- 4. Constraints**
- 5. Free variables**
- 6. Results**
- 7. Conclusion**

1. Introduction

Microwave dishes principal applications:

- Fast food
- Reheating food

Common materials:

- Polymers such as PP and PE
- Polymer foams of PS
- Traditional glass and ceramic dishware

2. Function

Principal function :

- Contain food heated by microwaves

Microwave oven :

- Microwave: radiation of 2.45 GHz through the food
- Water, fat and other substances in the food absorb energy from the microwaves in a process called dielectric heating

3. Objectives

Choice of materials and process

- Scenario 1
Disposable microwave dishes
→ very cheap
- Scenario 2
Reusable dishes
→ cost less critical
→ very good resistance to fresh water

4. Constraints

- Minimal microwave absorption Z_{ϵ}
 - Minimal dielectric constant ϵ
 - Minimal power factor Z
- Minimal thickness to limit absorption
- Stiff and strong enough to cope with ordinary handling loads
- Support service temperature of about 100°C
- Good thermal insulation for handling and keep dishes hot

4. Constraints

- Estimation of mechanical properties required

$$\delta = \frac{Fw^3}{384EI} \quad \text{with} \quad I = \frac{wt^3}{12} \quad \Rightarrow \quad E = \frac{Fw^3}{384I\delta}$$

$$\sigma = \frac{Ftw}{16I} = \frac{3F}{4t^2}$$

Numerical application :

$$F = 10 \text{ N}$$

$$\delta = 10 \text{ mm}$$

$$w = 200 \text{ mm}$$

$$t = 2 \text{ mm}$$

$$E = 156.25 \text{ MPa}$$

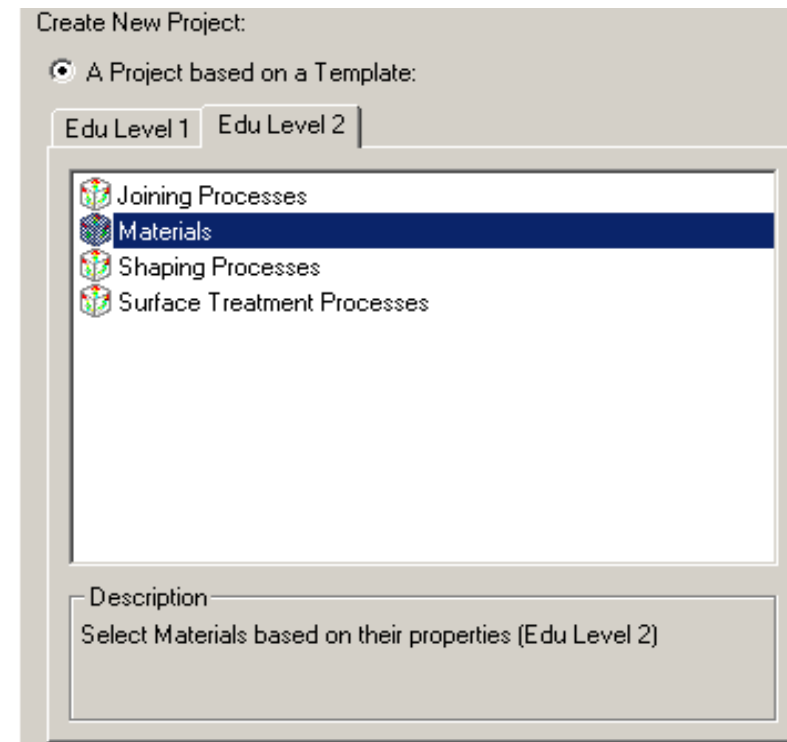

$$\sigma = 1.875 \text{ MPa}$$

5. Free variables

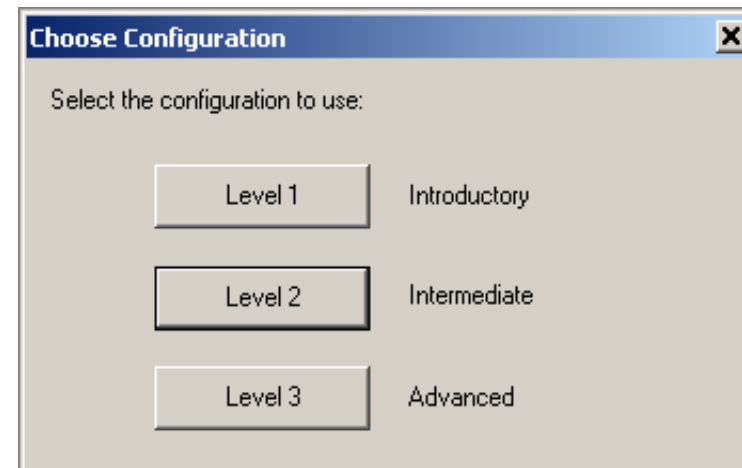

- Choice of materials
- Choice of process

6. Approach - Scenario 1

Selection data :
Edu Level 2 - Materials

Configuration :
Level 2 - Intermediate

6. Approach - Scenario 1

Choice of materials :
Stage 1 - Limit Stage

Mechanical properties			
	Minimum	Maximum	
Young's modulus	0.15625		GPa
Shear modulus			GPa
Bulk modulus			GPa
Poisson's ratio			
Yield strength (elastic limit)	1.875		MPa
Tensile strength			MPa

Thermal properties			
	Minimum	Maximum	
Thermal conductor or insulator?	<input type="checkbox"/> Good conductor <input type="checkbox"/> Poor conductor <input checked="" type="checkbox"/> Poor insulator <input checked="" type="checkbox"/> Good insulator		
Thermal conductivity			W/m.K
Thermal expansion coefficient			$\mu\text{strain}/^{\circ}\text{C}$
Specific heat			J/kg.K
Melting point			$^{\circ}\text{C}$
Glass temperature			$^{\circ}\text{C}$
Maximum service temperature	100		$^{\circ}\text{C}$
Minimum service temperature			$^{\circ}\text{C}$

6. Approach - Scenario 1

Calculated values

Can be taken &
keep dishes hot

Water boiling

Mechanical properties			
	Minimum	Maximum	
Young's modulus	0.15625		GPa
Shear modulus			GPa
Bulk modulus			GPa
Poisson's ratio			
Yield strength (elastic limit)	1.875		MPa
Tensile strength			MPa

Thermal properties			
<input type="checkbox"/> Good conductor <input type="checkbox"/> Poor conductor <input checked="" type="checkbox"/> Poor insulator <input checked="" type="checkbox"/> Good insulator			
	Minimum	Maximum	
Thermal conductivity			W/m.K
Thermal expansion coefficient			$\mu\text{strain}/^\circ\text{C}$
Specific heat			J/kg.K
Melting point			$^\circ\text{C}$
Glass temperature			$^\circ\text{C}$
Maximum service temperature	100		$^\circ\text{C}$
Minimum service temperature			$^\circ\text{C}$

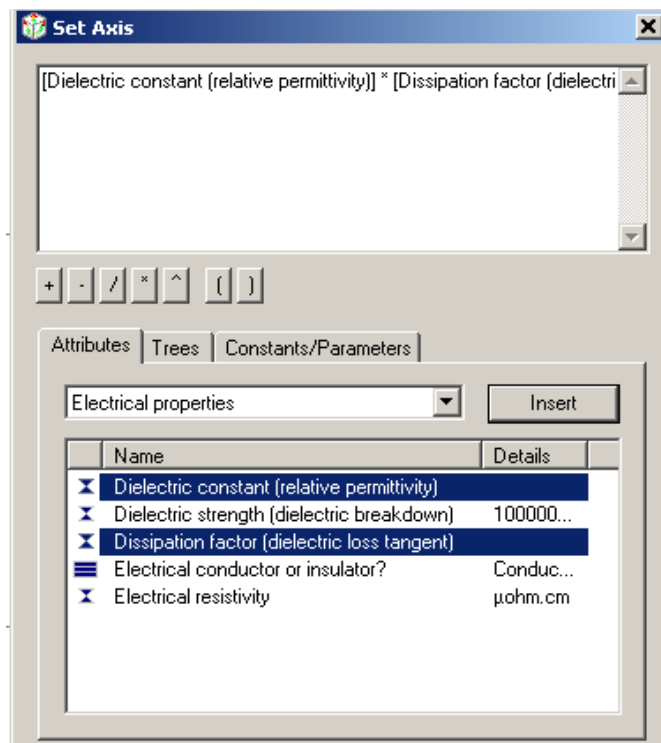

Results	
Stage 1	
37 of 94 pass

6. Approach - Scenario 1

Choice of materials :

Stage 2 – Graph Stage

$Z \epsilon$
VS
Price [m³]

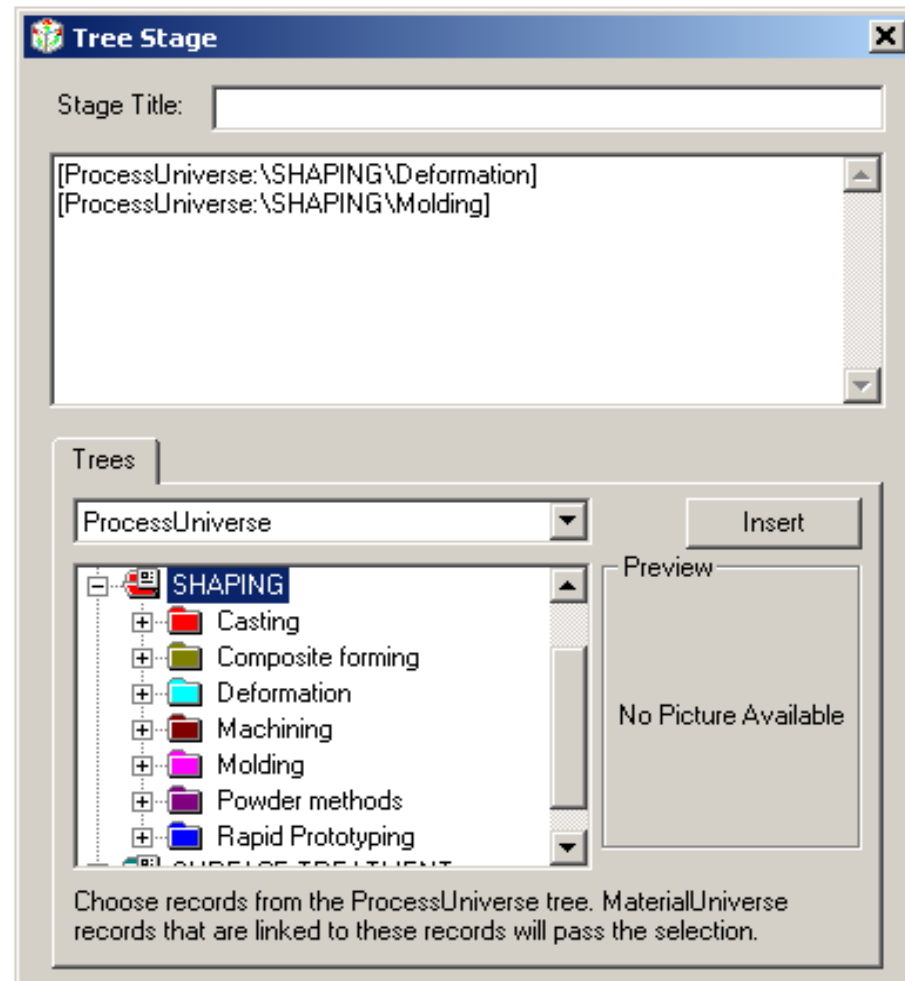

6. Approach - Scenario 1

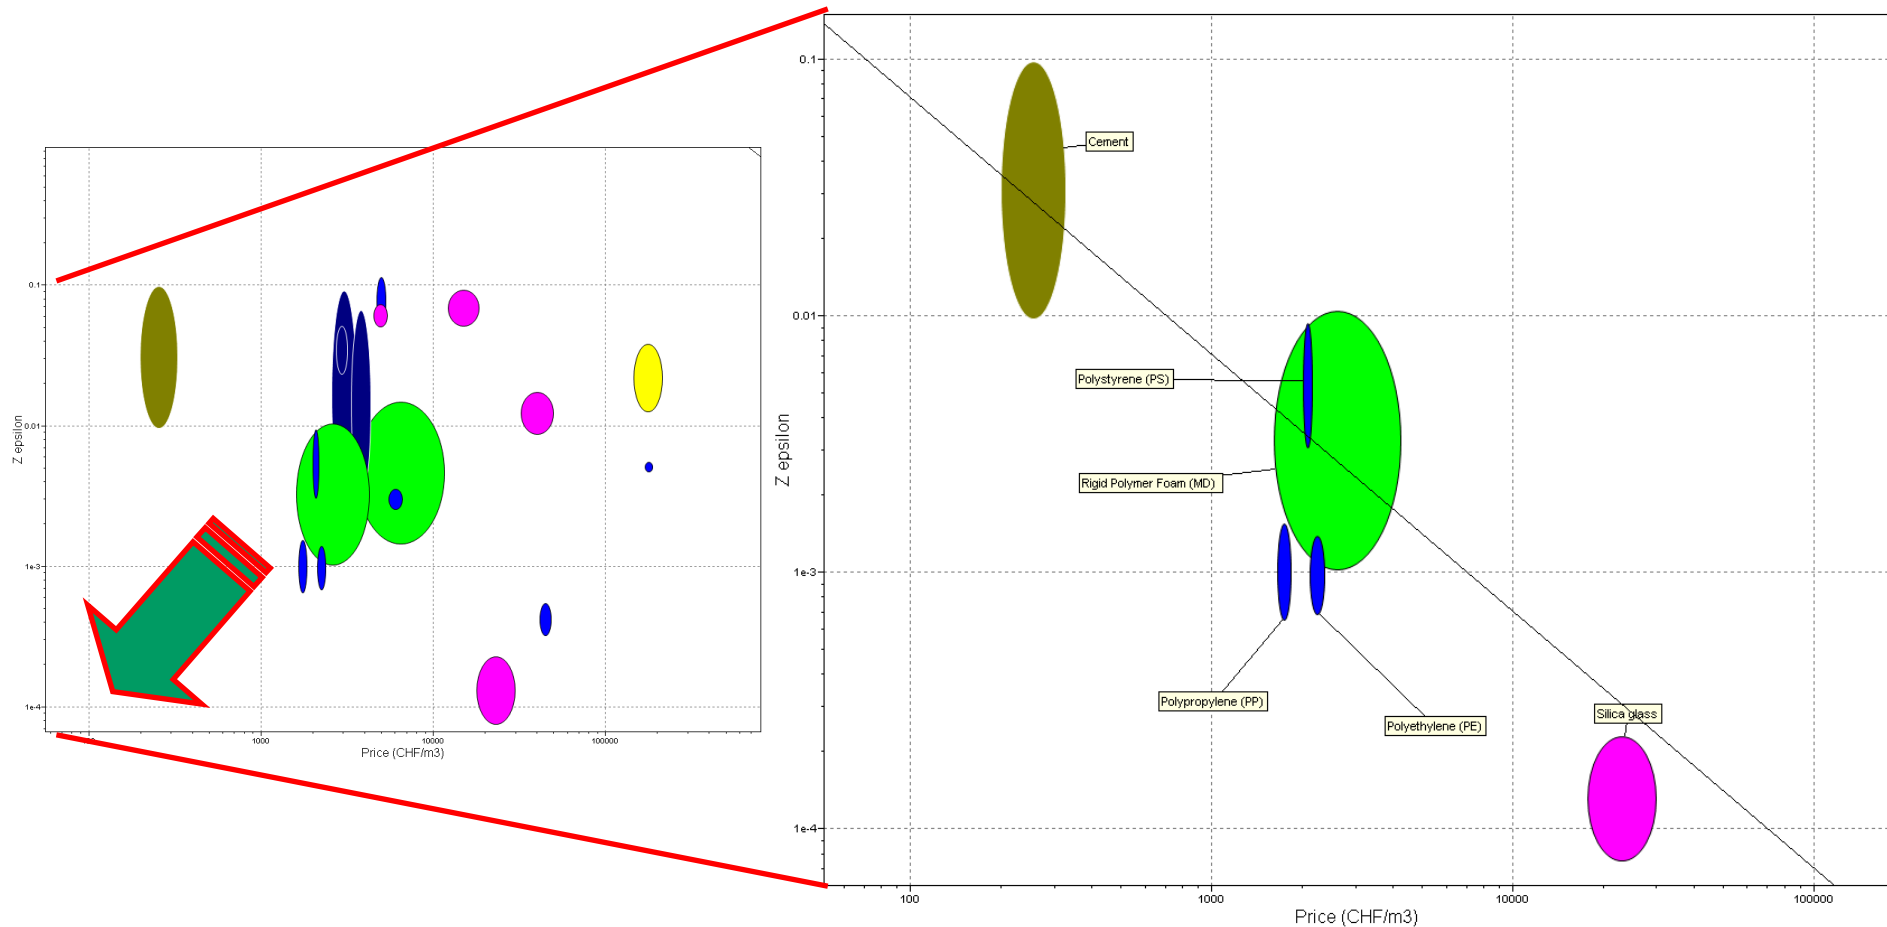

Choice of process :

Stage 3 – Tree Stage

- Deformation
- Molding

6. Results - Scenario 1

- ➡ The best one is Polypropylene (PP), but generally Rigid Polymer Foam (MD) and Polystyrene (PS) are used for disposable microwave dishes containers
- ➡ Ribs can be added to the geometrical design to increase mechanical resistance

6. Approach - Scenario 2

From scenario 1 :

- Same data selection & configuration

Edu Level 2 - Materials - Intermediate

- Same choice of process

Molding

Deformation

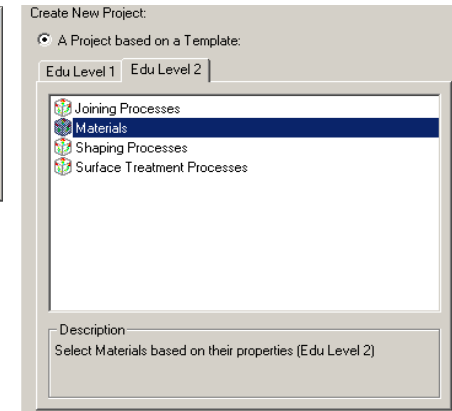

Added constraint :

Limit added to stage 1: very good resistance to fresh water

Analysis :

The price is less critical

The mechanical durability is more critical

Mechanical properties			
	Minimum	Maximum	
Young's modulus	0.15625		GPa
Shear modulus			GPa
Bulk modulus			GPa
Poisson's ratio			
Yield strength (elastic limit)	1.875		MPa
Tensile strength			MPa

Thermal properties			
	Minimum	Maximum	
Thermal conductor or insulator?	<input type="checkbox"/> Good conductor <input type="checkbox"/> Poor conductor <input checked="" type="checkbox"/> Poor insulator <input checked="" type="checkbox"/> Good insulator		
Thermal conductivity			W/m.K
Thermal expansion coefficient			μstrain/°C
Specific heat			J/kg.K
Melting point			°C
Glass temperature			°C
Maximum service temperature	100		°C
Minimum service temperature			°C

6. Approach - Scenario 2

Choice of materials :
Stage 4 – Graph Stage

- Mechanical performances

Young modulus
[GPa]

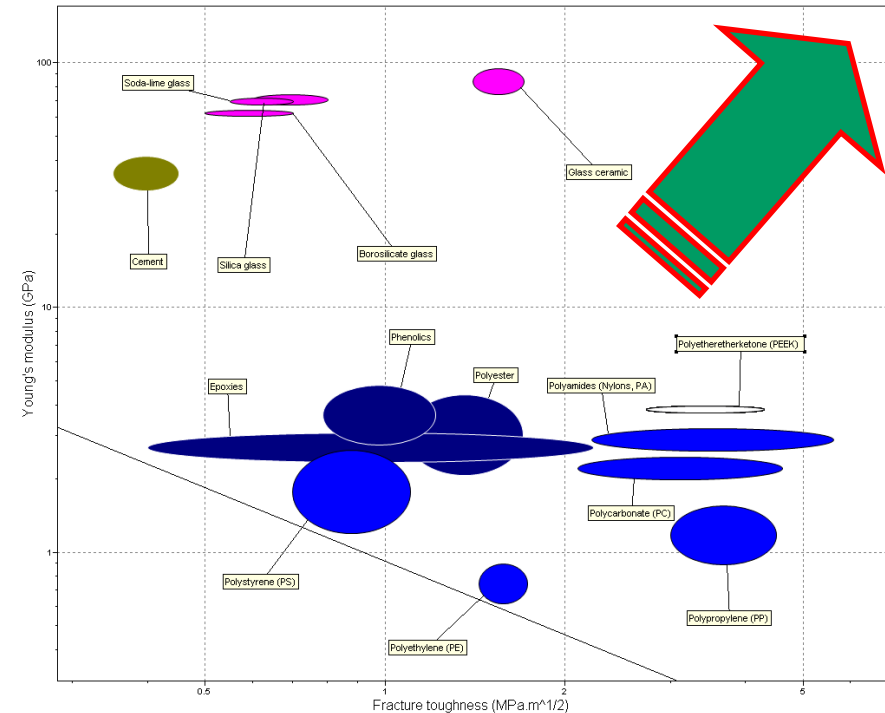

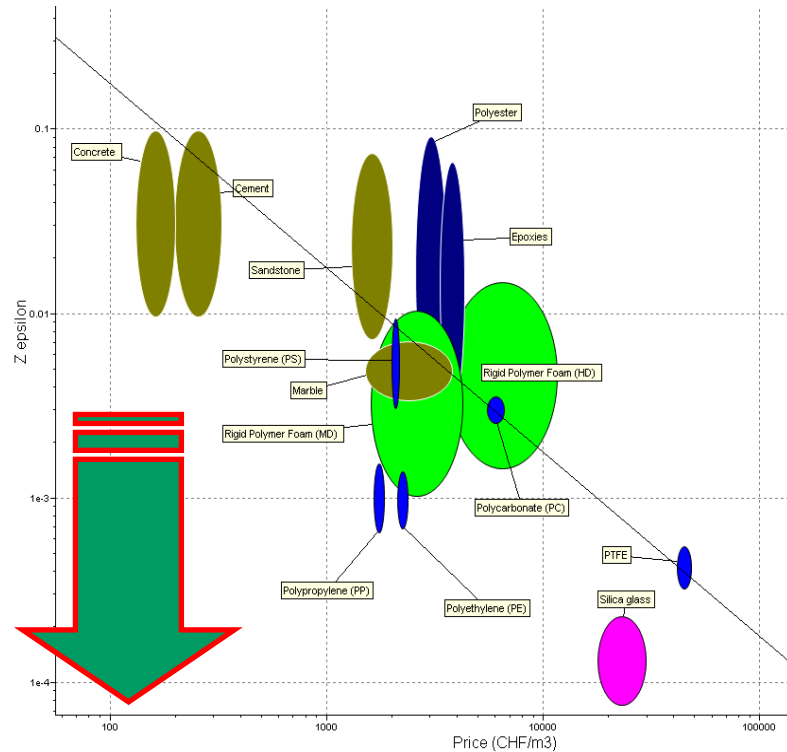

vs.

Fracture toughness
[MPa·m^{1/2}]

6. Results - Scenario 2

For **reusable** microwave dishes containers

- ➡ The best material is Silica glass, but Polyethylene (PE) and Polypropylene (PP) are also very good
- ➡ Polystyrene (PS) is not good and polymer foams are avoided by the fresh water resistance limit stage

7. Conclusions

- Materials are partially the same for both scenario 1 and 2 (PP, PE) even if constraints change considerably
 - There are always several possibilities for materials
 - Not a big surprise – commonly used materials are the among the best
 - Selected Processes help to limit materials (example cement)
 - CES does not say much about food compatibility
- ➡ First approach for selecting the materials but further study necessary
