Prolonged drought lowered the level of the Elbe River so much in summer 2022 that the so-called Hunger Stone, one of the oldest hydrological monuments in Central Europe, appeared in Decin, Czech Republic.

It heralded the famine years—reduced harvests due to drought.

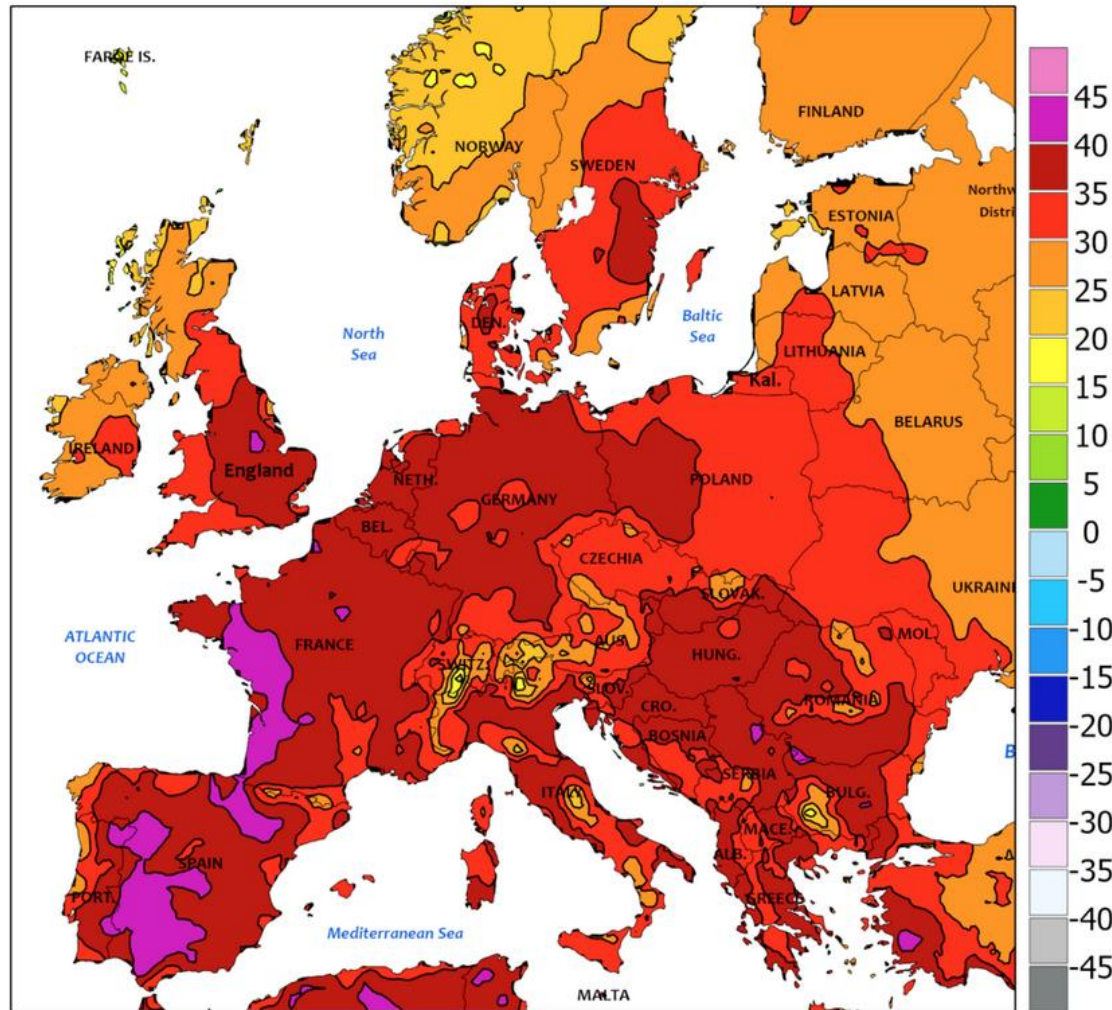

The stone is engraved with the years—the oldest from 1616—and inscriptions. The most distinct is the old German "Wenn du mich siehst, dann weine" ("If you see me, weep").

## River Ecosystems Laboratory

Owing to global change, the ecological integrity of streams and rivers is at threat worldwide. At RIVER, we conduct insight-driven and fundamental research that cuts across the physical, chemical and biological domains of alpine stream ecosystems. We study biofilms, the dominant form of microbial life in streams, including the structure and function of their microbiome, and their orchestration of ecosystem processes. We also study stream ecosystem processes and biogeochemistry, including whole-ecosystem metabolism and related carbon fluxes — from the small to the global scale. We blend environmental sciences and ecology, and combine fieldwork with experiments and modeling to gain a better mechanistic understanding of stream ecosystem functioning.

# **How is water distributed on Earth?**

# A Map of the Wet Mantle

Recent discoveries of water-bearing minerals hint that Earth's mantle might hold more water than all the oceans combined. The findings challenge the standard ideas about Earth's formation.

**Table 10.4 Estimated mean residence times (storage to throughput) and stored water volumes of the main components of the Earth's hydrosphere**

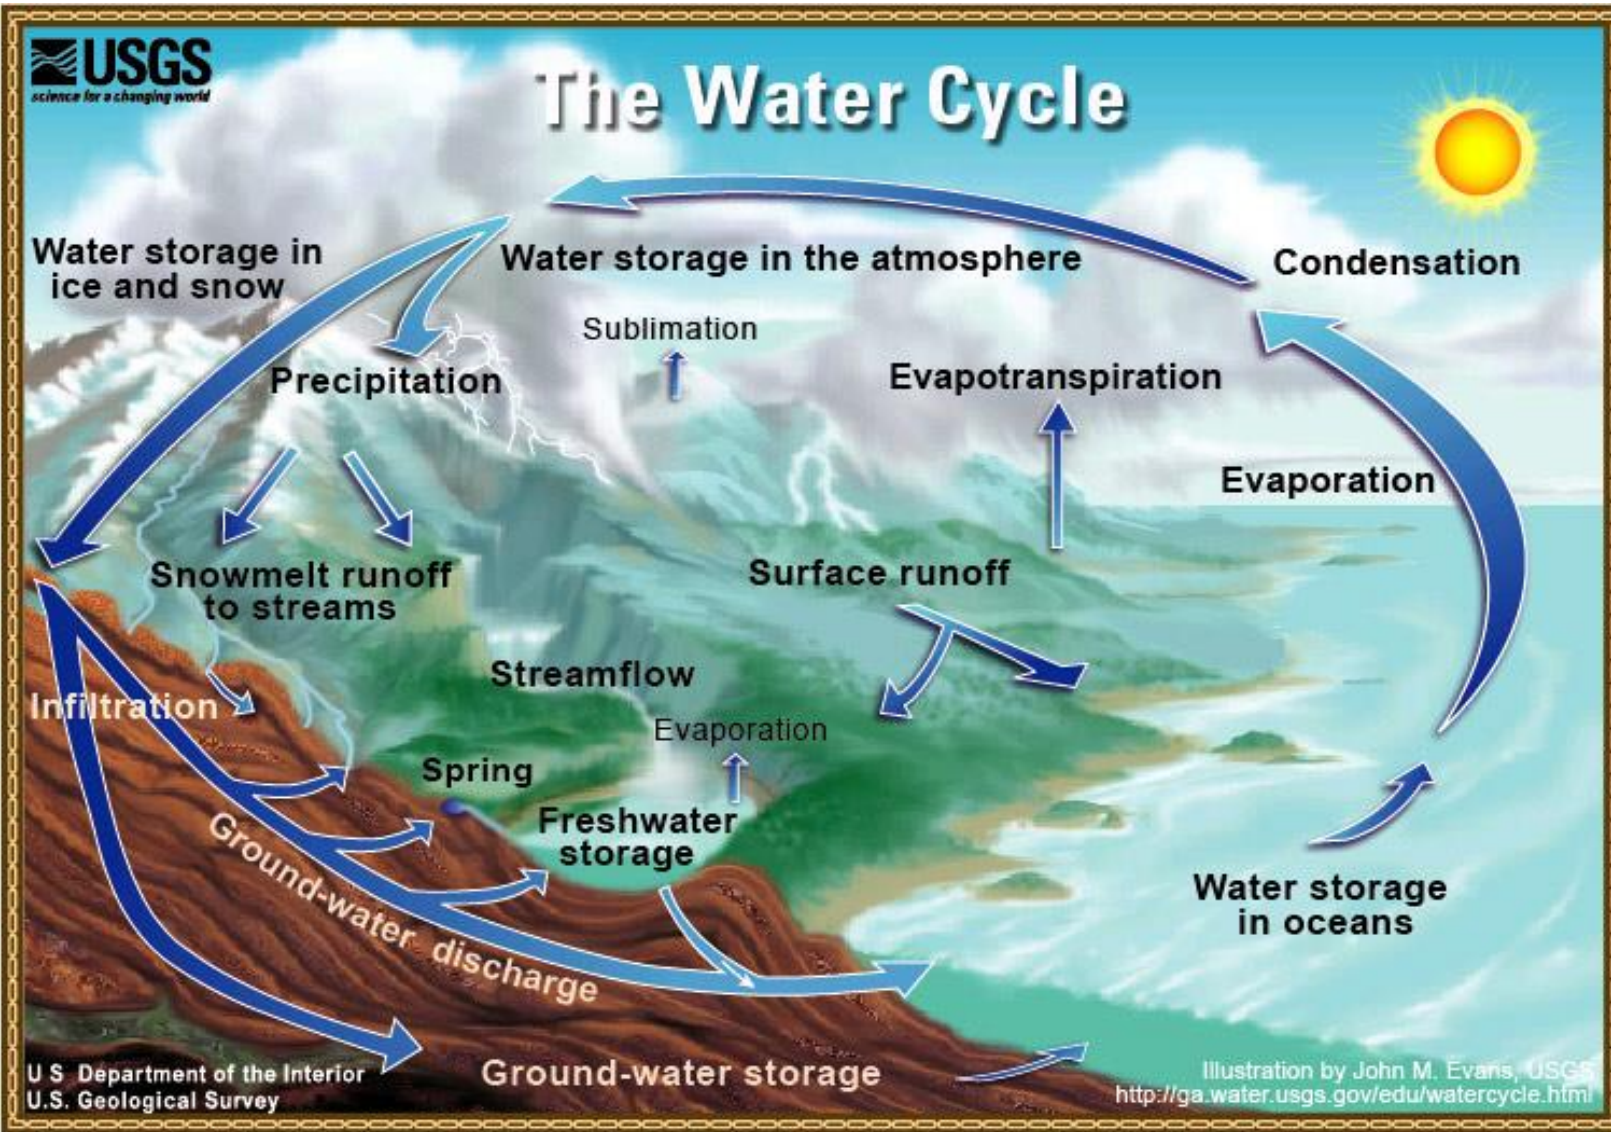

<b>Component</b>	<b>Mean residence time</b>	<b>Total water stored (thousands of cubic kilometres)</b>	<b>Freshwater stored (thousands of cubic kilometres)</b>
Permafrost zone, ground ice	10,000 years	300	300
Polar ice	9,700 years	24,023	24,023
Oceans	2,500 years	1,338,000	na
Mountain glaciers	1,600 years	40.6	40.6
Groundwater (excluding Antarctica)	1,400 years	23,400	10,530
Lakes	17 years	176.4	91.0
Swamps	5 years	11.5	11.5
Soil moisture	1 year	16.5	16.5
Streams	16 days	2.1	2.1
Atmosphere	8 days	12.9	12.9
Biosphere	Several hours	11.2	11.2
<b>Total</b>		<b>1,385,985</b>	<b>35,029</b>

## Turnover of water in aquatic ecosystems

Storage and residence times

## Why does it matter?

- Physical and chemical stability
- Biogeochemical reactions
- Habitat diversification and biodiversity

## Storage and fluxes Interactions between aquatic ecosystems

- Atmosphere
- Surface flow
- Subsurface flow

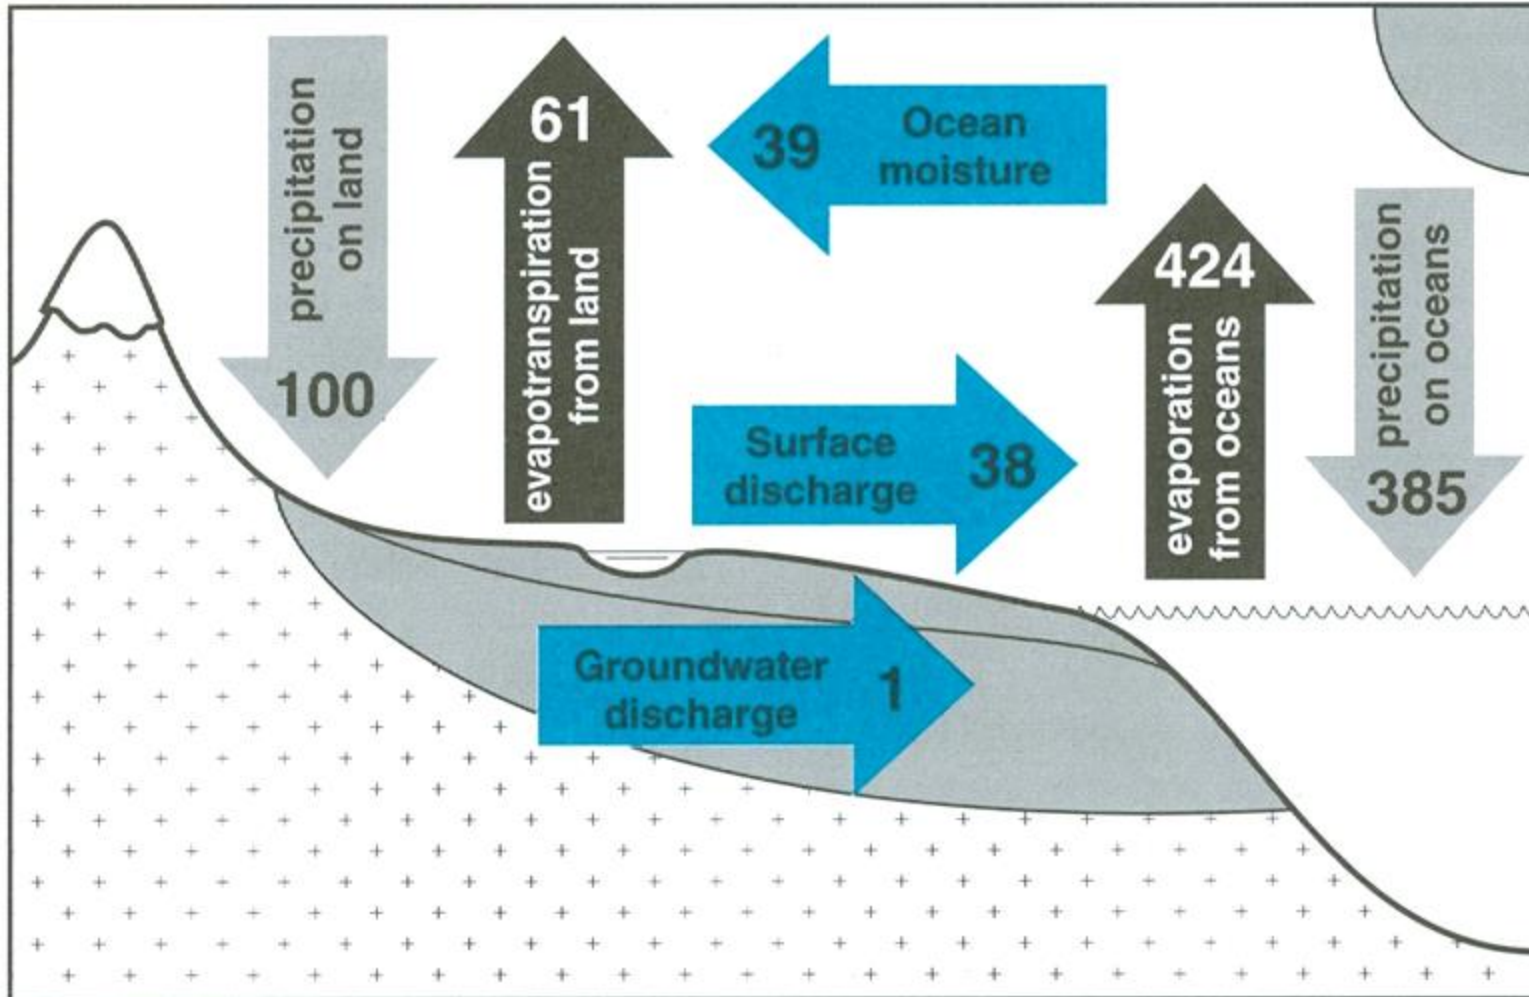

Figure 1.4 Flows within the hydrological cycle. Units are relative to the annual precipitation on the land surface ( $100 = 119,000 \text{ km}^3 \text{ yr}^{-1}$ ). Black arrows depict flows *to* the atmosphere, gray arrows depict flows *to* land or oceans, and blue arrows indicate lateral flows. Data from Maidment (1993).

## Storage and fluxes Interactions between aquatic ecosystems

- Atmosphere
- Surface flow
- Subsurface flow

# What is an ecosystem?

An ecosystem can be categorized into its abiotic components, including minerals, climate, soils and water, and all other non-living elements, and its biotic constituents, consisting of all its living members.

Linking these constituents together are two major forces: the flow of energy through the ecosystem and the cycling of nutrients within the ecosystem.

Ecosystems are embedded in the landscape, with transition zones between other ecosystems.

# Global distribution of lakes

A legacy of the last glaciation

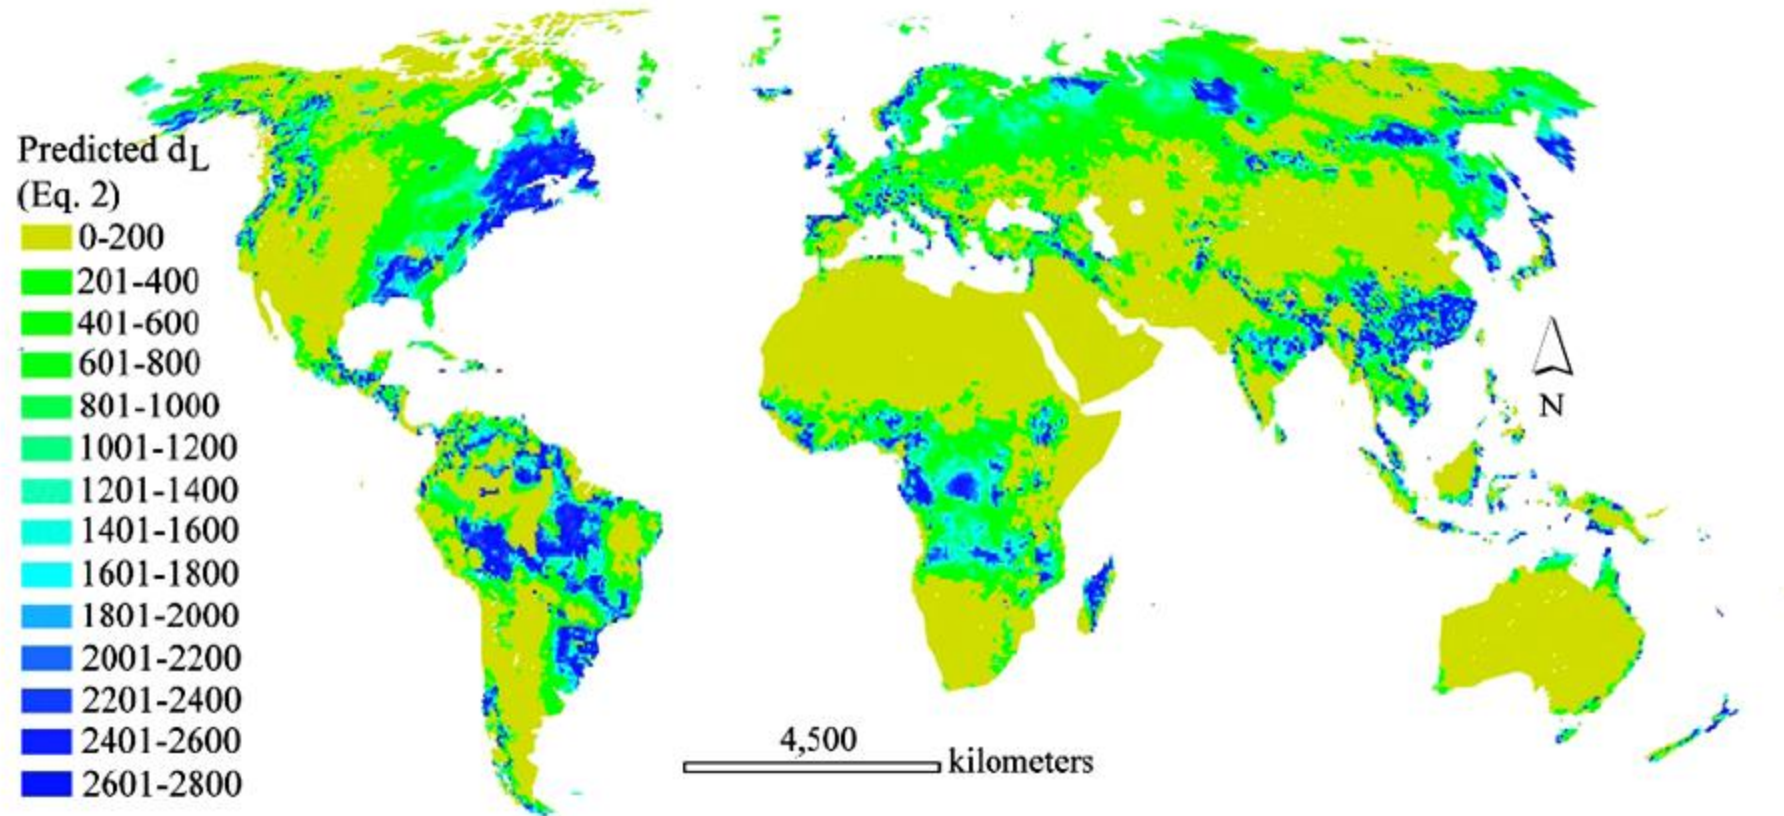

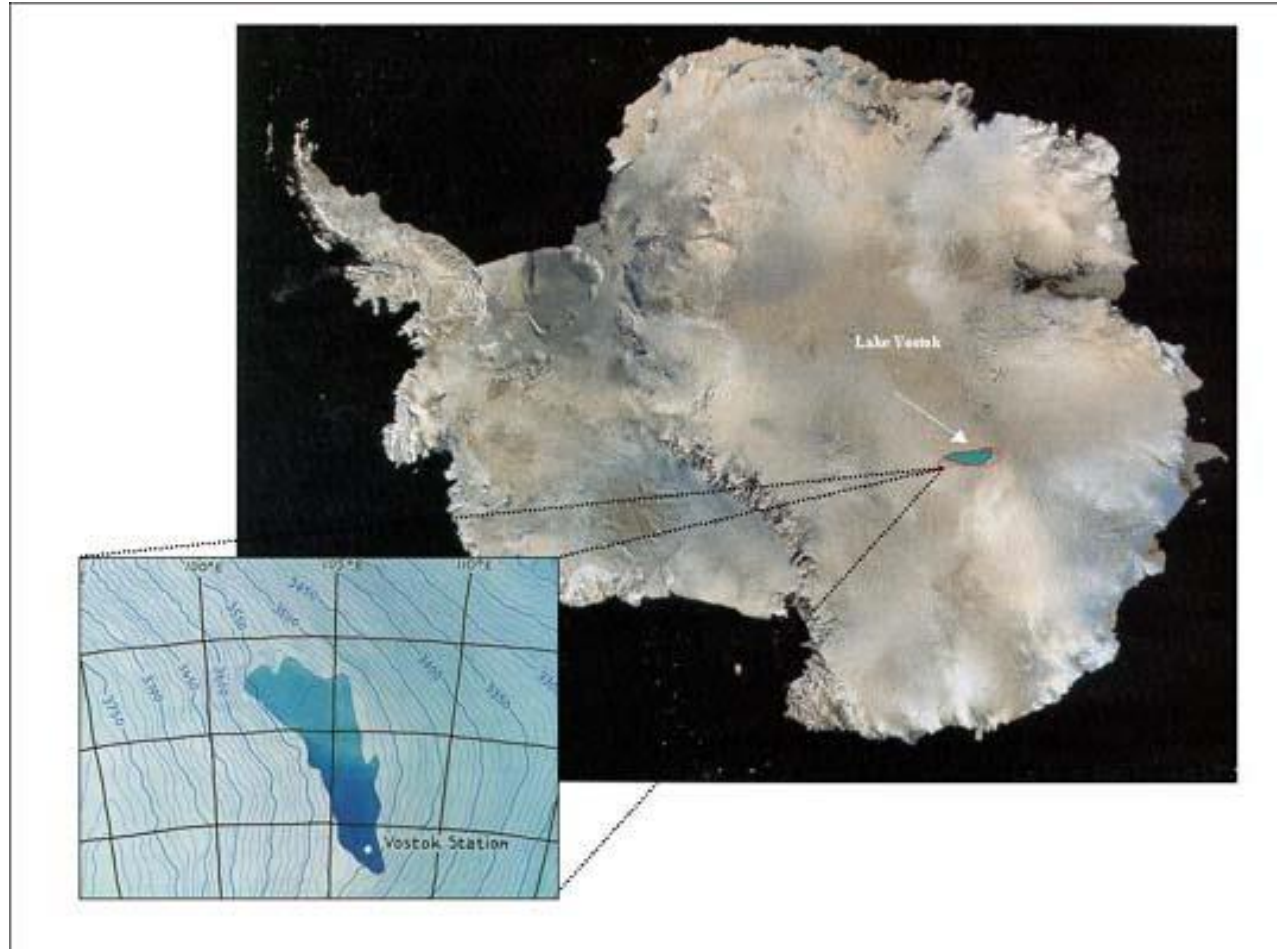

Fig. 3. Geographical analysis of the predicted world distribution of densities ( $d_L$ ; Eq. 2) of lakes between 1 km<sup>2</sup> and 10 km<sup>2</sup> surface area. Predictions follow a world GIS model of annual run-off (Fekete et al. 2005) with a geographical resolution of 0.5° of latitude and longitude. Lake densities are shown in lakes per 10<sup>6</sup> km<sup>2</sup>.

Downing et al. 2006

## **Brief portraits of some enigmatic lakes**

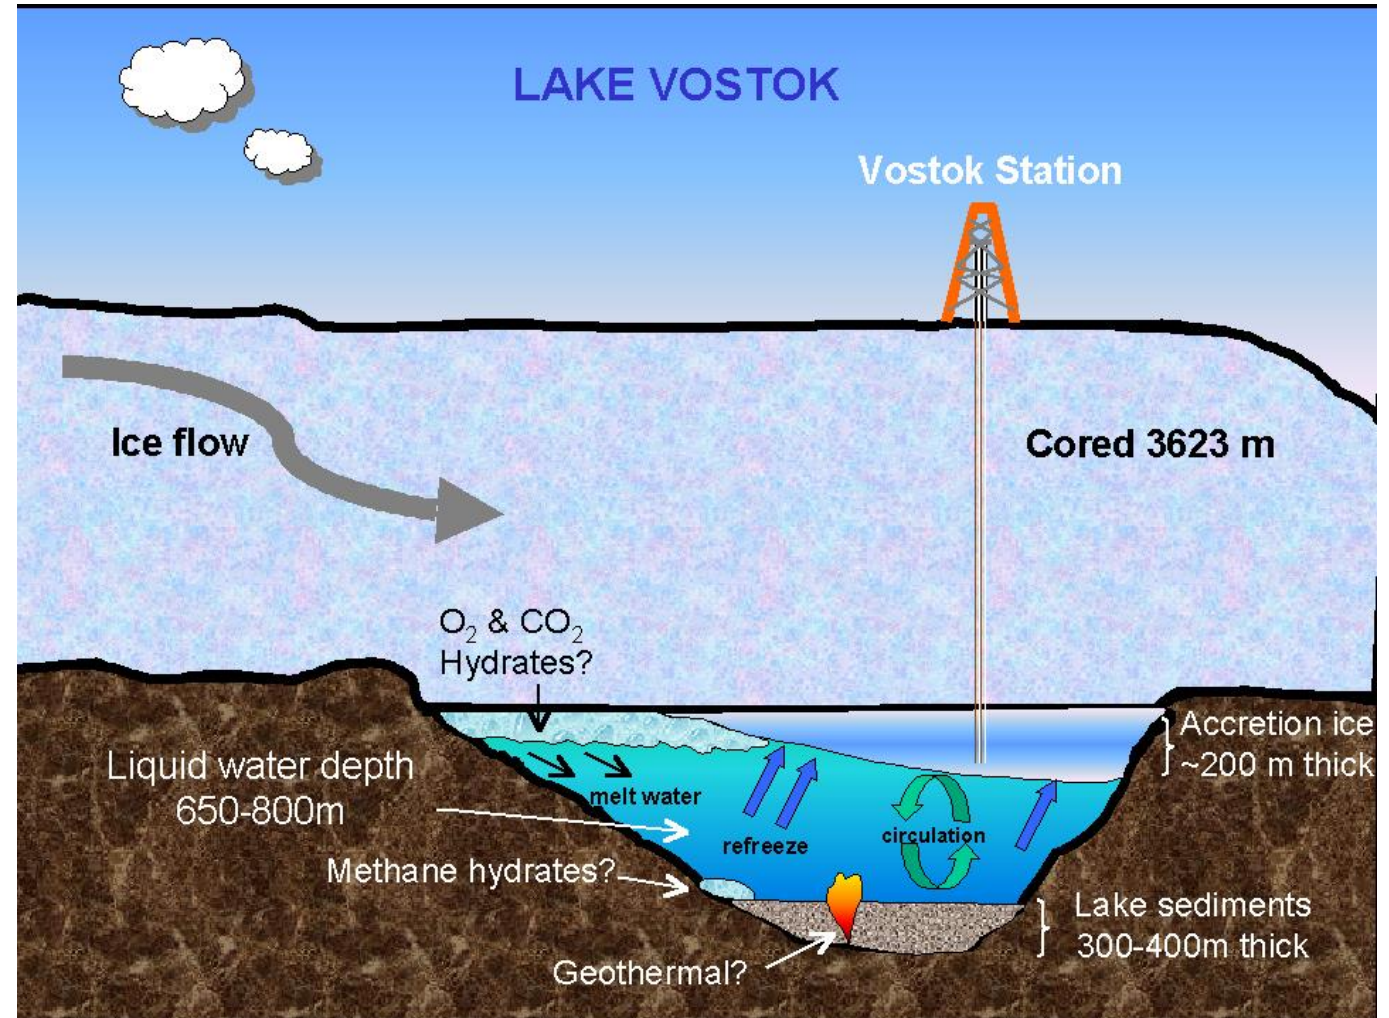

# Lake Vostok (Восток, "east")

- 4,000 meters under the surface of the central Antarctic ice sheet
- 250 x 50 km
- 15,690 km<sup>2</sup>
- 5,400 km<sup>3</sup>
- average depth 344 m
- 35 million years old

# Lake Vostok (Восток, "east")

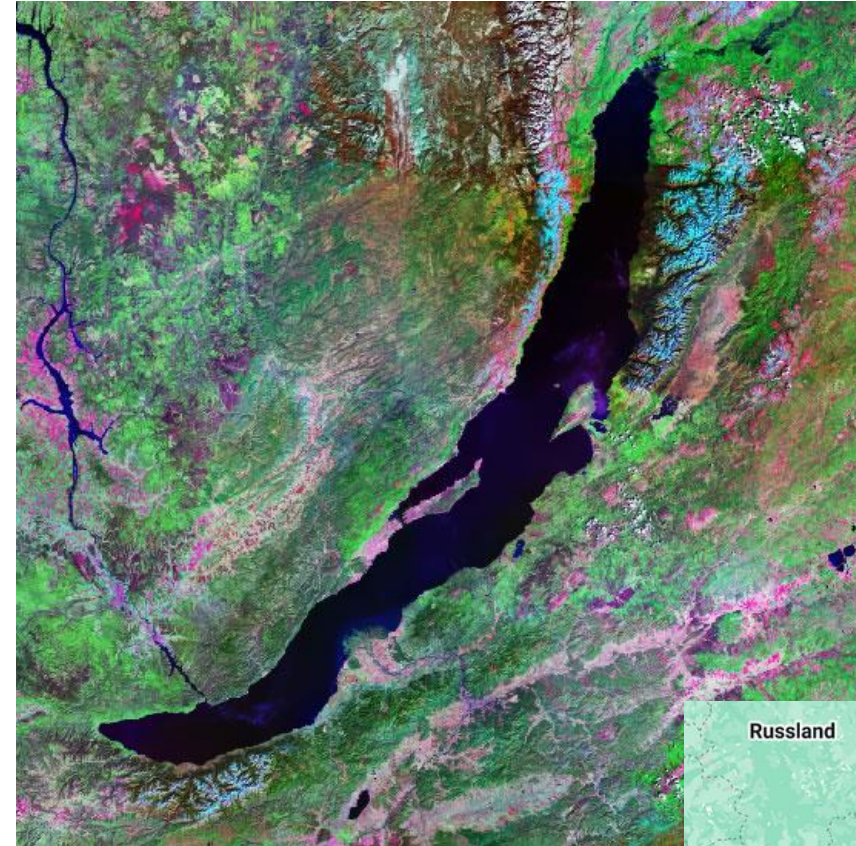

- 4,000 meters under the surface of the central Antarctic ice sheet
- 250 x 50 km
- 15,690 km<sup>2</sup>
- 5,400 km<sup>3</sup>
- average depth 344 m
- 35 million years old

# Lake Baikal

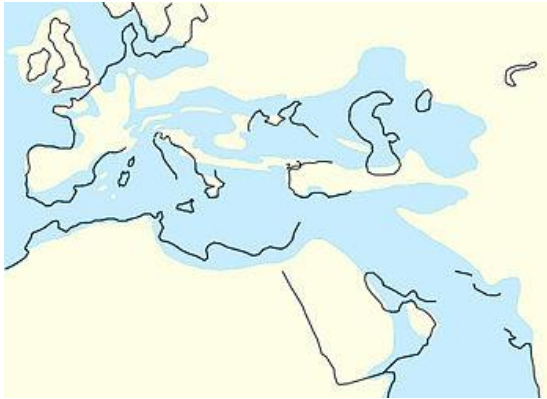

- deepest lake on Earth (1,642 m)
- ca. 20% of the world's freshwater
- oldest lakes (20 – 25 M years)
- 1,700 species, ca 60% endemic

# Caspian lake

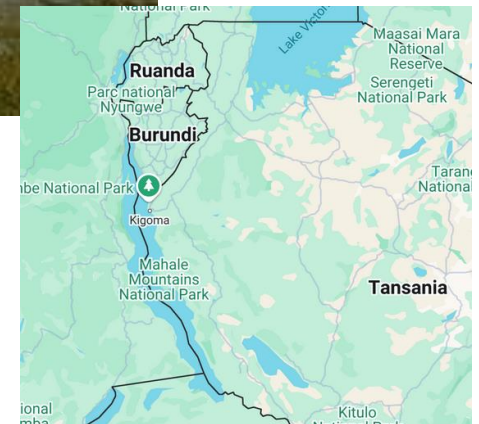

- Largest lake: 371,000 km<sup>2</sup>
- 78,200 km<sup>3</sup>
- endorheic basin
- Taratethys Sea (Oligocene ca 34 M years)
- drying out

# Lake Tanganjika

- East-African rift valley
- ca. 20 M years
- 18,880 km<sup>3</sup>
- 32,893 km<sup>2</sup> (50 km wide)
- “fossile” water
- large sink of organic carbon

# Lac Léman

580 km<sup>2</sup>

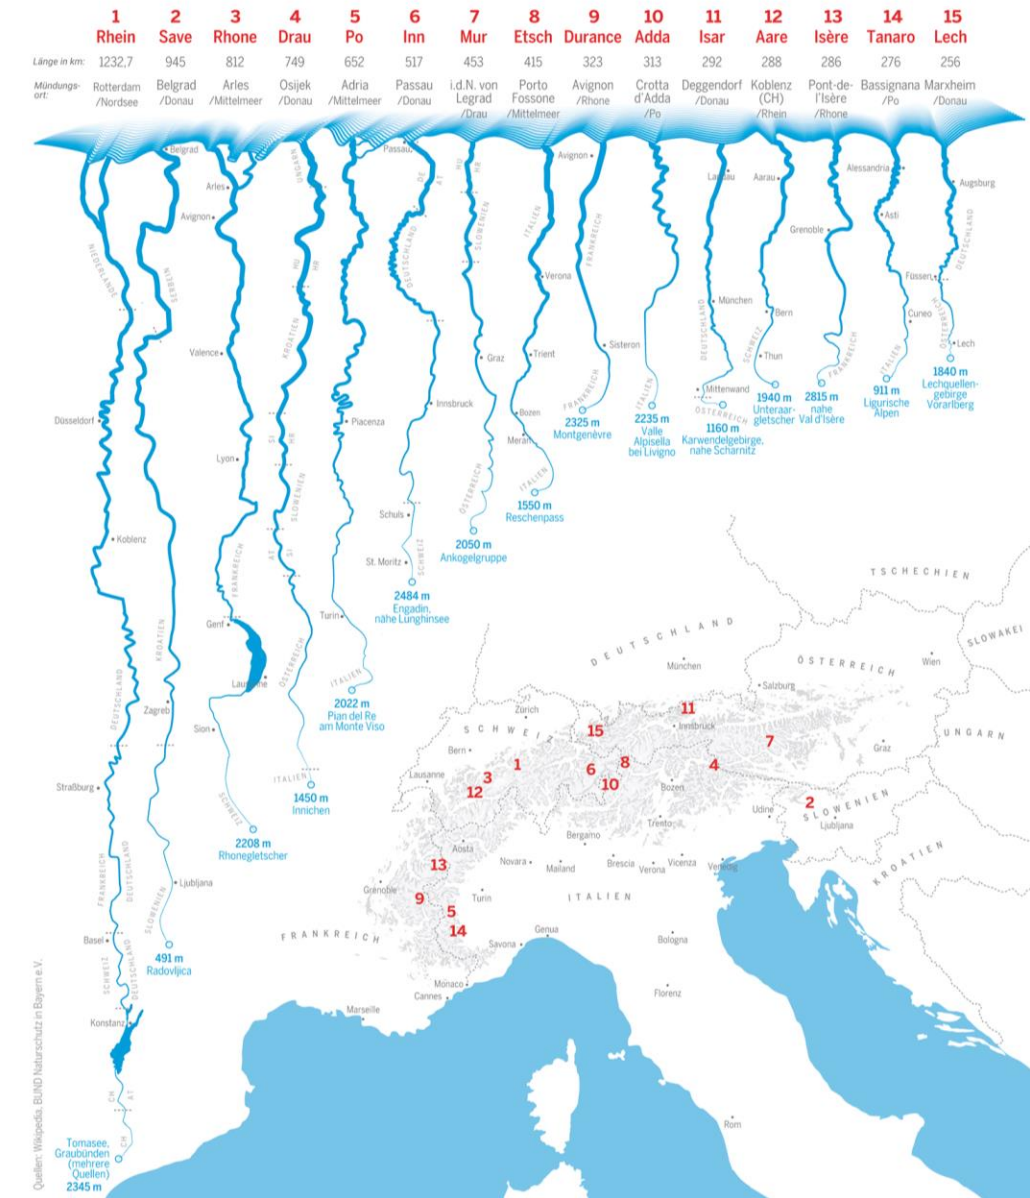

310 m deep

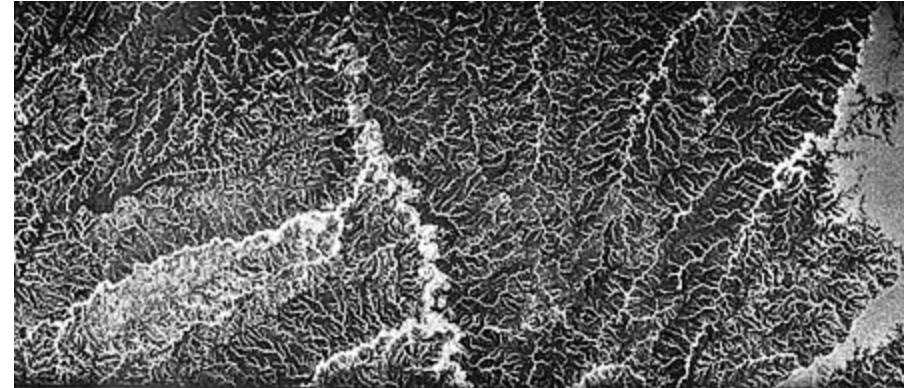

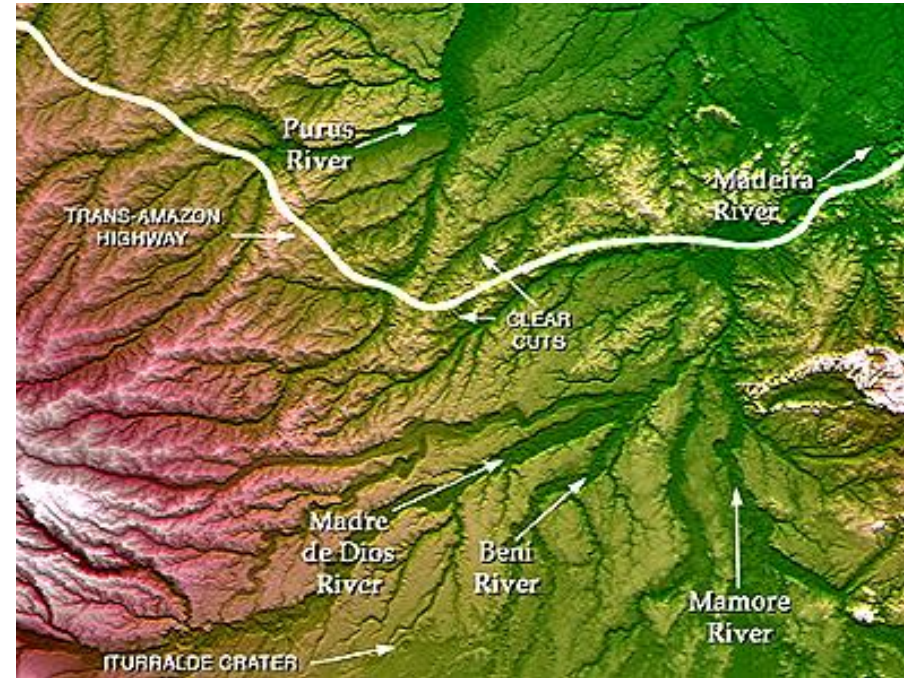

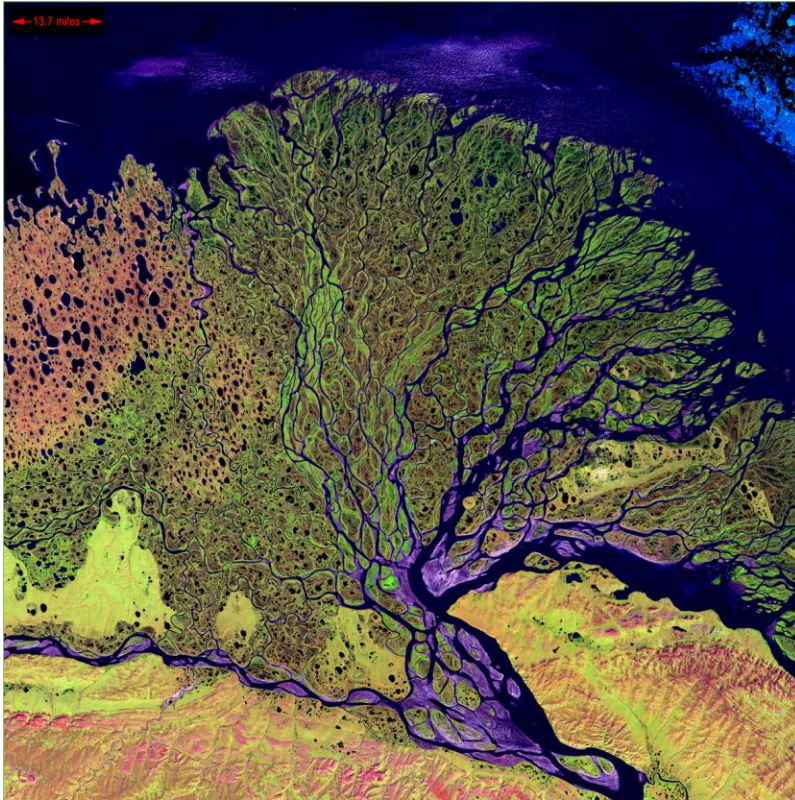

# Rivers

Large Alpine rivers

Cutting across national borders and biomes

# Stream networks

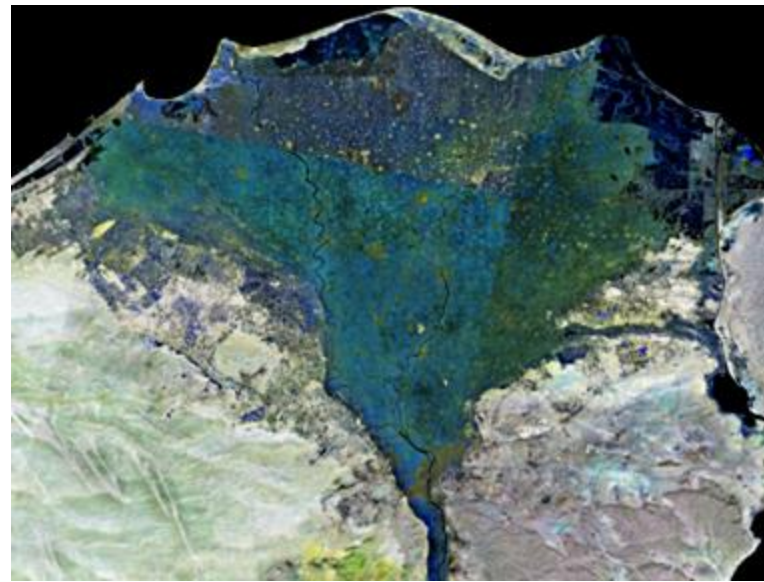

# River floodplains and corridors

Connected to the terrestrial milieu

# Nile River

- 6,671 km length
- discharge: ca. 1200 m<sup>3</sup>/s
- Delta: 24.000 km<sup>2</sup>
- Catchment size: 3,254,853 km<sup>2</sup>

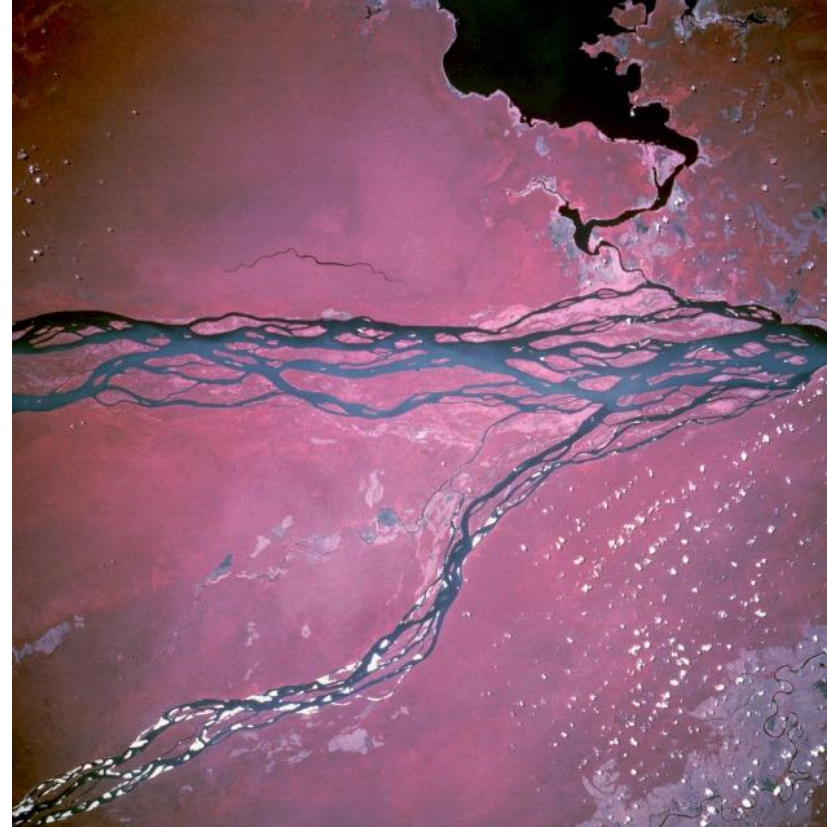

# Amazon River

- Length: 6,448 km
- Discharge: ca. 209.000 m<sup>3</sup>/s
- Catchment size: 6,112,000 km<sup>2</sup>

# Congo River

- Length: 4,700 km
- Discharge: ca. 41,000 m<sup>3</sup>/s
- Catchment size: 4,014,500 km<sup>2</sup>
- Black water

# Rhone River

Length: 812 km

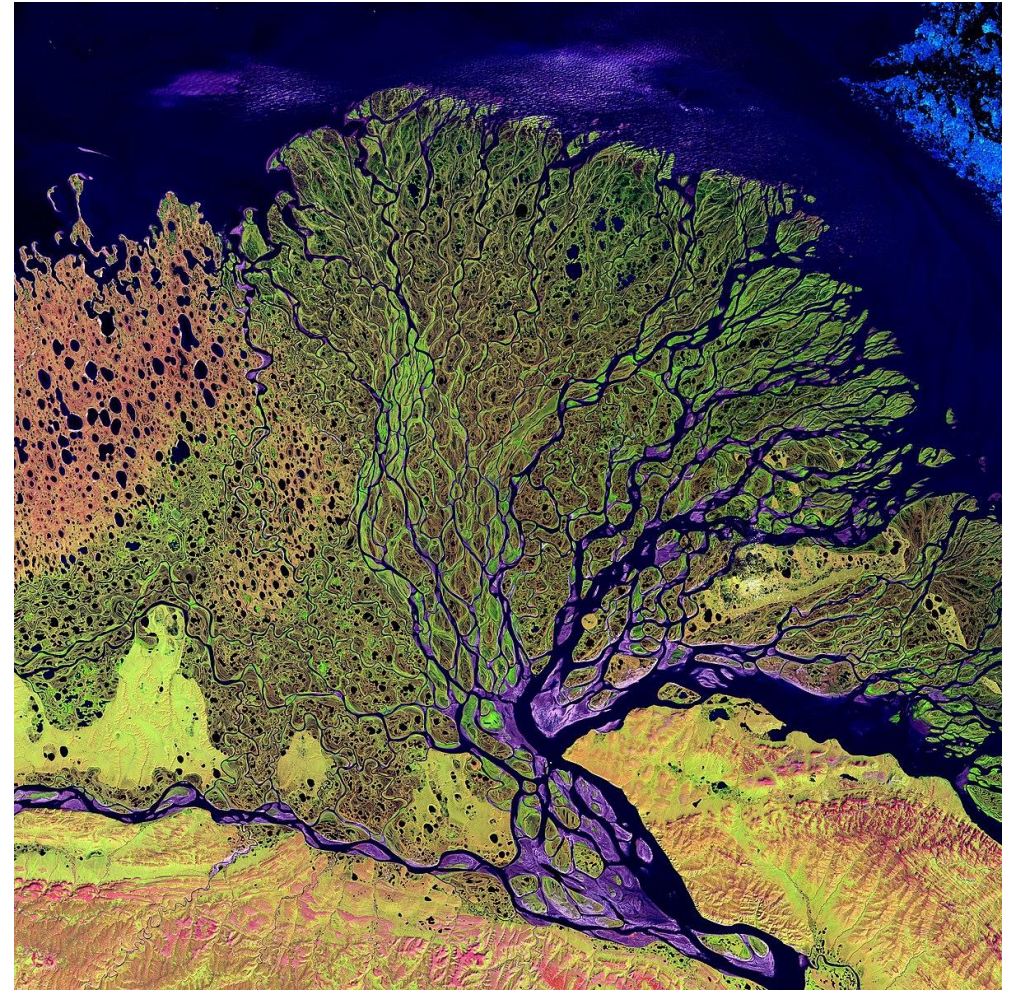

Discharge: ca. 1,710 m<sup>3</sup>/s

Catchment size: 100,200 km<sup>2</sup>

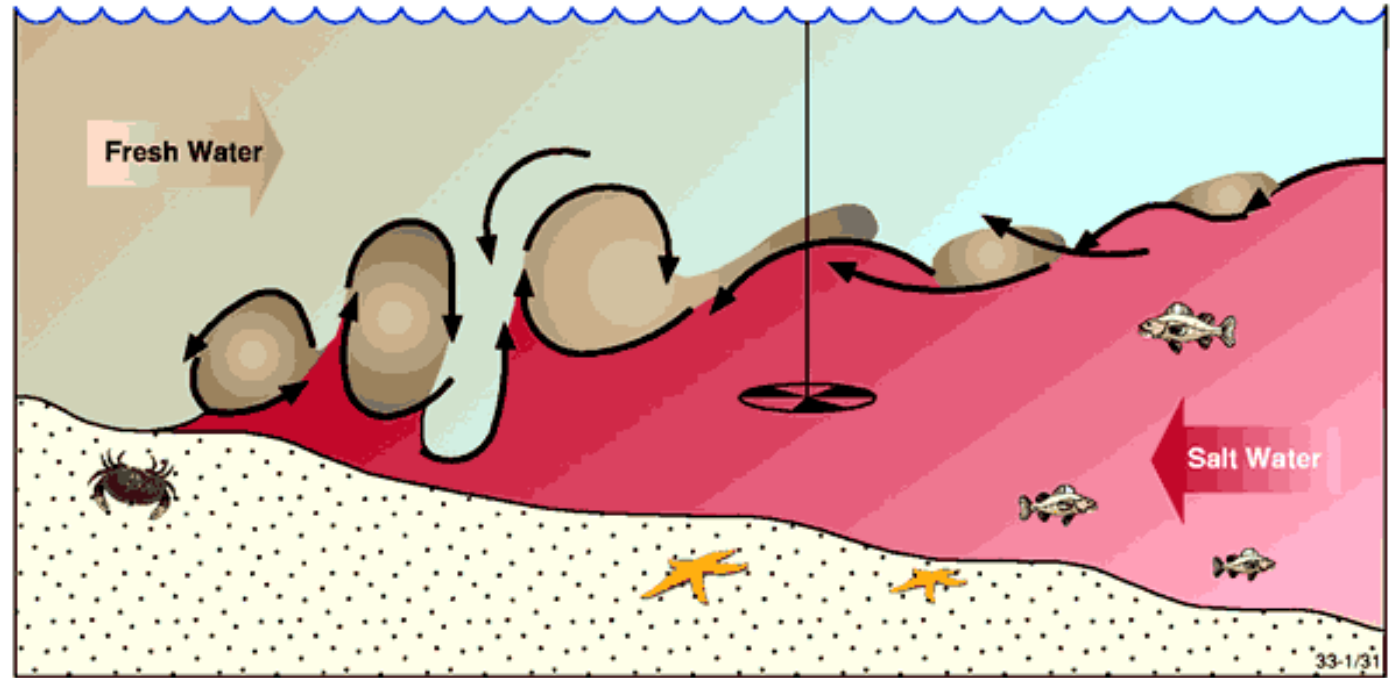

# Estuaries

- Mixing zone between freshwater and saltwater
- Internal wakes with extended residence times and flocculation of organic matter
- High productivity and biodiversity
- Large cities built next to estuaries worldwide

# Wetlands

Okavango Delta

# Wetlands

Wetlands are areas where water covers the soil, or is present either at or near the surface of the soil all year or for varying periods of time during the year, including during the growing season.

Water saturation largely determines how the soil develops and the types of plant and animal communities living in and on the soil.

Wetlands are transition zones (in space and time) that may support both aquatic and terrestrial species.

The prolonged presence of water creates conditions that favour the growth of specially adapted plants (hydrophytes) and promote the development of characteristic wetland (hydric) soils.
