoto.com>

<https://commons.wikimedia.org>

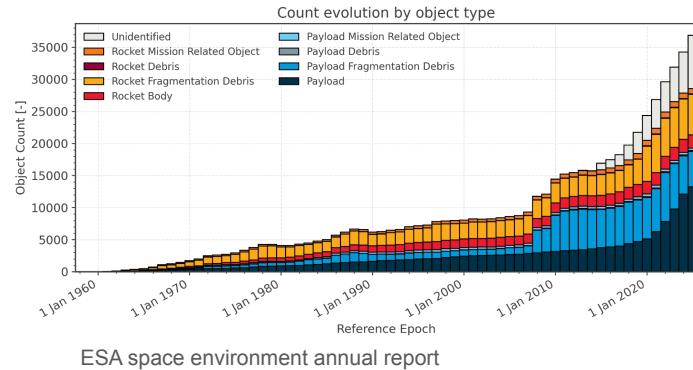

→ A coherent configuration schematized in a simple manner\* is preferred over a CAD model that would be hard to iterate on.

\*simple shapes, 2D diagrams, tangibles (e.g. LEGO®), ... CAD if fluent

# Expected results per sub-systems

## Sustainability

- Close collaboration with systems engineering
- Space debris risks and end-of-life management
- Criterias about impacts on Earth environment
  - Life cycle inventory
  - Duplicate model on LCA software ([Activity Browser](#))
  - Ecodesign choices
  - Launcher selection
- Sustainability benefits *from* the space mission ?

Martin Lemaire (PdS)

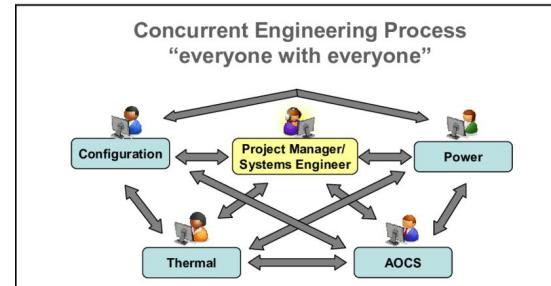

<https://blogs.esa.int/cleanspace/>

# Expected results

## Systems engineering

- Translate needs into requirements
- Update mission ConOps
- Keep track of technical assumptions
- Coordinate all subsystems
  - Manage the Push (submit) → publish → pull (synchronise) loop on COMET
- Manage the mass (and cost) budgets (+ support power, link, data budgets)
- Identify and quantify risks
- Choose payload characteristics

Source: Volker Maiwald et al. (2010) "DLR Feasibility Study SolMeX - CE Study Report"

# Subsystems summary

| Subsystems                                     | Calculation sheets | User manual |

Each ESA file has:

- Cover
- Change log
- Objectives
- Product tree
- Trade-off
- (Constants)

Require values *from* COMET  
Outputs values *to* COMET

# How

## Team

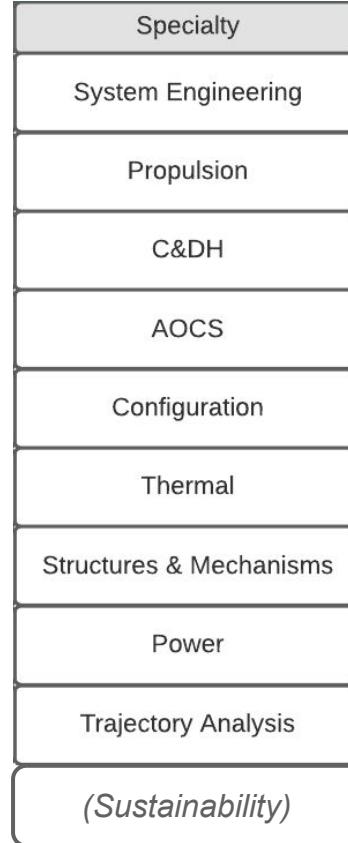

You will be ALL part of the same **team**.

Your team will be tasked with the design of a **mission** and provided with a **data pack** (i.e., basic background information about the design problem and selected resources).

This is a **cooperative challenge**.

On the last day of the course, your team will **present its own final mission design**.

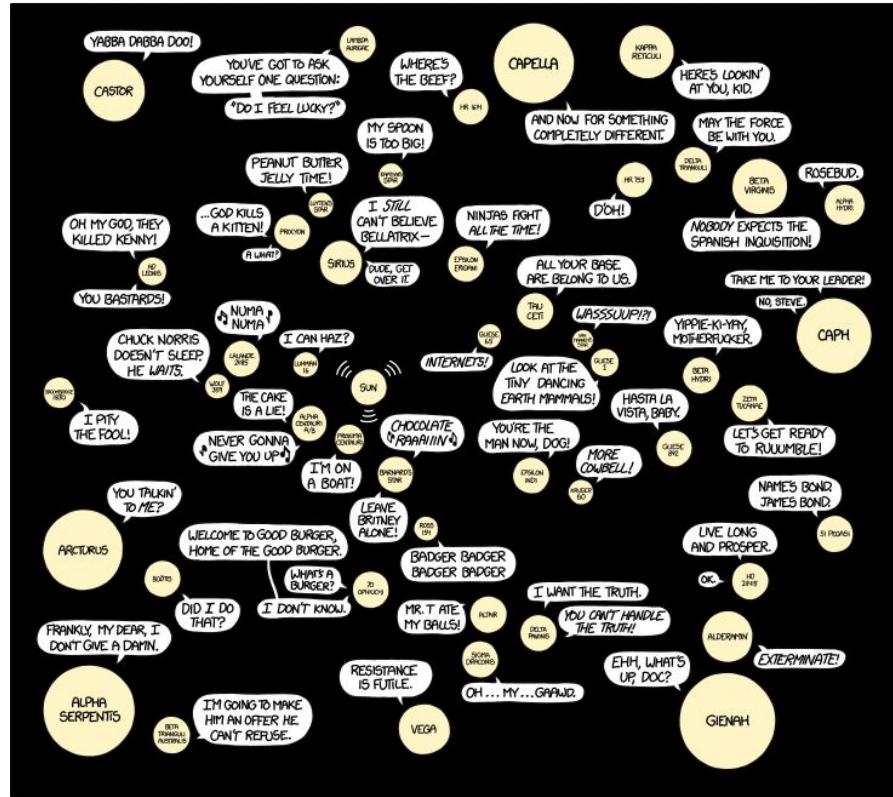

There are no right or wrong solutions.

**Roles** will be assigned next week (trying to fulfill [your preference](#))

IF OTHER STAR SYSTEMS ARE LISTENING IN ON OUR POP CULTURE,  
GIVEN THE SPEED-OF-LIGHT DELAY, THESE ARE THE JOKES AND CATCHPHRASES  
THEY JUST LEARNED ABOUT AND ARE CURRENTLY REPEATING WAY TOO MUCH:

# COMET tutorial - Models & building blocks

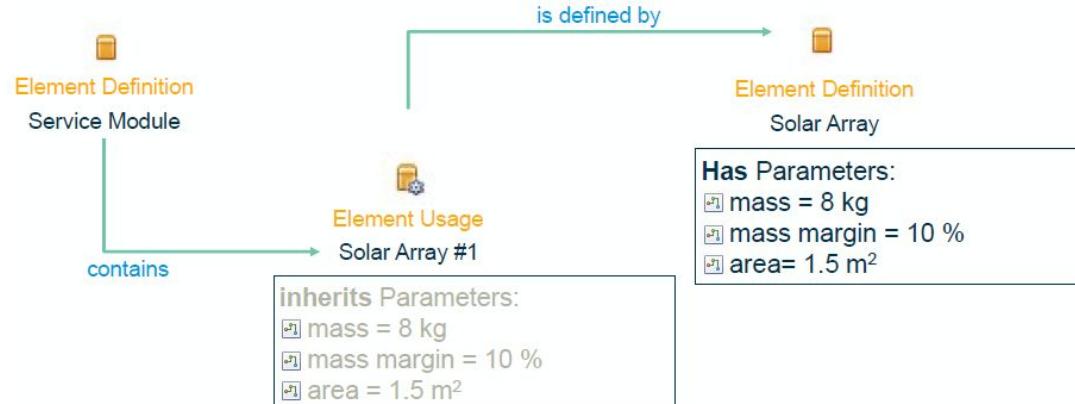

“Model” = “physical or abstract representation used for calculations, predictions or further assessment”  
- ECSS-S-ST-00-01C

In COMET: a model is made with **elements definitions** (≈classes)

Elements definitions are characterized by **parameters** (type mass, volume, etc. and unit)

There can be several similar elements used in a model (**element usage** in the product tree ≈instances)

Reference data library (RDL) to hold predefined generic data (types, units, scales, categories, etc.)

# COMET Tutorial - Elements definition

1. Open Element definitions and Product tree
2. SEs set the **top element** (mission test)
3. Drag and drop element definitions (to product tree or other element definition)

# COMET tutorial - Ownership & subscription

**Element Definitions** are the building blocks of a COMET model, **owned** by the Domain of Expertise that has created it  
→ Responsible to keep it up to date

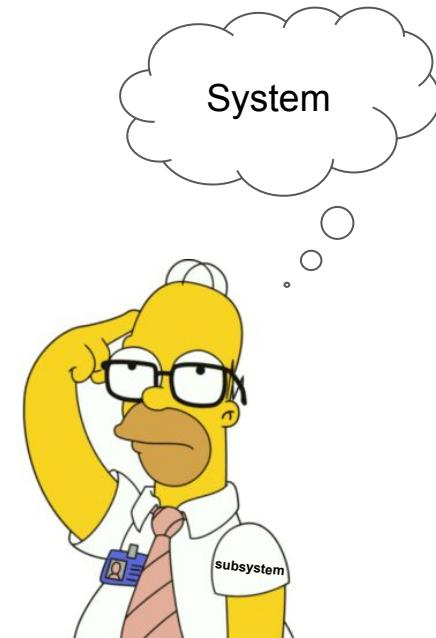

A **parameter** is always **owned** by one Domain of Expertise  
→ Responsible for its existence and for keeping it up to date  
→ It can be used - **Subscribed to** - by other Domains of Expertise

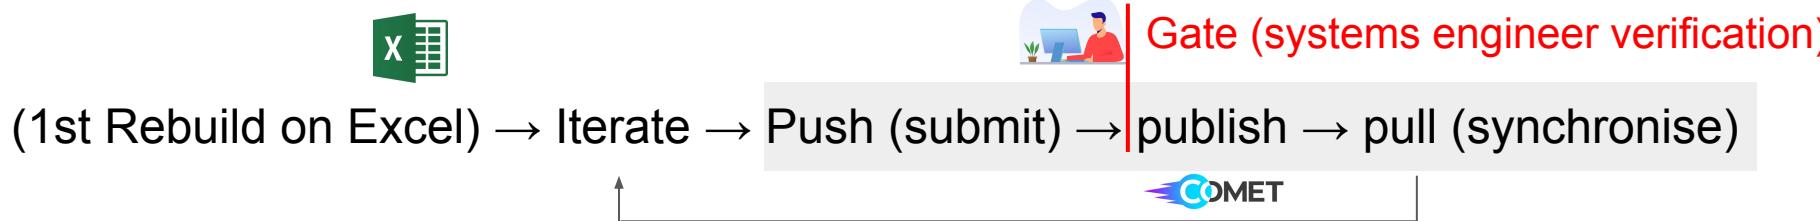

Right click > Subscribe to this parameter

**Element usages** inherit and change automatically

Which parameters do you need ?  
Which one do you own that the others need ?

# COMET tutorial - Three switch mechanism

When do we publish? (by Design Authority)

- At the end of a session
- (At the end of a Domain Expert's presentation)
- On request

Best practice: alert people when your data is updated  
(pushed, ready to publish)

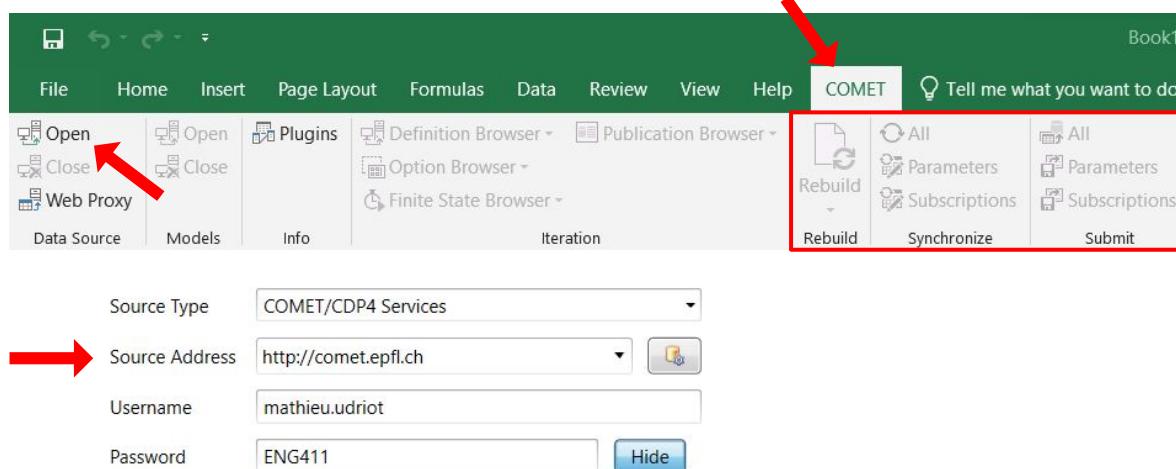

# COMET tutorial - Excel add-in

Log to COMET from Excel add-in

Open the model

Server path: <https://comet.epfl.ch>

Note: do not add “www”

“Rebuild” to create the Parameters and Option sheets

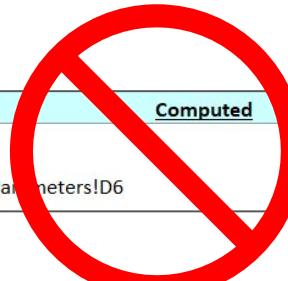

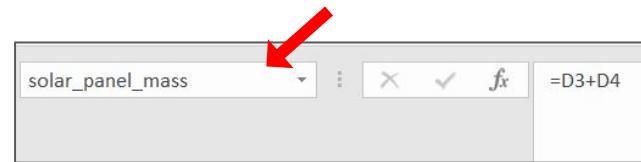

“Synchronize” to **pull** data

“Submit” to **push** → The outputs (Parameter values) are transferred to COMET via the Parameters worksheet

# COMET tutorial - Excel add-in

How to iterate:

- Rebuild (or synchronise if rebuilt already)
- See “owned” and “subscribed to” parameters
- Compute values of **owned** parameters
- Create a **stable** link to the Parameter sheet → use symbolic cell names !
- Fill the “Computed” and “Manual” field of the target parameter
- Toggle switch
- Submit to COMET
- Publication by design authority

| Name                    | Computed       | Manual |
|-------------------------|----------------|--------|
| solar panel<br>dry mass | =Parameters!D6 | 4      |

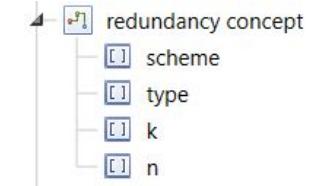

| Name                    | Computed          | Manual |
|-------------------------|-------------------|--------|
| solar panel<br>dry mass | =solar_panel_mass | 4      |

YES

# COMET tutorial - Advanced modelling

Redundancy concept parameter includes:

- **red\_scheme** (hot - all units are on, or cold - k units on)
- **red\_type** (internal - redundant units all in single package, or external - explicit)
- **k\_out\_of\_n\_items** : number of units needed for nominal operation
- **n\_items** : total number of units in system

State dependency:

- Create list of **possible** finite states

- Define list of **actual** finite states
  - Select 2 or more possible lists
  - Change state kind to “forbidden” is not allowed
- Define parameter state-dependant value

Finite States, iteration\_1

| Name                    | Short Name    | Owner | State Kind |
|-------------------------|---------------|-------|------------|
| Possible Finite Stat... | Possible List |       |            |
| Actual Finite State...  | Actual List   |       |            |

 Domain Of Expertise: System Engineering [SYS]

# CDF wiki and report

Connect to <https://cdf.epfl.ch/> to edit

- name.surname@epfl.ch
- ENG411

Go to “[previous CE studies → ENG-411 2025 study report](#)”

How to write the report:

- [Markdown language](#) 
- Each subsystem has its report section
- Keep track of iterations, justify decisions
- Executive summary to be written at the end
- Technical lessons learnt = main takeaways for future, similar studies

## ENG-411 2023 study report

Subtitle/Mission/Subsystem Name

Report Status

Version: 001

Reviewed by: xx

Review date: xx/xx/2023

Review status:  TO-DO

 For reference on how to fill the different sections of the report, check the [DUMBO mission study report](#).

 Avoid as much as possible duplicating information between sections.

 The executive summary must be a standalone, self-explanatory section of the report.

*[Write here a short abstract describing the context of this study.]*

The following contains all the relevant information resulting from this study, from the [context](#) and [mission objectives](#) to [lessons learned](#).

For a list of terms and acronyms often used, check the [Glossary](#) section.

*[Add mission patch here]*

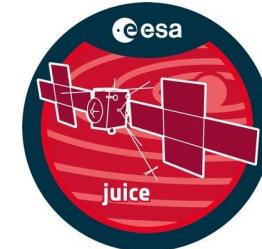

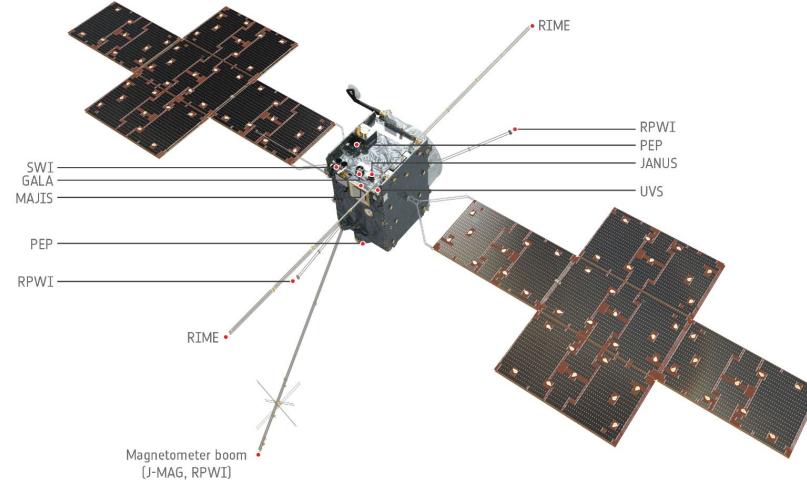

This study was performed at eSpace Concurrent Design Facility by the following team:

| Name          | Affiliation | Role   |
|---------------|-------------|--|
| Name LastName | eSpace      | Team Leader/Facilitator                      |
| Name LastName | eSpace      | Team Leader/Facilitator                      |
| Name LastName | EPFL        | Attitude & Orbit Control (AOC)               |
| Name LastName | EPFL        | Communications & Data Handling (CDH)         |
| Name LastName | EPFL        | <i>[Add as many disciplines as required]</i> |

# Wrap up

- Summary of subsystems making the team and the available tools
- Remind concurrent process - three switch mechanism: **push, publish, pull**
- Where to find the COMET user guide:
  - Here is the [2024 version of the User Guide](#)
  - Or (if the above link does not work), go to [COMET's Github page](#), and find the hyperlink to the User Guide in the README

[JUICE mission](#): launch planned on April 13th 2023, was studied in the CDF in 2005 (as "Laplace", [see poster](#))

# Any questions?

## Parting thoughts

First time this course is given at EPFL. There will be things to improve and polish.

We need your feedback!

We are here to help YOU learn. Anything you may need help with or on your mind on how to make the course better, let us know.
